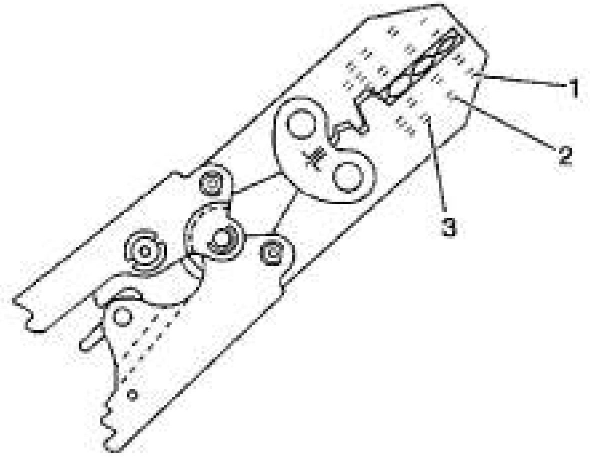
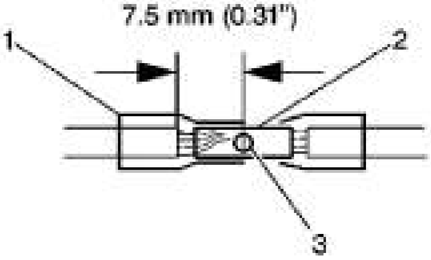
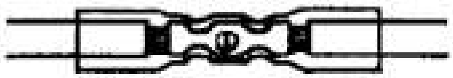
at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.



5. Use the EL-38125-10 splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. The crimp tool has four nests, one for each color.

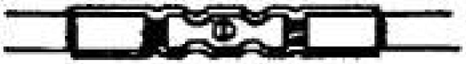


6. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.



7. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
8. Tightly close the handles of the crimp tool until the crimper handles open when released.

   The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 5 for the opposite end of the splice.



9. Using the heat torch, apply heat to the crimped area of the barrel.
10. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Heated Oxygen Sensor Wiring Repairs

Caution: Do not solder repairs under any circumstances as this could result in the air reference being obstructed.

If the heated oxygen sensor pigtail wiring, connector, or terminal is damaged the entire oxygen sensor assembly must be replaced. Do not attempt to repair the wiring, connector, or terminals. In order for the sensor to function properly it must have a clean air reference. This clean air reference is obtained by way of the oxygen sensor signal and heater wires. Any attempt to repair the wires, connectors or terminals could result in the obstruction of the air reference and degrade oxygen sensor performance.

The following guidelines should be used when servicing the heated oxygen sensor:

- Do not apply contact cleaner or other materials to the sensor or vehicle harness connectors. These materials may get into the sensor, causing poor performance. Also, the sensor pigtail and harness wires must not be damaged in such a way that the wires inside are exposed. This could provide a path for foreign materials to enter the sensor and cause performance problems.
- Neither the sensor nor vehicle lead wires should be bent sharply or kinked. Sharp bends, kinks, etc., could block the reference air path through the lead wire.
- Do not remove or defeat the oxygen sensor ground wire (where applicable). Vehicles that utilize the ground wire sensor may rely on this ground as the only ground contact to the sensor. Removal of the ground wire will also cause poor engine performance.
- To prevent damage due to water intrusion, be sure that the peripheral seal remains intact on the vehicle harness connector.

High Temperature Wiring Repairs

Special Tools

- DuraSeal splice sleeves, in order to repair the SIR/SRS wiring
- EL-38125-10 Splice Sleeve Crimping Tool
- EL-38125-5 Ultra Torch

For equivalent regional tools, refer to Special Tools.

High Temperature Wiring

Wiring that is exposed to high temperatures, 135°C (275°F) or higher, for prolonged periods of time may use materials i.e. wires, connectors, and shielding that has a higher heat rating than typical wiring. When making a repair in a high temperature area observe the following:

- Use high temperature bulk wire rated at 150°C (302°F) continuous temperature to replace any damaged wire.
- Replace any heat shielding that is removed.
- Cover any DuraSeal splice sleeves with SCT1 shrink tubing.
- After making a wiring repair, ensure that the location of the wiring is not moved closer to the heat source.

Identifying High Temperature Wiring

Wiring that is exposed to high temperature, 135°C (275°F) or higher, for prolonged periods of time need special considerations when making wiring repairs. Areas that may be exposed to higher temperatures can be identified by heat resistant materials that are being used in those areas. These materials may include heat reflective tape, moon tape, and high temperature shrink tubing. Also conduit and other protective coverings may be used. Because conduit or similar coverings are used throughout the vehicle regardless of the temperature, it may be necessary for the technician to determine if an area is exposed to excessive heat before making a wiring repair. Obvious areas of consideration would be any area located near the exhaust manifolds, catalytic converter, and exhaust pipes.

Items Required

- DuraSeal splice sleeves to crimp and seal connections
- High temperature SCT1 shrink tubing to protect the splice sleeves
- Terminated leads or pigtails
- The correct tools to remove the terminals from the connectors

Use high temperature bulk wire rated at 150°C (302°F) continuous temperature of the same or larger gage size as the original wire when repair damage wire. Also replace any reflective tape that you remove during the repair.

High Temperature Wire Repair

Note: Refer to Wiring Repairs in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire rated at 150°C (302°F) continuous temperature rating of the same gage size (0.5 mm, 0.8 mm, 1.0 mm etc.). Use the DuraSeal splice sleeves and the EL-38125-10 splice sleeve crimping tool and then encapsulate the splice sleeve using the high temperature SCT1 shrink tubing. Use the following wiring repair procedures in order to ensure the integrity of the sealed splice.

Splice Sleeve Color	Crimp Tool Nest Color	Wire Gage mm² / (AWG)
Salmon (Yellow-Pink) 12089189	Red (1)	0.035-0.8/(18-20)
Blue 12089190	Blue (2)	1-2/(14-16)
Yellow 12089191	Yellow (3)	3-5/(10-12)
Green 88988379	Red (1)	0.22-0.35/(22-26)

Note: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

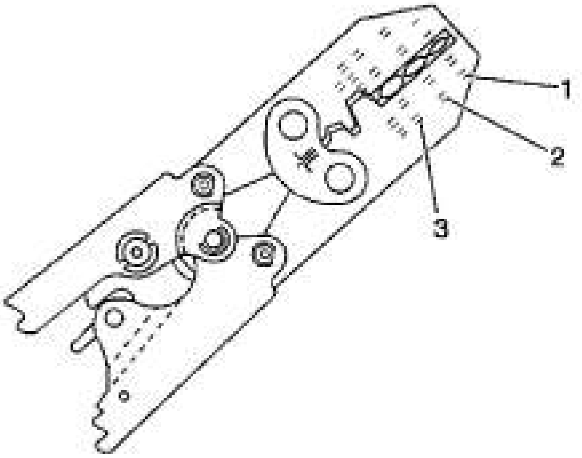
1. Open the harness by removing any tape:
   - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
   - Use the DuraSeal splice sleeves on all types of insulation except tefzel and coaxial.
   - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

   Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

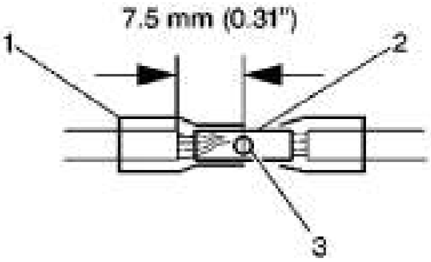
3. Strip the insulation:
   - When adding a length of wire to the existing harness, use the same size wire as the original wire.
   - Perform one of the following items in order to find the correct wire size:
     - Find the wire on the schematic and convert to regional wiring gage size.
     - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.

- Strip approximately 7.5 mm (0.313 in) of insulation from each wire to be spliced.
- Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
- If the wire is damaged, repeat this procedure after removing the damaged section.

4. Slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

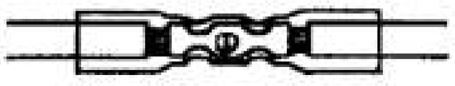


6. Use the EL-38125-10 splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. The crimp tool has four nests, one for each color.



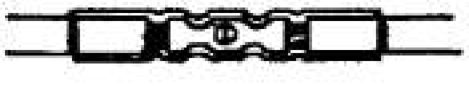
7. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in

order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.



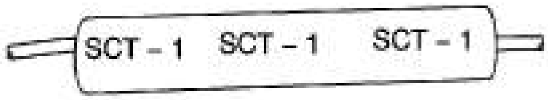
8. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
9. Tightly close the handles of the crimp tool until the crimper handles open when released.

   The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 5 for the opposite end of the splice.



10. Using the heat torch, apply heat to the crimped area of the barrel.
11. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage

is achieved.



12. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
13. Using the heat torch, apply heat to the high temperature heat shrink tubing.
14. Gradually move the heat from the center to the open end of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
15. Replace any reflective tape and clips that may have been remove during the repair.

Inducing Intermittent Fault Conditions

Special Tools

EL-25070 Heat Gun

For equivalent regional tools, refer to Special Tools.

Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, engine torque, bumps/rough pavement, etc. In order to duplicate the customer's concern, it may be necessary to manipulate the wiring harness if the malfunction appears to be vibration related. Manipulation of a circuit can consist of a wide variety of actions, including:

- Wiggling the harness
- Disconnecting a connector and reconnecting
- Stressing the mechanical connection of a connector
- Pulling on the harness or wire in order to identify a separation/break inside the insulation
- Relocating a harness or wires

All these actions should be performed with some goal in mind. For instance, with a scan tool connected, wiggling the wires may uncover a faulty input to the control module. The snapshot option would be appropriate here. Refer to Scan Tool Snapshot Procedure. Another option is, with the component commanded ON and OFF by the scan tool, move related connectors and wiring and observe the component operation. With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/system operation, or engine operation, inspect and repair the harness/connections as necessary.

You may need to load the vehicle in order to duplicate the concern. This may require the use of weights, floor jacks, jackstands, frame machines, etc. In these cases you are attempting to duplicate the concern by manipulating the suspension or frame. This method is useful in finding harnesses that are too short and their connectors pull apart enough to cause a poor connection. A DMM set to Peak Min/Max mode and connected to the suspect circuit while testing can yield desirable results. Refer to Testing for Electrical Intermittents.

Certainly, using the senses of sight, smell, and hearing while manipulating the circuit can provide good results as well.

There may be instances where circuit manipulation alone will not meet the required criteria for the fault condition to appear. In such cases it may be necessary to expose the suspect circuit to other conditions while manipulating the harness. Such conditions would include high moisture conditions, along with exceptionally high or low temperatures. The following discusses how to expose the circuit to these kinds of conditions.

Salt Water Spray

Some compounds possess the ability to conduct electricity when dissolved in water such as ordinary salt. By mixing table salt with water in sufficient quantities, you can enhance the conductive properties of water so that any circuit which may be sensitive to moisture will more readily fail when liberally sprayed with this mixture.

Mixing 0.35L (12 oz) of water with approximately 1 tablespoon of salt will yield a salt solution of 5 percent. Fill a normal spray bottle with this mixture. This mixture is sufficient to enhance the water's own conductivity. This may cause the circuit to fail more easily when sprayed. Once the mixture is completed, spray the suspect area liberally with the solution. Then, while monitoring either a scan tool or DMM, manipulate the harness as discussed previously.

High Temperature Conditions

If the complaint tends to be heat related, you can simulate the condition using the EL-25070.

Using the heat gun, you can heat up the suspected area or component. Manipulate the harnesses under high temperature conditions while monitoring the scan tool or DMM to locate the fault condition.

The high temperature condition may be achieved simply by test driving the vehicle at normal operating temperature. If a heat gun is unavailable, consider this option to enhance your diagnosis. This option does not allow for the same control, however.

Low Temperature Conditions

Depending on the nature of the fault condition, placing a fan in front of the vehicle while the vehicle is in the shade can have the desired effect.

If this is unsuccessful, use local cooling treatments such as ice or a venturi type nozzle (one that provides hot or cold air). This type of tool is capable of producing air stream temperatures down to -18°C (0°F) from one end and +71°C (160°F) from the other. This is ideally suited for localized cooling needs.

Once the vehicle, component, or harness has been sufficiently cooled, manipulate the harness or components in an effort to duplicate the concern.

Duplicating Failure Conditions

- If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions.
- Freeze Frame/Failure Records data, where applicable, contains the conditions that were present when the DTC set.

1. Review and record Freeze Frame/Failure Records data.
2. Clear the DTCs using the scan tool.
3. Turn the key to OFF and wait 15 seconds.
4. Operate the vehicle under the same conditions that were noted in Freeze Frame/Failure Records data, as closely as possible. The vehicle must also be operating within the Conditions for Running the DTC. Refer to Conditions for Running the DTC in the supporting text if a DTC is being diagnosed.
5. Monitor DTC Status for the DTC being tested. The scan tool will indicate Ran, when the enabling conditions have been satisfied long enough for the DTC to run. The scan tool will

also indicate whether the DTC passed or failed.

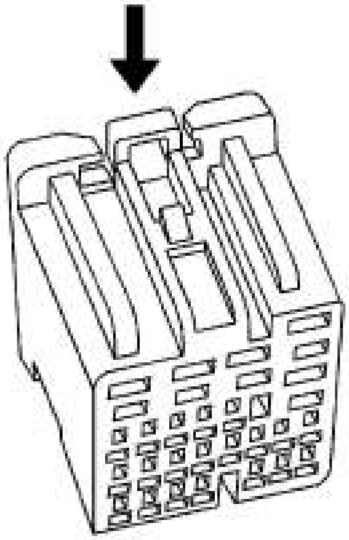
- An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the concern occurs, may help you locate the concern.

JST Connectors

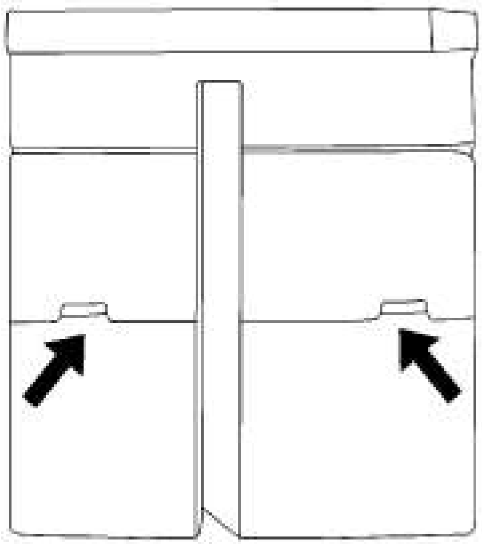
Special Tools

For equivalent regional tools, refer to Special Tools.

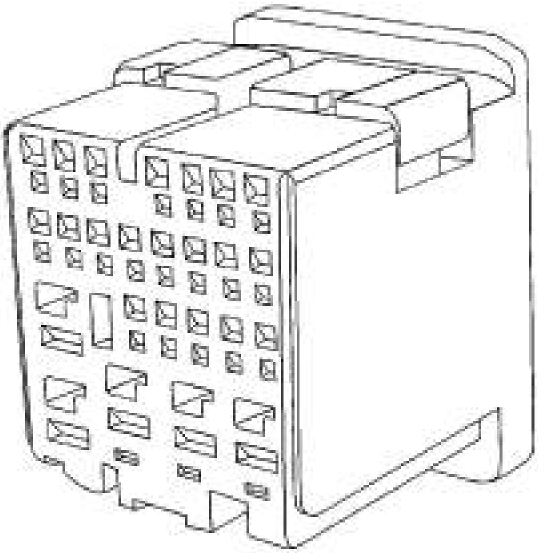
Removal Procedure



1. While depressing the lock, remove the connector from the component.

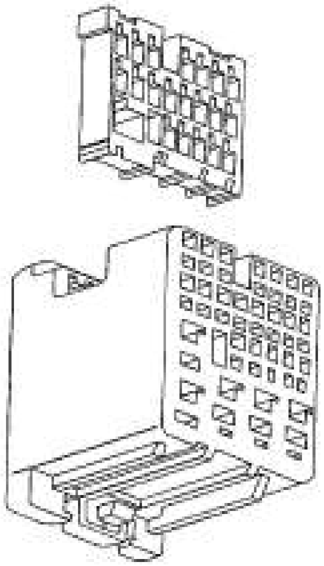


2. Locate the two indents of the terminal position assurance (TPA) located on the bottom of the connector body.

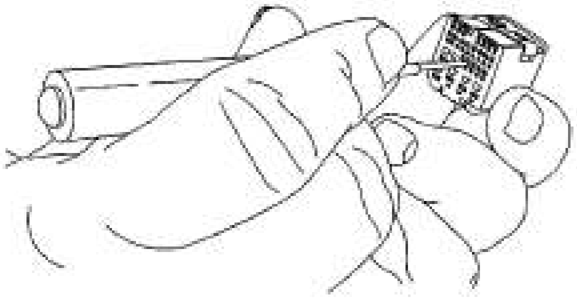


Note: The TPA cannot be removed from the connector while there are terminals present in the connector body.

3. Use a small flat-blade tool to very carefully raise the TPA on both sides of the connector.



4. View of the TPA when removed from the connector body.



5. Use the EL-38125-12A tool to release the terminals by inserting the tool into the left side of the terminal release cavity as shown in the graphic. Use the tool to move the terminal release to the right with a gentle prying motion.
6. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

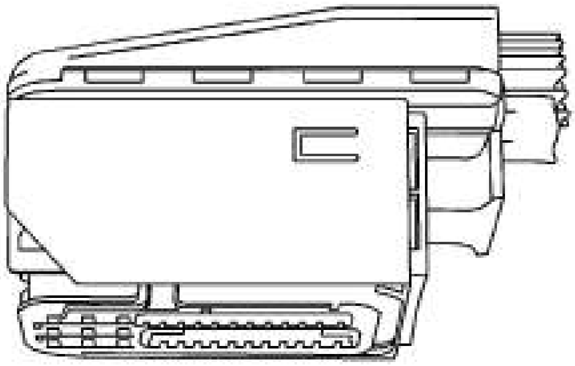
1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Kostal Connectors (Glow Plug Control Module)

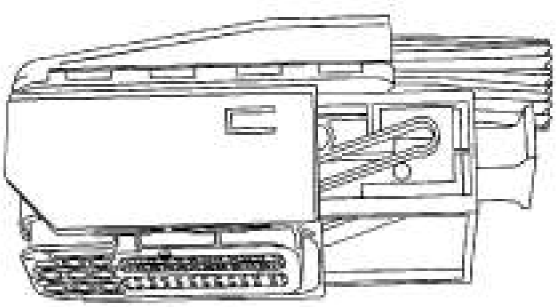
Special Tools

For equivalent regional tools, refer to Special Tools.

Removal Procedure

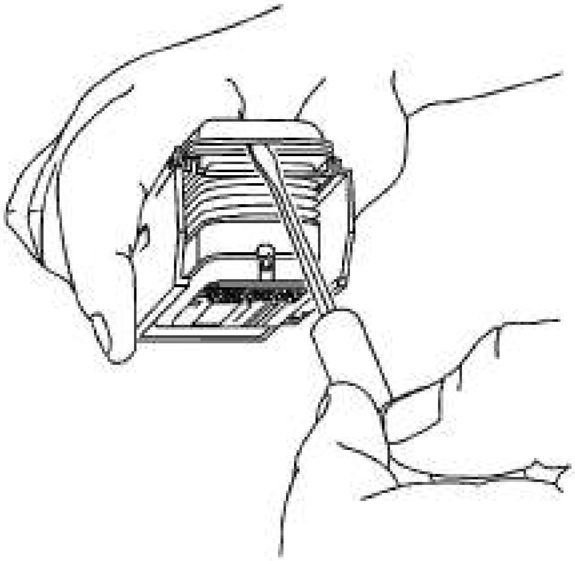


View of typical connector.

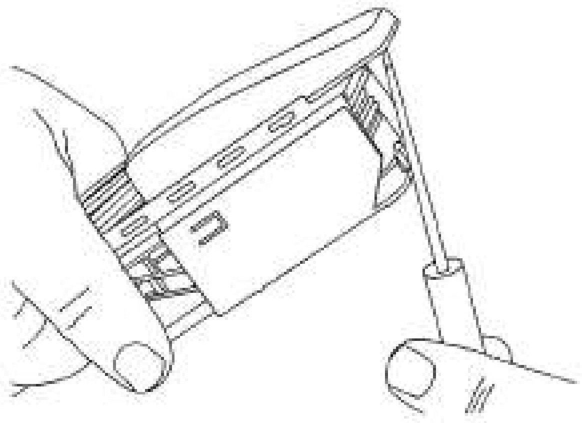


View of connector in released position.

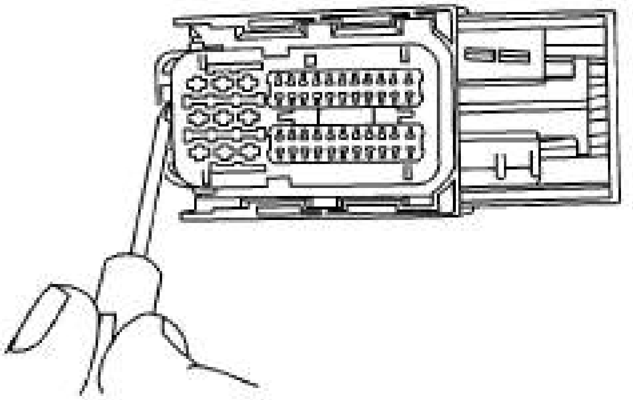
1. Locate the assist lever at the back of the connector. Move the assist lever to the rear position.
2. Disconnect the connector from the component.



3. Use a small flat-blade tool to remove the dress cover.



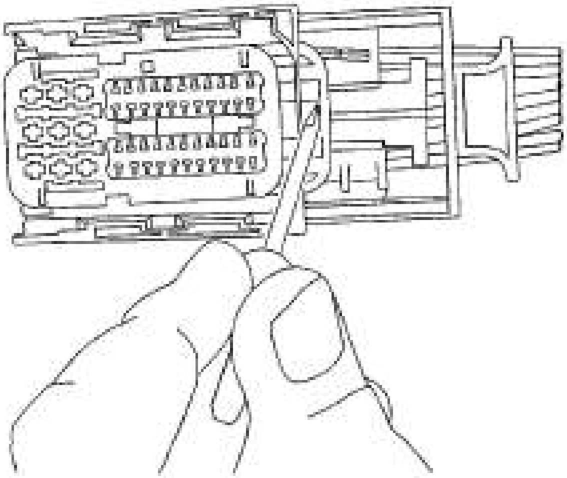
4. Slide the dress cover forward and off of the connector.



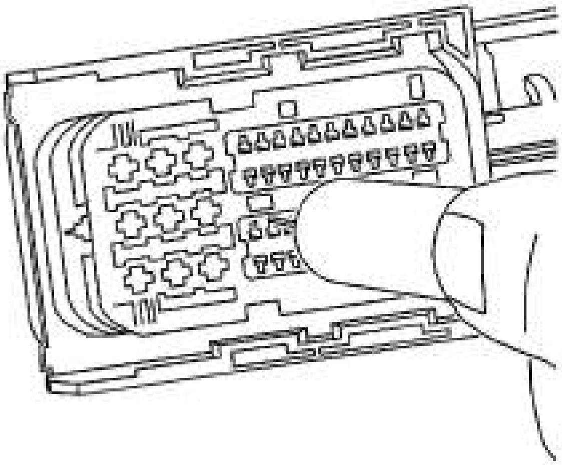
5. The terminal positive assurance (TPA) is located in the front and rear of the connector.

   Note: The front TPA cannot be removed from the connector. Only move it to the preset position.

6. Use a small flat-blade tool to move the front TPA to the preset position, outboard approximately 0.125 in. (3 mm).



7. Use a small flat-blade tool to completely remove the rear TPA from the connector.



8. Use the EL-38125-24 or the EL-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.
9. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

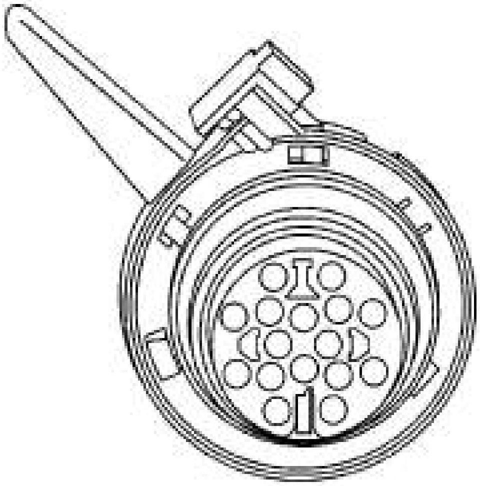
1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Kostal Connectors (Transmission)

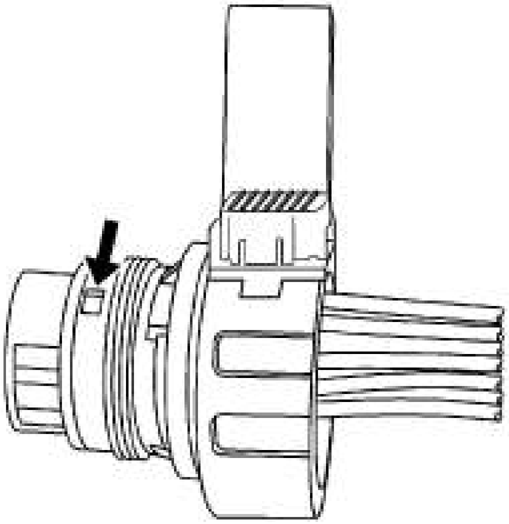
Special Tools

For equivalent regional tools, refer to Special Tools.

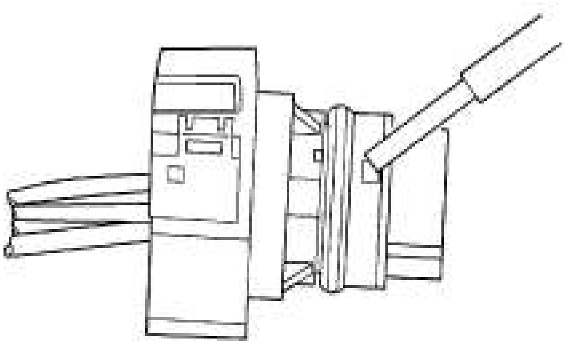
Removal Procedure



1. While depressing the lock, twist and remove the connector from the component.

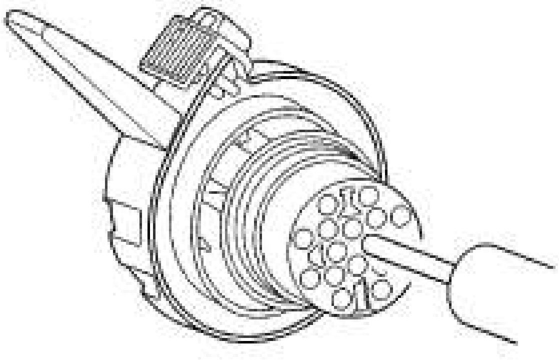


2. Locate the terminal position assurance (TPA).



Note: The TPA cannot be removed from the connector while there are terminals present in the connector body.

3. Use a small flat-blade tool to push the TPA until it bottoms out.



4. Use the EL-38125-28 tool to release the terminals by inserting the tool into the terminal cavity as shown in the graphic.
5. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

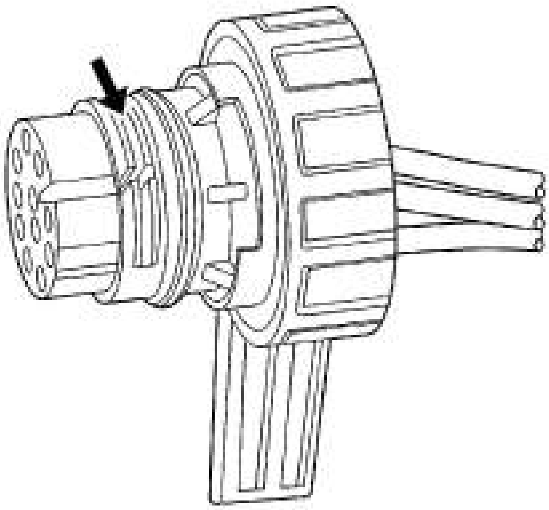
Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

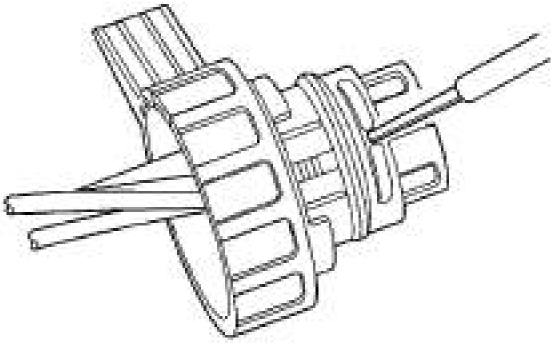
Terminal Replacement Procedure

After the terminal is crimped to the wire, perform the following procedure in order to replace the terminal.

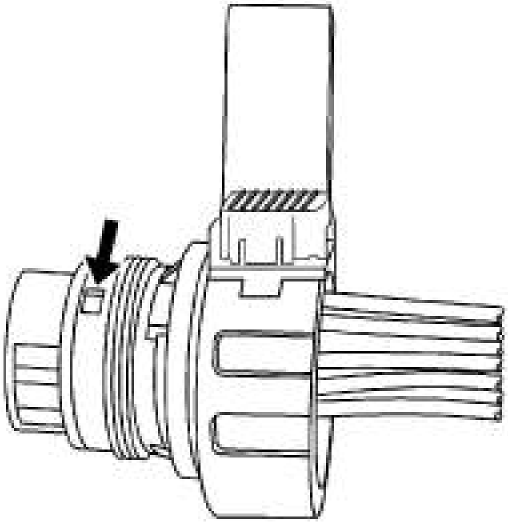
1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.



3. Locate the terminal position assurance (TPA).



4. Use a small flat-blade tool to push the TPA until it bottoms out.



5. Ensure the TPA is fully seated. The TPA should be centered and flush with the connector body when viewed.

Measuring Frequency

Notice: Refer to Test Probe Notice in the Preface section.

The following procedure determines the frequency of a signal.

Note: Connecting the DMM to the circuit before pressing the HZ button will allow the DMM to autorange to an appropriate range.

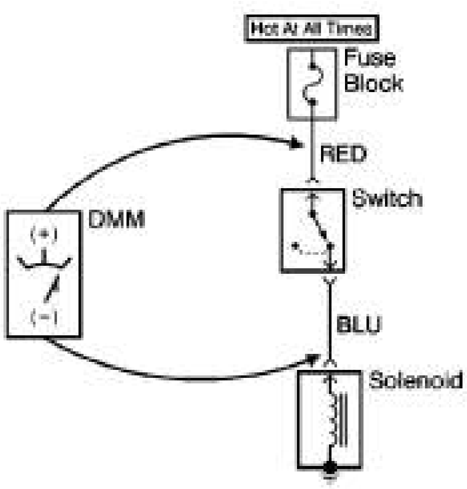
1. Apply power to the circuit.
2. Set the rotary dial of the DMM to the V (AC) position.
3. Connect the positive lead of the DMM to the circuit to be tested.
4. Connect the negative lead of the DMM to a good ground.
5. Press the HZ button on the DMM.
6. The DMM will display the frequency measured.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures | **Document ID: 2192787**

Measuring Voltage Drop

Notice: Refer to Test Probe Notice in the Preface section.

The following procedure determines the difference in voltage potential between 2 points.



1. Set the rotary dial of the DMM to the V (DC) position.
2. Connect the positive lead of the DMM to one point of the circuit to be tested.
3. Connect the negative lead of the DMM to the other point of the circuit.
4. Operate the circuit.
5. The DMM displays the difference in voltage between the 2 points.

Measuring Voltage

Notice: Refer to Test Probe Notice in the Preface section.

The following procedure measures the voltage at a selected point in a circuit.

1. Disconnect the electrical harness connector for the circuit being tested, if necessary.
2. Enable the circuit and/or system being tested. Use the following methods:
   - Turn ON the ignition, with the engine OFF.
   - Turn ON the engine.
   - Turn ON the circuit and/or system with a scan tool in Output Controls.
   - Turn ON the switch for the circuit and/or system being tested.
3. Select the V (AC) or V (DC) position on the DMM.
4. Connect the positive lead of the DMM to the point of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. The DMM displays the voltage measured at that point.

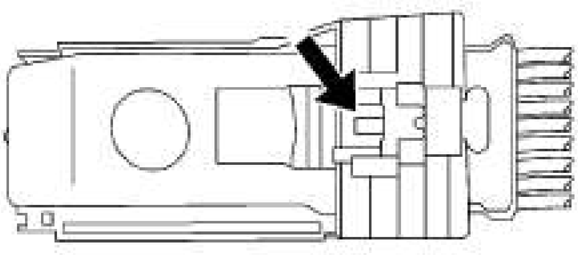
Molex Connectors

Special Tools

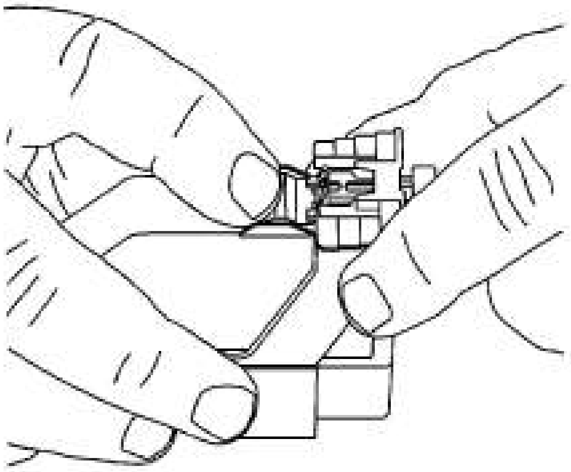
For equivalent regional tools, refer to Special Tools.

Terminal Removal Procedure

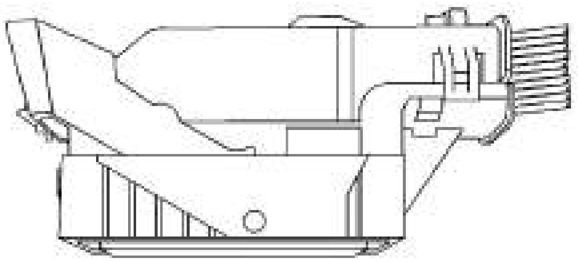
1. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.



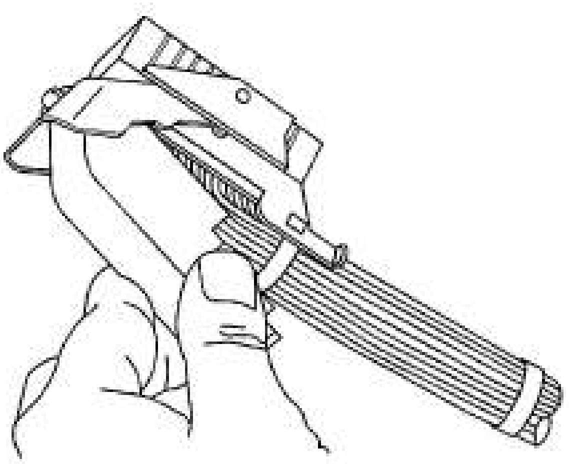
2. Slide the lever lock forward while pressing down on the lever lock release tab.



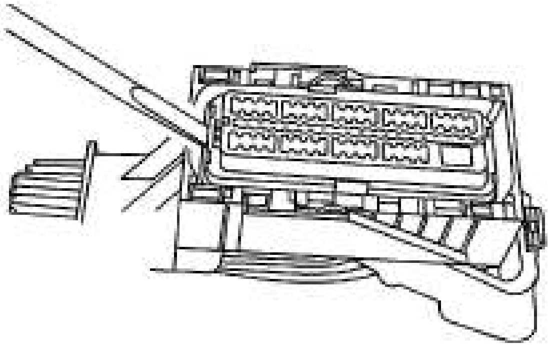
3. The lever should be in the full forward position.



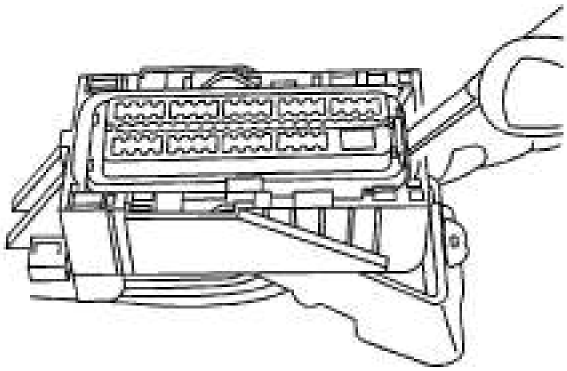
4. Disconnect the connector from the component.



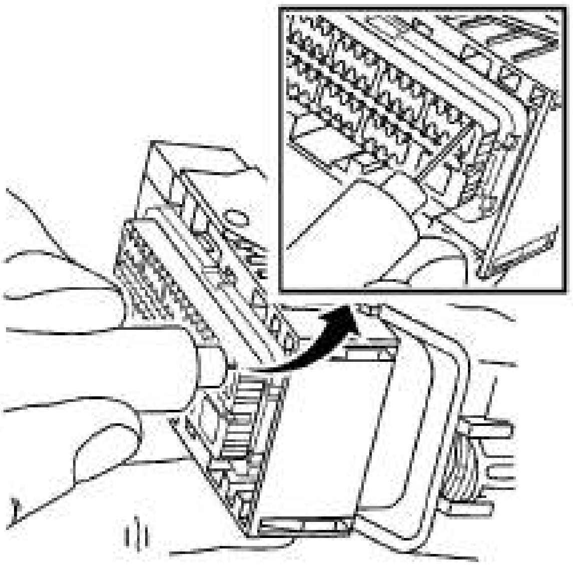
5. Remove the dress cover by using a flat bladed tool to release the dress cover locking tabs and lift up on the dress cover.
6. Cut the tie wrap that holds the wires to the connector body.



7. Use a small flat-blade tool to pry one side of the nose piece up to the pre-stage position. When the nose piece is in the pre-staged position, the nose piece will be raised above the connector body the length of the step in the nose piece.



8. Use a small flat-blade tool to pry the other side of the piece to the pre-stage position. If the nose piece is higher than the first step in the nose piece, gently push down on the nose piece until it meets with resistance from the connector body, you should feel the nose piece click into position.



9. Insert the EL-38125-213 into the small terminal release hole on the nose piece and gently pull on the back of the wire.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Terminal Replacement Procedure

After the terminal is crimped to the wire, perform the following procedure in order to replace the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Insure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

1. Power Mode Mismatch. Different specific symptoms may occur depending on the vehicle operating conditions when the fault occurred.
2. Vehicle may not start.
3. The B+ circuit fuse to the ignition switch may be open.
4. May lose communication with other module(s).
5. The ignition switch may not return to the OFF position and the key may not come out of the ignition.
6. SIR system may retain DTC B1370 06 as current.
7. Vehicle will continue to run after the ignition key is removed.

Circuit/System Description

The vehicle power mode master (PMM) is the body control module (BCM). The ignition switch is a low current switch with multiple discrete circuits to the BCM. The BCM logic uses the ignition switch positions to identify the operator's desired power mode and activate specific discrete signals, and serial data messages for the operation of different subsystems as necessary. Other modules which have switched voltage inputs may operate in a default mode if the PMM serial data message does not match what the individual module can detect from its own connections.

The PMM will activate relays and other direct outputs of the PMM as needed according to the calculated power mode. Some relays controlled by the BCM are switched ignition voltage outputs that are pass through circuits within the BCM directly from the ignition switch. If these circuits short to ground, the B+ circuit fuse to the ignition switch will open.

Conditions for Running the DTC

B1370 01, B1380 01

Ignition switch is in the RUN or CRANK positions.

B1370 06, B1380 06

Ignition switch is in the RUN or ACCESSORY positions.

B1440 00

Ignition switch is in the RUN position.

B1441 01, B1441 06

Ignition switch is in the CRANK position.

Conditions for Setting the DTC

B1370 01

Ignition circuit is shorted to voltage.

B1370 06

- Ignition circuit is open.
- Ignition, accessory, or off/run/crank circuit shorted to ground.
- B+ circuit of the ignition switch is open or shorted to ground.
- Ignition relay control circuit open, including relay coil and ground.

B1380 01

Accessory circuit is shorted to voltage.

B1380 06

- Accessory circuit is open.
- Ignition, accessory, or off/run/crank circuit shorted to ground.
- B+ circuit of the ignition switch is open or shorted to ground.

B1440 00

BCM detects an open or short to voltage on the off/run/crank signal circuit when both ignition ACCESSORY/RUN and ignition RUN/CRANK parameters are active.

BCM detects an open on the B+ circuit to the ignition switch while the engine is running.

B1441 01

Off/run/crank signal circuit is shorted to voltage.

B1441 06

Off/run/crank signal circuit is open.

Actions Taken When the DTC Sets

- The BCM operates in a fail-safe power mode dependent on the last valid power mode detected and the state of the engine run flag data on the serial data communications circuits.
- The other modules on the vehicle operate in a fail-safe power mode dependent on the last

valid power mode transmitted by the BCM and the state of the engine run flag on the serial data communications circuits.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Verification

1. Verify that DTC U1814 or B1428 is not set.

   If any of the DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. With a scan tool, access BCM, Power Mode data display list and compare all parameters listed with the corresponding ignition key position. The BCM Power Mode Parameters table below illustrates the correct state of these input parameters in correspondence to the ignition switch position. The circuits which the individual parameters are related to are in parentheses.

   If any parameters are incorrect in any key position, proceed to the Circuit/System Testing or Component Testing.

BCM Power Mode Parameters

Ignition Switch Position	Standard Power Mode	Ign. Off/Run/Crank (Ignition Switch, Terminal 4)	Ignition Accessory/Run (Ignition Switch, Terminal 3)	Ignition Run/Crank (Ignition Switch, Terminal 1)
Off Key Out	Off	Key Out/ACC	Inactive	Inactive
Off Key IN	Off	Key In/Off	Inactive	Inactive
Accessory	Accessory	Key Out/ACC	Active	Inactive
Run	Run	Run	Active	Active
Start	Crank	Cranking	Inactive	Active

Circuit/System Testing

1. Disconnect the harness connector at the ignition switch.
2. Verify that a test lamp illuminates between B+ circuit terminal 2 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test the ignition circuits listed below for a short to ground.

   Note: To help isolate a short to ground, it may be necessary to disconnect modules that are connected to the following circuits:

   - terminal 1
   - terminal 3
   - terminal 4
   - terminal 6
   - BCM terminal 19, X4
   - BCM terminal 21, X4
3. Connect the harness connector at the ignition switch.
4. Ignition OFF, key out, disconnect the X1 harness connector at the BCM. Verify that a test lamp does not illuminate between the ignition circuit terminals listed below and ground:
   - terminal 2
   - terminal 14
   - terminal 21

   If the test lamp illuminates, test the ignition circuits for a short to voltage. If the circuit tests normal, replace the ignition switch.
5. Ignition in the ACCESSORY position, verify that a test lamp illuminates between the terminal 21 and ground.

   If the test lamp does not illuminate, test the ignition circuit for an open/high resistance. If the circuit tests normal, replace the ignition switch.
6. Ignition in the CRANK position, verify that a test lamp illuminates between terminal 14 and ground.

   If the test lamp does not illuminate, test the ignition circuit for an open/high resistance. If the circuit tests normal, replace the ignition switch.
7. If all of the circuits test normal, replace the BCM.

Component Testing

Ignition Switch

1. Ignition OFF, disconnect the harness connector at the ignition switch.
2. Verify the resistance between the terminals listed below match for each ignition switch position.

   If not the specified value, replace the ignition switch.

Resistance Test

Ignition Switch Position	Terminals 1 and 2	Terminals 2 and 3	Terminals 2 and 4	Terminals 2 and 6	Terminals 4 and 6
Off Key Out	Infinite	Infinite	Infinite	Infinite	Infinite
Off Key IN	Infinite	Infinite	< 5.0 Ω	Infinite	Infinite
Accessory	Infinite	< 5.0 Ω	Infinite	Infinite	Infinite
Run	< 5.0 Ω	< 5.0 Ω	Infinite	Infinite	< 5.0 Ω
Start	< 5.0 Ω	Infinite	Infinite	Infinite	1275-1325 Ω

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Ignition and Start Switch Replacement
- Control Module References for BCM replacement, setup, and programming.

Probing Electrical Connectors

Note: Always be sure to reinstall the connector position assurance (CPA) and terminal position assurance (TPA) when reconnecting connectors or replacing terminals.

Front probe

Disconnect the connector and probe the terminals from the mating side (front) of the connector.

Notice: Refer to Test Probe Notice in the Preface section.

Note: When probing female 0.64 terminals, it is important to use the correct adapter. There have been some revisions to the test adapter for 0.64 terminals. The proper adapter for 0.64 terminals is the EL-35616-64B which has a gold terminal and a black wire between the base and tip. Failure to use the proper test adapter may result in damage to the terminal being tested and improper diagnosis.

Note: The proper adapter for probing the terminals for fuses, relays, or diodes in an electrical center is EL-35616-35. Using any other tool or adapter may damage the terminal being tested.

Refer to the following table as a guide in selecting the correct test adapter for front probing connectors:

Test Adapter	Description
J-35616-2A	150 Male Probe Adapter (gray)
J-35616-3	150 Female Probe Adapter (gray)
J-35616-4A	280 Male Probe Adapter (purple)
J-35616-5	280 Female Probe Adapter (purple)
J-35616-6	100W Male (round) Probe Adapter (brown)
J-35616-7	100W Female (round) Probe Adapter (brown)
J-35616-8	Weather Pack Male Probe Adapter (orange)

J-35616-43	630 Female Probe Adapter (red)
J-35616-44	800 Male Probe Adapter (yellow)
J-35616-45	800 Female Probe Adapter (yellow)
J-35616-54	280 Male (round) Probe Adapter (tan)
J-35616-55	280 Female (round) Probe Adapter (tan)
J-35616-64B	0.64 Male Probe Adapter (lt blue)
J-35616-65B	0.64 Female Probe Adapter (lt blue)
J-35616-66	150 Male (round) Probe Adapter (yellow)
J-35616-67	150 Female (round) Probe Adapter (yellow)

Backprobe

Note:

- Backprobe connector terminals only when specifically required in diagnostic procedures.
- Do not backprobe a sealed (Weather Pack®) connector, less than a 280 series Metri-Pack connector, a Micro-Pack connector, or a flat wire (dock and lock) connector.
- Backprobing can be a source of damage to connector terminals. Use care in order to avoid deforming the terminal, either by forcing the test probe too far into the cavity or by using too large of a test probe.
- After backprobing any connector, inspect for terminal damage. If terminal damage is suspected, test for proper terminal contact.

Do not disconnect the connector and probe the terminals from the harness side (back) of the connector.

Repairing Connector Terminals

Special Tools

EL-38215-10 Splice Sleeve Crimp Tool

EL-35616-D Terminal Test Probe Kit

EL-38125-5 Ultra Torch

Terminal Release Tool Kit

For equivalent regional tools, refer to Special Tools

Making a Repair with a Terminated Lead or Connector Assembly

1. If using a terminated lead, remove the terminal to be replaced with the appropriate terminal release tool. Refer to the Terminal Release Tool Kit.
2. Cut and strip the wire insulation away from the terminal leaving enough wire length to reassemble the harness and connector without causing binding or a pinch condition.
3. Crimp the splice sleeve to the terminated lead or connector assembly to the harness wire using the Splice Sleeve Crimp Tool EL-38215-10. Refer to Splicing Copper Wire Using Splice Sleeves.
4. Use the Ultra Torch EL-38125-5 to seal the splice.
5. Repeat steps 2-4 if a connector assembly is being used to repair the vehicle.
6. Reassemble the connector and harness.
7. Verify the repair.

Repairing Damaged Wire Insulation

If the conductive portion of the wire is not damaged, locate the problem and apply tape around the wire. If the damage is more extensive, replace the faulty segment of the wire. Refer to Splicing Copper Wire Using Splice Sleeves and follow the instruction to repair the wire.

Wire Size Conversion

Metric Wire Sizes (mm 2)	AWG Sizes
0.13	26
0.21	24
0.32	22
0.52	20
0.83	18
1.31	16
2.09	14
3.31	12
5.27	10
8.37	8
13.3	6
21.2	4
33.6	2
53.5	1/0

Retained Accessory Power Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
RAP Relay Switch B+	1	1	2	--
RAP Relay Control	B1475 00, 1	1	2	--
RAP Relay Ignition	1	1	2	--
RAP Relay Ground	--	1	--	--

1. All or partial relay controlled RAP functions might be inoperative depending on the location that the fault occurred.
2. Relay RAP remains on past the timer limit after key out and will not turn off when a vehicle door is opened.

Circuit/System Description

The retained accessory power (RAP) system allows specific vehicle functions to operate after the ignition is turned OFF for a predetermined time. The RAP 1 relay is located in the I/P fuse block. The relay switched output feeds the WNDW CNTRL Fuse and the WNDW MTR circuit breaker within the fuse block. Relay RAP is controlled by the BCM using inputs from the door ajar switches to determine control of the relay when the ignition is turned OFF. Radio RAP is controlled by a serial data message from the BCM using inputs from the driver door open switch.

Diagnostic Aids

The radio RAP mode is a separate function and will still operate properly. The radio RAP function is controlled by serial data and the specific module. These functions are not effected by the BCM RAP relay circuits.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Radio RAP

1. With all passenger doors closed, observe the courtesy lamps while opening and closing the driver door. The courtesy lamps should illuminate when the door is opened and turn off approximately 30 seconds after closing the door.

   If the courtesy lamp operation is incorrect from the drivers door, refer to Courtesy Lamps Malfunction.
2. If courtesy lamp operation is correct, and the radio is the only RAP concern, replace the radio.

Relay RAP

1. Ignition ON, observe the scan tool parameters in the modules listed below while opening and closing each vehicle door. The reading should change appropriately between Door Closed/Door Ajar for the door ajar switches, and between Open/Closed for the door open switches.

   #### Module/Parameter

   - Driver Door Ajar Sw.
   - Driver Door Open Sw.
   - Passenger Door Ajar Sw.
   - Passenger Door Open Sw.

If any parameter does not change as specified, refer to Door Ajar Indicator Malfunction.

2. Command the scan tool Accy/RAP Relay OFF. Attempt to operate any RAP relay controlled component within 5 seconds. The component should not operate.
3. Command the scan tool Accy/RAP Relay ON. Attempt to operate any RAP relay controlled component within 5 seconds. The component should operate.
4. Ignition ON, all doors closed. Observe the scan tool parameter Accy/RAP Relay Command. Ignition OFF, key removed, the reading should be ON for approximately 40 minutes then change to OFF.

   If the parameter does not respond as specified, replace the BCM.

Circuit/System Testing

1. Ignition OFF, disconnect the RAP relay.
2. Test for less than 5 Ω between the ground circuit terminal 86 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the relay control circuit terminal 85 and ground.
4. With the driver and passenger doors open, cycle the ignition key ON and OFF. The test lamp should turn ON and OFF when cycling the ignition switch.

   If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.

   If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. Verify that a test lamp illuminates between the B+ circuit terminal 30 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
6. If all circuits test normal, test or replace the RAP relay.

Component Testing

1. Ignition OFF, disconnect the RAP relay.
2. Test for 70 - 150 Ω between the control terminal 85 and the ground terminal 86 of the relay.

   If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If not the specified value, replace the relay.
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.

   If greater than specified, replace the relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for BCM replacement, setup, and programming.

Scan Tool Snapshot Procedure

Snapshot is a recording of what a control module on the vehicle was receiving for information while the snapshot is being made. A snapshot may be used to analyze the data during the time a vehicle condition is current. This allows you to concentrate on making the condition occur, rather than trying to view all the data in anticipation of the fault. The snapshot contains information around a trigger point that you have determined. Only a single data list may be recorded in each snapshot. The Scan Tool has the ability to store 2 snapshots. The ability to record 2 snapshots allows comparing hot versus cold and good versus bad vehicle scenarios. The snapshots are stored on a first-in, first-out basis. If a third snapshot is taken, the first snapshot stored in the memory will be lost.

Snapshots can be 1 of 2 types:

- Snapshot - taken from the Snapshot menu choice
- Quick Snapshot - taken from the Data Display soft key choice, does not contain DTC information

When a snapshot is taken, it is recorded on the memory card and may contain as many as 1200 frames of information. Because the snapshot is recorded onto the memory card, snapshots are not lost if the Scan Tool is powered down.

The snapshot replay screen has a plot soft key that can be of great value for intermittent diagnosis. The snapshot plot feature can help you to quickly determine if a sensor is outside of its expected values by plotting 3 parameters at a time. The data will be displayed both graphically and numerically showing the minimum and maximum values for all frames captured. This is helpful, especially if the fault occurs only once and does not set a DTC.

SIR/SRS Wiring Repairs

Special Tools

- DuraSeal splice sleeves, in order to repair the SIR/SRS wiring
- EL-38125-10 Splice Sleeve Crimping Tool
- EL-38125-5 Ultra Torch

For equivalent regional tools, refer to Special Tools.

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides the necessary low resistance contact integrity for these sensitive, low energy circuits.

The Supplemental Inflatable Restraint (SIR) System/Supplemental Restraint System (SRS) requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working with the SIR/SRS, and the wiring components, such as connectors and terminals.

Note: Do not use the terminals in the kit in order to replace damaged SIR/SRS system terminals. Use either an SIR/SRS pigtail or a terminated lead from the SIR Repair Kit Tray.

SIR/SRS Connector Repair (Plastic Body and Terminal Metal Pin)

The terminals in the SIR/SRS system are made with a special plating. This plating provides the necessary contact integrity for the sensitive, low energy circuits.

Pigtail repair packs are available for SIR/SRS connectors with eight or less terminals. Only the connector body is available for connectors with more than eight terminals. Terminated leads can be used to replace damaged terminals when replacing the connector body.

SIR/SRS Component Wire Pigtail Repair

Note: Do not make wire, connector, or terminal repairs on components with wire pigtails.

A wire pigtail is a wire or wires attached directly to the device, not by a connector. If a wiring pigtail is damaged, you must replace the entire component, with pigtail. The inflatable restraint steering wheel module coil is an example of a pigtail component.

SIR/SRS Wire Repair

Note: Refer to Wiring Repairs in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gage size (0.5 mm, 0.8 mm, 1.0 mm etc.). Use the DuraSeal splice sleeves and EL-35125-10 splice sleeve crimping tool. Use the following wiring repair procedures in order to ensure the integrity of the DuraSeal splice sleeves.

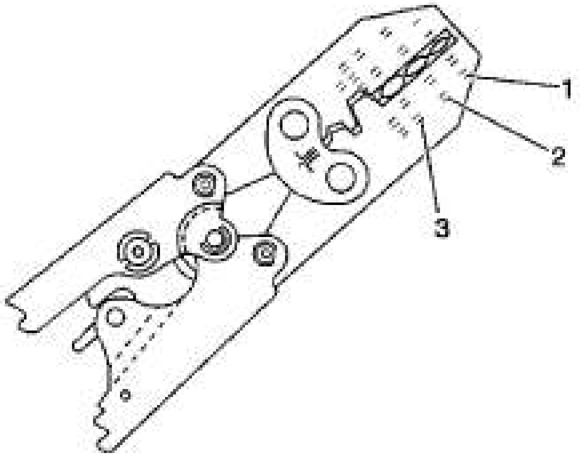
Splice Sleeve Color	Crimp Tool Nest Color	Wire Gage mm² / (AWG)
Salmon (Yellow-Pink) 12089189	Red (1)	0.035-0.8/(18-20)
Blue 12089190	Blue (2)	1-2/(14-16)
Yellow 12089191	Yellow (3)	3-5/(10-12)
Green 88988379	Red (1)	0.22-0.35/(22-26)

Note: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

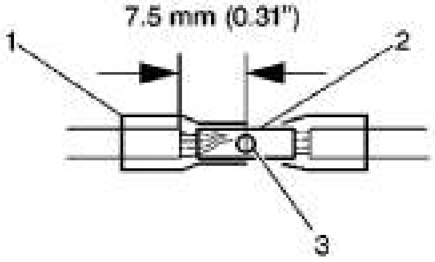
1. Open the harness by removing any tape:
   - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
   - Use the DuraSeal splice sleeves on all types of insulation except tefzel and coaxial.
   - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

   Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

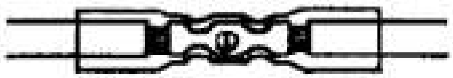
3. Strip the insulation:
   - When adding a length of wire to the existing harness, use the same size wire as the original wire.
   - Perform one of the following items in order to find the correct wire size:
     - Find the wire on the schematic and convert to regional wiring gage size.
     - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
   - Strip approximately 7.5 mm (0.313 in) of insulation from each wire to be spliced.
   - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
   - If the wire is damaged, repeat this procedure after removing the damaged section.
4. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.



5. Use the EL-38125-10 splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. The crimp tool has four nests, one for each color.

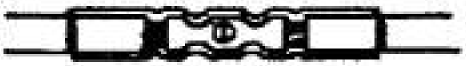


6. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.



7. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
8. Tightly close the handles of the crimp tool until the crimper handles open when released.

   The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 5 for the opposite end of the splice.



9. Using the heat torch, apply heat to the crimped area of the barrel.
10. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Connector Position Assurance (CPA)

The connector position assurance (CPA) is a small plastic insert that fits through the locking tabs of a connector. CPAs are used in all SIR System connectors and also in some connectors of other systems. The CPA ensures that the connector halves cannot vibrate apart. You must have the CPA in place in order to ensure good contact between the mating terminals of a connection.

Terminal Position Assurance (TPA)

The terminal position assurance (TPA) insert resembles the plastic combs used in the control module connectors. The TPA keeps the terminal securely seated in the connector body. Do not remove the TPA from the connector body unless you remove a terminal for replacement.

Splicing Copper Wire Using Splice Sleeves

Special Tools

- DuraSeal splice sleeves, in order to repair the SIR/SRS wiring
- EL-38125-10 Splice Sleeve Crimping Tool
- EL-38125-5 Ultra Torch

For equivalent regional tools, refer to Special Tools.

Note: Use only DuraSeal splice sleeves. Other splice sleeves may not protect the splice from moisture or provide a good electrical connection.

Use DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except tefzel and coaxial. Use DuraSeal splice sleeves where there is special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

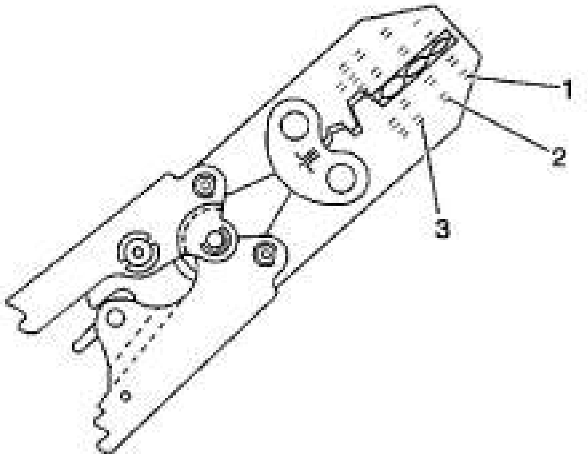
Splice Sleeve Color	Crimp Tool Nest Color	Wire Gage mm² / (AWG)
Salmon (Yellow-Pink) 12089189	Red (1)	0.035-0.8/(18-20)
Blue 12089190	Blue (2)	1-2/(14-16)
Yellow 12089191	Yellow (3)	3-5/(10-12)
Green 88988379	Red (1)	0.22-0.35/(22-26)

Note: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

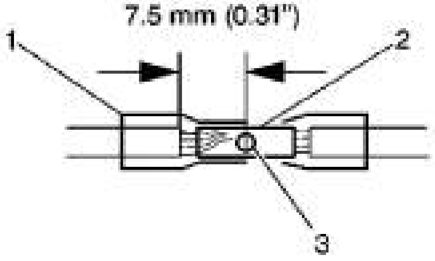
1. Open the harness by removing any tape:
   - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
   - Use the DuraSeal splice sleeves on all types of insulation except tefzel and coaxial.
   - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

   Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

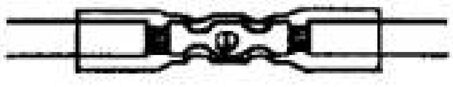
3. Strip the insulation:
   - When adding a length of wire to the existing harness, use the same size wire as the original wire.
   - Perform one of the following items in order to find the correct wire size:
     - Find the wire on the schematic and convert to regional wiring gage size.
     - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
   - Strip approximately 7.5 mm (0.313 in) of insulation from each wire to be spliced.
   - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
   - If the wire is damaged, repeat this procedure after removing the damaged section.
4. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.



5. Use the EL-38125-10 splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. The crimp tool has four nests, one for each color.

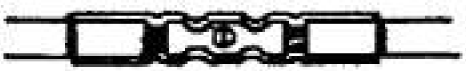


6. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.



7. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
8. Tightly close the handles of the crimp tool until the crimper handles open when released.

   The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 5 for the opposite end of the splice.



9. Using the heat torch, apply heat to the crimped area of the barrel.
10. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Splicing Inline Harness Diodes

Many vehicle electrical systems use a diode to isolate circuits and protect the components from voltage spikes. When installing a new diode use the following procedure.

1. Open the harness.
   - If the harness is taped, remove the tape.
   - To avoid wiring insulation damage, use a sewing ripper in order to cut open the harness.
   - If the harness has a black plastic conduit, pull out the diode.
2. If the diode is taped to the harness, remove all of the tape.
3. Check and record the current flow direction and orientation of diode.
4. Remove the inoperative diode from the harness with a suitable soldering tool.

   Note: If the diode is located next to a connector terminal remove the terminal(s) from the connector to prevent damage from the soldering tool.

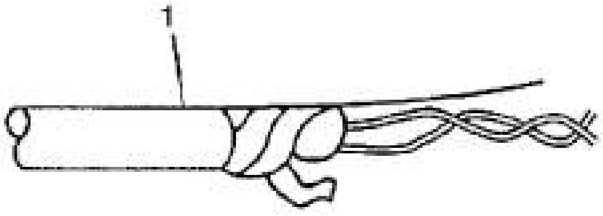
5. Carefully strip away a section of insulation next to the old soldered portion of the wire(s). Do not remove any more than is needed to attach the new diode.
6. Check current flow direction of the new diode, being sure to install the diode with correct bias. Reference the appropriate service manual wiring schematic to obtain the correct diode installation position.
7. Attach the new diode to the wire(s) using 60/40 rosin core solder. Before soldering attach some heat sinks (aluminum alligator clips) across the diode wire ends to protect the diode from excessive heat. Follow the manufacturer's instruction for the soldering equipment.
8. Reinstall terminal(s) into the connector body if previously removed.

   Note: To prevent shorts to ground and water intrusion, completely cover all exposed wire and diode attachment points with tape.

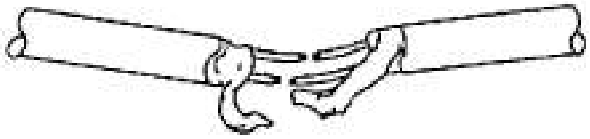
9. Tape the diode to the harness or connector using electrical tape.

Splicing Twisted or Shielded Cable

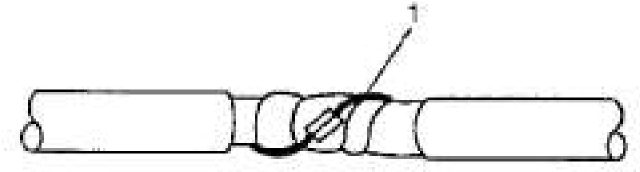
Twisted/shielded cable is used in order to protect wiring from electrical noise. Two-conductor cable of this construction is used between the radio and the Delco-Bose® speaker/amplifier units and other applications where low level, sensitive signals must be carried. Follow the instructions below in order to repair the twisted/shielded cable.



1. Remove the outer jacket (1). Use care not to cut into the drain wire of the mylar tape.
2. Unwrap the tape. Do not remove the tape. Use the tape in order to rewrap the twisted conductors after the splice is made.

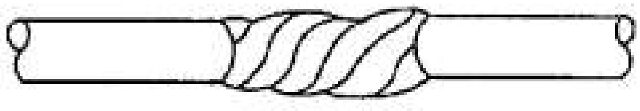


3. Prepare the splice. Untwist the conductors and follow the instructions for Splicing Copper Wire Using Splice Sleeves. Staggering the splices by 65 mm (2.5 in) is recommended.



Note: Apply the mylar tape with the aluminum side inward. This ensures good electrical contact with the drain wire.

4. Re-assemble the cable.
    - Rewrap the conductors with the mylar tape. If the mylar tape is damaged, use 3M product AL-36FR to replace the damaged mylar tape.
    - Use caution not to wrap the drain wire in the tape (1).
    - Follow the splicing instructions for copper wire and splice the drain wire.
    - Wrap the drain wire around the conductors and tape with electrical tape to replace the outer insulation.



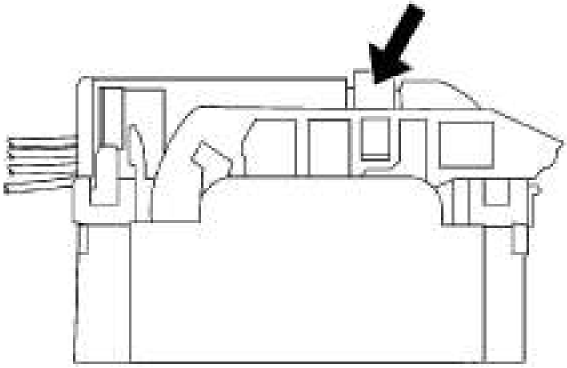
5. Tape over the entire cable. Use a winding motion when you apply the tape.

Sumitomo Connectors

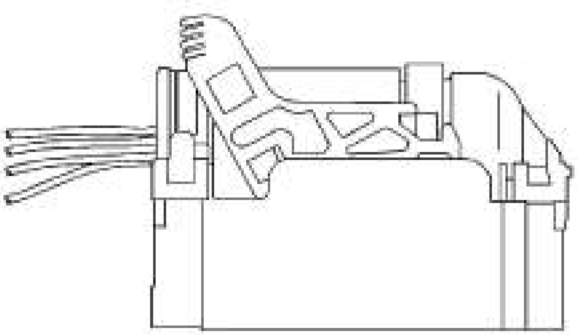
Special Tools

For equivalent regional tools, refer to Special Tools.

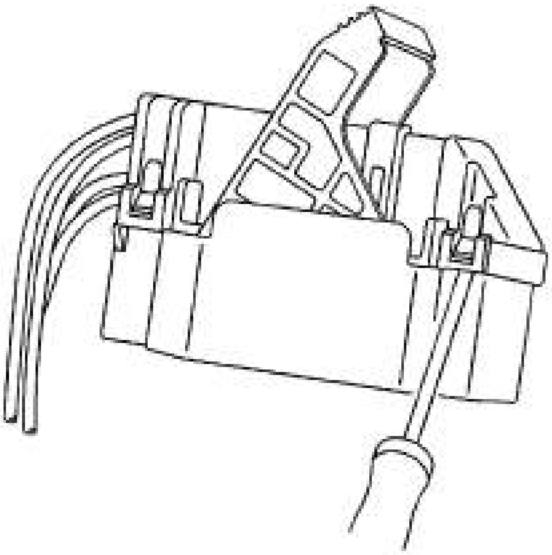
Terminal Removal Procedure



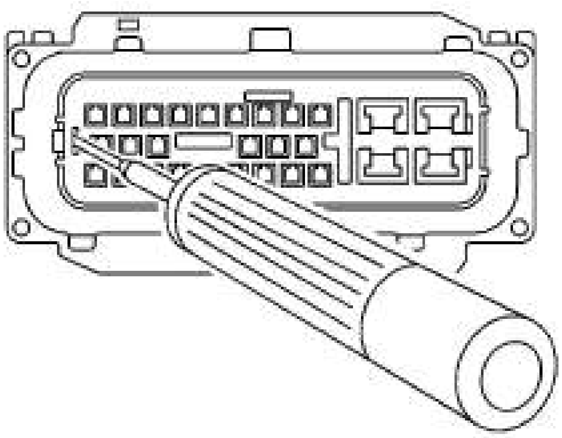
1. Slide the lever lock forward while pressing down on the lever lock release tab.



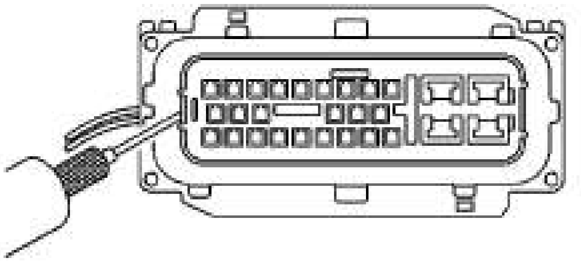
2. Disconnect the connector from the component.



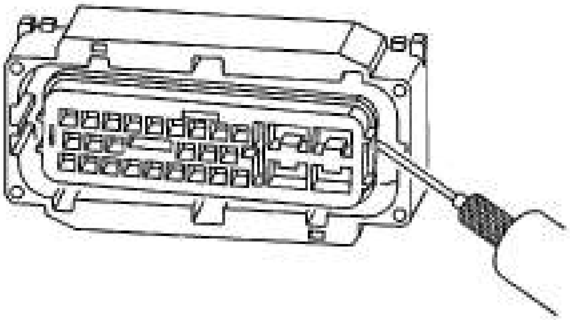
3. Remove the dress cover by using a flat-blade tool to release the connector locking tabs and pulling off the dress cover.



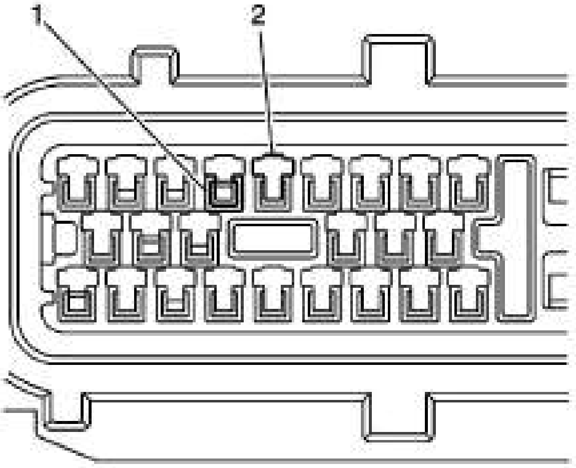
4. Relieve the tension on the nose piece retainers by inserting EL-38125-12A into the single retainer slot on the end of the nose piece and gently prying out the locking tab. Repeat the process for both of the nose piece locking tabs on the opposite side of the nose piece.



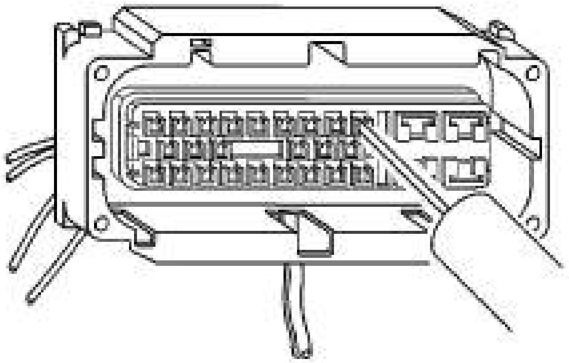
5. Once the nose piece retainers are relaxed, use the EL-38125-552 to pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should raise slightly.



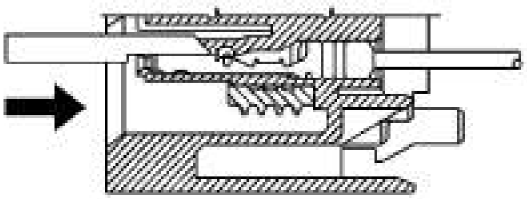
6. On the opposite side of the nose piece, use the EL-38125-552 pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should release completely. If the nose piece does not come off, repeat the procedure on the opposite side.

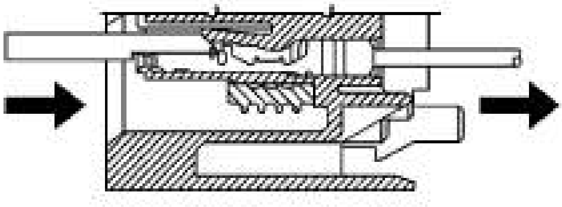


7. The illustration above identifies the entry canal where the terminal release tool will be inserted, and the terminal cavity.
   - Terminal (1)
   - Entry Canal (2)



8. Insert the EL-38125-553 tool into the entry canal and pry up on the terminal retainer. The terminal retainer is a small plastic piece on the top of the terminal. The terminal retainer must be held up while the terminal is pulled out of the connector.





9. The illustration shows a cutaway view of the connector to aid the technician in releasing the terminal retainer.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Terminal Replacement Procedure

After the terminal is crimped to the wire, perform the following procedure in order to replace the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

Symptoms - Wiring Systems

Note: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to:
   - Power Mode Description and Operation
   - Retained Accessory Power Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Power Mode Mismatch
- Retained Accessory Power Malfunction

Terminal Position Assurance Locks

The terminal position assurance (TPA) insert resembles the plastic combs used in the control module connectors. The TPA keeps the terminal securely seated in the connector body. Do not remove the TPA from the connector body unless you remove a terminal for replacement.

Testing for a Short to Voltage

Notice: Refer to Test Probe Notice in the Preface section.

The following procedure tests for a short to voltage in a circuit.

1. Set the rotary dial of the DMM to the V (DC) position.
2. Connect the positive lead of the DMM to one end of the circuit to be tested.
3. Connect the negative lead of the DMM to a good ground.
4. Turn ON the ignition and operate all accessories.
5. If the voltage measured is greater than 1 V, there is a short to voltage in the circuit.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures |

Document ID: 2192783

Testing for Continuity

Notice: Refer to Test Probe Notice in the Preface section.

The following procedures verify good continuity in a circuit.

With a DMM

1. Set the rotary dial of the DMM to the Ω position.
2. Disconnect the power feed (i.e. fuse, control module) from the suspect circuit.
3. Disconnect the load.
4. Press the MIN MAX button on the DMM.
5. Connect one lead of the DMM to one end of the circuit to be tested.
6. Connect the other lead of the DMM to the other end of the circuit.
7. If the DMM displays low or no resistance, the circuit has good continuity.

With a Test Lamp

Note: Only use the test lamp procedure on low impedance power and ground circuits.

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to one end of the circuit to be tested.
4. Connect the other lead of the test lamp to battery positive voltage.
5. Connect the other end of the circuit to ground.
6. If the test lamp illuminates (full intensity), then the circuit has good continuity.

Testing for Electrical Intermittents

Special Tools

EL-39200 Digital Multimeter

For equivalent regional tools, refer to Special Tools.

Perform the following procedures while wiggling the harness from side to side. Continue this at convenient points (about 6 inches apart) while watching the test equipment.

- Testing for Short to Ground
- Testing for Continuity
- Testing for a Short to Voltage

If the fault is not identified, perform the procedure below using the MIN MAX feature on the EL-39200 DMM. This feature allows you to manipulate the circuit without having to watch the EL-39200. The EL-39200 will generate an audible tone when a change is detected.

Note: The EL-39200 must be used in order to perform the following procedure since the EL-39200 can monitor current, resistance or voltage while recording the minimum (MIN), and maximum (MAX) values measured.

1. Connect the EL-39200 to both sides of a suspected connector (still connected), or from one end of a suspected circuit to the other. Refer to Troubleshooting with a Digital Multimeter for information on connecting the EL-39200 to the circuit.
2. Set the rotary dial of the EL-39200 to the V (AC) or V (DC) position.
3. Press the range button of the EL-39200 in order to select the desired voltage range.
4. Press the MIN MAX button of the EL-39200. The EL-39200 displays 100 ms RECORD and emits an audible tone (beep).

   Note: The 100 ms RECORD mode is the length of time an input must stay at a new value in order to record the full change.

5. Simulate the condition that is potentially causing the intermittent connection, either by wiggling the connections or the wiring, test driving, or performing other operations. Refer to Inducing Intermittent Fault Conditions.
6. Listen for the audible Min Max Alert which indicates that a new minimum or maximum value has been recorded.
7. Press the MIN MAX button once in order to display the MAX value and note the value.
8. Press the MIN MAX button again in order to display the MIN value and note the value.
9. Determine the difference between the MIN and MAX values.
   - If the variation between the recorded MIN and MAX voltage values is 1 V or greater an intermittent open or high resistance condition exists. Repair the condition as necessary.
   - If the variation between the recorded MIN and MAX voltage values is less than 1 V, an intermittent open or high resistance condition does not exist.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures | Document ID: 2161319

Testing for Intermittent Conditions and Poor Connections

Special Tools

EL-35616-D Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools.

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- Poor terminal to wire connection--Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to Inducing Intermittent Fault Conditions in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to Testing for Electrical Intermittents for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to Scan Tool Snapshot Procedure for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the EL-35616 when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center. Use EL-35616-35 to test for proper terminal contact. Failure to use EL-35616-35 can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal / terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire (Dock and Lock) Connectors

There are no serviceable parts for flat wire (dock and lock) connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter from the on the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Ensure that the circuit can carry the current necessary to operate the component. Refer to Circuit Testing and Power Distribution Schematics.

- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Ensure that the circuit can carry the current necessary to operate the component. Refer to Circuit Testing and Ground Distribution Schematics.

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
  - High ambient temperatures
  - Underhood/engine generated heat
  - Circuit generated heat due to a poor connection, or high electrical load
  - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
  - Low ambient temperatures--In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
  - The condition only occurs on a cold start.
  - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to Inducing Intermittent Fault Conditions in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference or other types of electrical noise. Inspect for the following conditions:

- A misrouted harness that is too close to high voltage/high current devices such as secondary ignition components, motors, generator etc.--These components may induce electrical noise on a circuit that could interfere with normal circuit operation.
- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch--These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc.--These accessories may lead to interference while in use, but do not fail when the accessories are not in use. Refer to Checking Aftermarket Accessories.
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.

- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
  - A new service control module is installed.
  - A control module from another vehicle is installed.
  - Revised software/calibration files have been released for this vehicle.

Note: DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to Control Module Referencesfor replacement, setup, and programming.

Testing for Short to Ground

Notice: Refer to Test Probe Notice in the Preface section.

The following procedures test for a short to ground in a circuit.

With a DMM

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the rotary dial of the DMM to the Ω position.
4. Connect one lead of the DMM to one end of the circuit to be tested.
5. Connect the other lead of the DMM to a good ground.
6. If the DMM does NOT display infinite resistance (OL), there is a short to ground in the circuit.

With a Test Lamp

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to battery positive voltage.
4. Connect the other lead of the test lamp to one end of the circuit to be tested.
5. If the test lamp illuminates, there is a short to ground in the circuit.

Fuse Powering Several Loads

1. Review the system schematic and locate the fuse that is open.
2. Open the first connector or switch leading from the fuse to each load.
3. Connect a DMM across the fuse terminals (be sure that the fuse is powered).
   - When the DMM displays voltage the short is in the wiring leading to the first connector or switch.
   - If the DMM does not display voltage refer to the next step.
4. Close each connector or switch until the DMM displays voltage in order to find which circuit is shorted.

Troubleshooting with a Digital Multimeter

Special Tools

EL-39200 Digital Multimeter

For equivalent regional tools, refer to Special Tools.

Notice: Refer to Test Probe Notice in the Preface section.

Note: Circuits which include any solid state control modules, such as the powertrain control module (PCM), should only be tested with a 10 MΩ or higher impedance digital multimeter such as the EL-39200 Digital Multimeter (DMM).

The EL-39200 instruction manual is a good source of information and should be read thoroughly upon receipt of the DMM as well as kept on hand for future reference.

A DMM should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The ohmmeter function on a DMM shows how much resistance exists between 2 points along a circuit. Low resistance in a circuit means good continuity.

Note: Disconnect the power feed from the suspect circuit when measuring resistance with a DMM. This prevents incorrect readings. DMMs apply such a small voltage to measure resistance that the presence of voltages can upset a resistance reading.

Diodes and solid state components in a circuit can cause a DMM to display a false reading. To find out if a component is affecting a measurement take a reading once, then reverse the leads and take a second reading. If the readings differ the solid state component is affecting the measurement.

Following are examples of the various methods of connecting the DMM to the circuit to be tested:

- Backprobe both ends of the connector and either hold the leads in place while manipulating the connector or tape the leads to the harness for continuous monitoring while you perform other operations or test driving. Refer to Probing Electrical Connectors.
- Disconnect the harness at both ends of the suspected circuit where it connects either to a component or to other harnesses.
- If the system that is being diagnosed has a specified pinout or breakout box, it may be used in order to simplify connecting the DMM to the circuit or for testing multiple circuits quickly.

Troubleshooting with a Test Lamp

Special Tools

EL-35616-200 Test Light - Probe Kit

Notice: Refer to Test Probe Notice in the Preface section.

A test lamp can simply and quickly test a low impedance circuit for voltage. A DMM should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The EL-35616-200 is Micro-Pack compatible and comprised of a 12 V light bulb with an attached pair of leads.

To properly operate this tool use the following procedures.

When testing for voltage:

1. Attach one lead to ground.
2. Touch the other lead to various points along the circuit where voltage should be present.
3. When the bulb illuminates, there is voltage at the point being tested.

When testing for ground:

1. Attach one lead to battery positive voltage.
2. Touch the other lead to various points along the circuit where ground should be present.
3. When the bulb illuminates, there is ground at the point being tested.

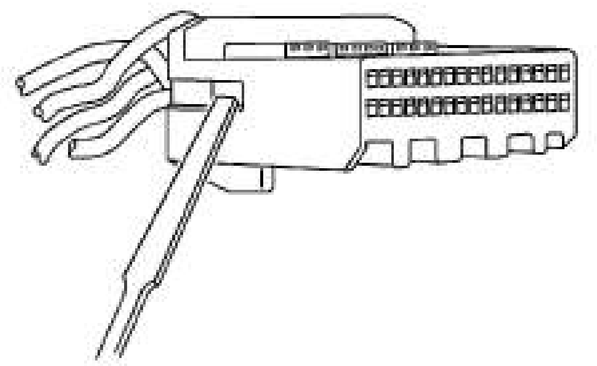
Tyco / AMP Connectors (0.25 Cap)

Special Tools

For equivalent regional tools, refer to Special Tools.

Terminal Removal Procedure

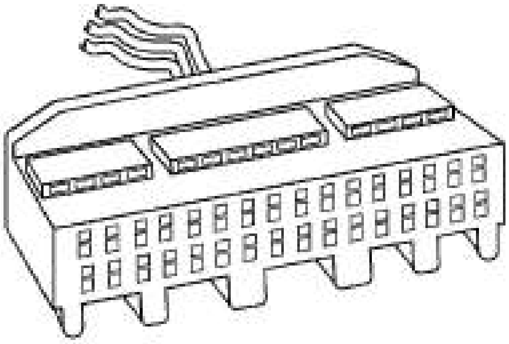
1. Disconnect the connector from the component by pressing down on the connector position assurance (CPA).



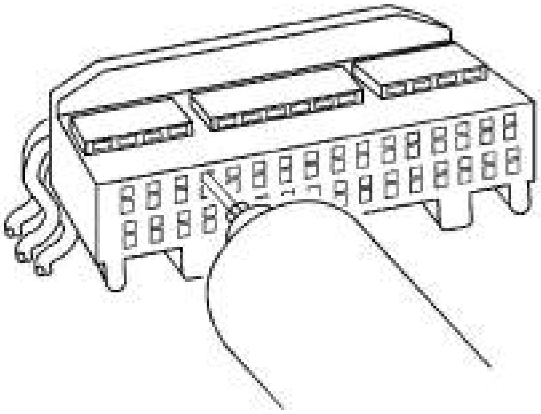
2. Use a small flat-bladed tool to release the terminal position assurance (TPA) by inserting the tool in the small recess on the side of the connector and pushing up until the TPA releases from the connector body. The TPA should raise just slightly. Do not try to remove the TPA.

   Note: The TPA on this connector cannot be removed unless the terminals are removed first. The TPA will come out of the connector body, but only slightly. When the TPA is slightly raised the terminals can be removed. Using excessive force to remove the TPA with the terminals still in the connector will damage the connector.

3. Repeat the process for the other side of the connector.



4. Ensure that the TPA is in the proper position to remove the terminals.



5. While pushing the terminal forward, insert the EL-38125-24 in the release cavity above the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

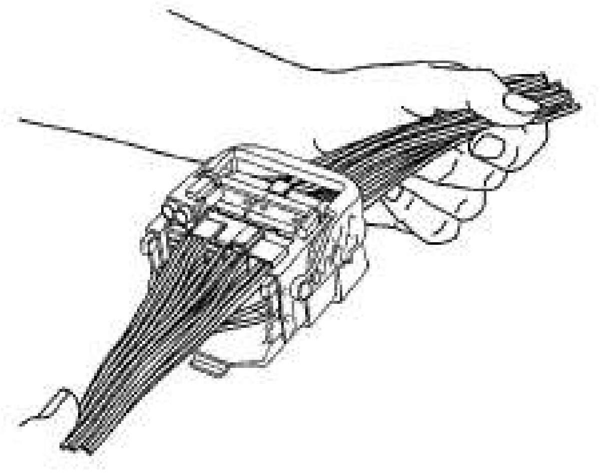
1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Tyco / AMP Connectors (102-Way Inline)

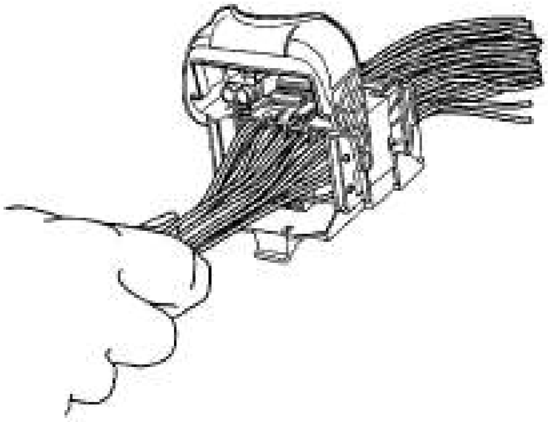
Special Tools

For equivalent regional tools, refer to Special Tools Special Tools.

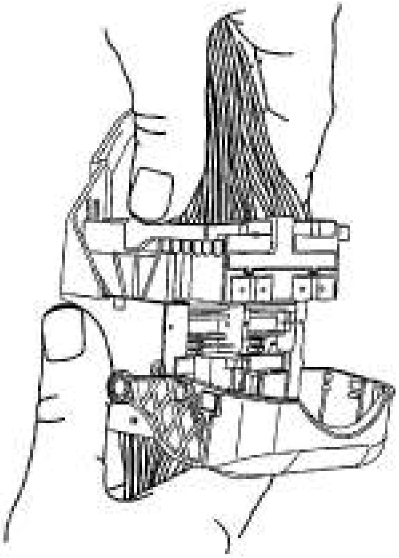
Removal Procedure



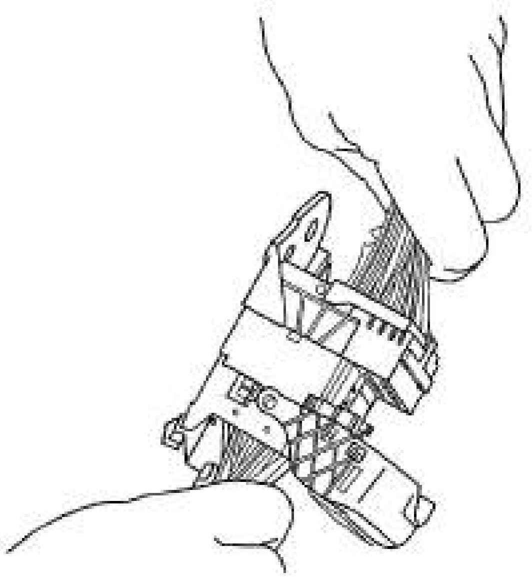
View of a typical connector in the assembled position.



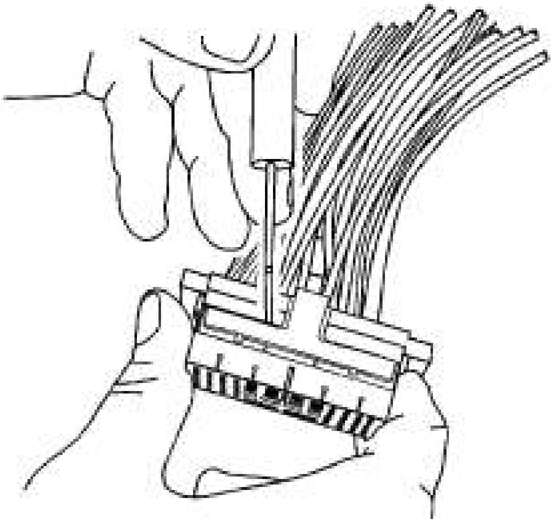
1. Pull the locking lever to the 90 degree position from the connector body.



2. With the locking lever in the 90 degree position and the male connector body separated, it can be slid outward for removal.

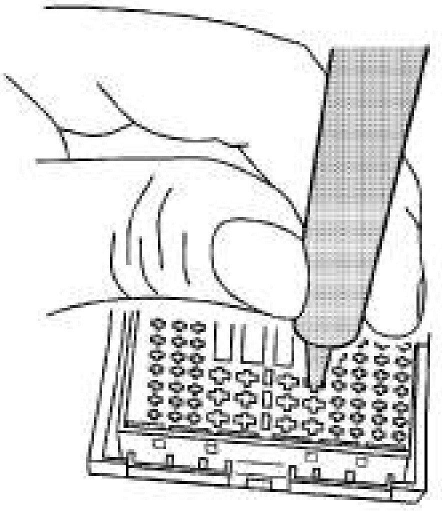


3. Slide the male connector body out away from the guide plates.

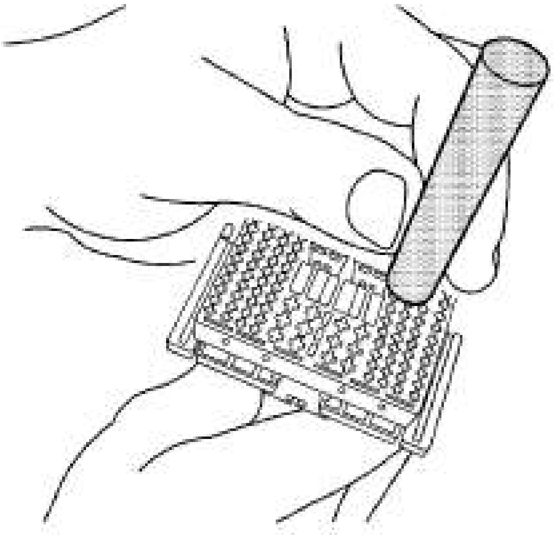


Note: During assembly the TPA will not fully seat if any terminal is not fully seated.

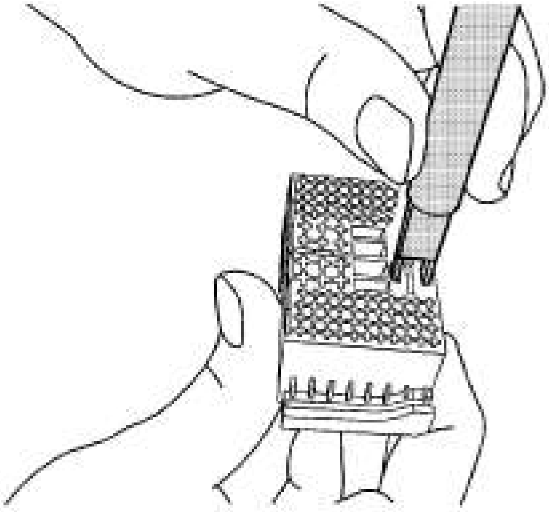
4. Using terminal release tool J-38125-11A or equivalent, remove the TPA from the connector body.



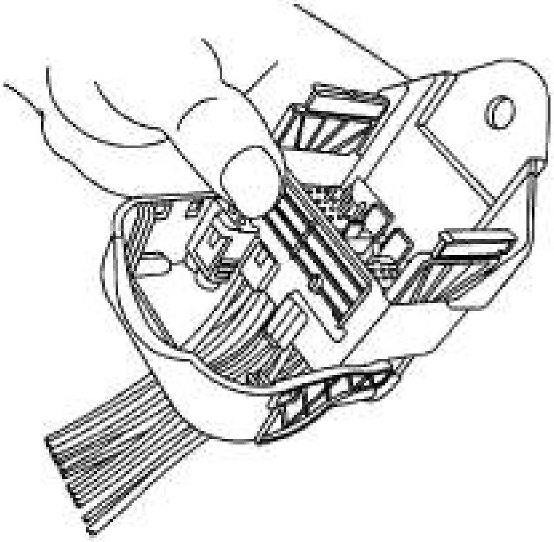
5. Using terminal release tool J 38125-566, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



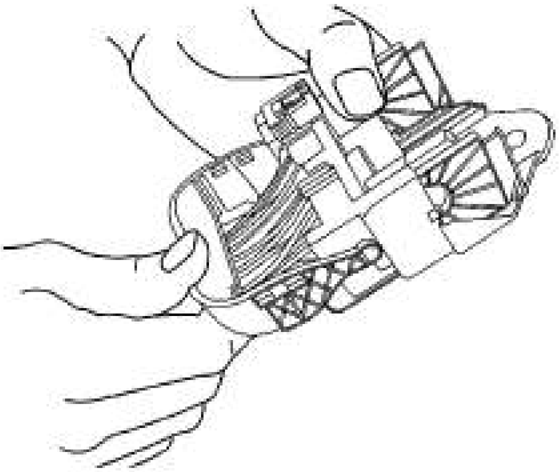
6. Using terminal release tool J 38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



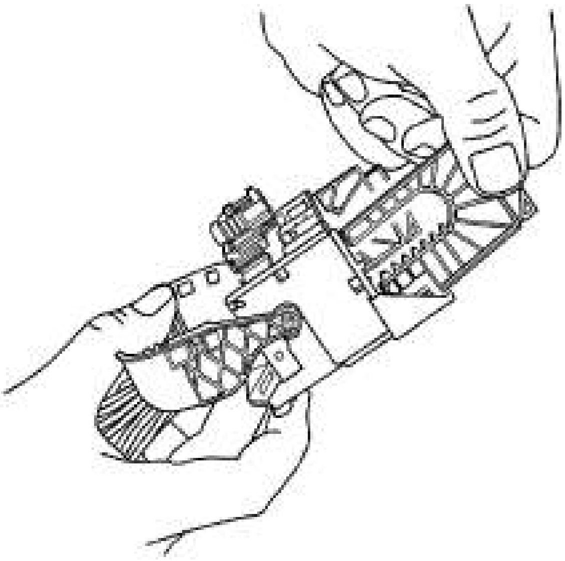
7. Using terminal release tool J 38125-221, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



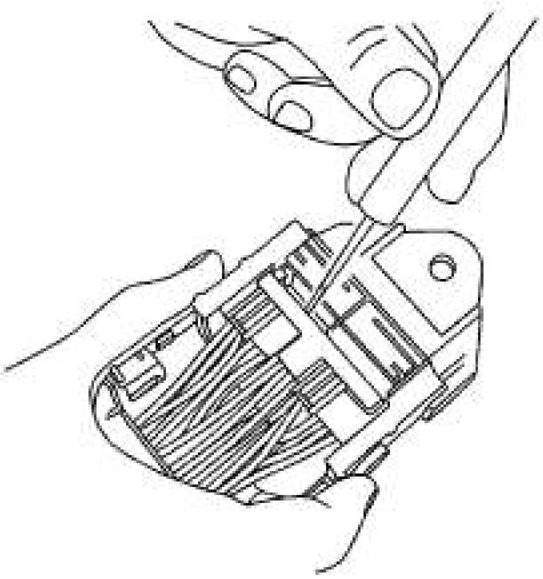
8. The female connector body may have an additional connector hooked to the edge of the body. Use terminal release tool J-38125-11A or equivalent to release the locking tab and slide the connector off the female body.



9. Move the locking lever 180 degrees from the connected position.

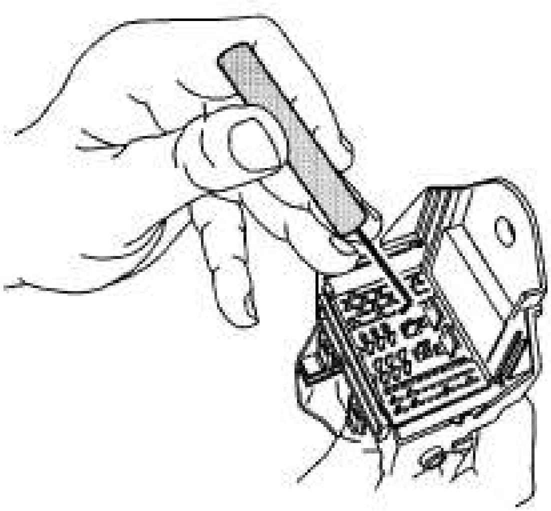


10. With the locking lever in the 180 degree position the guide plates can be removed from the connector body.

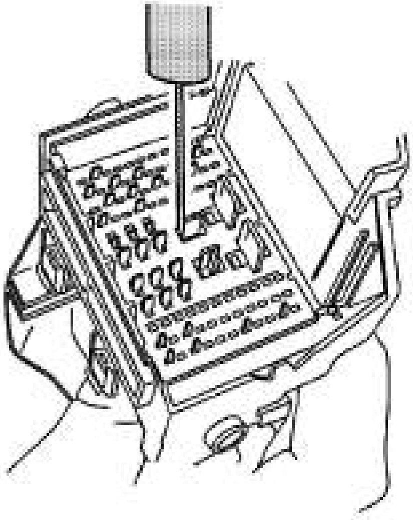


Note: During assembly the TPA will not fully seat if any terminal is not fully seated.

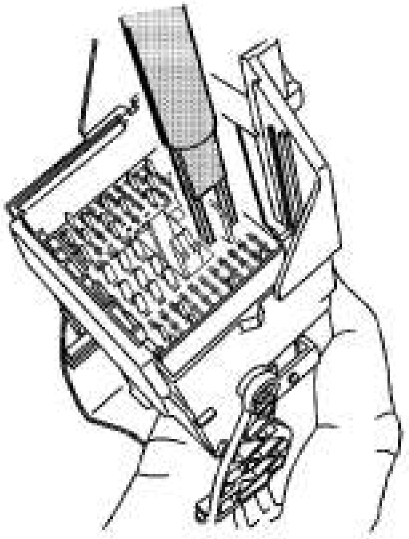
11. Using terminal release tool J 38125-11A or equivalent, remove the TPA from the connector body.



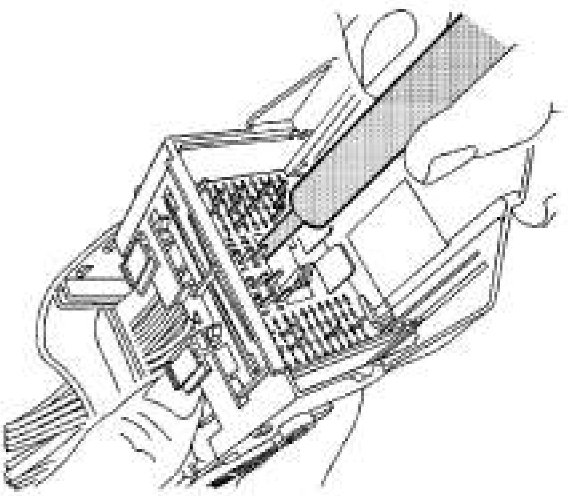
12. Using terminal release tool J 38125-216, lift the terminal plate past the terminals and out of the connector body cavity.



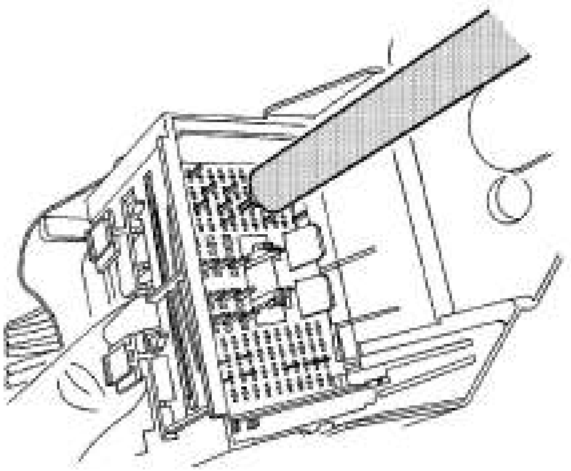
13. Terminal plate will bind slightly on each corner.



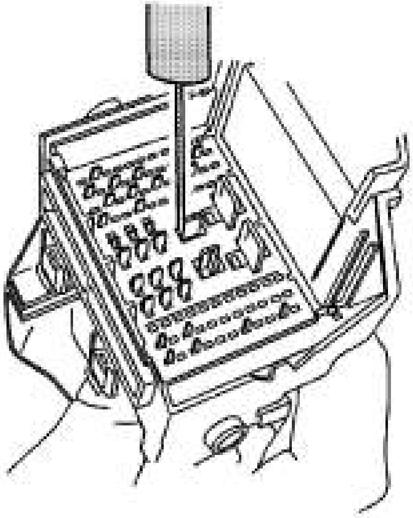
14. Using terminal release tool J 38125-221, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



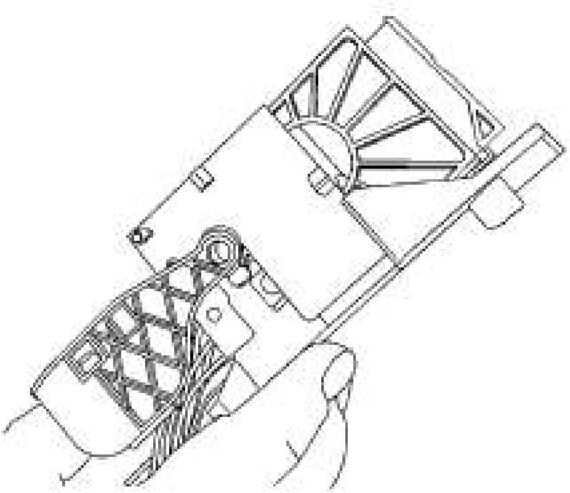
15. Using terminal release tool J 38125-212, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



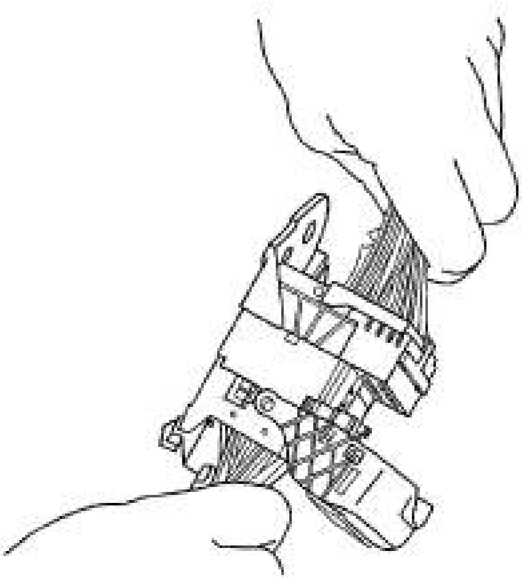
16. Using terminal release tool J 38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



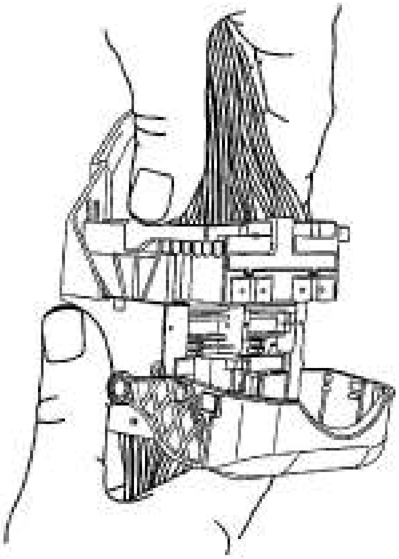
17. Press the terminal plate back into the female connector to the preset position. The plate will bind slightly on each corner.



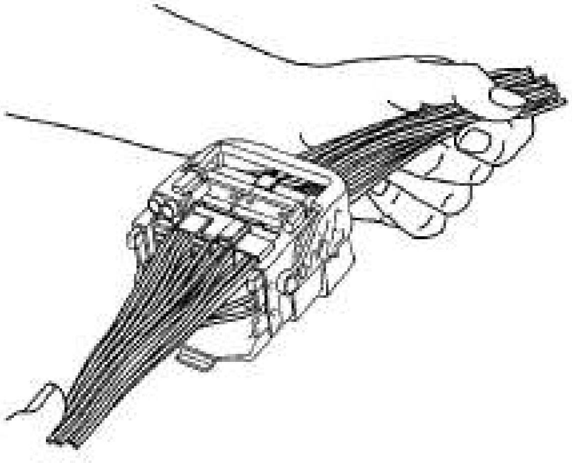
18. With the locking lever in the 180 degree position, align the guide plates to mesh with the gears on the locking lever.



19. Slide the male connector body back inward toward the guide plates.



20. With the locking lever in the 90 degree position and the male connector body connected, it can be slid inward for assembly.



21. Move the lever into the locked position or in the assembled position. This will pull the male connector down into the female connector.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Tyco/AMP Connectors (43-Way)

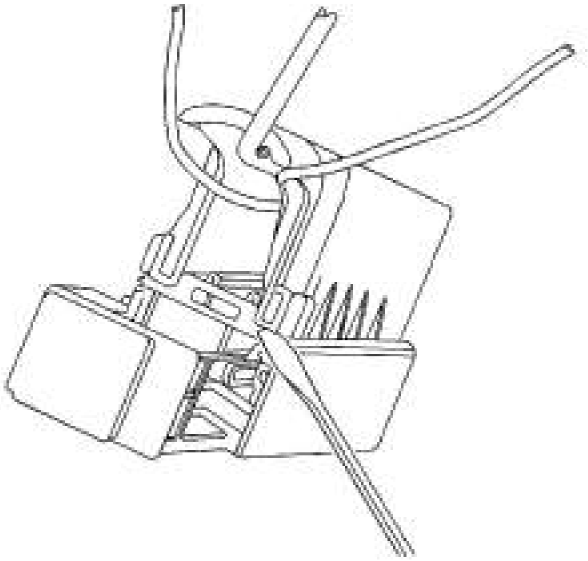
Special Tools

For equivalent regional tools, refer to Special Tools.

Removal Procedure

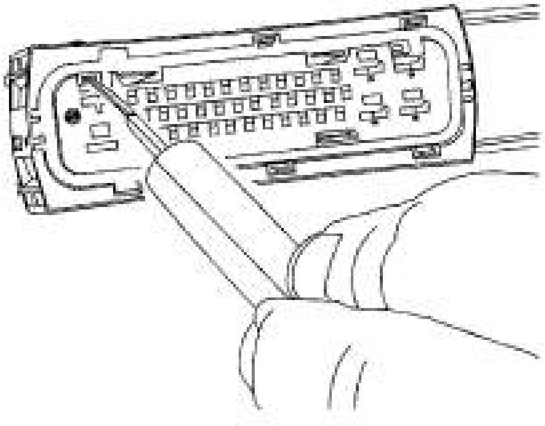
Follow the steps below in order to remove terminals from the connector.

1. Locate the lever lock on the wire dress cover. Slide the lever lock away from the connector body.
2. Disconnect the connector from the component.
3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-blade tool release all of the locking tabs.
4. Once the locks are unlocked, lift the dress cover off.

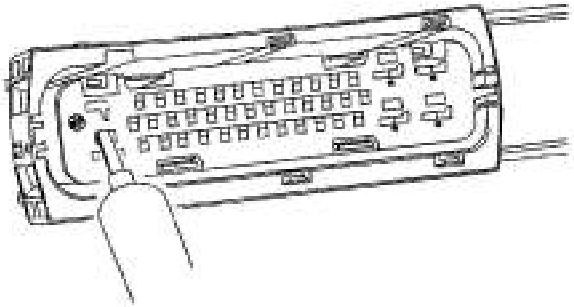


Note: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

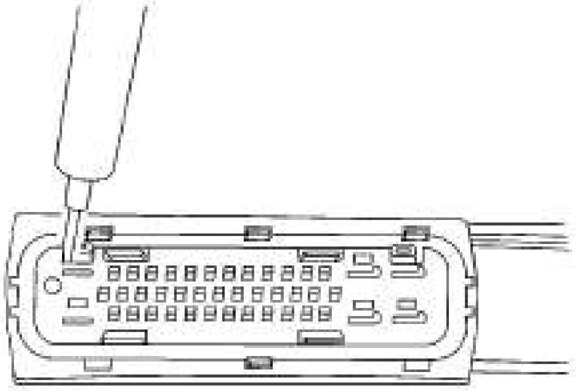
5. Release the TPA by inserting a small flat-blade tool into the blue locking tabs on both ends of the connector. Gently slide the TPA up to the released position on both ends.



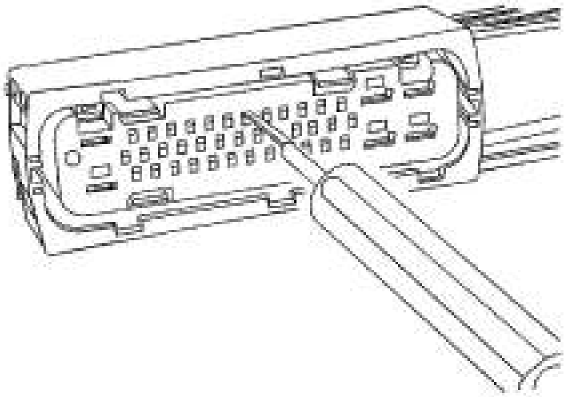
6. For the larger terminals insert the EL-38125-13A tool to release the terminals by inserting the tool into the terminal release cavity. For the smaller terminals insert the EL-38125-12A tool to release the terminals by inserting the tool into the terminal release cavity.



7. View of the release tool being used for the larger terminals.



8. View of the release tool being used for the larger terminals.



9. View of the release tool being used for the smaller terminals.
10. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

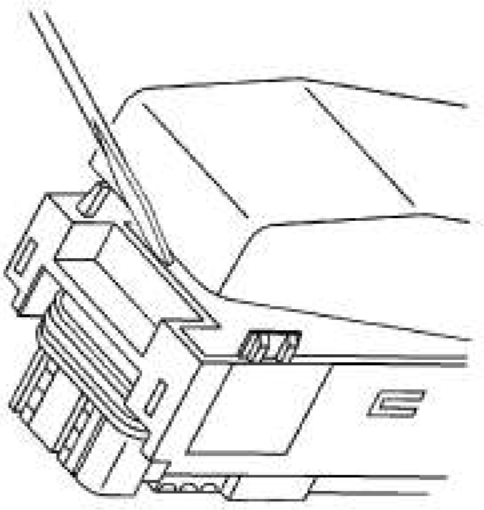
Tyco / AMP Connectors (CM 42-Way)

Special Tools

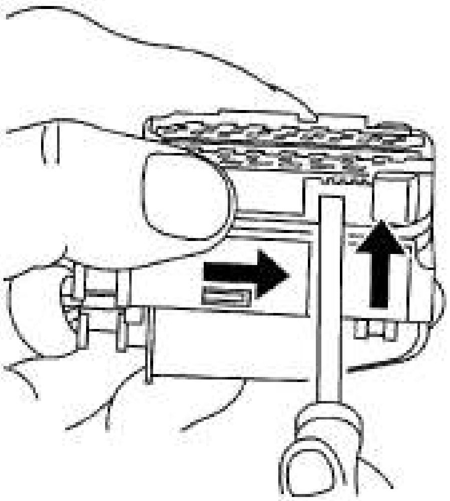
For equivalent regional tools, refer to Special Tools.

Removal Procedure

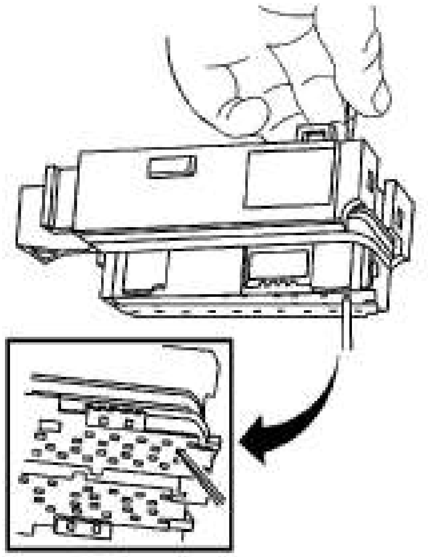
1. Locate the connector position assurance (CPA) on the connector body and pull the CPA out. The CPA is on the wire harness side of connector.
2. Disconnect the connector from the component.



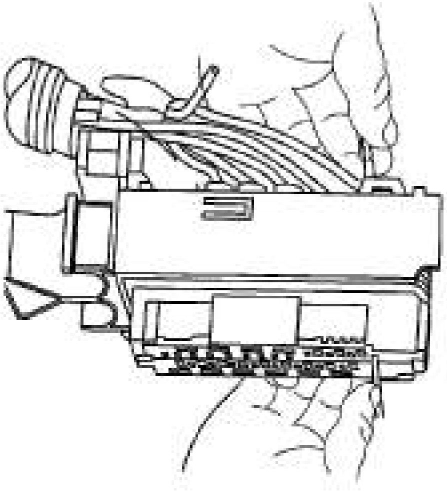
3. Use a small flat-bladed tool to gently pry off the dress cover by inserting the tool under the cover opposite the harness side and prying up.
4. Remove the cover.



5. Using a small flat-bladed tool, push on the side of the nose piece retainer while pushing the nose piece forward with your thumb. This will release the terminal position assurance (TPA).



6. Insert the EL-38125-12A into the corresponding terminal release cavity. The release cavities are the 2 center rows of cavities on one half of the connector.



7. Pressing the EL-38125-12A tool in the release cavity of the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

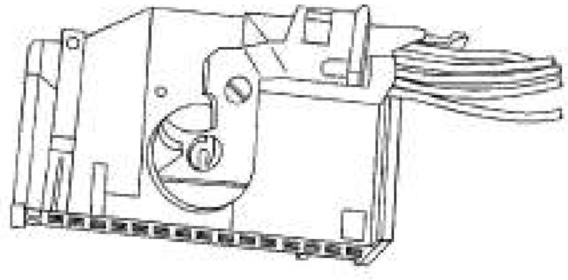
1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Tyco / AMP Connectors (Door Module)

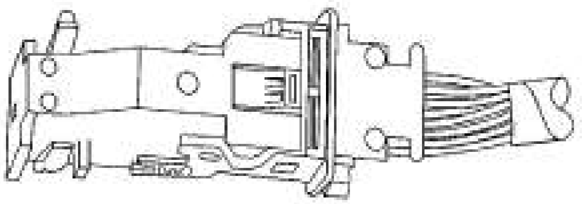
Special Tools

For equivalent regional tools, refer to Special Tools.

Removal Procedure

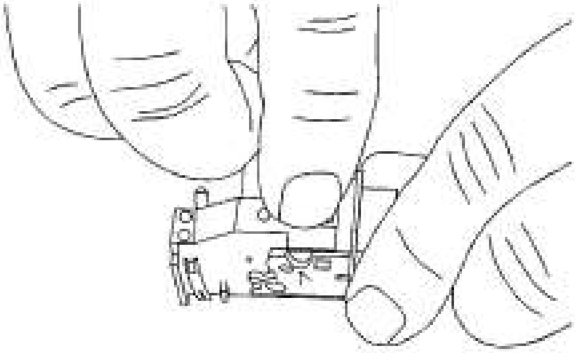


Side view of connector.

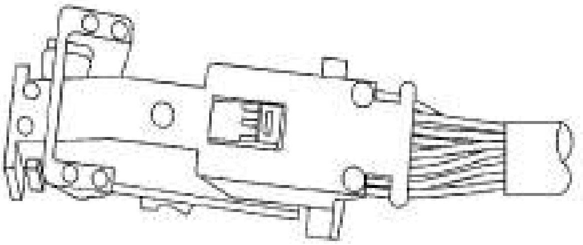


View of top of connector.

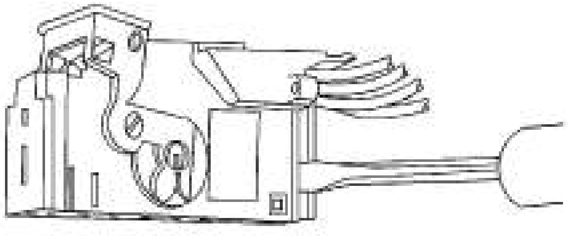
1. Locate the assist lever and lock on the top of the connector.



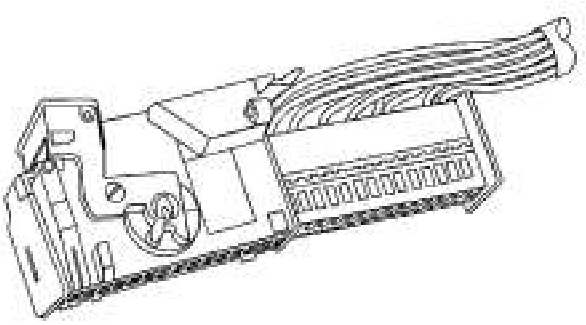
2. While depressing the lock, pull the lever over and past the lock.



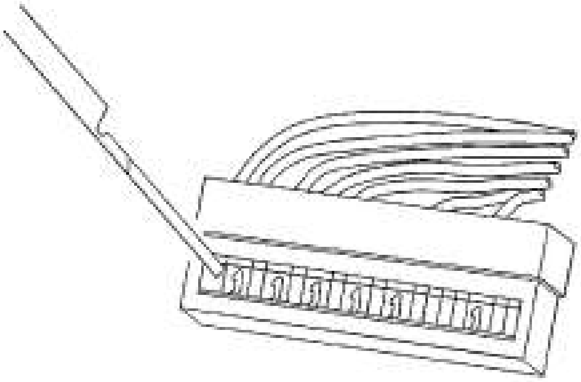
3. Disconnect the connector from the component.



4. Locate the dress cover locking tabs at the rear of the connector. Use a small flat-blade tool to release the locking tabs. Repeat this procedure for the other locking tab.



5. Once the locking tabs are unlocked, slide the inner connector out of the rear of the connector housing.



6. Use the EL-38125-12A tool to release the terminals by pressing on the tang.
7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

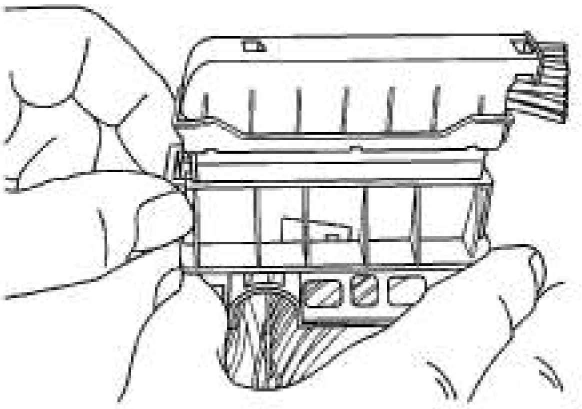
1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Tyco / AMP Connectors (Seat)

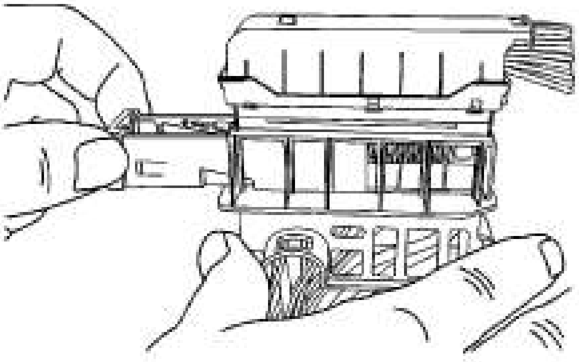
Special Tools

For equivalent regional tools, refer to Special Tools.

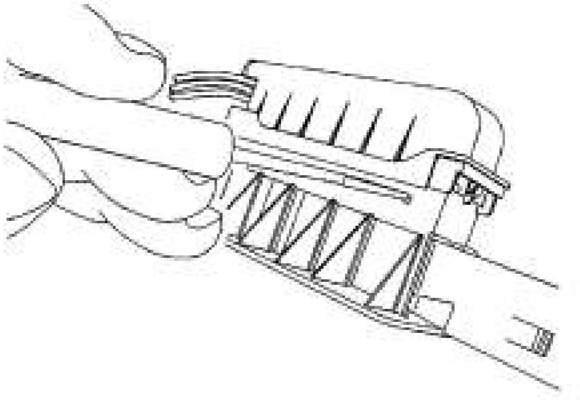
Removal Procedure



1. Grasp the locking slide lever and pull outward from the end of the connector.

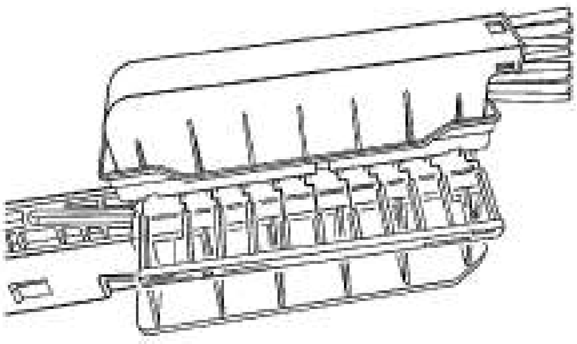


2. As the slide lever is pulled out the mating connector is lifted from the seated position.

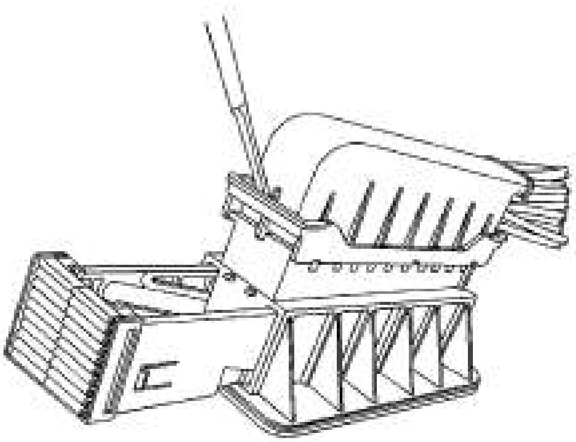


Note: TPA is keyed and can only be inserted in one direction.

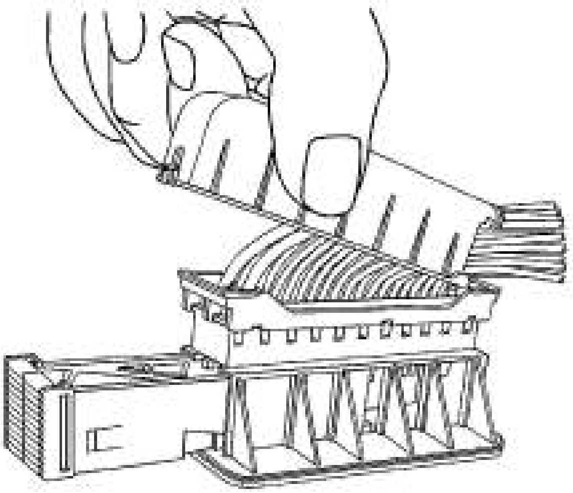
3. Using terminal release tool J-38125-11A or equivalent, push the TPA tabs into the connector body.



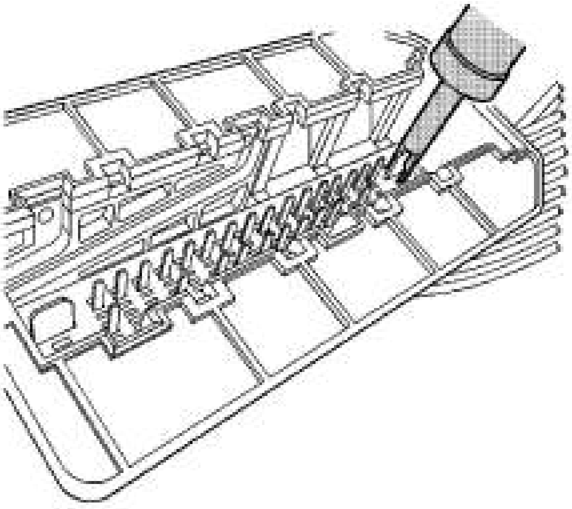
4. Pull the TPA from the connector body.



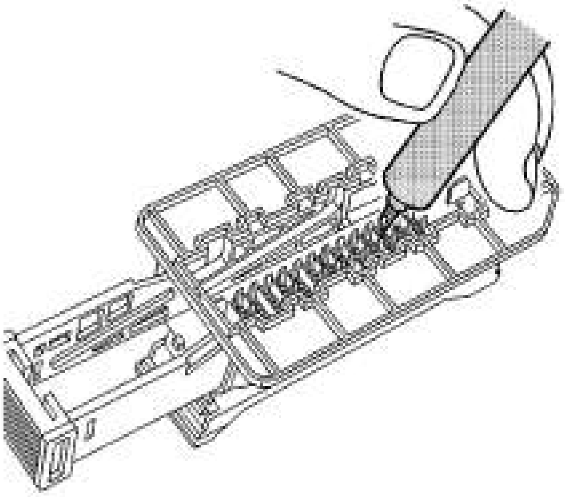
5. Using terminal release tool J-38125-11A or equivalent, release the connector wire dress cover locking tab.



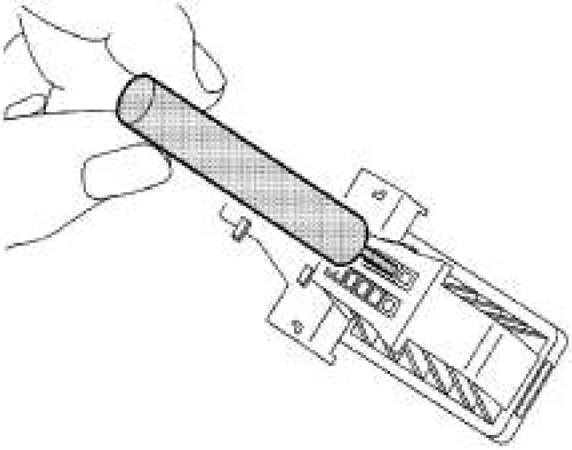
6. With the lock tab released, lift the connector wire dress cover from the connector body.



7. Using terminal release tool EL-38125-212, press the prongs into the holes each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



8. Using terminal release tool EL-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.



9. Using terminal release tool EL-38125-556, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

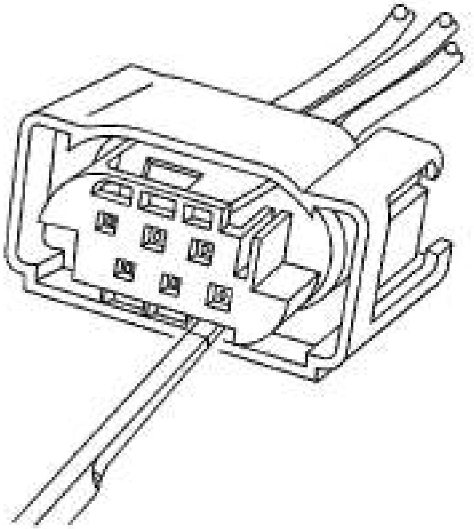
Tyco / AMP Connectors (Sensor)

Special Tools

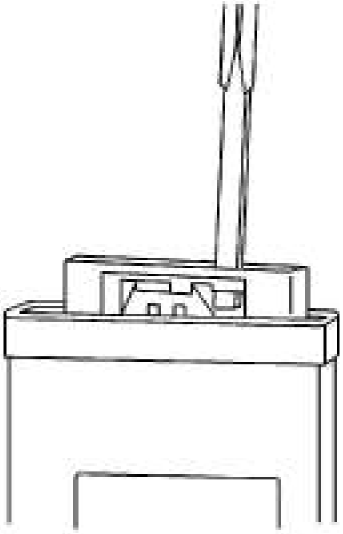
J-38125 Terminal Repair Kit

Terminal Removal Procedure

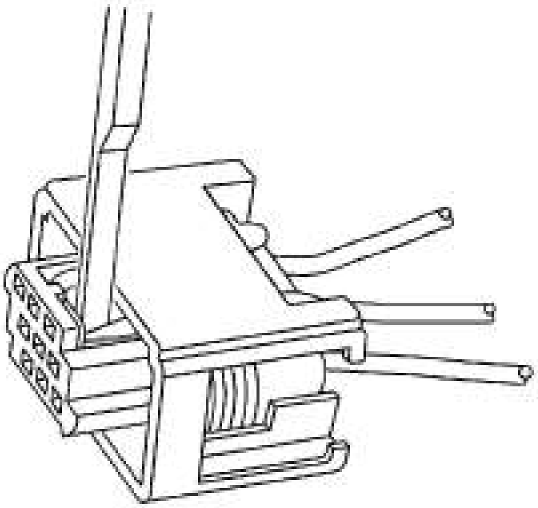
1. Disconnect the connector from the component.



2. Insert the EL-38125-11A tool into the cavity on the lower right hand face of the connector until the terminal release tang access panel slides over.



3. Ensure that the terminal release tang access panel is in the correct location to access the terminals.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.



5. Insert the EL-38125-11A into the terminal release tang access slot located behind the access panel of the connector and press down on the terminal while carefully pulling the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

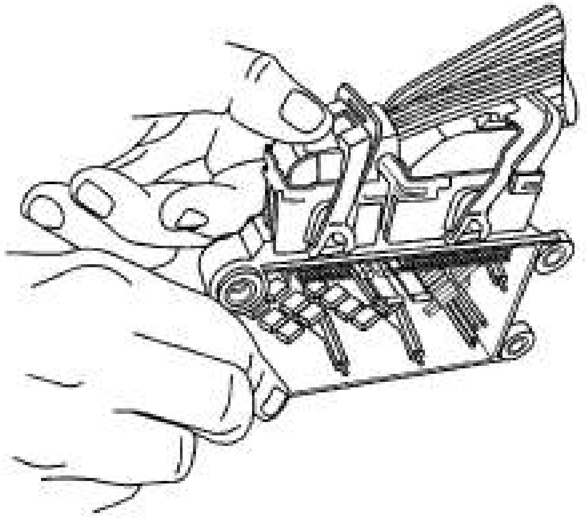
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Diagnostic Information and Procedures | **Document ID: 2168733**

Tyco / AMP Connectors (SIR)

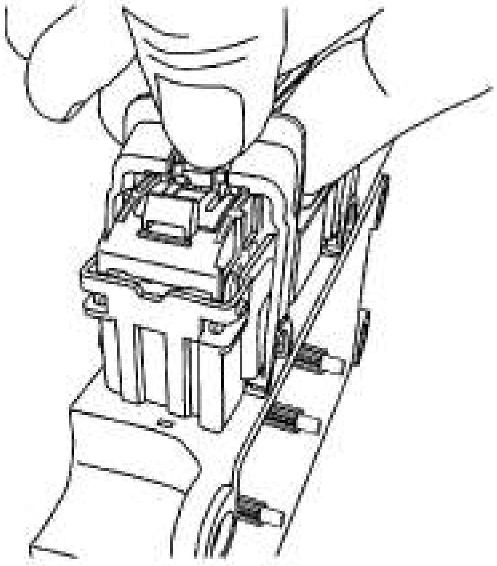
Special Tools

For equivalent regional tools, refer to Special Tools.

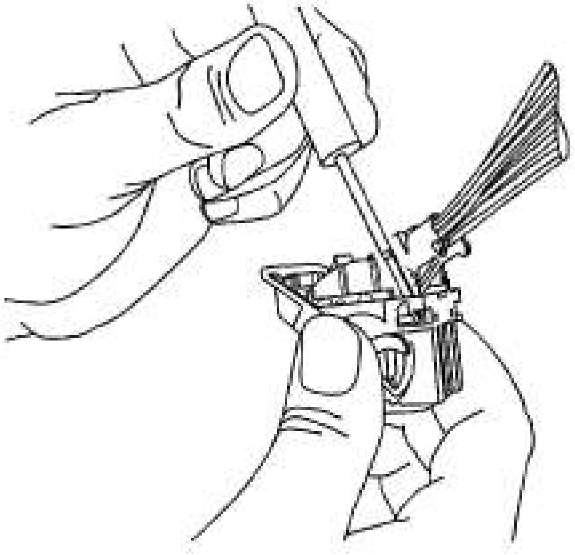
Removal Procedure



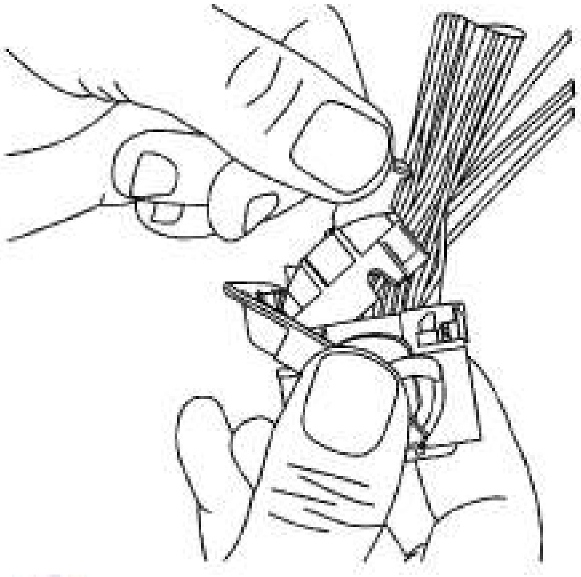
1. Using your thumbs press down and slide the red CPA away from the connector lever.



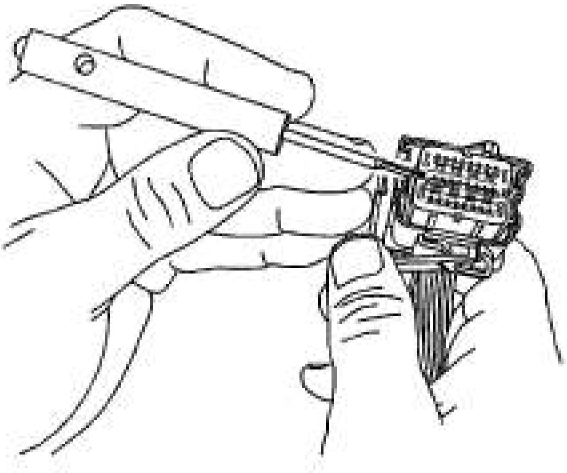
2. Using your thumb press down on the locking tab and move the lever to the released position.



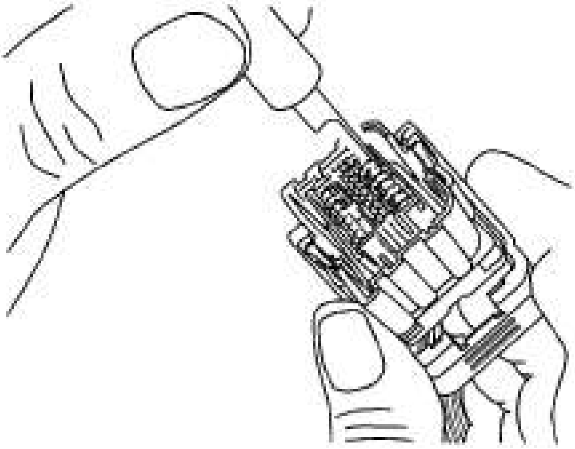
3. Using terminal tool J-38125-11A or equivalent, release the wire dress cover locking tabs.



4. Pivot connector wire dress cover while removing from the connector body.



5. Using terminal tool J-38125-11A or equivalent, remove the TPA by lifting straight off the connector body.



6. Using terminal release tool EL-38125-215A, place the tip of the tool on the outside edge next to the terminal and depress the lock tab and remove the rear of the connector body.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Using Connector Test Adapters

Notice: Do not insert test equipment probes (DVOM etc.) into any connector or fuse block terminal. The diameter of the test probes will deform most terminals. A deformed terminal will cause a poor connection, which will result in a system failure. Always use the J-35616-C Holden-Approved Terminal Test Kit or the J 42675 Flat-Wire Probe Adapter in order to front probe terminals. Do not use paper clips or other substitutes to probe terminals.

When using the J-35616-C Holden-Approved Terminal Test Kit, ensure the terminal test adapter choice is the correct size for the connector terminal. Do not visually choose the terminal test adapter because some connector terminal cavities may appear larger than the actual terminal in the cavity. Using a larger terminal test adapter will damage the terminal. Refer to the J-35616-C Holden-Approved Terminal Test Kit label on the inside of the J-35616-C Holden-Approved Terminal Test Kit for the correct adapter along with the connector end view for terminal size.

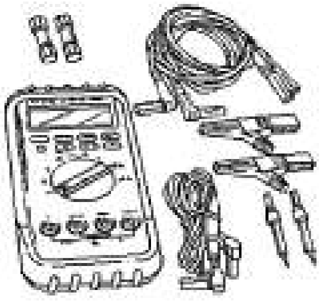
Using Fused Jumper Wires

Special Tools

EL-35616-D Fused Jumper Wire

For equivalent regional tools, refer to Special Tools.

Note: A fused jumper may not protect solid state components from being damaged.



The EL-35616-20F includes small clamp connectors that provide adaptation to most connectors without damage. This fused jumper wire is supplied with a 20-A fuse which may not be suitable for some circuits. Do not use a fuse with a higher rating than the fuse that protects the circuit being tested.

Wiring Repairs

The Wiring Repairs section contains the following types of wiring repair information. Using these elements together will make wiring repair faster and easier:

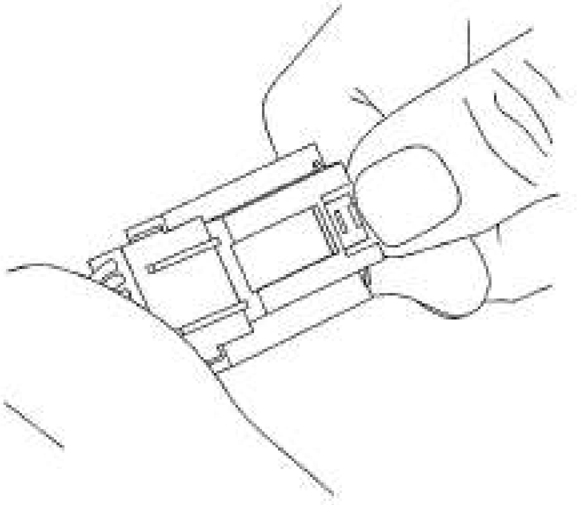
- Testing for Intermittent Conditions and Poor Connections
- Flat Wire Repairs
- GMLAN Wiring Repairs
- High Temperature Wiring Repairs
- Heated Oxygen Sensor Wiring Repairs
- Splicing Copper Wire Using Splice Sleeves
- Splicing Twisted or Shielded Cable
- Splicing Inline Harness Diodes
- SIR/SRS Wiring Repairs

Yazaki Connectors (16-Way)

Special Tools

For equivalent regional tools, refer to Special Tools.

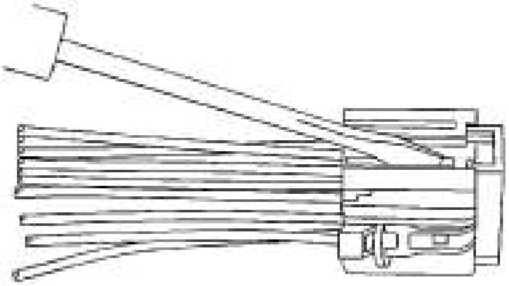
Removal Procedure



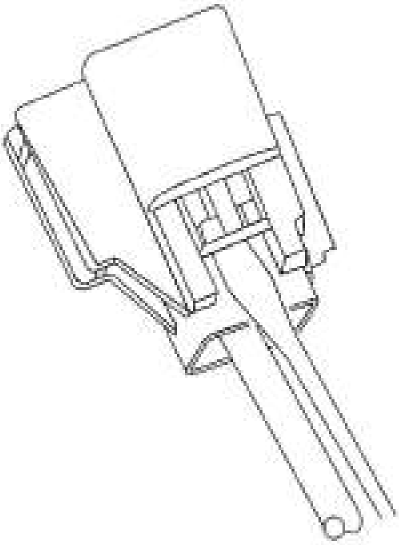
1. While depressing the lock, pull the two connector halves apart.

   Note: The TPA is fragile and may break if not done carefully.

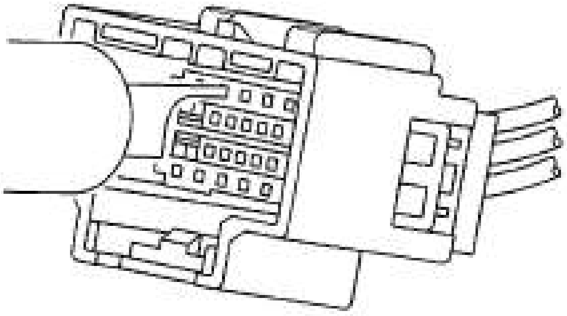
2. Use a small flat-blade tool to very carefully push the terminal position assurance (TPA) towards the face of the connector on both sides of the connector.



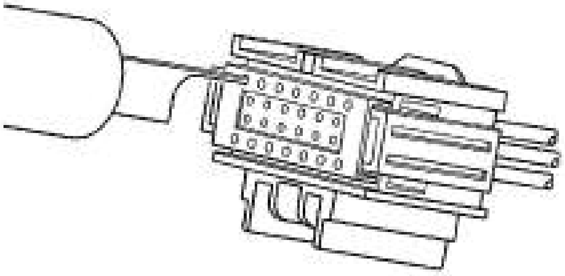
3. View of the male half of the connector with female terminals.



4. View of the female half of the connector with male terminals.
5. Use the EL 38125-215 tool to release the terminals by inserting the tool into the terminal release cavity.



6. View of the female half of the connector with male terminals.



7. View of the male half of the connector with female terminals.
8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

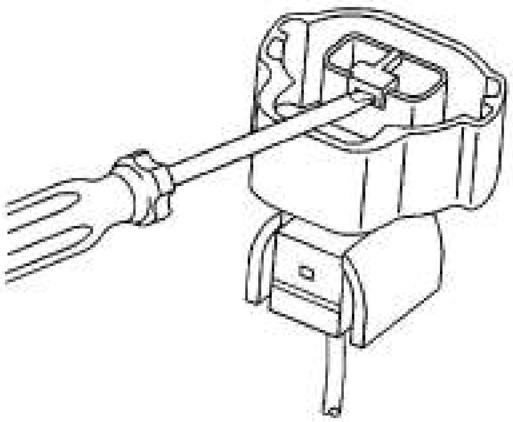
Yazaki Connectors (2-Way)

Special Tools

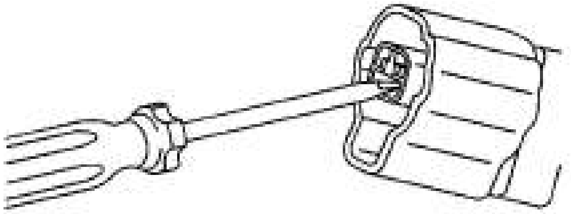
For equivalent regional tools, refer to Special Tools.

Terminal Removal Procedure

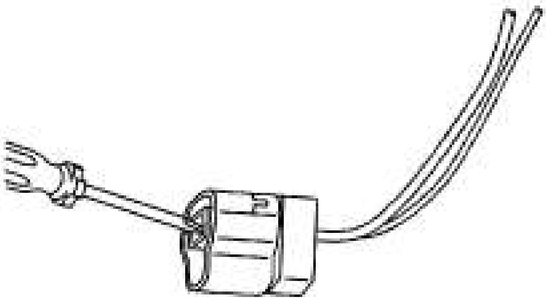
1. Disconnect the connector from the component.



2. Insert a small flat-blade tool in the slot below the front loaded terminal position assurance (TPA) and pry up.
3. Remove the TPA by pulling it out of the connector.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.



5. Insert the EL 38125-553 on a slight upward angle into the cavity below the terminal to be removed. Ensure that the pointed on the end of the tool is facing the bottom of the terminal and it stays in contact with the terminal until it stops on the plastic terminal retainer.



6. Gently pry the plastic terminal retainer down and carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gage size.
4. Refer to Splicing Copper Wire Using Splice Sleeves.

Document ID: 1993813

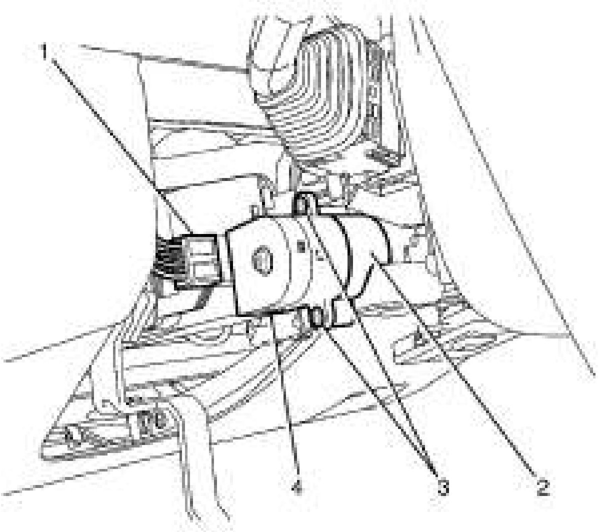
Ignition and Start Switch Replacement

Removal Procedure

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

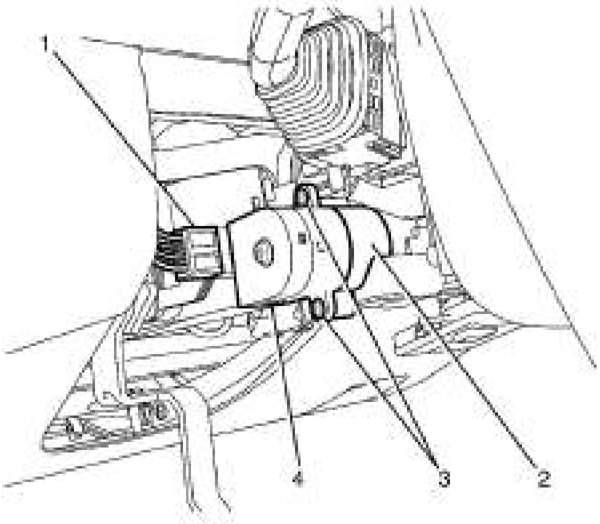
   Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling Disabling the SIR in SIR.
3. Remove the Steering Column Trim Covers. Refer to Steering Column Trim Covers Replacement .



4. Disconnect the ignition switch electrical connector (1).
5. Remove the ignition switch to steering column assembly retaining screws (3).
6. Remove the ignition switch (4) from the steering column assembly (2).

Installation Procedure



Important: The ignition switch groove must be correctly aligned with the ignition lock cylinder tongue.

1. Install the ignition switch (4) to the steering column assembly (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the ignition switch to steering column assembly retaining screws (3).

   Tighten
   Tighten the screws to 3 N·m (27 lb in).

3. Connect the ignition switch electrical connector (1).
4. Install the Steering Column Trim Covers. Refer to Steering Column Trim Covers Replacement .
5. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .
6. Enable the SIR system. Refer to SIR Disabling and Enabling Disabling the SIR in SIR.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Repair Instructions | **Document ID: 1993820**

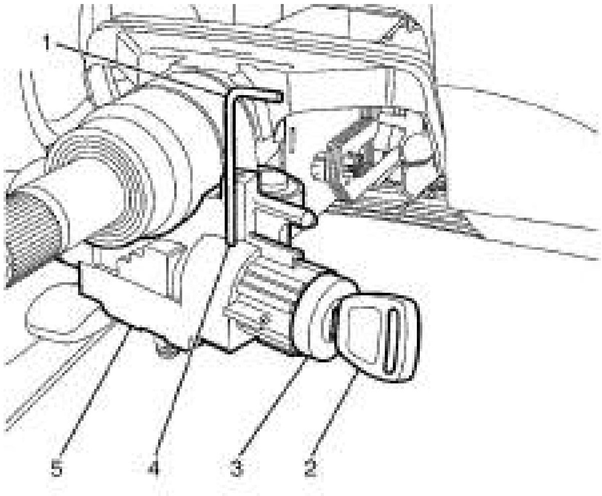
Ignition Lock Cylinder Replacement

Removal Procedure

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling .
3. Remove the inflatable restraint steering wheel module. Refer to Inflatable Restraint Steering Wheel Module Replacement .
4. Remove the steering wheel. Refer to Steering Wheel Replacement .
5. Remove the steering column trim covers. Refer to Steering Column Trim Covers Replacement .
6. Remove the inflatable restraint steering wheel module coil. Refer to Inflatable Restraint Steering Wheel Module Coil Replacement .
7. Remove the theft deterrent exciter module. Refer to Theft Deterrent Module Replacement .

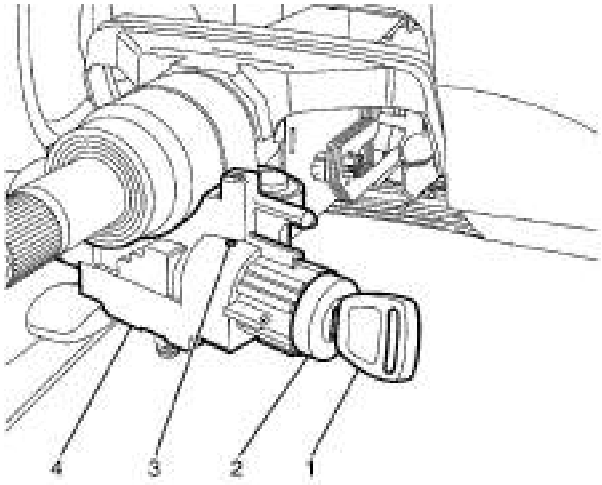


8. Insert the ignition key (2) into the ignition lock cylinder (3), and turn to the ON position.

   Important: Insert a 2.5 mm pin (1) into the locking pin hole (4) to depress the spring loaded ignition lock cylinder locking latch in order to release the ignition lock cylinder from the ignition lock cylinder housing (5).

9. Release the ignition lock cylinder locking latch.
10. Remove the pin (1) from the locking pin hole (4).
11. Remove the ignition lock cylinder (3) and ignition key (2) assembly from the ignition lock cylinder housing (5).
12. Remove the ignition key (2) from the ignition lock cylinder (3).

Installation Procedure



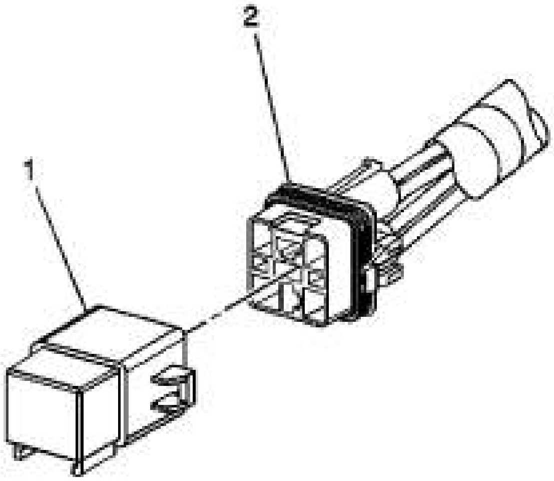
1. Insert the ignition key (1) into the ignition lock cylinder (2) and turn to the ON position.

   Important: The ignition lock cylinder latch must fully engage and lock into the ignition lock cylinder housing (3).

2. Install the ignition lock cylinder (2) and ignition key (1) assembly into the ignition lock cylinder housing (3).
3. Turn the key to the OFF lock position.
4. Remove the ignition key (1) from the ignition lock cylinder (2).
5. Install the inflatable restraint steering wheel module coil. Refer to Inflatable Restraint Steering Wheel Module Coil Replacement .
6. Install the theft deterrent exciter module. Refer to Theft Deterrent Module Replacement .
7. Install the steering column trim covers. Refer to Steering Column Trim Covers Replacement .
8. Install the steering wheel. Refer to Steering Wheel Replacement .
9. Install the inflatable restraint steering wheel module. Refer to Inflatable Restraint Steering Wheel Module Replacement .
10. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .
11. Enable the SIR system. Refer to SIR Disabling and Enabling .

Relay Replacement (Attachedto Wire Harness)

Removal Procedure

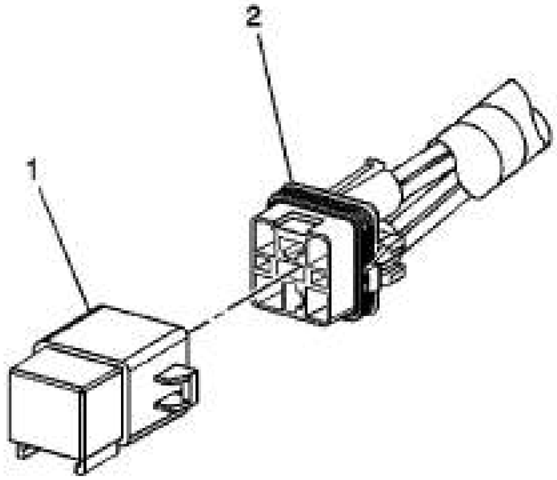


1. Locate the relay. Refer to the Master Electrical Component List to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

   Note: Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.

4. Separate the relay (1) from the wire harness connector (2).

Installation Procedure



1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

Relay Replacement (Within an Electrical Center)

Special Tools

EL 43244 Relay Puller Pliers

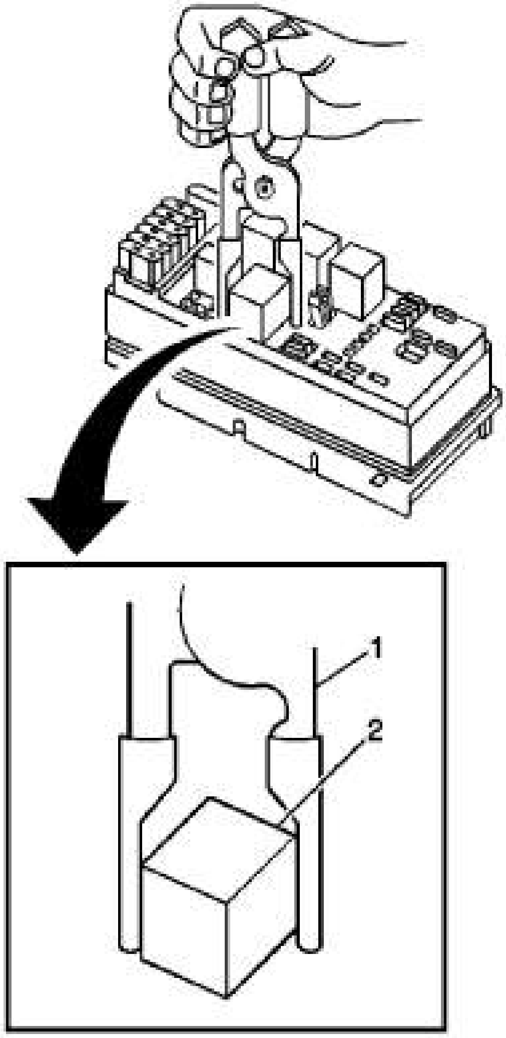
For equivalent regional tools, refer to Special Tools.

Removal Procedure

1. Remove the electrical center cover.
2. Locate the relay. Refer to Electrical Center Identification Views to locate the electrical center where the relay exists.

Note:

- Always note the orientation of the relay.
- If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in the same location.
- Ensure that the electrical center is secure, as not to put added stress on the wires or terminals.

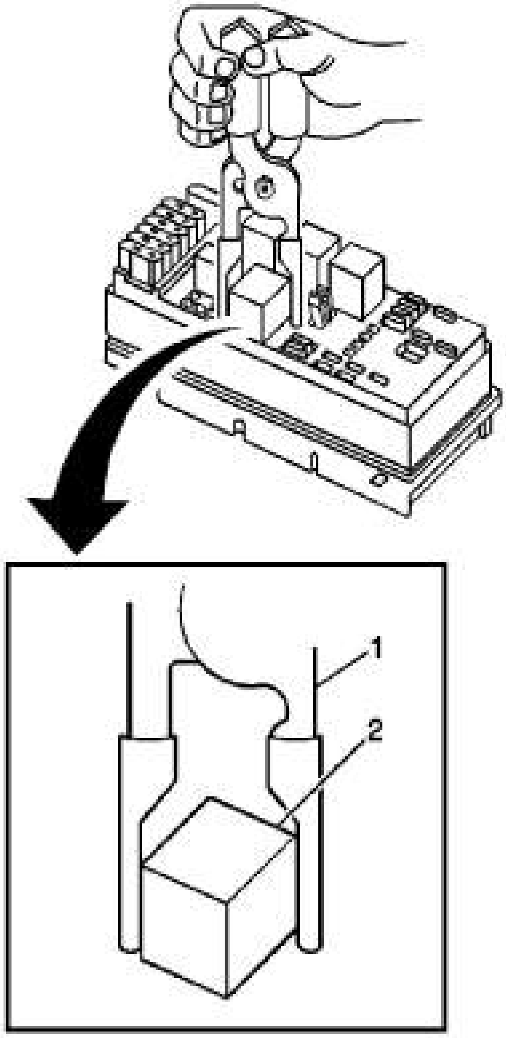


3. Using the EL 43244 (1) position the tool on opposing corners of the relay (2).

   Caution: Use EL-43244 to pull the relay straight out from the electrical center terminals. The use of pliers or a flat bladed tool could damage the electrical center.

4. Remove the relay (2) from the electrical center.

Installation Procedure



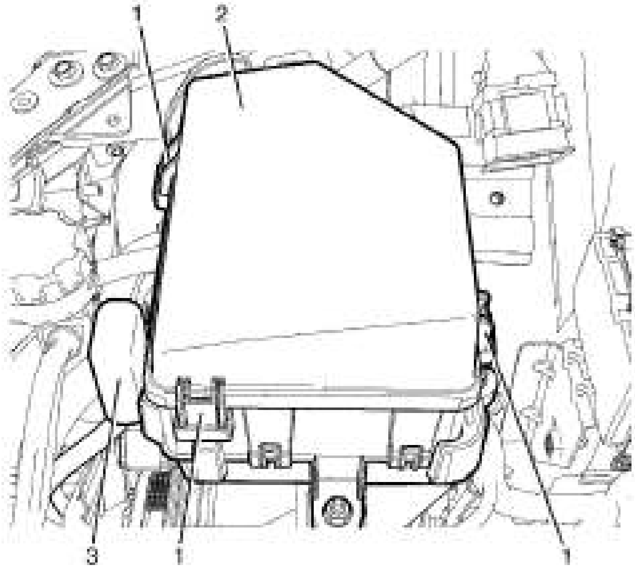
1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Power and Signal Distribution | Wiring Systems and Power Management | Repair Instructions |
Document ID: 1997426

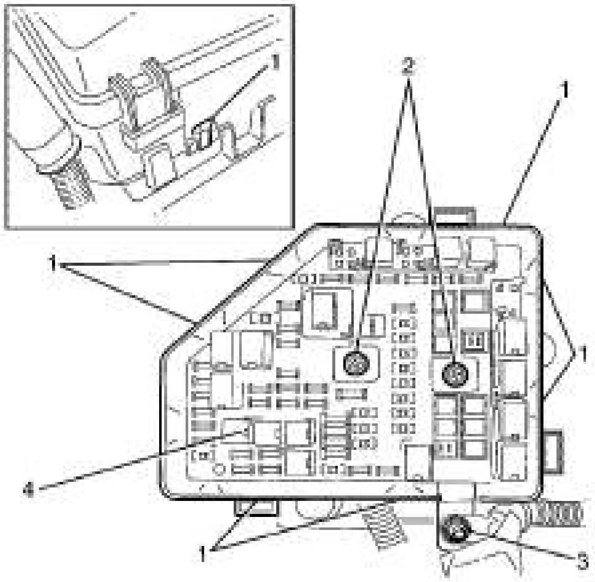
Underhood Electrical Center or Junction Block Replacement

Removal Procedure

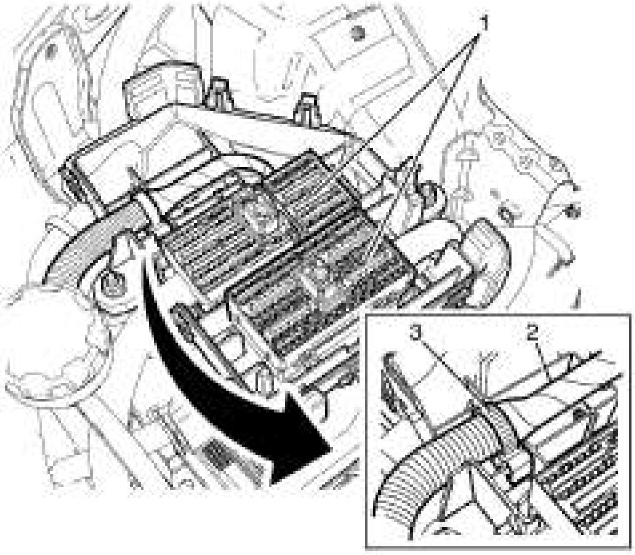
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.



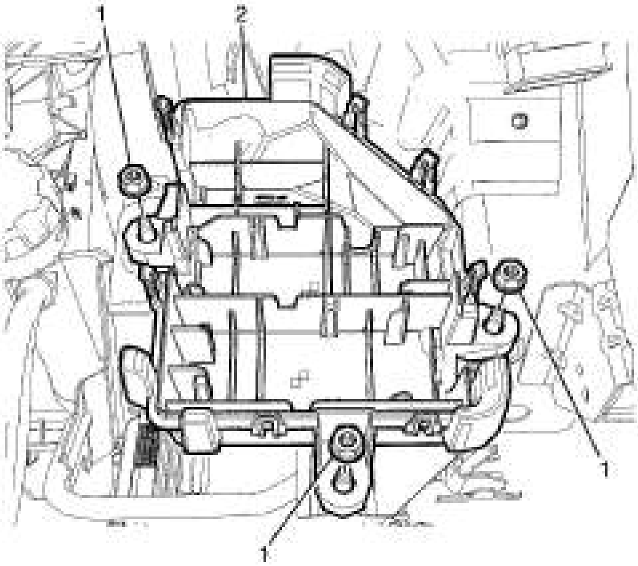
2. Release the underhood body electrical centre cover retaining clips (1).
3. Remove the underhood body electrical centre cover (2).
4. Detach the battery positive cable cover (3).



5. Remove the battery positive cable to upper underhood body electrical centre retaining nut (3).
6. Loosen the upper underhood body electrical centre to lower underhood body electrical centre retaining bolts (2).
7. Release the upper underhood body electrical centre retaining clips (1).
8. Remove the upper underhood body electrical centre (4).

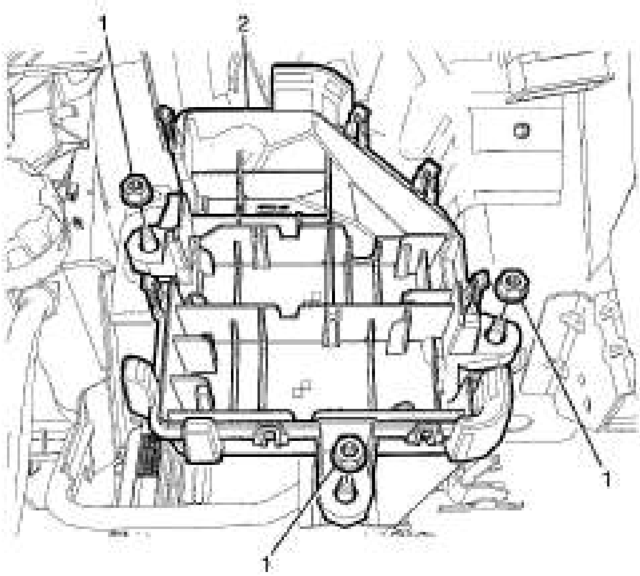


9. Release the wiring harness retaining clip (3) to allow movement of the wiring harness (2).
10. Reposition the underhood body electrical centre electrical connectors (1) to gain access to the lower underhood body electrical centre.

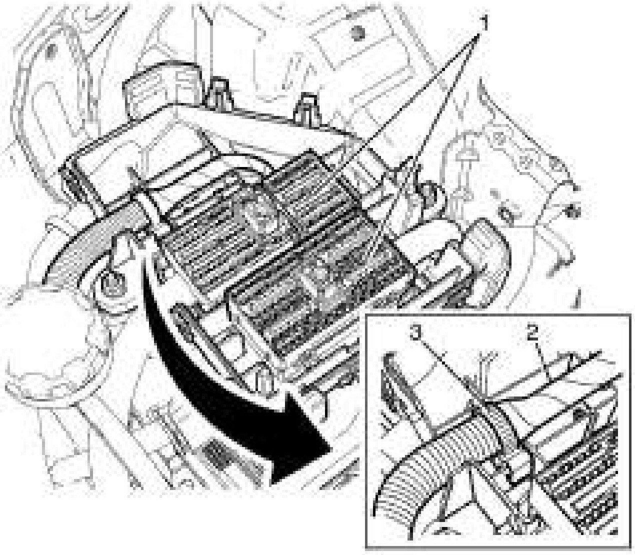


11. Remove the lower underhood body electrical centre to body retaining nuts (1).
12. Remove the lower underhood body electrical centre (2).

Installation Procedure



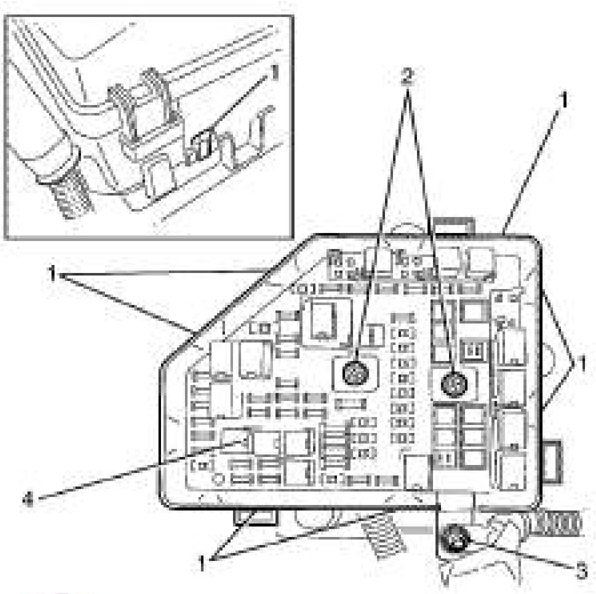
1. Install the lower underhood body electrical centre (2).
2. Install the lower underhood body electrical centre to body retaining nuts (1).



3. Reposition the underhood body electrical centre electrical connectors (1) into the lower underhood body electrical centre.

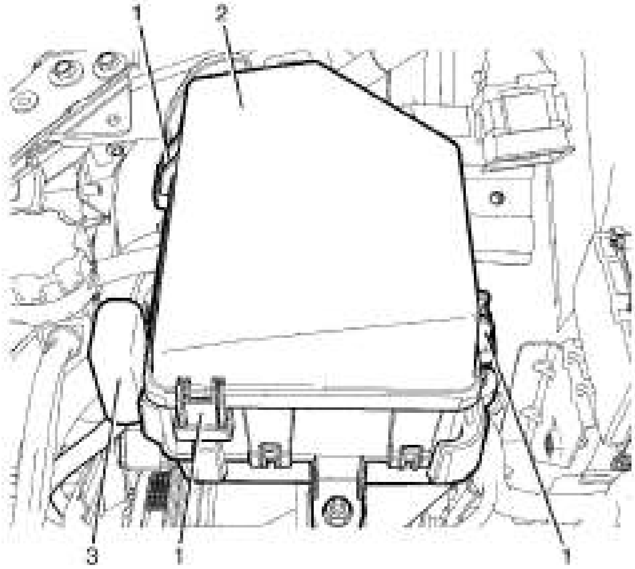
   Important: Ensure that the wiring harness (2) is routed correctly.

4. Attach the wiring harness retaining clip (3).



Important: Ensure that the upper underhood body electrical centre retaining clips (1) are located correctly.

5. Install the upper underhood body electrical centre (4).
6. Tighten the upper underhood body electrical centre to lower underhood body electrical centre retaining bolts (2).
7. Tighten the battery positive cable to upper underhood body electrical centre retaining nut (3).



Important: Ensure the underhood body electrical centre cover retaining clips (1) are located correctly.

8. Install the underhood body electrical centre cover (2).
9. Reposition the battery positive cable cover (3).
10. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Power Mode Description and Operation

Serial Data Power Mode Master

Power to many of this vehicles circuits is controlled by the module that is designated the power mode master (PMM). This vehicles PMM is the body control module (BCM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determination of the power mode that will be sent over the serial data circuits to the other modules that need this information. The PMM will also activate relays and other direct outputs of the PMM as needed. The PMM determines which power mode (Off, Accessory, Run, Crank Request) is required, and reports this information to other modules via serial data. Modules which have switched voltage inputs may operate in a default mode if the PMM serial data message does not match what the individual module can see from its own connections.

The PMM receives ignition switch signals to identify the operators desired power mode. The PMM Power Mode Parameters table below illustrates the correct state of these input parameters (circuits) in correspondence to the ignition switch position:

PMM Power Mode Parameters

Ignition Switch Position	Power Mode Transmitted	Ign. Off/Run/Crank (Run Crank Ignition 1 Voltage circuit)	Ignition Accessory/Run (Accessory voltage circuit)	Ignition Run/Crank (Ignition 1 Voltage circuit)
Off Key Out	Off	Key Out/ACC	Inactive	Inactive
Off Key IN	Off	Key In/Off	Inactive	Inactive
Accessory	Accessory	Key In/ACC	Active	Inactive
Run	Run	Run	Active	Active
Start	Crank Request	Crank	Inactive	Active

Relay Controlled Power Mode

The BCM uses the discrete ignition switch inputs Run/Crank Ignition 1 Voltage, Accessory Voltage, and Ignition 1 Voltage, to distinguish the correct power mode. The BCM, after determining the desired power mode, will activate the appropriate relays for that power mode.

The RAP relay remains on for a timed period after the Ignition key is removed. Refer to Retained Accessory Power Description and Operation for more information on the retained accessory power (RAP) function.

BCM Awake/Sleep States

The BCM is able to control or perform all of the BCM functions in the awake state. The BCM enters the sleep state when active control or normal monitoring of system functions has stopped and a time limit has passed. The BCM must detect certain wake-up inputs before entering the awake state. The BCM monitors for these inputs during the sleep state.

The BCM will enter the awake state if any of the following wake-up inputs are detected:

- Activity on the serial data line
- Detection of a battery reconnect
- Any door open signal
- Headlamps ON
- Key-in-ignition
- Ignition ON
- Park lamps ON
- Keyless entry or remote start message

The BCM will enter a sleep state when all of the following conditions exist:

- The ignition switch is OFF, key out.
- No activity exists on the serial data line.
- No outputs are commanded.
- No delay timers are actively counting.
- No wake-up inputs are present.

If all these conditions are met, the BCM will enter a low power or sleep condition.

Retained Accessory Power Description and Operation

Serial Data Control of Retained Accessory Power (RAP)

The modules receive the power mode message from the body control module (BCM) over the serial data circuits, indicating when the retained accessory power (RAP) power mode is current. The BCM monitors the ignition switch position, battery condition and passenger compartment doors status to determine whether RAP should be initiated. The modules then support the operation of the systems under their control as required by their RAP power mode operation. Components and systems that are active in RAP are also activated anytime the ignition is any position other than OFF.

The BCM sends a serial data power mode message ending the RAP function when one of the following conditions is met:

- The BCM receives an input indicating the opening of any passenger compartment door after the ignition key is out of the ignition.

  Note: The only door that will turn off the radio during RAP is the driver door. This is a function of the radio and will still turn off after the time limit.

- The BCM internal timer for the RAP expires after approximately 40 minutes.
- The BCM detects a decrease in battery capacity below a prescribed limit.

Relay Control of Retained Accessory Power (RAP)

The BCM keeps the RAP relay energized during all power modes, except Off-Awake and Crank. The relay is also energized for approximately 40 minutes after shutting the ignition OFF and removing the key, providing no door is opened. The BCM will de-energize the RAP relay a the same time as the serial data message is sent to end RAP.

The devices powered by the accessory relay during the RAP power mode are the sunroof, power window switches and BTSI/Park Lock.

DTC B3006

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3006 5A: Hood Ajar Circuit Plausibility Failure

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hood Ajar Switch Signal	B3006 5A	B3006 5A	B3006 5A	--
Hood Closed Switch Signal	B3006 5A	B3006 5A	B3006 5A	--
Ground	B3006 5A	B3006 5A	--	--

Circuit/System Description

The body control module (BCM) monitors the voltage input of the hood open switch signal circuit and the hood open closed switch signal circuit. With the hood open, the hood ajar portion of the switch is closed, grounding the hood ajar switch signal circuit from the BCM, and the hood closed portion of the switch is open. With the hood closed, the hood closed portion of the switch is closed, grounding the hood closed switch signal circuit from the BCM, and the hood ajar portion of the switch is open. During proper operation, the two separate voltage signals at the BCM should never be at the same voltage.

Conditions for Running the DTC

The BCM continuously monitors for this DTC

Conditions for Setting the DTC

Both the hood open switch signal circuit and the hood closed switch signal circuit are simultaneously in an active or inactive state.

Action Taken When the DTC Sets

- Remote start functions will be disabled.

- The hood ajar switch inputs will be ignored by content theft deterrent (CTD).

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting are no longer present.
- A history DTC will clear after 40 malfunction free ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool BCM Hood Open Switch and Hood Closed Switch parameters. With the hood open, the Hood Open Switch parameter should read Active and the Hood Closed Switch parameter should read Inactive. With the hood closed, the Hood Open Switch parameter should read Inactive and the Hood Closed Switch parameter should read Active.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the hood ajar switch.
2. Ignition OFF, test for less than 5 ohms between the ground circuit terminal C and ground.
   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for 11.5-12.0 volts between the signal circuit terminal A and ground.

If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.

If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.

4. Ignition ON, test for 11.5-12.0 volts between the signal circuit terminal B and ground.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.

5. If all circuits test normal, test or replace the hood ajar switch.

Component Testing

Hood Ajar Switch

1. Ignition OFF, disconnect the harness connector at the hood ajar switch.
2. With the switch in the hood closed position, test for infinite resistance between the ground terminal C and the signal terminal A.

   If not infinite, replace the hood ajar switch.

3. Test for less than 2.0 ohms between the ground terminal C and the signal terminal B.

   If greater than the specified range, replace the hood ajar switch.

4. With the switch in the hood open position, test for infinite resistance between the ground terminal C and the signal terminal B.

   If not infinite, replace the hood ajar switch.

5. Test for less than 2.0 ohms between the ground terminal C and the signal terminal A.

   If greater than the specified range, replace the hood ajar switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Hood Primary and Secondary Latch Replacement
- Control Module References for BCM replacement, programming and setup

DTC B302A

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B302A 00: Telematic Requested Immobilization

Circuit/System Description

As part of the vehicle telematics enhanced services, a request may be sent to the theft deterrent module (TDM) to disable vehicle starting. If a valid message is received by the TDM requesting that starting be disabled, the start enable message will not be sent to the engine control module (ECM).

Conditions for Setting the DTC

A valid start disable from telematics will set DTC B302A only as a history DTC.

Action Taken When the DTC Sets

Vehicle starting will be suspended and the security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will clear when the telematic start disable request is no longer seen.
- A history DTC will clear after 100 ignition cycles in which the telematic start disable request is not seen.

Diagnostic Aids

DTC B302A is only an indicator that a start disable request has been received from the vehicle telematics system and does not indicate a fault in the immobilizer system. B302A will only set as a history DTC. The only procedure required is to clear the DTC with a scan tool.

Circuit/System Verification

1. With a master vehicle key, turn the ignition ON.
2. Observe the security indicator. After approximately 10 minutes, the indicator will turn off.
3. Turn the ignition OFF and wait 5 seconds.
4. Repeat steps 2-4 two more times for a total of 3 cycles or 30 minutes.
5. With a master vehicle key, turn the ignition ON. The start disable will now be cleared.
6. With a scan tool, clear any DTCs.

DTC B3031

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3031 00: Security System Controller In Learn Mode

Circuit/System Description

When learning a coded key, the theft deterrent module (TDM) is placed in learn mode. DTC B3031 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the coded key is learned, learn mode will be exited and the DTC cleared. If the TDM does not exit learn mode, B3031 will remain current and indicate a fault.

Conditions for Running the DTC

The immobilizer system is the learn coded keys state.

Conditions for Setting the DTC

DTC B3031 will set any time the TDM enters the learn coded keys state.

Action Taken When the DTC Sets

The security indicator will illuminate.

Conditions for Clearing the DTC

- A current DTC B3031 will be cleared upon the successful exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Circuit/System Verification

Important: When performing the 10-Minute Vehicle Key Relearn Procedure, all keys not learned at that time will be erased and not be recognized. Perform the Adding Keys procedure on all keys or instruct the customer how to perform the Adding Keys procedure should all keys not be present at the time of repair.

1. Verify DTC B3055 is not set.
   If the DTC is set, refer to DTC B3055.
2. Verify the scan tool TDM Learn Coded Key parameter displays Yes.
   If not the specified value, perform the 10 Minute Vehicle Key Relearn procedure. Refer to Replacing Keys.
3. Perform the 10 Minute Vehicle Key Relearn procedure. Refer to Replacing Keys. The TDM should exit the learn coded key state and DTC B3031 should clear.
   If the TDM does not exit the learn coded key state after the programming attempt, replace the TDM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for TDM replacement, setup and programming

DTC B3055

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3055 00: No Transponder Modulation or No Transponder

Circuit/System Description

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the theft deterrent module (TDM). The TDM then compares this value to a value stored in memory. This stored value is the learned key code. If the value is correct, the TDM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the TDM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The TDM is unable to measure the ignition key transponder value.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will be cleared when the TDM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Circuit/System Verification

Important: When using this diagnostic, more than one vehicle key is required to ensure proper diagnosis. If more than one key is not available at the time of service, contact the customer and ask if any other keys can be provided for service. If unavailable, a new second key can be created.

1. Inspect all available vehicle keys that they are correct vehicle keys .
   If not a correct vehicle key, replace the key.
2. While viewing the scan tool TDM Transponder Key parameter, turn ON the ignition with each of the available vehicle keys. The parameter should read Present with all available keys.
   If only one key results in the parameter reading Not Present, replace the appropriate key.
   If all available keys result in the parameter reading Not Present, replace the TDM.

DTC Descriptor

DTC B3060 00 : Unprogrammed Transponder Identification Code Received

Circuit / System Description

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the theft deterrent module (TDM). The TDM then compares this value to a value stored in memory. This stored value is the learned key code. If the value is correct, the TDM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the transponder value does not match the learned key code or a transponder value is not received, the TDM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The transponder value measured by the TDM is incorrect or not learned to the vehicle.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will be illuminated.
- The security indicator will flash (Canada only).

Conditions for Clearing the DTC

- A current DTC will be cleared when the TDM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

DTC Descriptor

DTC B3935 57: Transponder Authentication Error

Circuit/System Description

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the theft deterrent module (TDM). The TDM then compares this value to a value stored in memory. This stored value is the learned key code. If the value is correct, the TDM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the transponder value does not match the learned key code or a transponder value is not received, the TDM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- A valid transponder value has been read.

Conditions for Setting the DTC

- The transponder value is valid and matches the value stored in the TDM memory.
- The transponder calculation to the challenge from the TDM does not match the TDM calculation.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid transponder value has been read and authenticated.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is

used to clear DTCs.

DTC B3976

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3976 46 : Unconfigured Transponder/Vehicle Configuration Not Programmed

Circuit/System Description

When the theft deterrent module (TDM) is in the learn coded key state, the TDM checks the current key to ensure it has been configured as a proper vehicle key.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- The TDM is in the learn coded key state.

Conditions for Setting the DTC

The TDM has determined the current key is not configured as a proper vehicle key.

Action Taken When the DTC Sets

- The security indicator will be illuminated.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC will be cleared when the TDM detects a properly configured vehicle key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Circuit/System Verification

Important: When using this diagnostic, more than one vehicle key is required to ensure proper diagnosis. If more than one key is not available at the time of service, contact the customer and ask if any other keys can be provided for service. If unavailable, a new second key can be created.

While viewing DTCs with a scan tool, attempt to start the vehicle using all of the available keys. The vehicle should start with all available keys.

If any key results in inoperative starting and DTC B3976 is set, replace the appropriate key.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Replacing Keys

DTC P0513

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0513: Theft Deterrent Key Incorrect

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The calculated response from the TDM does not equal the calculation performed by the ECM.

Action Taken When the DTC Sets

- The security indicator will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P0513 will be cleared when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The "key" referenced in the DTC descriptor does not refer to the vehicle key. In this case, "key" is referring to the challenge response.

Circuit/System Verification

1. Verify the following BCM DTCs are not present:
   - U1814
   - U2099
   - B1428
   - B1370
   - B1380
   - B1440
   - B1441

   If any listed DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle to diagnose that DTC prior to this diagnostic.

   Important: Because of normal system communications between the TDM and ECM, any theft deterrent B-codes must be diagnosed prior to the diagnosis of P-codes.

2. Perform the 10-Minute Immobilizer Relearn procedure. Refer to Immobilizer System Component Programming. The ECM should successfully complete the password learn and the vehicle should start.

   If the ECM does not complete the learn or vehicle starting remains disabled, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for ECM replacement, setup, and programming

DTC P0633

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0633: Theft Deterrent Key Not Programmed

Circuit/System Description

When learning the prerelease password, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. DTC P0633 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the password and challenge/response are learned, learn mode will be exited when the engine is successfully started. If the ECM does not exit learn mode, P0633 will remain current and indicate a fault.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

DTC P0633 will set any time the ECM enters learn mode.

Action Taken When the DTC Sets

The security indicator will illuminate.

Conditions for Clearing the DTC

- A current DTC P0633 will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The "key" referenced in the DTC descriptor does not refer to the vehicle key. In this case, "key" is referring to the challenge response.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Important: Because of normal system communications between the TDM and ECM, any theft deterrent B-codes must be diagnosed prior to the diagnosis of P-codes.

DTC P0633 will clear upon a successful engine start. Any malfunction that will cause a no-start condition will prevent DTC P0633 from clearing. Prior to diagnosing DTC P0633, ensure that all power moding and engine control systems are operating properly and all conditions that may cause a no-start have been corrected.

1. Ignition in the CRANK position, verify the scan tool Ignition Run/Crank parameter is Active.
   If not the specified value, refer to Power Mode Mismatch .
2. Perform the 10-Minute Immobilizer Relearn procedure. Refer to Immobilizer System Component Programming . The ECM should successfully complete the password learn and the vehicle should start.
   If the ECM does not complete the learn or vehicle starting remains disabled, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P1629

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P1629: Theft Deterrent Fuel Enable Signal Not Received

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

- Ignition is in the ACCESSORY or RUN position.
- The ECM is not in learn mode.

Conditions for Setting the DTC

The ECM receives does not receive the challenge response from the TDM within the required amount of time.

Action Taken When the DTC Sets

The security indicator will illuminate.

Conditions for Clearing the DTC

- A current DTC P1629 will be cleared when a challenge response is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

DTC P1629 is an indicator that the challenge/response was not received within the required time. This does not necessarily indicate a fault is present with the TDM or ECM. Factors such as a long engine crank, a delay in the serial data communication, or B-codes set in the TDM will cause DTC P1629 to set. This DTC should not be used as a fault indicator, but rather as a symptom to assist in the diagnosis of these other systems.

DTC P1631

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P1631: Theft Deterrent Fuel Enable Signal Not Correct

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The ECM receives an incorrect prerelease password from the TDM.

Action Taken When the DTC Sets

- The security indicator will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P1631 will be when a correct fuel enable password is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

DTC P1632

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P1632: Theft Deterrent Fuel Disable Signal Received

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the RUN position.

Conditions for Setting the DTC

A fuel disable signal from the TDM is received by the ECM.

Action Taken When the DTC Sets

- The security indicator will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P1632 will be when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The prerelease password sent to the ECM by the TDM is reliant on the communications between the transponder located in the vehicle key and the TDM. Failure to establish communications or an interruption in the communications between the vehicle key and the TDM will cause the fuel disable message to be sent and the setting of DTC B1632. DTC B3055 or B3060 will be set in the TDM. To properly diagnose DTC P1632, DTC B3055 or B3060 must be diagnosed and corrected first.

Immobilizer System Component Programming

10-Minute Immobilizer Relearn

This 10-minute relearn procedure will relearn the prerelease password and the challenge/response data between the theft deterrent module (TDM) and the engine control module (ECM).

1. Connect a scan tool to the vehicle in the pass-thru arrangement.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. On the Techline Terminal, select Service Programming System and follow the Techline Terminal on-screen instructions, using the Pass-Thru method. Ensure the correct programming selection is chosen based on component being replaced or programmed. For this procedure, go to the V.T.D. Vehicle Theft Deterrent Learn menu and choose the Vehicle Theft Deterrent Learn, ECM, or PK3 Replaced selection.
5. At this point the scan tool must remain connected for the duration of the 10-minute relearn procedure.

   Important:
   - The scan tool will initially display 12 Minutes. The first 2 minutes allow the scan tool to initialize the appropriate control module. The remaining 10 minutes is the relearn timer.
   - On some vehicles the security indicator may be illuminated for the duration of the 10-minute relearn procedure.

6. Observe the scan tool, after approximately 10 minutes the scan tool will display "Programming Successful, Turn OFF Ignition". The vehicle is now ready to relearn the key information and/or the passwords on the next ignition switch transition from OFF to CRANK.
7. Turn OFF the ignition and wait 2 minutes.
8. With a master vehicle key, turn the ignition to the RUN position for 15 seconds, then start the vehicle. The TDM and ECM have now relearned the pre-release password and the challenge/response data.
9. With a scan tool, clear any DTCs.

Adding Keys

Important:

- To initiate, this procedures requires that a learned master key be available.
- A total of 10 keys may be programmed to a single vehicle.
- This procedure adds keys only. The procedure does not erase previously learned keys.
- The keys to be learned must duplicate the mechanical cut of the current key.
- If more than one valet key is to be learned, immediately precede each valet key with a learned master key.

1. With a previously learned master key, turn ON the ignition, with the engine OFF.
2. Turn OFF the ignition and remove the key.
3. Within 10 seconds of turning OFF the ignition, insert the key to be learned and turn ON the ignition. The vehicle has now learned the new key.

Replacing Keys

When replacing keys, the 10-minute re-learn procedure must be performed. Lost keys can also be delisted. Refer to Theft Deterrent Control Module Programming and Setup.

Immobilizer Description and Operation

The immobilizer system functions are provided by the theft deterrent module (TDM) and the engine control module (ECM). When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coil surrounding the ignition lock cylinder. This exciter coil is part of the TDM. The energized transponder transmits a signal that contains its unique value, which is received by the TDM. The TDM then compares this value to a value stored in memory. If the values match, the TDM will send the prerelease password via the serial data circuit to the ECM. If the transponders unique value is incorrect, the TDM will send the fuel disable password to the ECM.

When the ECM receives the TDM prerelease password, the ECM will challenge the password. The ECM sends this challenge back to the TDM via the serial data circuit. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The components of the theft system are as follows:

- TDM
- ECM
- Ignition key (Transponder)
- Security indicator

Theft Deterrent Module (TDM)

Vehicles with steering column mounted ignition switches have the exciter integral with the theft deterrent module (TDM), which is located within the steering column. The TDM can learn up to 10 keys (transponder values).

The TDM uses the following inputs:

- Battery voltage
- Ignition switched voltage
- Ground circuit

The theft deterrent control module uses the following outputs:

- Password exchange
- Challenge/response with the engine control module (ECM)

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the TDM. The TDM then compares this value to the learned key code stored in memory. The TDM then performs one of the following functions:

- If the transponder value matches the values stored in the TDM memory, the TDM will send the prerelease password to the ECM via the serial data circuit.

- If the transponders unique value does not match the value stored in the TDM, the TDM will send the fuel disable message to the ECM via the serial data circuit.
- If the TDM is unable to measure the ignition key transponder value, the TDM will not send any messages to the ECM.

Engine Control Module (ECM)

When the engine control module (ECM) receives the theft deterrent module (TDM) prerelease password, the ECM will challenge the password. The ECM sends this challenge back to the TDM via the serial data circuit. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The ECM will disable vehicle starting if any of the following conditions occur:

- The prerelease password is invalid.
- The fuel disable password is sent by the TDM.
- No passwords are received. There is no communication with the TDM.
- The TDM calculated response to the challenge does not equal the calculation performed by the ECM.

The Ignition Key (Transponder)

The ignition key for PassKey III+ (PK3+) equipped vehicles is a standard ignition key with a transponder located in the plastic head of the key. The transponder value is fixed and unable to be changed. The immobilizer system uses the ignition key transponder value to determine if a valid ignition key is being used to start the vehicle. There are approximately 3 trillion possible transponder values. There are no visible electrical contacts. The keys are identified by + symbol in a circle stamped into the steel shank of the key. The immobilizer system use the following types of ignition keys:

Master Keys

Master keys have a black plastic head for full access operation of the vehicle. Master keys may perform the following functions:

- Start the vehicle.
- Lock/unlock all of the door locks and rear compartment.
- Lock/unlock all of the storage compartments.

Valet Keys

Important: Valet keys are NOT standard equipment on all GM vehicle lines.

Valet keys have a gray plastic head and are for restricted operation of the vehicle. Valet keys may perform the following functions:

- Start the vehicle.
- Lock/unlock all of the door locks.

Fleet Keys

Important: Fleet keys are NOT standard equipment on all GM vehicle lines.

Fleets keys allow full access to the vehicle just as a master key would. However, unlike a master key which may only learn 10 keys to a particular vehicle, an unlimited number of fleet keys may be learned to the vehicle. Fleet keys are only used in vehicles configured for fleet use with RPO 6E2 or 6E8.

- Start the vehicle.
- Lock/unlock all of the door locks and rear compartment.
- Lock/unlock all of the storage compartments.

Security Indicator

The theft deterrent module (TDM) can command the instrument panel cluster (IPC) to illuminate the security indicator only when the ignition key is in the ON position. The TDM will command the security indicator be illuminated any time a fault is noted in the immobilizer system and when the engine starting is disabled.

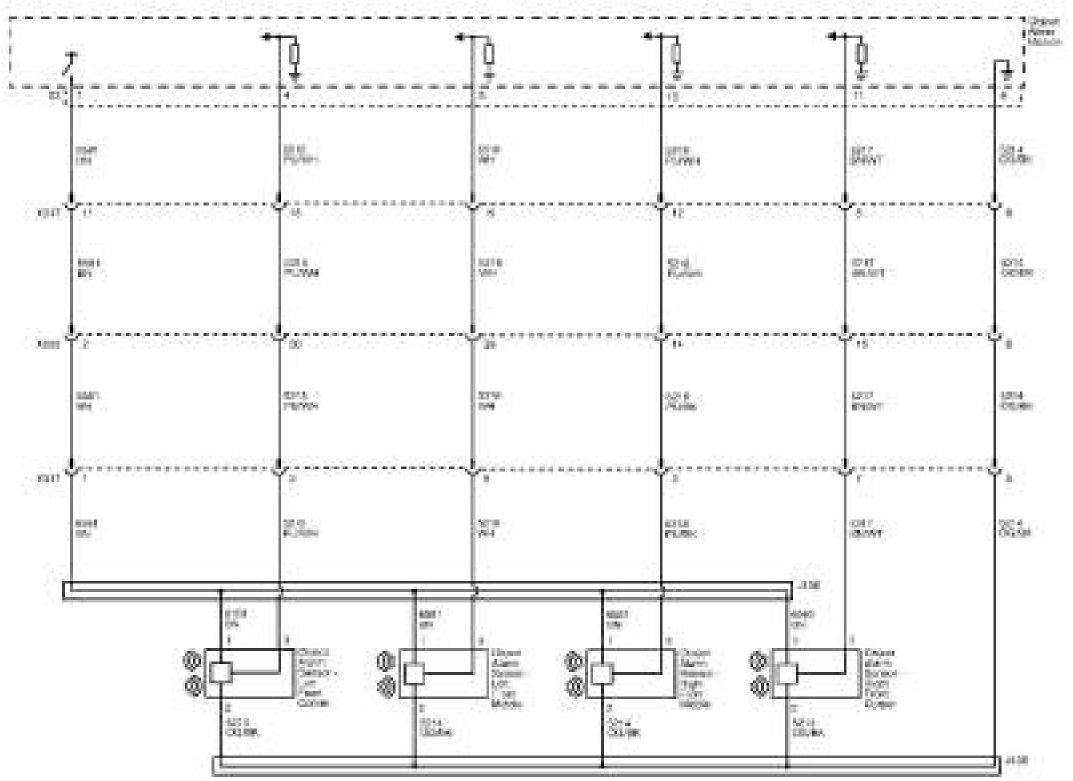
Sensors (UFR Except UD7)



Diagnostic Starting Point - Object Detection

Begin the system diagnosis with the Diagnostic System Check - Vehicle.

- The identification of the control module which commands the system.
- The ability of the control module to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTC's) and their status.

The use of Diagnostic System Check - Vehicle, will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B0953

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B0953 00: Park Assist Audio Output Circuit

Circuit/System Description

The dual object detection system consists of an object alarm module, eight object alarm sensors, an object alarm speaker, and a switch. The object alarm speaker will sound as the vehicle approaches an object.

Conditions for Running the DTC

Ignition RUN

Conditions for Setting the DTC

The object alarm module has detected a malfunction.

Action Taken When the DTC Sets

- Park assist system is disabled.
- The multifunction switch light will flash rapidly when the switch is pressed.
- A chime will sound.

Conditions for Clearing

The object alarm module clears the history DTC when a current DTC is not detected in 100 ignition cycles.

Description and Operation

Object Detection Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Circuit/System Testing

1. Ignition OFF, disconnect the harness at the object alarm speaker.
2. Connect a test lamp between the voltage circuit terminal 1 and ground.
3. Ignition ON, engine OFF, transmission in REVERSE, the test lamp should illuminate.

   If the test lamp does not illuminate, test the voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the object alarm module.
4. Connect a test lamp between the low reference circuit terminal 2 and ground. The test lamp should not illuminate.

   If the test lamp illuminates, test the low reference circuit for a short to voltage. If the circuit tests normal, replace the object alarm module.
5. Test for infinite resistance between the low reference circuit terminal 2 and ground.

   If less than the specified value test the low reference circuit for a short to ground. If the circuit tests normal, replace the object alarm module.
6. Ignition OFF, place an object behind the vehicle.
7. Connect a test lamp between the voltage circuit terminal 1 and low reference circuit terminal 2.
8. Ignition ON, engine OFF, transmission in REVERSE, the test lamp should illuminate.

   If the test lamp does not illuminate, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the object alarm module.
9. If all circuits test normal, test or replace the object alarm speaker.

Component Testing

1. Ignition OFF, disconnect the harness at the object alarm speaker.
2. Apply 2.5 V to the voltage circuit terminal 1.
3. Apply ground to the ground circuit terminal 2, the object alarm speaker should sound.

   If the speaker does not sound replace the object alarm speaker.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for object alarm speaker replacement.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The object alarm module supplies an 8 V reference and ground reference to each of the object sensors. The object alarm module triggers the sensors in a sequential loop. After each sensor transmits, the object alarm module uses the sensor ring received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- DTC B1325 is not set
- The ignition voltage is at least 9.0 V and no more than 16.0 V
- Transmission is in DRIVE or REVERSE

Conditions for Setting the DTC

B0954 01, B0955 01, B0956 01 or B0957 01

The front object sensor signal circuit detects a voltage greater than 11.5 V.

B0954 06, B0955 06, B0956 06 or B0957 06

The front object sensor signal circuit detects a voltage less than 0.5 V.

B0954 08, B0955 08, B0956 08 or B0957 08

The object alarm module detects an invalid signal.

B0954 21, B0955 21, B0956 21 or B0957 21

The front object sensor determines no change in the position of an object while the vehicle is in motion.

Action Taken When the DTC Sets

- Park assist system is disabled.
- SERVICE PARK ASSIST message is displayed on the driver information center and a chime will sound.

Conditions for Clearing the DTC

- The object alarm module clears the history DTC when a current DTC is not detected in 100 ignition cycles.
- The condition for the DTC is no longer present.

Circuit/System Verification

1. Verify that DTC B138A is not set.
   If DTC is set, refer to DTC B138A.
2. Park brake OFF, transmission in DRIVE, individually place a suitable object in front of each object sensor. Verify the appropriate scan tool Front Region parameter is between Zone 1 and Zone 4.

Circuit/System Testing

Single Object Sensor DTC Set

1. Ignition OFF, disconnect the harness connector at the appropriate front object sensor.
2. Ignition OFF for 30 seconds, test for less than 5 Ω between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the object alarm module.
3. Ignition ON, transmission in DRIVE, test for 7.2 - 9.2 V between the voltage reference terminal 1 and ground.

   If greater than the specified range, test the voltage reference circuit for a short to voltage. If the circuit tests normal, replace the object alarm module.

   If less than the specified range, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the object alarm module.
4. Ignition OFF, remove the malfunctioning object sensor and swap locations with another properly functioning object sensor. Connect the harness connector at both sensors.
5. Ignition ON, verify the DTC is set for the new location in which the malfunctioning sensor is installed.

   If the DTC does not set for the new location, test the signal circuit terminal 3 for a short to voltage, short to ground, or an open/high resistance. If the circuit tests normal, replace the object alarm module.
6. If the DTC sets for the new location in which the malfunctioning sensor is installed, replace the appropriate front object sensor.

Multiple Object Sensor DTCs Set

1. Ignition OFF, disconnect the harness connector at each of the object sensors.
2. Ignition OFF for 30 seconds, test for less than 5 Ω between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the object alarm module.
3. Ignition ON, transmission in DRIVE, test for 8.0 - 9.0 V between the voltage reference circuit terminal 1 and ground.

   If greater than the specified range, test the voltage reference circuit for a short to voltage. If the circuit tests normal, replace the object alarm module.

   If less than the specified range, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the object alarm module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Front Object Alarm Sensor Replacement
- Control Module References for park assist module replacement, setup, and programming

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The object alarm module supplies an 8 V reference and ground reference to each of the object sensors. The object alarm module triggers the sensors in a sequential loop. After each sensor transmits, the object alarm module uses the sensor ring received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- DTC B1325 is not set
- The ignition voltage is at least 9.0 V and no more than 16.0 V
- Transmission is in DRIVE or REVERSE

Conditions for Setting the DTC

B0958 01, B0959 01, B0960 01 or B0961 01

The rear object sensor signal circuit detects a voltage greater than 11.5 V.

B0958 06, B0959 06, B0960 06 or B0961 06

The rear object sensor signal circuit detects a voltage less than 0.5 V.

B0958 08, B0959 08, B0960 08 or B0961 08

The object alarm module detects an invalid signal.

B0958 21, B0959 21, B0960 21 or B0961 21

The rear object sensor determines no change in the position of an object while the vehicle is in motion.

Action Taken When the DTC Sets

- Parking assist is disabled.
- SERVICE PARK ASSIST message is displayed in the driver information center and a chime will sound.

Conditions for Clearing the DTC

- The object alarm module clears the history DTC when a current DTC is not detected in 100 ignition cycles.
- The condition for the DTC is no longer present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that DTC B138A is not set.
   If DTC is set, refer to DTC B138A.
2. Park brake OFF, transmission in REVERSE, individually place a suitable object behind each sensor. Verify the appropriate scan tool Rear Region parameter is between Zone 1 and Zone 4.

Circuit/System Testing

Single Object Sensor DTC Set

1. Ignition OFF, disconnect the harness connector at the appropriate object sensor.
2. Ignition OFF for 30 seconds, test for less than 5 Ω between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the object alarm module.
3. Ignition ON, transmission in REVERSE, test for 7.2 - 9.2 V between the voltage reference circuit terminal 1 and ground.

   If greater than the specified range, test the voltage reference circuit for a short to voltage. If the circuit tests normal, replace the object alarm module.

   If less than the specified range, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the object alarm module.
4. Ignition OFF, remove the malfunctioning object sensor and swap locations with another properly functioning rear object sensor. Connect the harness connector at both sensors.
5. Ignition ON, verify the DTC is set for the new location in which the malfunctioning sensor is installed.

   If the DTC does not set for the new location, test the signal circuit terminal 3 for a short to voltage, short to ground, or an open/high resistance. If the circuit tests normal, replace the object alarm module.
6. If the DTC sets for the new location in which the malfunctioning sensor is installed, replace the appropriate rear object sensor.

Multiple Object Sensor DTCs Set

1. Ignition OFF, disconnect the harness connector at each of the object sensors.
2. Ignition OFF for 30 seconds, test for less than 5 Ω between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the object alarm module.
3. Ignition ON, transmission in REVERSE, test for 8.0 - 9.0 V between the voltage reference circuit terminal 1 and ground.

   If greater than the specified range, test the voltage reference circuit for a short to voltage. If the circuit tests normal, replace the object alarm module.

   If less than the specified range, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the object alarm module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Rear Object Sensor Replacement
- Control Module References for object alarm module replacement, setup, and programming

DTC B0967

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B0967 02: Park Assist Switch Circuit Short to Ground

Circuit/System Description

The object detection park assist switch allows the driver to enable or disable the park assist system. The park assist switch is supplied voltage from the object alarm module. When the park assist system is enabled low reference is provided to the switch activating the park assist system.

Conditions for Running the DTC

- DTC B1325 is not set
- Ignition is in RUN mode

Conditions for Setting the DTC

The object alarm module detects a malfunction with the park assist switch.

Action Taken When the DTC Sets

- The park assist system is enabled when transmission is in DRIVE or REVERSE.
- The park assist switch will not disable the park assist system when commanded by the switch.

Conditions for Clearing

- The object alarm module clears the history DTC when a current DTC is not detected in 100 ignition cycles.
- The condition for the DTC is no longer present.

Circuit/System Verification

Park brake OFF, transmission in REVERSE, using the park assist switch enable and disable the park assist system. Verify the park assist system enables and disables respectively.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the park assist switch.
2. Test for less than 5 Ω between the ground circuit terminal 2 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance. If the circuit tests normal, replace the park assist switch.
3. Ignition ON, transmission in REVERSE, test for 4.0 - 6.0 V between the voltage reference circuit terminal 5 and ground.

   If greater than the specified range, test the voltage reference circuit for a short to voltage. If the circuit tests normal, replace the object alarm module.

   If less than the specified range, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the object alarm module.
4. If the circuit tests normal, replace the park assist switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC B0968

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B0968 00: Park Assist Indicator Circuit Malfunction

Circuit/System Description

The park assist switch is equipped with a light that indicates when the park assist system is enabled or disabled. When the park assist system is enabled the light is turned on.

Conditions for Running the DTC

- DTC B1325 is not set
- Ignition is in RUN mode

Conditions for Setting the DTC

The object alarm module detects a malfunction with the park assist switch light.

Action Taken When the DTC Sets

- The park assist system is disabled.
- The park assist switch light will not turn on.

Conditions for Clearing

- The object alarm module clears the history DTC when a current DTC is not detected in 100 ignition cycles.
- The condition for the DTC is no longer present.

Circuit/System Verification

Park brake OFF, transmission in REVERSE, the park assist switch light should turn on.

Circuit/System Testing

1. Ignition OFF, disconnect the park assist switch.
2. Test for less than 5 Ω between the low reference circuit terminal 8 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance. If the circuit tests normal, replace the object alarm module.
3. Ignition ON, transmission in REVERSE, test for 1.7 - 3.3 V between the voltage reference circuit terminal 7 and ground.

   If greater than the specified range, test the voltage reference circuit for a short to voltage. If the circuit tests normal, replace the body control module.

   If less than the specified range, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the body control module.
4. If the circuit tests normal, replace the park assist switch.

DTC B1008

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1008 42: Calibration Data Not Programmed

Circuit/System Description

When the ignition is turned ON, the object alarm module performs a self-test to verify if any critical malfunction exists within the system. During the power-up mode, the object alarm module checks for a valid calibration data set.

Conditions for Running the DTC

- DTC B1325 is not set
- The ignition voltage is at least 9.0 V and no more than 16.0 V

Conditions for Setting the DTC

The object alarm module does not detect a valid calibration data set.

Action Taken When the DTC Sets

- Parking assist is disabled.
- SERVICE PARK ASSIST message is displayed in the driver information center and a chime will sound.

Conditions for Clearing

- The object alarm module clears the history DTC when a current DTC is not detected in 100 ignition cycles.
- The condition for the DTC is no longer present.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The object alarm module supplies an 8 V reference and ground reference to each of the object sensors. The object alarm module triggers the sensors in a sequential loop. After each sensor transmits, the object alarm module uses the sensor ring received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- DTC B1325 is not set
- The vehicle is in REVERSE or DRIVE

Conditions for Setting the DTC

B138A 03

The object alarm module detects the sensor 8 V reference circuit is less than 7.2 V.

B138A 07

The object alarm module detects the sensor 8 V reference circuit is greater than 9.2 V.

Action Taken When the DTC Sets

- Parking assist system is disabled.
- SERVICE PARK ASSIST message is displayed in the driver information center and a chime will sound.

Conditions for Clearing

- The object alarm module clears the history DTC when a current DTC is not detected in 100 ignition cycles.
- The condition for the DTC is no longer present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, transmission in REVERSE, verify that the scan tool Sensor Supply Voltage parameter is between 7.2 - 9.2 V.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at each of the object sensors.
2. Ignition ON, verify DTC B138A is not set as current.

   If the DTC is set, test the 8 V reference circuit terminal 1 for a short to voltage, short to ground, or an open/high resistance. If circuit tests normal, replace the object alarm module.
3. Install each sensor harness connector one at a time, checking DTCs after each sensor is connected. Verify DTC B138A is not set as current.

   If the DTC is set, replace the object sensor that was connected immediately before the DTC set.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Front Object Alarm Sensor Replacement
- Rear Object Sensor Replacement
- Control Module References for object alarm module replacement, setup, and programming.

Symptoms - Object Detection

Note: Review the system operation in order to familiarize yourself with the system functions. Refer to Object Detection Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to Checking Aftermarket Accessories
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Make sure the front object alarm sensors located on the vehicles front bumper are clear. Remove any snow, mud or ice that is blocking the sensors.
- Make sure the rear object alarm sensors located on the vehicles rear bumper are clear. Remove any snow, mud or ice that is blocking the sensors.
- If the vehicle is fitted with a trailer hitch, enter the customization menu in the infotainment unit and select *Tow Bar Att* . Select *Yes* if a tow ball tongue/neck is attached or *No* if a tow ball tongue/neck is removed.
- Drive the vehicle for longer than 20 seconds and at a speed greater than 17 km/h.

Intermittent

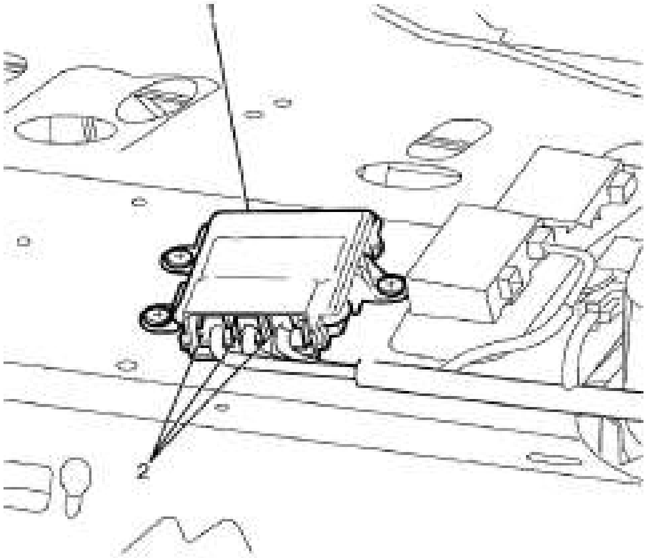
Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Object Detection | Repair Instructions | Document ID: 2090728

Front and Rear Object Alarm Module Replacement (LWB SWB)

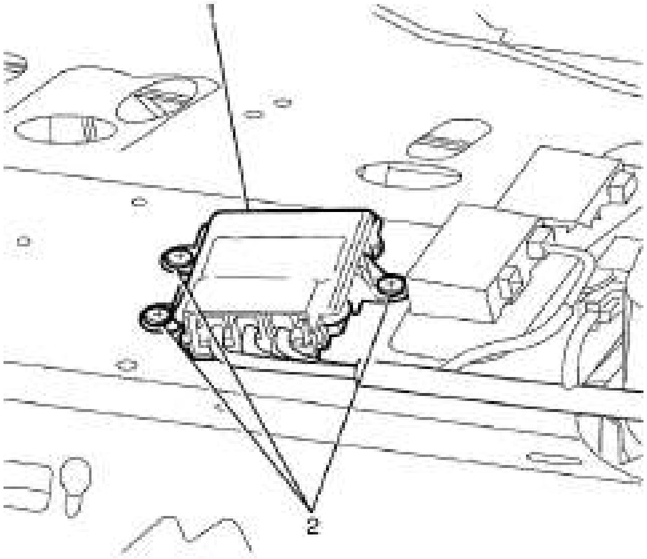
Removal Procedure

1. Remove the rear window shelf trim panel assembly. Refer to Rear Window Shelf Trim Panel Replacement.



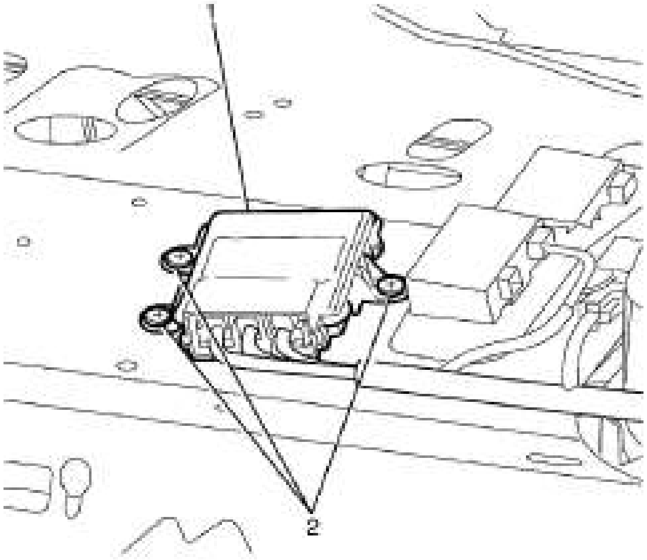
Important: Release the retaining lever before disconnecting the front and rear object sensor alarm module electrical connectors.

2. Disconnect the front and rear object alarm module electrical connectors (2) from the front and rear object alarm module (1).

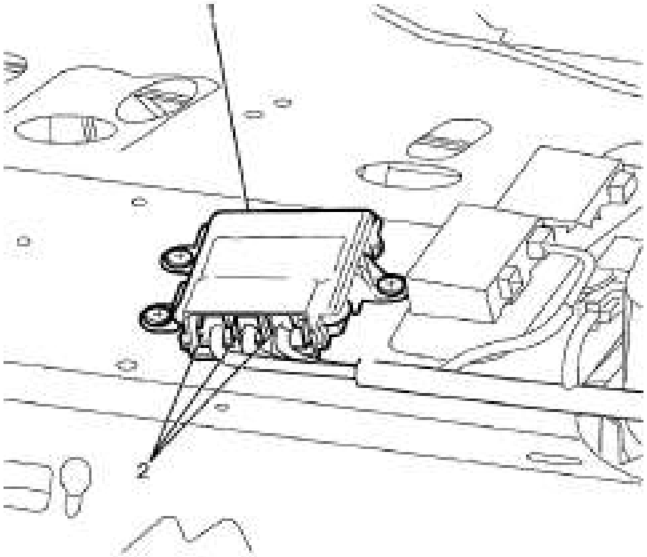


3. Remove the front and rear object alarm module retaining clips (2).
4. Remove the front and rear object alarm module (1) from the vehicle.

Installation Procedure



1. Install the front and rear object alarm module (1) to the vehicle.
2. Install the front and rear object alarm module retaining clips (2).

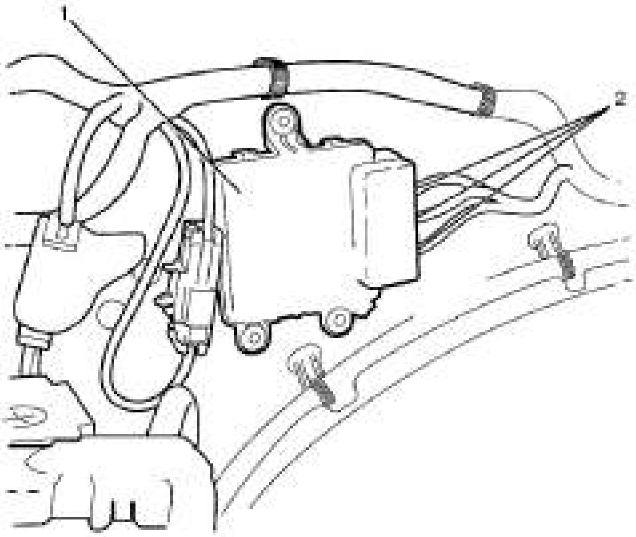


3. Connect the front and rear object alarm module electrical connectors (2) to the front and rear object alarm module (1).
4. Install the rear window shelf trim panel assembly. Refer to Rear Window Shelf Trim Panel Replacement.
5. If re-programming is required. Refer to Control Module References.

Front and Rear Object Alarm Module Replacement (Sportwagon)

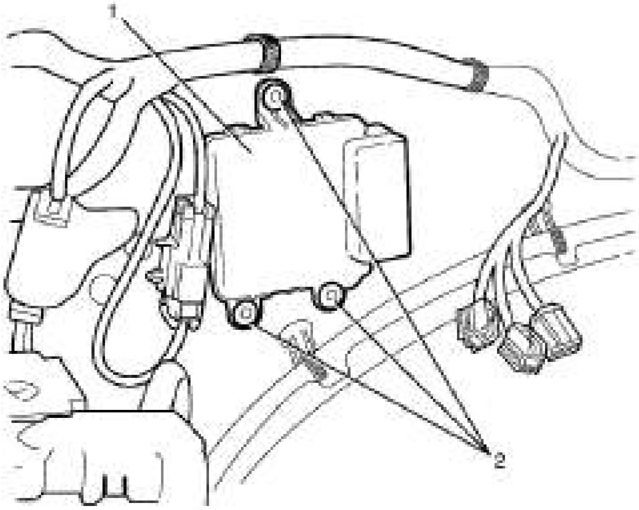
Removal Procedure

1. Remove the rear window shelf panel assembly. Refer to Rear Window Shelf Trim Panel Replacement.



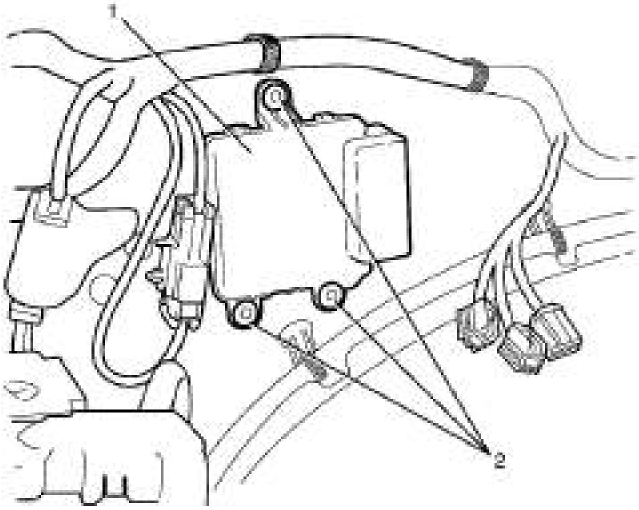
Important: Release the retaining lever before disconnecting the front and rear object sensor alarm module electrical connectors.

2. Disconnect the front and rear object alarm module electrical connectors (2) from the front and rear object alarm module (1).

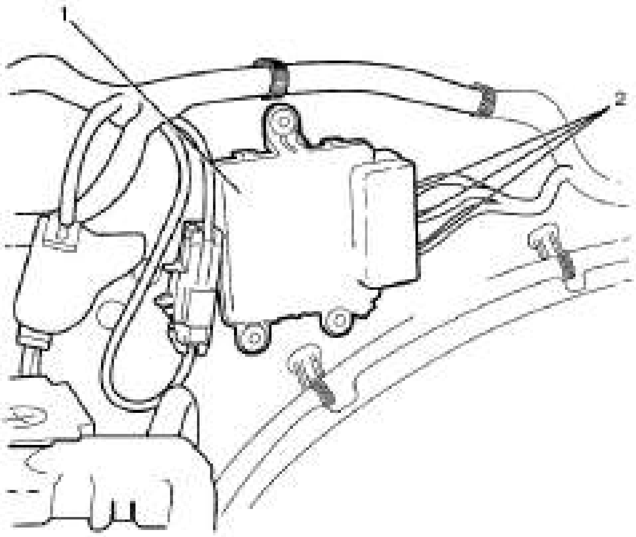


3. Using a suitable tool depress the centres of the retaining clips (2) to disengage them form the front and rear object alarm module (1).
4. Remove the front and rear object alarm module (1) from the vehicle.

Installation Procedure



1. Install the front and rear object alarm module (1) to the vehicle.
2. Install the front and rear object alarm module retaining clips (2).

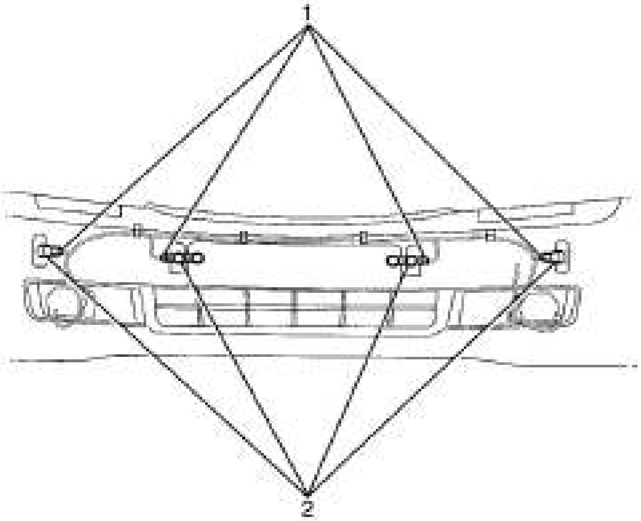


3. Connect the front and rear object alarm module electrical connectors (2) to the front and rear object alarm module (1).
4. Install the rear window shelf panel assembly. Refer to Rear Window Shelf Trim Panel Replacement.
5. If re-programming is required. Refer to Control Module References in Computer/Integrating Systems.

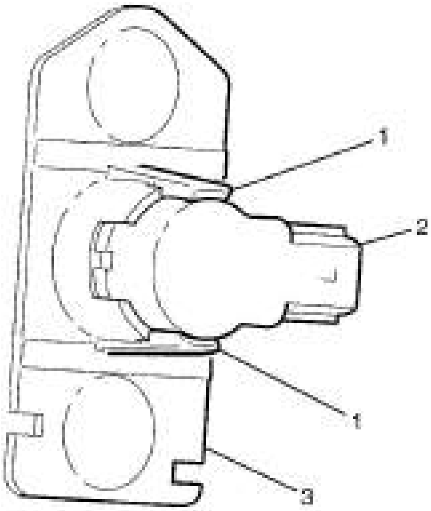
Front Object Alarm Sensor Replacement (LWB SWBRHD)

Removal Procedure - Sensor Front

1. Remove the front bumper fascia assembly. Refer to Front Bumper Fascia Replacement.



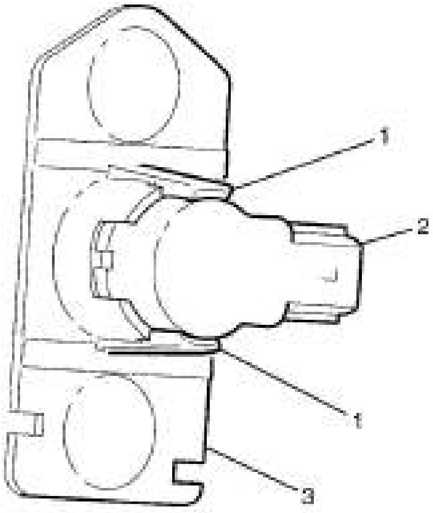
2. Disconnect the front object alarm sensor electrical connector (1) from the front object alarm sensor (2).



Important: Lift the top and bottom housing tabs (1) to release the front object alarm sensor (2) from the front object alarm sensor housing (3).

3. Remove the front object alarm sensor (2) from the front object alarm sensor housing (3).

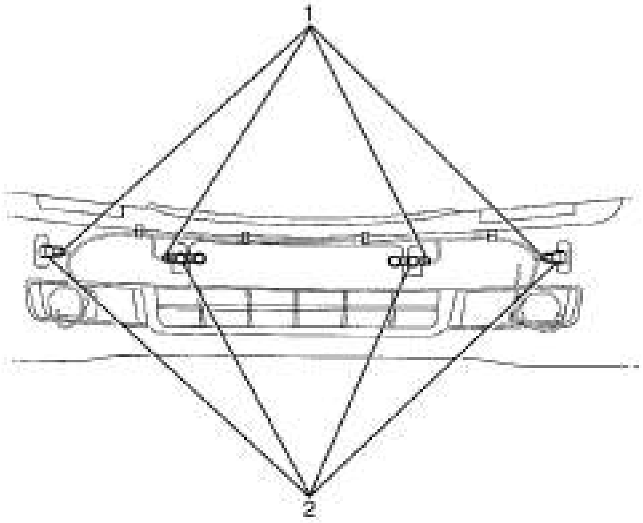
Installation Procedure - Sensor Front



Important: Replacement front object alarm sensors (2) are not pre-painted, they will require painting before installation is carried out.

Important: Ensure that the front object alarm sensor (2) is installed correctly.

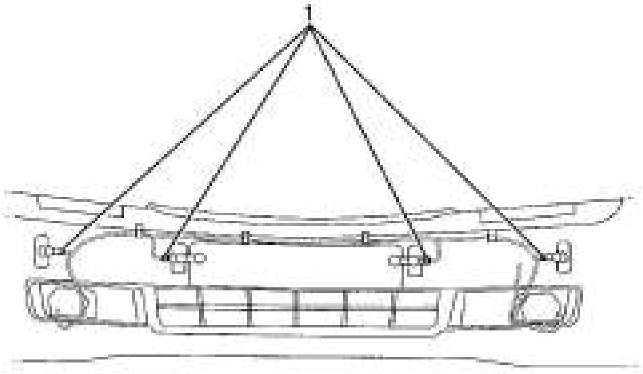
1. Locate the top and bottom housing tabs (1) to install the front object alarm sensor (2) to the front object alarm sensor housing (3).
2. Press the front object alarm sensor bezel flush to the fascia.



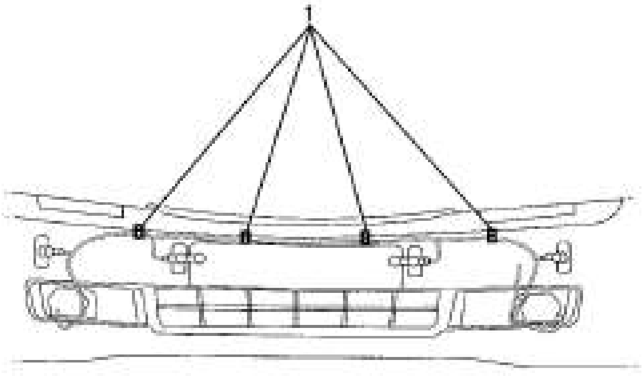
3. Connect the front object alarm sensor electrical connector (1) to the front object alarm sensor (2).
4. Install the bumper fascia assembly. Refer to Front Bumper Fascia Replacement.

Removal Procedure - Wiring Harness Front

1. Remove bumper fascia assembly. Refer to Front Bumper Fascia Replacement.



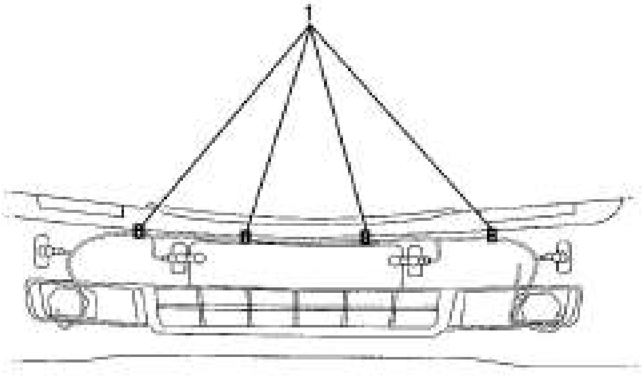
2. Disconnect the front object alarm sensor electrical connectors (1) from the front object alarm sensors.



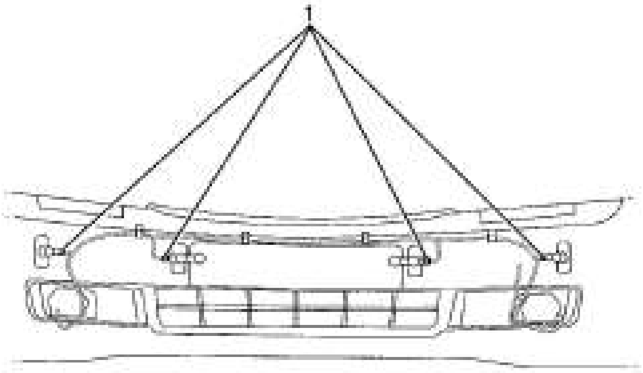
Important: If required use a suitable tool to pry the wiring harness away from bumper fascia connectors (1).

3. Remove the front object alarm sensor wiring harness from the bumper fascia connectors (1).

Installation Procedure - Wiring Harness Front



1. Install the front object alarm sensor wiring harness to the bumper fascia connectors (1).



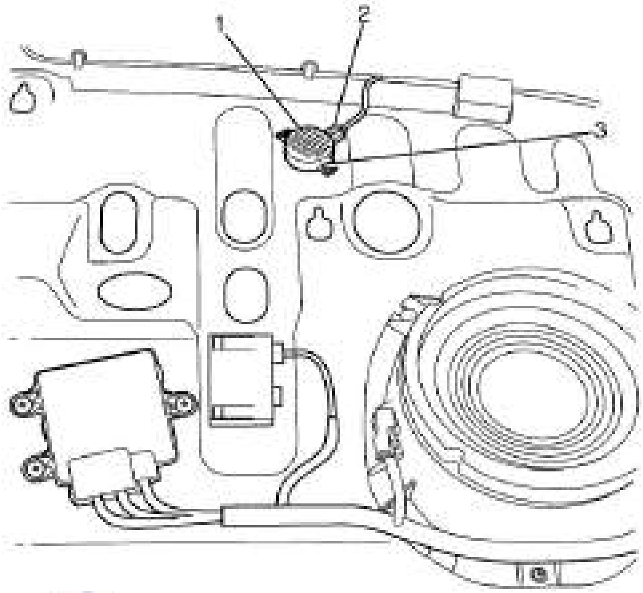
2. Connect the front object alarm sensor electrical connectors (1) to the front object alarm sensors.
3. Install the front bumper. Refer to Front Bumper Fascia Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Object Detection | Repair Instructions | **Document ID: 2090717**

Rear Object Alarm Replacement (SWB)

Removal Procedure

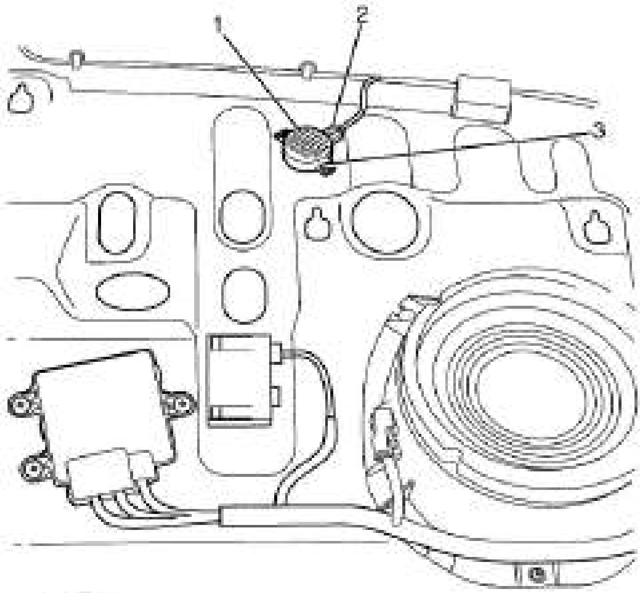
1. Remove the rear window shelf trim panel assembly. Refer to Rear Window Shelf Trim Panel Replacement.



Important: Before removing the rear object alarm (1), make note of its orientation on the rear window shelf.

2. Disconnect the rear object alarm electrical connector (2) from the rear object alarm (1).
3. Remove the rear object alarm retaining clips (3).
4. Remove the rear object alarm (1) from the vehicle.

Installation Procedure



Important: Orientate the rear object alarm (1) in the same position as it was removed.

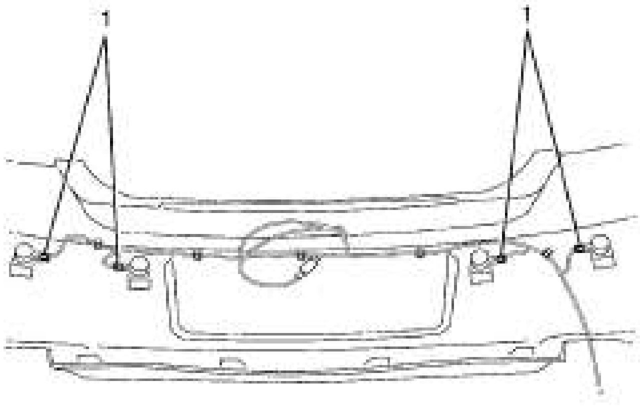
1. Install the rear object alarm (1) to the vehicle.
2. Install the rear object alarm retaining clips (3).
3. Install the rear object alarm electrical connector (2) to the rear object alarm (1).
4. Install the rear window shelf trim panel assembly. Refer to Rear Window Shelf Trim Panel Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Object Detection | Repair Instructions | **Document ID: 1984453**

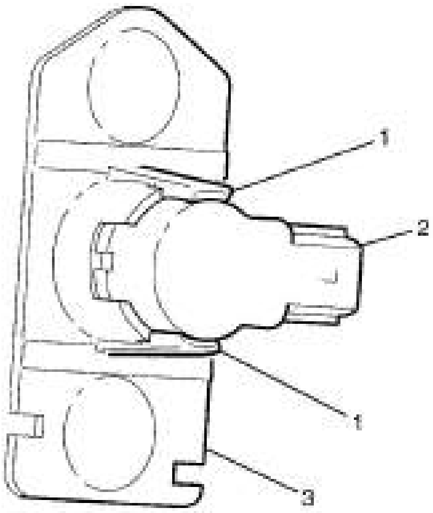
Rear Object Sensor Replacement

Removal Procedure - Sensor Rear

1. Remove the rear bumper fascia assembly. Refer to Rear Bumper Fascia Replacement.



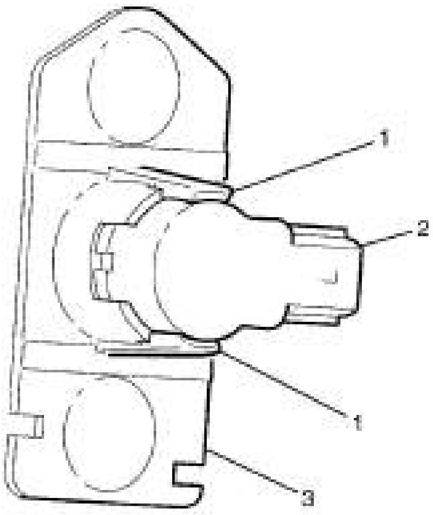
2. Disconnect the rear object alarm sensor electrical connectors (1) from the rear object alarm sensors.



Important: Lift the top and bottom housing tabs (1) to release the rear object alarm sensor (2) from the rear object alarm sensor housing (3).

3. Remove the rear object alarm sensor (2) from the rear object alarm sensor housing (3).

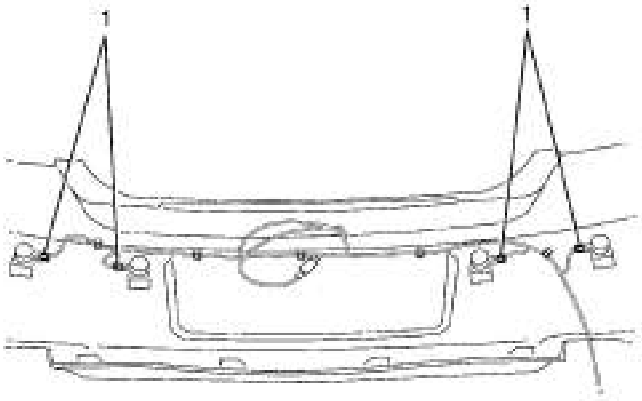
Installation Procedure - Sensor Rear



Important: Replacement rear object alarm sensors (2) are pre-painted in the vehicles body colour. Do not apply any further paint to the rear object alarm sensor (2) as this may affect system operation.

Important: Ensure that the rear object alarm sensor (2) is installed correctly.

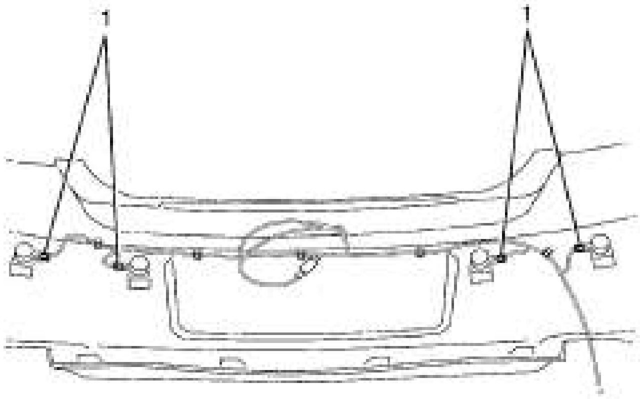
1. Locate the top and bottom housing tabs (1) to install the rear object sensor alarm sensor (2) to the rear object sensor alarm sensor housing (3)
2. Press the rear object alarm sensor bezel flush to the fascia.



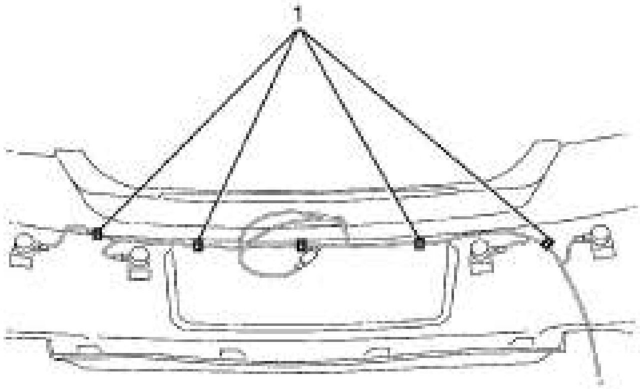
3. Connect the rear object alarm sensor electrical connectors (1) to the rear object alarm sensors.
4. Install the rear bumper fascia assembly. Refer to Rear Bumper Fascia Replacement .

Removal Procedure - Wiring Harness Rear

1. Remove rear bumper fascia assembly. Refer to Rear Bumper Fascia Replacement.



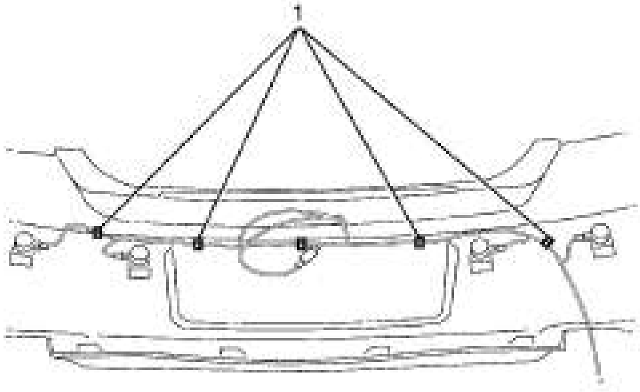
2. Disconnect the rear object alarm sensor electrical connectors (1) from the rear object alarm sensors.



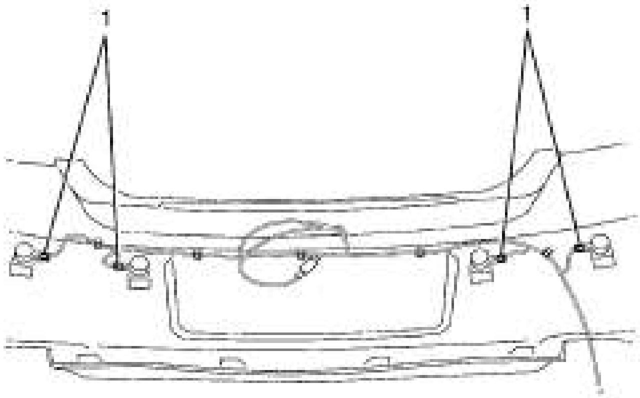
Important: If required use a suitable tool to pry the wiring harness away from bumper fascia connectors (1).

3. Remove the rear object alarm sensor wiring harness from bumper fascia connectors (1).

Installation Procedure - Wiring Harness Rear



1. Install the rear object alarm sensor wiring harness to bumper fascia connectors (1).



2. Connect the rear object alarm sensor electrical connectors (1) to the rear object alarm sensors.
3. Install the rear bumper. Refer to Rear Bumper Fascia Replacement.

Object Detection Description and Operation (UD7)

The rear object detection system consists of four object alarm sensors located in the rear bumper, a object alarm module, an object alarm speaker, and a switch. The object detection system is designed to identify and notify the driver of an object in the path of the vehicle. The distance and location of the object is determined by the alarm sensors.

Object Alarm Module

The object alarm module provides an 8 V reference and a low reference to each of the object alarm sensors. The object alarm module contains the logic needed to receive the individual signals from each of the sensors and determine the location and distance of an object. As the vehicle gets closer to an object the object alarm speaker will sound.

Object Alarm Sensors

The ultrasonic sensors are located in the rear bumper of the vehicle. The sensors are used to determine the distance between an object and the bumper. When the transmission is in reverse the rear sensors are activated. Each sensor emits an ultrasonic frequency which is reflected off an object located behind the vehicle, the reflections are received by the sensors. The time difference between when the frequency was emitted and when the reflection is received is used to determine the distance to the object. This information is sent to the object alarm module.

Object Alarm Speaker

The object alarm speaker will sound when the ultrasonic sensors detect an object in the vehicles path. The following table shows the object distance from the vehicle and the tone duration of the object alarm speaker.

Rear Object Detection System Tone Activation

Object Distance (MM)	Tone Duration ON (MS)	Tone Duration OFF (MS)
Less than 300	Continuous	
300-600	75	75
600-900	75	150
900-1200	75	225
1200-1500	75	300
1500-1800	75	375
1800-2100	75	450
2100-2500	75	525

Object Detection Switch

The object detection switch is equipped with a light that will illuminate when the system is activated. The switch allows the driver to manually enable or disable the object detection system. The switch light will flash rapidly when it is pressed if there is a malfunction present with the object detection system.

Object Detection Operation

The rear object detection system is automatically activated when the vehicle ignition is on, the park brake is released and the transmission is in reverse. When the transmission is in reverse the rear sensors will activate and the object alarm speaker will sound. If the object alarm speaker does not sound there is a malfunction with the object detection system. The object detection system will automatically deactive when the vehicle speed exceeds 25 km/h (15 mph).

Objects attached to the vehicle

If an object is attached to the vehicle, the object detection system will automatically deactivate approximately 10 seconds after the vehicle speed exceeds 15 km/h (9 mph). The object detection will be reactivated automatically when the object is removed or the ignition is switched OFF and then ON again.

Object Detection Description and Operation (UFR)

Table 1: Rear Object Detection System Tone Activation

Table 2: Front Object Detection System Tone Activation

The dual object detection system is designed to identify and notify the driver of an object in front and at the rear of the vehicle. The dual object detection system consists of an object alarm module, eight object alarm sensors, an object alarm speaker, and a switch. The distance and location of the object is determined by the eight object alarm sensors. Four object alarm sensors are located in the rear bumper and four are located in the front bumper.

Object Alarm Module

The object alarm module provides an 8 V reference and a low reference to each of the object alarm sensors. The object alarm module contains the logic needed to receive the individual signals from each of the sensors and determine the location and distance of an object. As the vehicle gets closer to an object the object alarm speaker will sound.

Object Alarm Sensors

The ultrasonic sensors are located in the front and rear bumpers of the vehicle. The sensors are used to determine the distance between an object and the bumper. When the transmission is in reverse the front and rear sensors are activated. If the front and rear sensors simultaneously detect an object at equal distances the rear sensors will be given priority. When the objects are not at equal distances the object closest to the vehicle will be given priority. Each sensor emits an ultrasonic frequency which is reflected off an object located behind or in front of the vehicle. The reflections are received by the sensors. The time difference between when the frequency was emitted and when the reflection is received is used to determine the distance to the object. This information is sent to the object alarm module.

Object Alarm Speaker

The object alarm speaker will sound when the ultrasonic sensors detect an object in the vehicles path. The following tables shows the object distance from the vehicle and the tone duration of the object alarm speaker.

Rear Object Detection System Tone Activation

Object Distance (MM)	Tone Duration ON (MS)	Tone Duration OFF (MS)
Less than 300	Continuous	
300-600	75	75
600-900	75	150
900-1200	75	225
1200-1500	75	300
1500-1800	75	375
1800-2100	75	450
2100-2500	75	525

Front Object Detection System Tone Activation

Object Distance MM	Tone Duration ON (MS)	Tone Duration OFF (MS)
Less than 300	Continuous	0
300-600	75	75
600-900	75	225
900-1200	75	450

Object Detection Switch

The object detection switch is equipped with a light that will illuminate when the system is activated. The switch allows the driver to enable or disable the object detection system. The switch light will flash rapidly when it is pressed if there is a malfunction present with the object detection system.

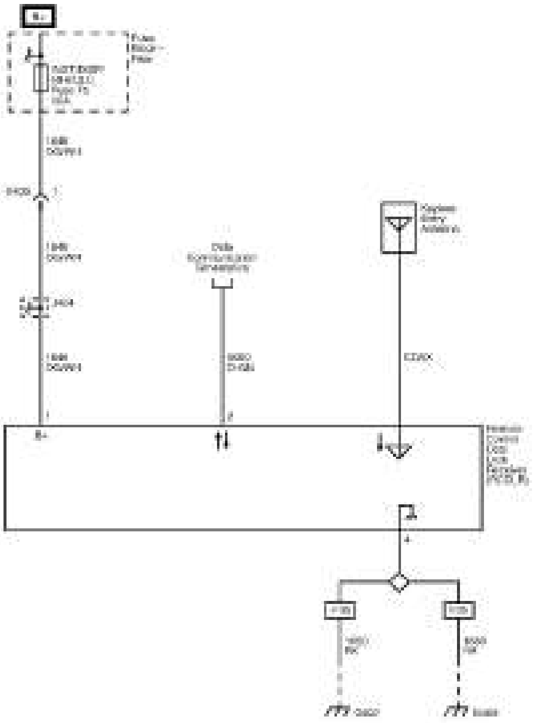
Object Detection Operation

The object detection system is automatically activated when the vehicle ignition is on, the park brake is released and the transmission is in reverse or drive. When the transmission is in drive the front sensors will activate and the object alarm speaker will sound. If the transmission is in reverse the front and rear sensors will activate and the object alarm speaker will sound. If the object alarm speaker does not sound there is a malfunction with the object detection system. The object detection system will automatically deactive when the vehicle speed exceeds 25 km/h (15 mph).

Special Tools

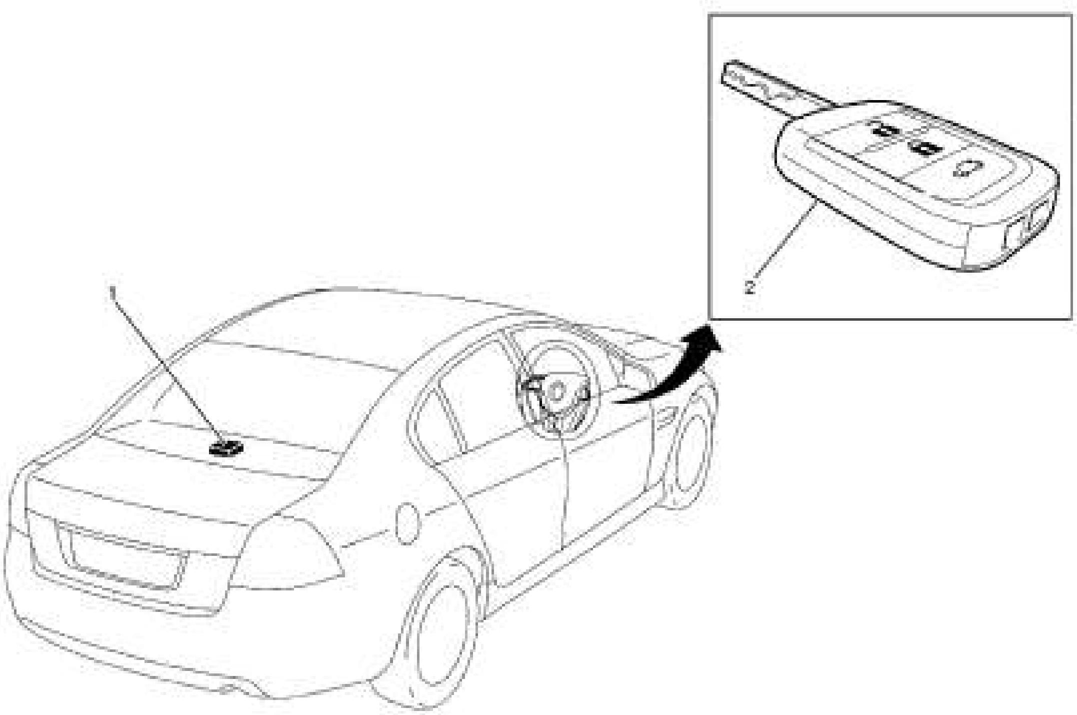
Illustration	Tool Number / Description
	7000086I Scan Tool Used for diagnosis of vehicle electrical system.

Remote Function Schematics



Remote Function Component Views (SWBRHD)

Rear of the Vehicle



(1) Remote Function Actuator

(2) Transmitter Key

Diagnostic Starting Point - Keyless Entry

Begin the system diagnosis with Diagnostic System Check - Vehicle. The Diagnostic System Check will provide the following information:

- The identification of the control module(s) which command the system
- The ability of the control module(s) to communicate through the serial data circuit
- The identification of any stored diagnostic trouble codes (DTCs) and their status

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B3105

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B3105: Keyless Entry System Key Not Programmed

Circuit / System Description

DTC B3105 sets if the remote function actuator (RFA) has not learned any key.

Conditions for Running the DTC

The RFA system must be enabled and a test is ran every time the key is cycled.

Conditions for Setting the DTC

This code is set if there are no learned key in the RFA.

Action Taken When the DTC Sets

The RFA system is inoperative.

Conditions for Clearing the DTC

The code is cleared as current when at least one key is programmed to the RFA.

Control Module References

Circuit/System Testing

1. Verify that the transmitter is the correct type for the vehicle.
   If it is not the correct transmitter, replace the transmitter.
2. Verify the scan tool KEY Programmed parameter is Yes.
   If not Yes, program the transmitter.
3. Using scan tool, verify transmitter is transmitting signal when each button is pressed.
   If scan tool fails to indicate signal from transmitter, replace transmitter battery.

   If scan tool indicates a signal from one or more button presses, replace the transmitter.
4. Replace the RFA module.

Repair Instructions

Perform the Diagnostic Repair Verification .

Refer to Control Module References .

DTC B3109

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B3109: Keyless Entry Transmitter 1 or Generic Low Battery

Circuit / System Description

This fault sets if the key programmed to slot 1 has a low battery.

Conditions for Running the DTC

The remote function actuation (RFA) system must be enabled.

Conditions for Setting the DTC

The code sets after 3 consecutive low battery signals from the same programmed transmitter.

Action Taken When the DTC Sets

The RFA system is inoperative.

Conditions for Clearing the DTC

The code is cleared as current when a normal transmitter voltage signal is received from any programmed transmitter.

Perform the Diagnostic Repair Verification .

Keyless Entry System Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The keyless entry system is a vehicle entry device. The keyless entry will unlock the vehicle doors or open the rear compartment when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the keyless entry transmitter sending a radio frequency to the remote control door lock receiver (RCDLR). The RCDLR interprets the signal and activates the requested function via a message over the GMLAN serial data line. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Diagnostic Aids

For the J 43241 Keyless Entry Tester, inspect the keyless entry transmitter part number to determine that it is the correct model for the vehicle. A wrong model transmitter may pass the test, but it will not activate the vehicle remote system.

Scan Tool Reference

Control Module References for scan tool information

Special Tools

J 43241 Keyless Entry Tester

Circuit/System Verification

Attempt to program the keyless entry transmitter, refer to Transmitter Programming. The transmitter should program.

Circuit/System Testing

1. Verify that the transmitter is the correct transmitter for the vehicle.
   If not the correct transmitter, replace the transmitter.
2. Verify the scan tool Remote Key parameter for the appropriate transmitter is Programmed.
   If not the specified value, program the transmitter. Refer to Transmitter Programming.
3. Place the transmitter on the test pad of the J 43241 and press each transmitter button one at a time. The tester should sound a tone and illuminate a green light with each button press.
   If one or more buttons does not sound the tone and illuminate the green light, replace the transmitter battery and retest with the J 43241 . If the condition continues after battery replacement, replace the transmitter.
4. Operate the transmitter while observing the scan tool Remote Key Function parameter for the appropriate transmitter. The parameter should correspond with the function selected on the transmitter.
   If the parameter does not match the function selected on the transmitter, replace the transmitter.
5. Attempt to program the transmitter, refer to Transmitter Programming. The transmitter should program.
   If the transmitter does not program, test the keyless entry coax and/or antenna (if equipped) for a short to ground or an open/high resistance. If the circuit tests normal, replace the RCDLR.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Transmitter Programming
- Control Module References for RCDLR replacement, setup, and programming

Remote Vehicle Start Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of each diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

Remote vehicle start (RVS) begins as an RF message received by the remote control door lock receiver (RCDLR) from a keyless entry transmitter. The RVS request is sent by the RCDLR to the body control module (BCM) via serial data. The BCM monitors system conditions such as content theft deterrent (CTD), hood ajar status, and body DTCs to determine if an RVS event will occur. If conditions are determined to be acceptable, the RVS message is sent to the engine control module (ECM). The ECM monitors system conditions such as engine control parameters and vehicle theft deterrent (VTD) to determine if engine starting will be allowed. If conditions are acceptable, the ECM will initiate engine starting. During the engine run time in a RVS attempt, before the operator enters the vehicle, the ECM may discontinue engine operation if system conditions require it or a message is received from the BCM requesting the engine be turned OFF.

Diagnostic Aids

Important: If the vehicle has a current vehicle DTC that illuminates the malfunction indicator lamp (MIL), the cause of the DTC must be diagnosed before proceeding with the Remote Vehicle Start Inoperative diagnostic.

The RVS system will not operate if any of the following conditions are present:

- A current vehicle DTC that illuminates the malfunction indicator lamp (MIL)
- The vehicle is in valet mode.
- More than 2 remote starts have been attempted.
- The hazard switch is in the ON position.
- A current hazard switch DTC is set.
- The vehicle hood is ajar.
- A current hood ajar DTC is set.
- The CTD system detects an alarm trigger.
- Excessive engine RPM
- Excessive coolant temperature
- Accelerator pedal position greater than 0 percent
- Vehicle not in park
- Vehicle theft deterrent malfunction
- A current automatic transmission shift lock control system DTC is set.
- A vehicle speed sensor signal is detected by the ECM.

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

1. Verify that RVS is enabled through vehicle personalization.

   If RVS is not enabled, use vehicle personalization to turn on RVS functionality. Refer to the vehicle owners manual.
2. Verify that the keyless entry functions operate with all available keyless entry transmitters.

   If the keyless entry system does not function properly, refer to Keyless Entry System Malfunction.
3. Observe the scan tool ECM and BCM RVS Disable History parameters, Verify that no RVS Disable History items are present.

   If RVS Disable History items are present, refer to the appropriate subsection in which the failure occurred.
4. Verify the scan tool BCM Current CTD Trigger parameter displays None.

   If not specified value, refer to Content Theft Deterrent Malfunction.

Symptoms - Keyless Entry

Important: The following steps must be completed before using the symptom tables.

1. Perform Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Keyless Entry System Description and Operation.

Visual / Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Keyless Entry System. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

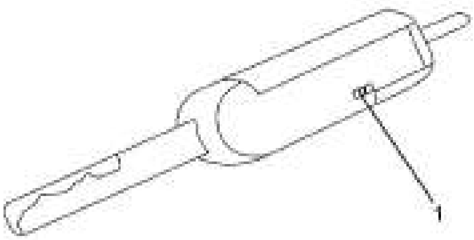
- Keyless Entry System Malfunction
- Remote Vehicle Start Malfunction

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Remote Functions | Repair Instructions | **Document ID: 1995572**

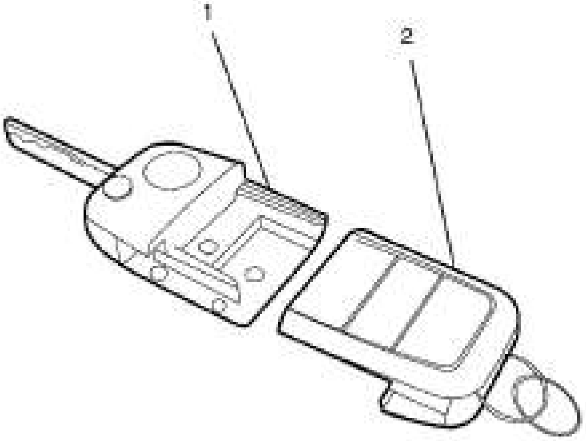
Transmitter Battery Replacement

Removal Procedure

Important: Replacement of the transmitter battery should only be carried out by your authorised Holden dealer.



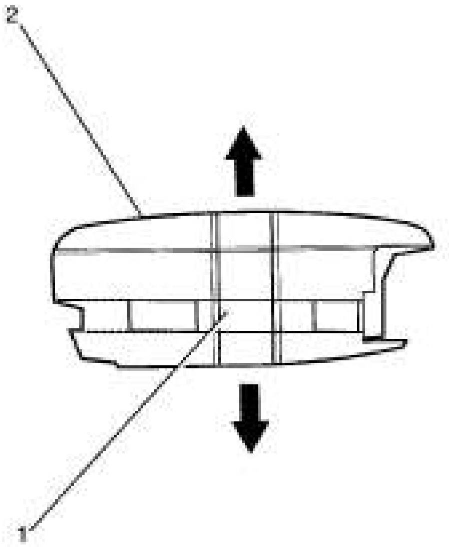
1. Insert a suitable tool between the two key halves (1).



Important: Do NOT twist the tool as damage to the key retaining tang will occur.

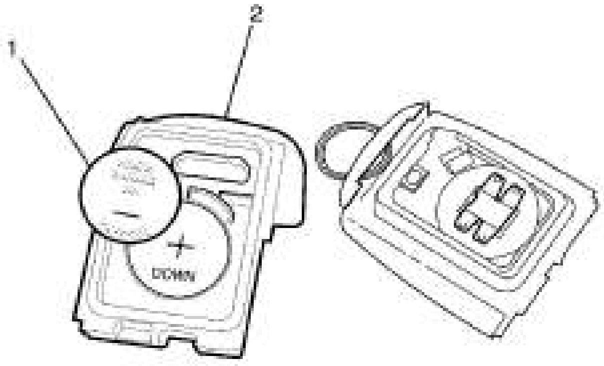
Important: While inserting the tool, push the remote half (2) away from the key half (1).

2. Separate the two key halves (1, 2).



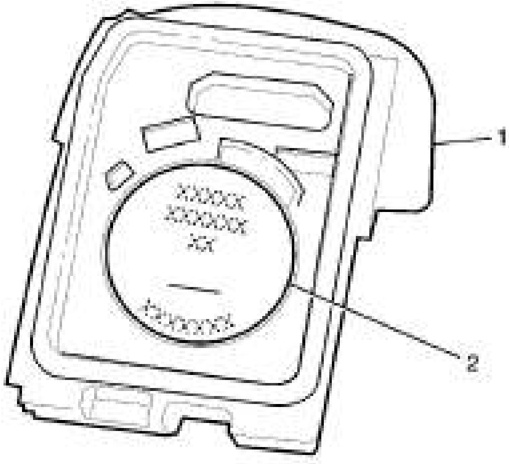
Important: Replace the battery when the range of the transmitter decreases to less than 7 m (23 ft).

3. Insert a suitable tool between the two halves (1) of the transmitter case (2), as shown in illustration.
4. Separate the two halves of the transmitter case (2).



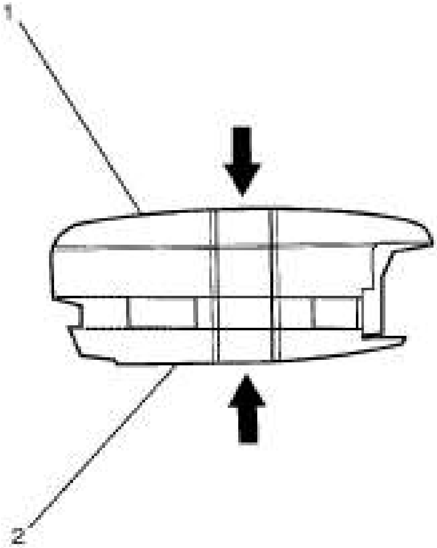
5. Remove the battery (1) from the transmitter case (2).

Installation Procedure

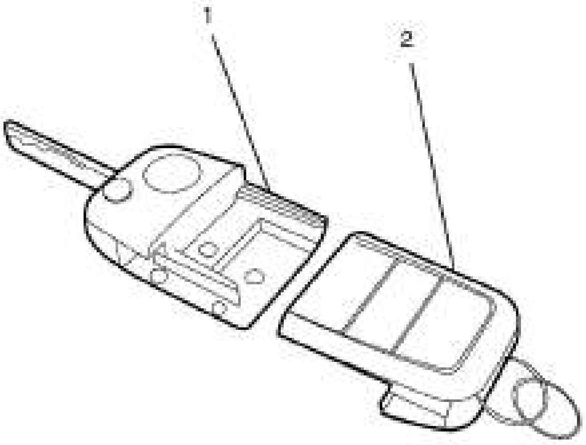


Important: Transfer the battery directly from the blister pack to the fob. Avoid finger contact with battery.

1. Install the transmitter battery (2) inside of the transmitter case (1) with the positive (+) side down.



2. Marry both halves of the transmitter case (1, 2).
3. Close the transmitter case, listen for an audible click to confirm fitting.



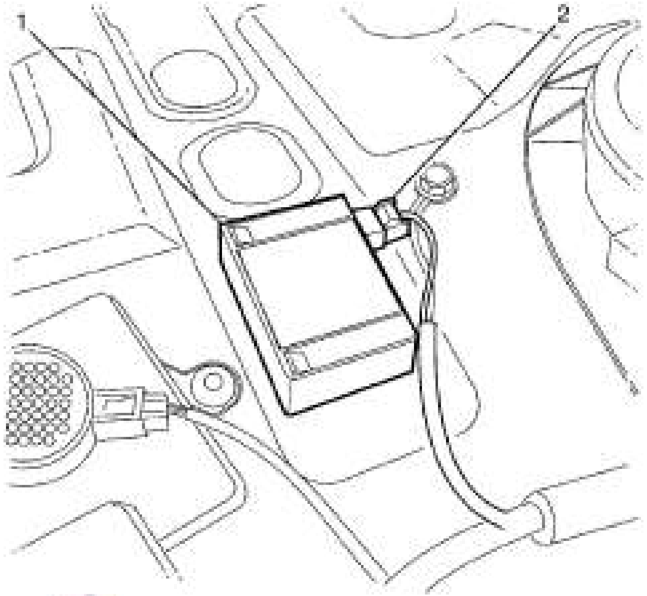
4. Marry the two halves (1 and 2) of the key by firmly pushing the two together, listen for an audible click to confirm fitting
5. Synchronize the transmitter. Refer to Transmitter Programming.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Remote Functions | Repair Instructions | Document ID: 2126725

Remote Control Door Lock Receiver and Theft Deterrent Module Replacement (Sedan)

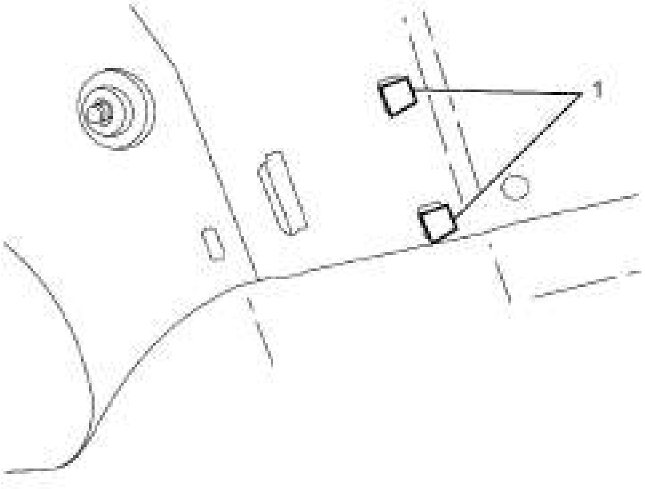
Removal Procedure

1. Remove the rear window shelf. Refer to Rear Window Shelf Trim Panel Replacement in Interior Trim.



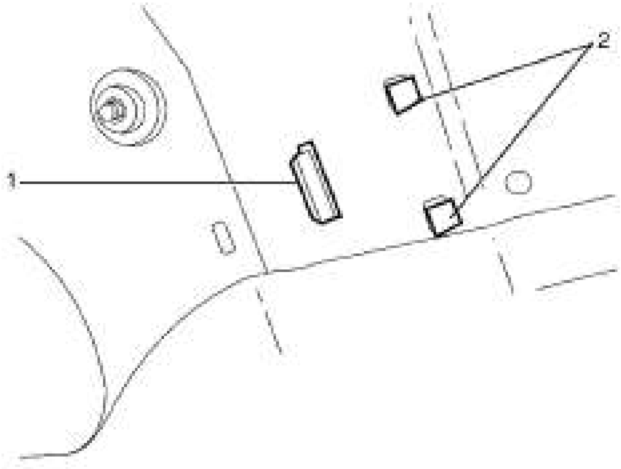
2. Disconnect the remote function actuator (RFA) (1) electrical connector (2).

Notice: Refer to General Repair Instructions in the Preface section.

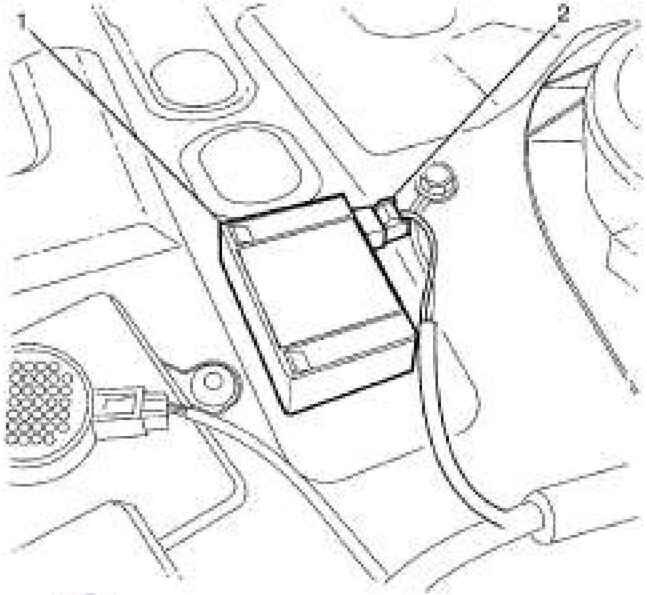


3. Remove the RFA by releasing the two retaining tangs (1) and removing it from the rear window shelf.

Installation Procedure



1. Install the RFA by inserting the retaining tang (1) first and snap fitting the other two retaining tangs (2) listen for an audible click to confirm fitting.



2. Connect the RFA (1) electrical connector (2).
3. Install the rear window shelf. Refer to Rear Window Shelf Trim Panel Replacement in Interior

Trim.

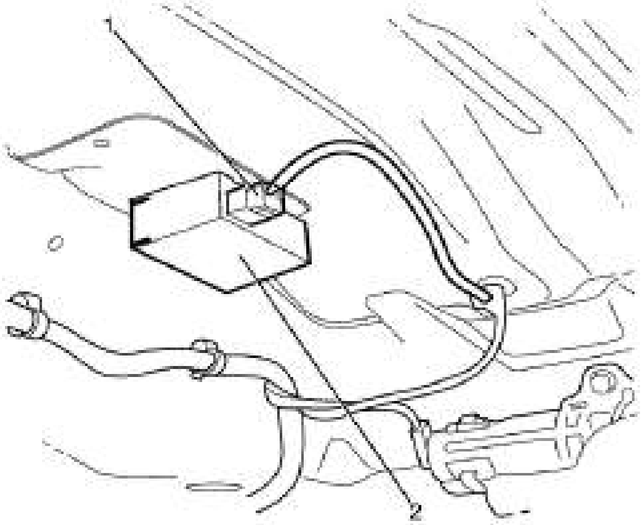
4. Program the RFA. Refer to Remote Control Door Lock Receiver and Theft Deterrent Module Programming and Setup.
5. Operate the keyless entry for correct operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Remote Functions | Repair Instructions | **Document ID: 2126727**

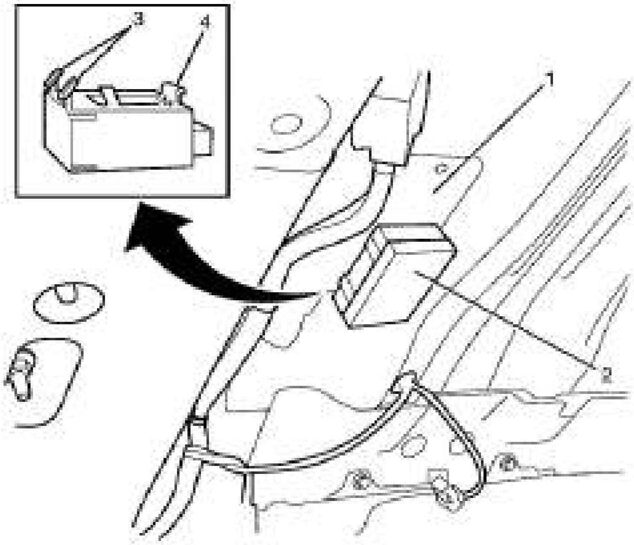
Remote Control Door Lock Receiver and Theft Deterrent Module Replacement (Sportwagon)

Removal Procedure

1. Remove the headliner. Refer to Headlining Trim Panel Replacement.



2. Disconnect the remote function actuator (RFA) electrical connector (1) from the RFA module (2).

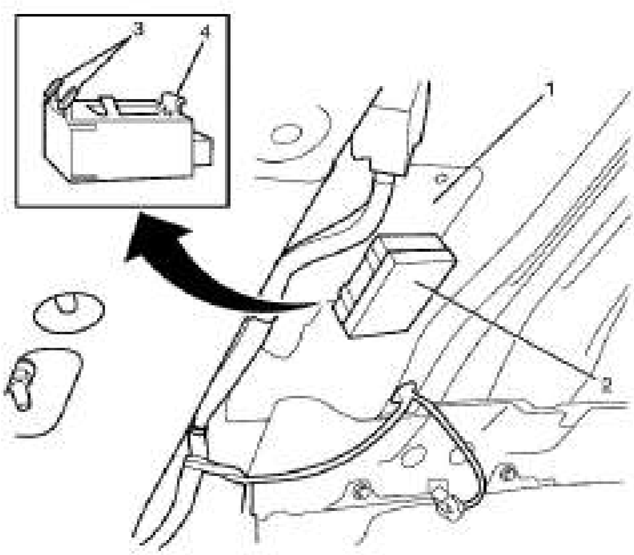


3. Apply suitable pressure to the RFA module retainers (3) and disengage the RFA module (2)

from the roof mounting (1).

4. Pivot the RFA module (2) down to disengage the RFA module retainer (4) from the roof mounting (1).
5. Remove the RFA module (2) from the vehicle.

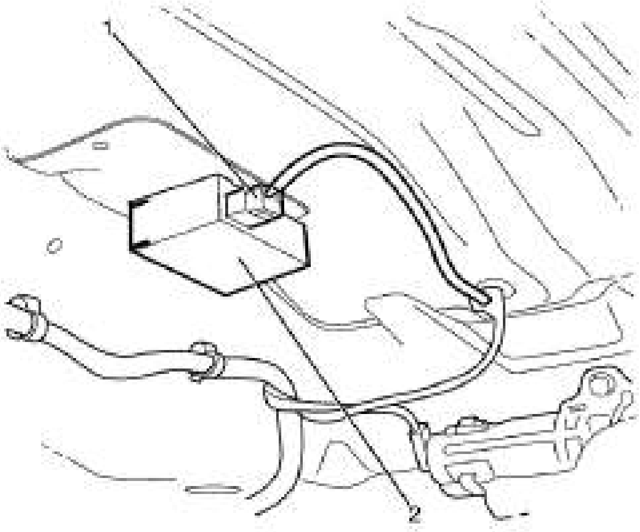
Installation Procedure



1. Install the RFA module retainer (4) to the roof mounting (1).

   Important: Listen for an audible click to confirm correct installation of the RFA module (2).

2. Pivot the RFA module (2) upward and apply suitable upward pressure. Make sure that the RFA module retainers (3) engage into the roof mounting (1).



3. Connect the RFA electrical connector (1) to the RFA module (2).
4. Program the RFA module (2). Refer to Remote Control Door Lock Receiver and Theft Deterrent Module Programming and Setup.
5. Operate the keyless entry to confirm correct operation.
6. Install the headliner. Refer to Headlining Trim Panel Replacement.

Transmitter Programming

Important: All transmitters which are to be recognized by the remote function actuator (RFA) must be programmed in a single programming sequence. If the system is placed in program mode it will erase all previously programmed transmitters upon the receipt of the programming signal from the first transmitter. Up to 4 transmitters can be programmed. Do not operate or program the transmitters in the vicinity of other vehicles that are in the keyless entry program mode. This prevents the programming of the transmitters to the incorrect vehicle.

1. Install a scan tool.

   Important: When the RFA is programmed the remote key and TPMS sensor data will be erased.

2. Use the scan tool in order to access programming: Body/RFA (Remote Function Actuator)/Programming and select either of the following options:
   - Erase all and program remotes.
   - Add additional remotes.
3. Follow the scan tool on screen instructions.

   Important: The scan tool must stay connected until all of the transmitters are programmed.

4. Press and hold the LOCK button and the UNLOCK button simultaneously on one transmitter. After a delay of 5-10 seconds, the scan tool will indicate that the transmitter is programmed.
5. Repeat the previous step in order to program up to 4 transmitters.
6. Remove the scan tool.
7. Operate the transmitter functions in within the specified range in order to verify correct system operation.
8. Do not cycle ignition. Final key fob may need to be programmed.

Keyless Entry System Description and Operation (Sedan)

The keyless entry system is a supplementary vehicle entry device. Radio frequency interference or discharged batteries may disable the system.

Keyless entry allows you to operate the following features:

- The door locks
- The Remote trunk release - Press and hold the trunk release button to release deck lid. The transmission must be in park for this feature to operate.
- The illuminated entry lamps
- The panic alarm
- Remote start (when installed)

The keyless entry system has the following main components:

- The transmitters
- The Remote Function Actuator (RFA) - When you press a button on the transmitter, the transmitter sends a signal to the RFA. The RFA receives the signal and sends a GMLAN serial data message requesting the appropriate function to the BCM.

Unlock Driver Door Only

Momentarily press the UNLOCK button in order to perform the following functions:

- Unlock the driver door only.
- Illuminate the interior lamps for approximately 20 seconds or until the ignition is turned ON.
- Flash all the direction indicators if the ignition is turned OFF and the doors are closed.
- Identify the driver to the Driver Information Center (DIC). The DIC will then revert to the station presets, the last station, the last volume settings, and the last playback mode used by that driver.

Unlock All Doors - Second Operation

Momentarily press the UNLOCK button a second time, within 5 seconds of the first press, in order to perform the following functions:

- Unlock all of the doors.
- Illuminate the interior lamps for approximately 20 seconds or until the ignition is turned ON.

Lock All Doors

Press the LOCK button in order to perform the following functions:

- Lock all of the doors.
- Immediately turn OFF the interior lamps.
- Flash the indicators if the ignition is OFF and the doors are closed.
- Chirp the horn if the ignition is OFF and the doors are closed.

Panic Alarm Function

A single press of the panic button performs the following functions:

- Illuminates the interior lamps
- Pulses the horn
- Powers up the daytime running lamps for 2 minutes or until the following conditions occur:
  - The panic button is pressed again.
  - The ignition switch is turned to the RUN position with a valid key.

Press and hold the panic button performs the following functions:

- The horn will sound continuously
- The turn signals will flash

This will continue until the button is pressed again or until the key is placed in the ignition.

Keyless Entry System Description and Operation (Sportwagon)

The keyless entry system is a supplementary vehicle access device. Radio frequency interference or discharged batteries may disable the system.

Keyless entry allows you to operate the following features:

- Door locks.
- Liftgate lock.
- Fuel tank filler door.
- Illuminated entry lamps.
- Panic alarm.

The keyless entry system has the following main components:

- Transmitters -- When a button on the transmitter is pressed, the transmitter sends a signal to the remote function actuator.
- Remote function actuator (RFA) - The RFA receives a signal from the transmitter and sends a GMLAN serial data message requesting the BCM to perform the appropriate functions.

Unlock All Doors (second stage unlocking disabled)

Momentarily press the UNLOCK button in order to perform the following functions:

- Unlock all the doors.
- Unlock the liftgate.
- Unlock the fuel tank filler door.
- Illuminate the dome lamp/lamps for approximately 20 seconds, or until the ignition is turned ON.
- Chirps the horn if the ignition is OFF and the doors are closed (when enabled via customisation menu).
- Flash the turn signal lamps, if the ignition is turned OFF and the doors are closed (if enabled via customisation menu).
- Identify the personalization setting to the Driver Information Centre (DIC). The DIC will then revert to the last IRC, IPC, HVAC setting used previously.

Unlock Driver Door Only (second stage unlocking enabled)

Momentarily press the UNLOCK button in order to perform the following functions:

- Unlock the driver door only.
- Unlock the fuel tank filler door.

- Illuminate the dome lamp/lamps for approximately 20 seconds, or until the ignition is turned ON.
- Flash the turn signal lamps, if the ignition is turned OFF and the doors are closed (when enabled via customisation menu).
- Identify the personalization setting to the Driver Information Centre (DIC). The DIC will then revert to the last IRC, IPC, HVAC setting used previously.

Unlock Passenger Doors - Second Operation (second stage unlocking enabled)

Momentarily press the UNLOCK button a second time, within 10 seconds of the first press, in order to perform the following functions:

- Unlock all the passenger doors.
- Unlock the liftgate.
- Illuminate the dome lamp/lamps for approximately 20 seconds or until the ignition is turned ON.

Lock All Doors

Momentarily press the LOCK button in order to perform the following functions:

- Lock all the doors.
- Lock the liftgate.
- Lock fuel tank filler door.
- Immediately turns OFF the dome lamp/lamps.
- Flashes the turn signal lamps if the ignition is OFF and the doors are closed (when enabled via customisation menu).
- Chirps the horn if the ignition is OFF and the doors are open (when enabled via customisation menu).

Panic Alarm Function

A single press of the panic button will perform the following functions:

- Pulses the horn.
- Flash the turn signal lamps.

Pressing and holding the panic button will perform the following functions:

- Continuously sound the horn for 30 seconds.
- Flash the turn signal lamps.
- Illuminate the dome lamp/lamps.
- Illuminate the outside rearview mirror courtesy lamps (where fitted).
- Illuminate the approach lighting (when enabled via customisation menu).

This will continue until the panic button is pressed again or the key is placed in the ignition lock and turned to the ignition position.

	7000086I Scan Tool Used for diagnosis of vehicle electrical system.

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Centre Seat Belt Retractor Fastener	43 N·m	32 lb ft
Centre/Left Rear Seat Belt Buckle Nut (Sportwagon)	43 N·m	32 lb ft
Child Restraint Anchor to Parcel Shelf Retaining Bolt	20 N·m	15 lb ft
Front Seat Belt Height Adjuster to Pillar Retaining Bolts	30 N·m	22 lb ft
Front Seat Belt Lower Anchor to Body Retaining Bolt	43 N·m	32 lb ft
Front Seat Belt Retractor to Pillar Retaining Bolts	43 N·m	32 lb ft
Front Seat Intermediate Guide to Pillar Retaining Screws	3 N·m	27 lb in
Front Seat Upper Guide to Body Retaining Bolt (Adjustable D-ring)	43 N·m	32 lb ft
Intermediate Seat Belt Guide to Vehicle (LHD)	2 N·m	18 lb in
Rear Seat Belt Buckle to Body Retaining Nuts	43 N·m	32 lb ft
Rear Seat Belt Lower Anchor to Body Retaining Bolt	43 N·m	32 lb ft
Rear Seat Belt Retractor to Body Retaining Bolts	43 N·m	32 lb ft
Rear Seat Upper Guide to Body Retaining Bolt	43 N·m	32 lb ft
Seat Belt Retractor to Seat Frame Retaining Nut (Sportwagon)	43 N·m	32 lb ft

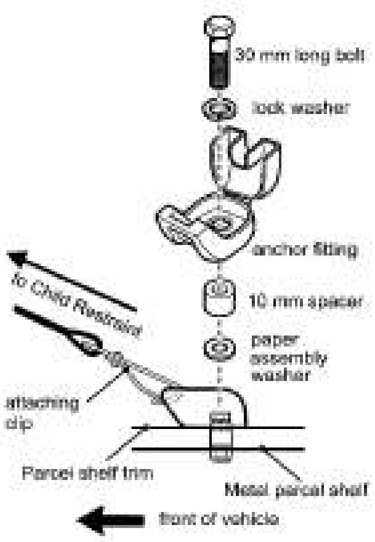
Child Restraint Tether Anchor Replacement (RHD)

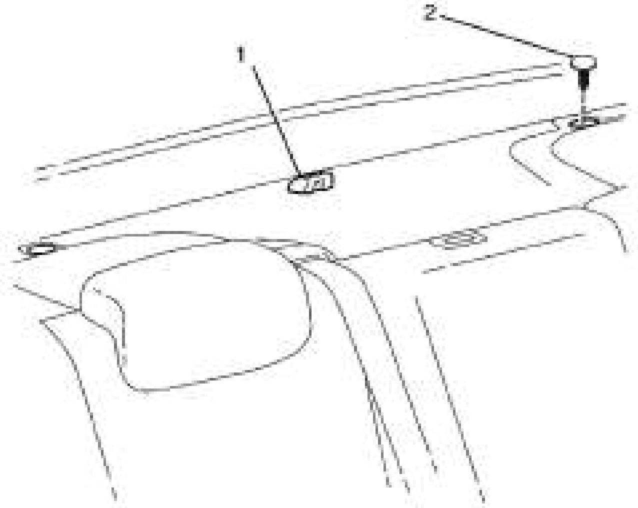
Removal Procedure

Important: Do NOT attempt to repair or alter the bracket on the child seat restraint system. If the bracket is damaged, replace the entire bracket. Altering the bracket could result in personal injury.



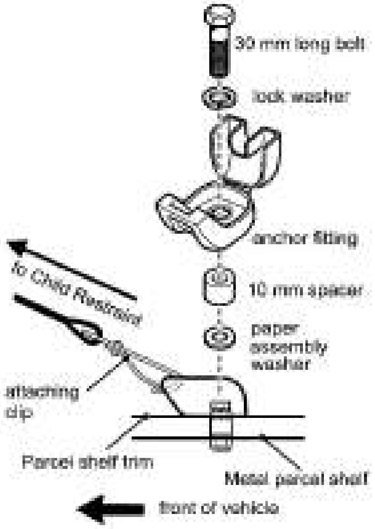
30 mm long bolt
lock washer
anchor fitting
to Child Restraint
10 mm spacer
paper assembly washer
attaching clip
Parcel shelf trim
Metal parcel shelf
front of vehicle

1. Using a suitable tool to open the cap, remove the bolt that retains the child restraint anchor fitting that is being serviced.



2. Remove the child restraint anchor fitting (1) from the vehicle.

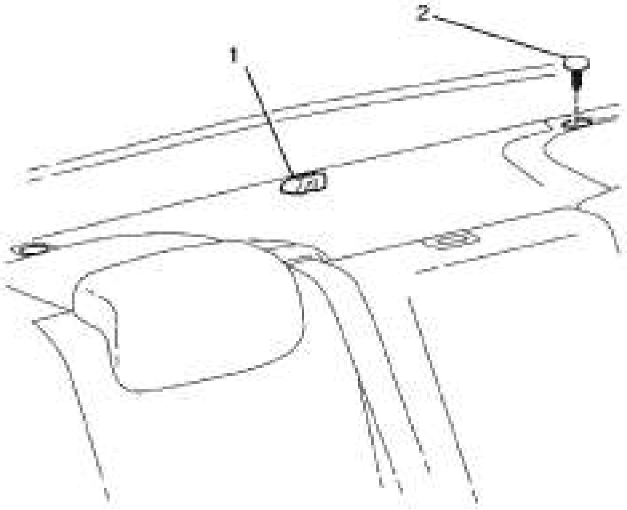
Installation Procedure



30 mm long bolt
lock washer
anchor fitting
10 mm spacer
paper assembly washer
to Child Restraint
attaching clip
Parcel shelf trim
Metal parcel shelf
front of vehicle

1. Install the child restraint anchor fitting to the rear windshield shelf.

Notice: Refer to Component Fastener Tightening Notice in the Preface section.



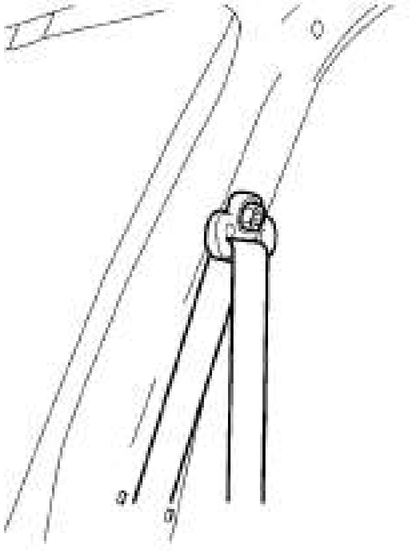
2. Install the child restraint anchor fitting bolt (1).

   Tighten
   Tighten the bolt to 20 N·m (22 lb ft).

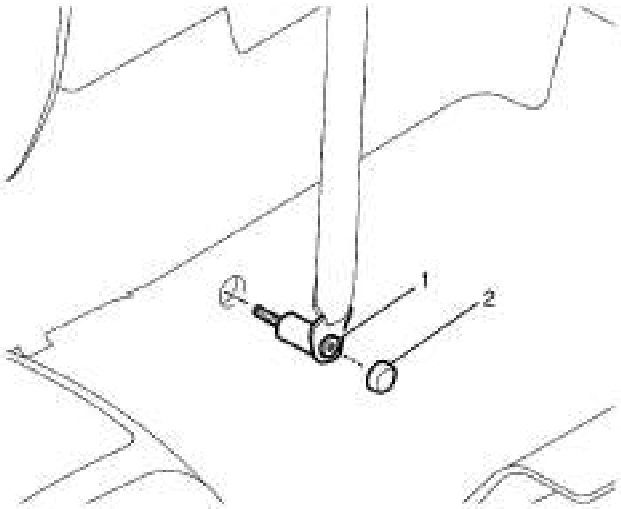
3. Using a suitable tool remove the retaining clip (2) to gain access for installing a secondary child restraint anchor (if required).

Front Seat Belt Replacement

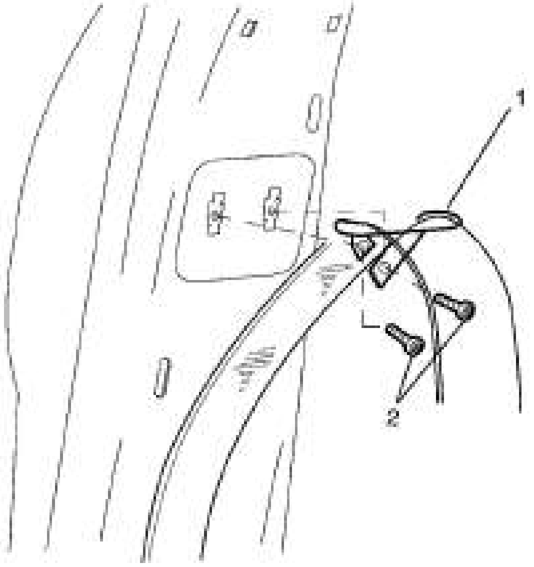
Removal Procedure - Type A (Fixed D-Ring) - Up to 8 Jun 2007



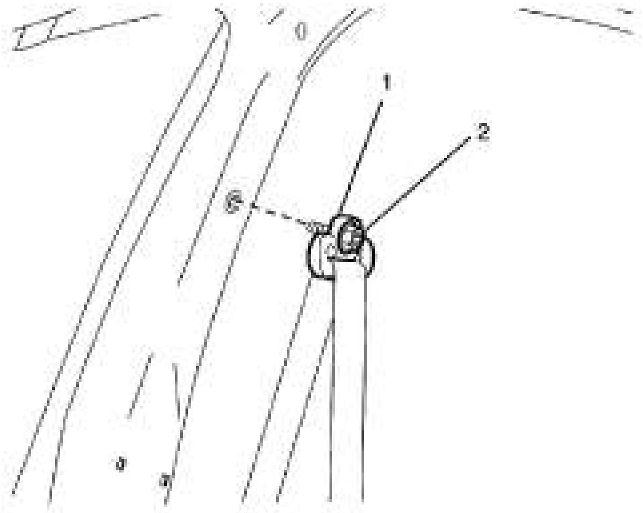
1. Move the seat all the way forward towards the front of the vehicle, to gain access to the seat belt.
2. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .
3. Remove the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
4. Remove the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
5. Remove the lower centre pillar trim plate. Refer to Center Pillar Lower Trim Panel Replacement .
6. Remove the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .



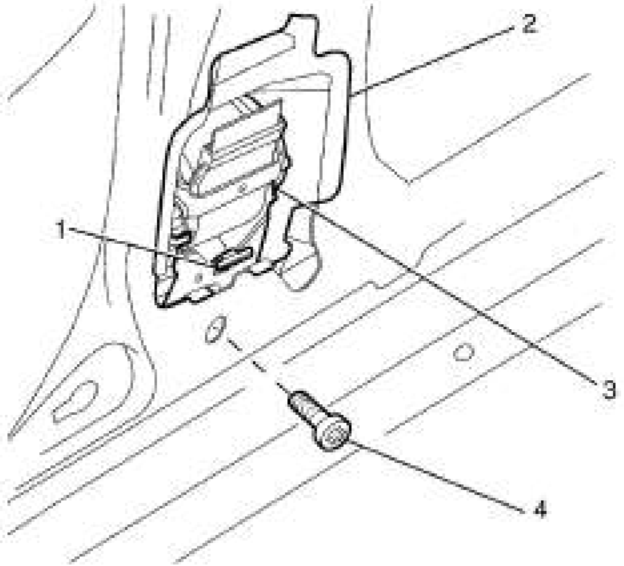
7. Remove the front seat belt lower anchor bolt cover (2).
8. Remove the front seat belt lower anchor assembly (1).



9. Remove the intermediate seat belt guide screws (2).
10. Remove the intermediate seat belt guide (1).

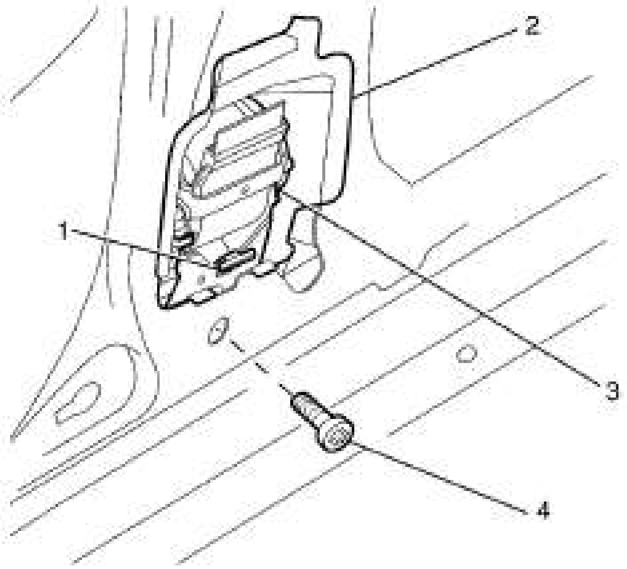


11. Remove the front seat belt upper guide bolt assembly (1).



12. Remove the front seat belt retractor bolt (4).
13. Lift the retractor (3) in a upwards direction.
14. Tilt the retractor on a 30 degree angle making sure that the locking tab (1) is clear.
15. Remove the dust cover (2) from the centre pillar (if required).

Installation Procedure - Type A (Fixed D-Ring) - Up to 8 Jun 2007

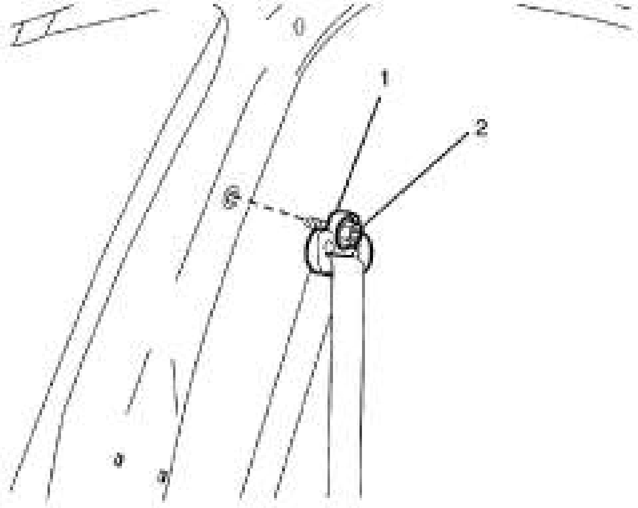


1. Install the front seat belt dust cover (2) to the vehicle (if removed).

   Notice: Refer to Fastener Notice in the Preface section.

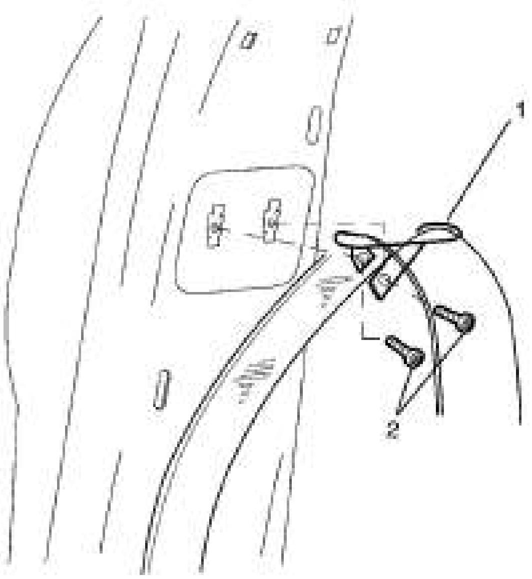
2. Install the front seat belt retractor (3) to the vehicle.
3. Make sure that the locking tab (1) is seated correctly.
4. Secure the retractor (3) with the bolt (4).

   Tighten
   Tighten the bolt (4) to 43 N·m (32 lb ft).



5. Install the front seat belt upper guide assembly (1).

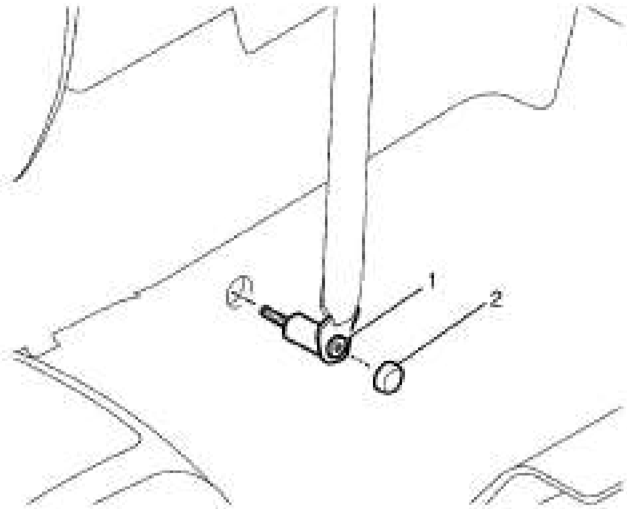
Tighten
Tighten the front seat belt upper guide bolt (2) to 43 N·m (32 lb ft).



6. Install the intermediate seat belt guide (1) to the vehicle. Secure the guide with the screws (2).

   Tighten
   Tighten the intermediate seat belt guide screws (2) to 3 N·m (27 lb in).

7. Install the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .
8. Install the lower centre panel trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
9. Install the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
10. Install the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
11. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement .

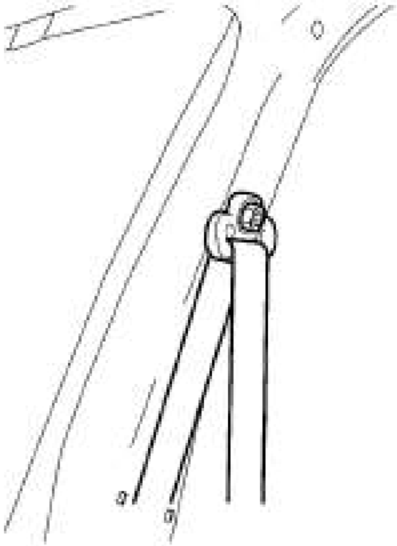


12. Install the front seat belt lower anchor bolt assembly (1).

    Tighten
    Tighten the front seat belt lower anchor bolt (1) to 43 N·m (32 lb ft).

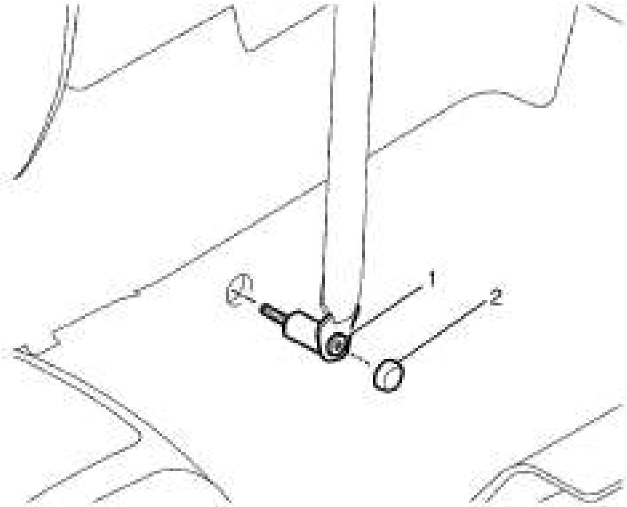
13. Install the front seat belt lower anchor bolt trim cover (2).
14. Move the front seat back to original position.

Removal Procedure - Type A (Fixed D-Ring) - From 8 Jun 2007

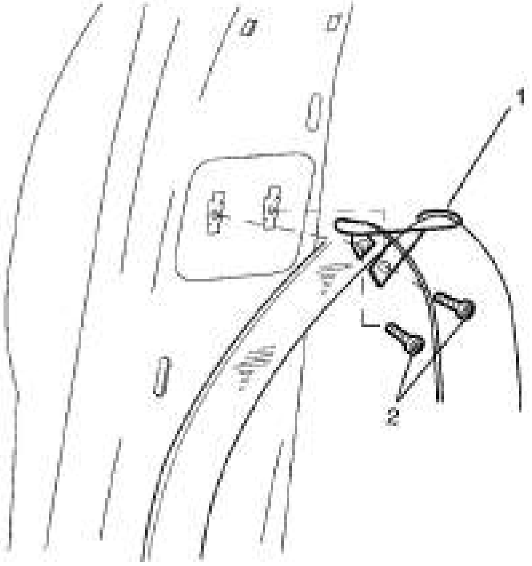


1. Move the seat all the way forward towards the front of the vehicle, to gain access to the seat belt.

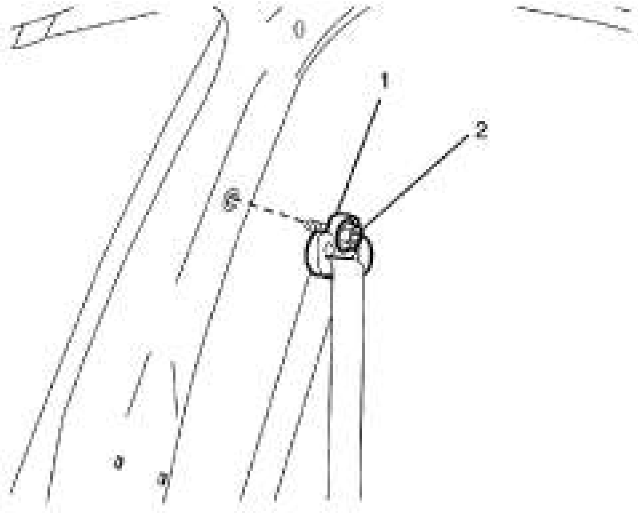
2. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .
3. Remove the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
4. Remove the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
5. Remove the lower centre pillar trim plate. Refer to Center Pillar Lower Trim Panel Replacement .
6. Remove the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .



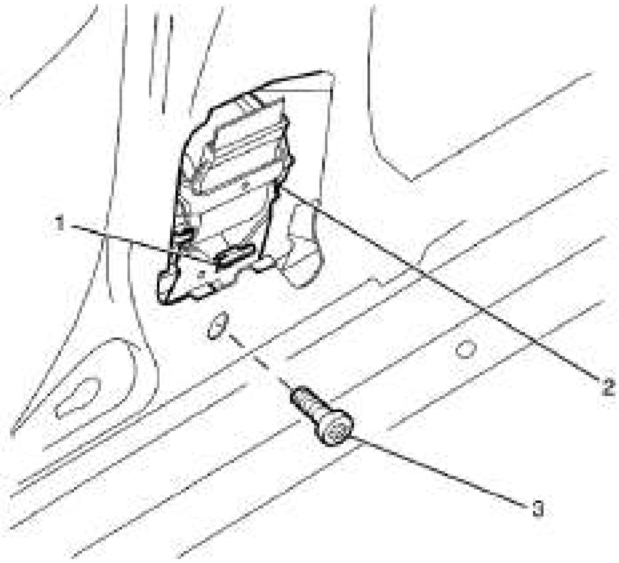
7. Remove the front seat belt lower anchor bolt cover (2).
8. Remove the front seat belt lower anchor assembly (1).



9. Remove the intermediate seat belt guide screws (2).
10. Remove the intermediate seat belt guide (1).

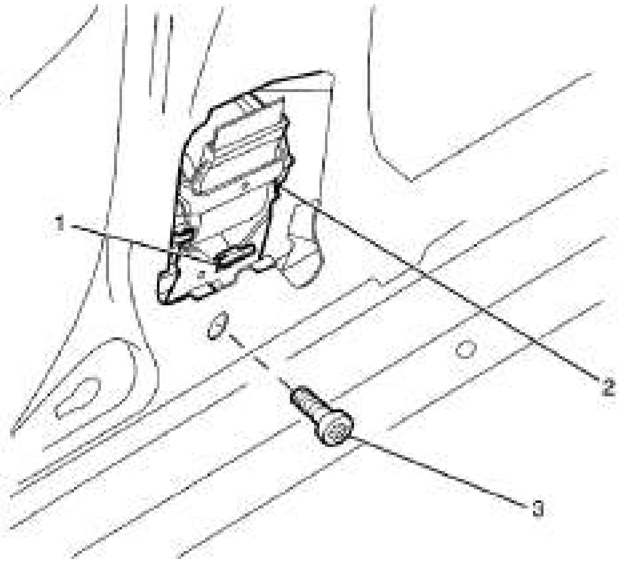


11. Remove the front seat belt upper guide bolt assembly (1).



12. Remove the front seat belt retractor bolt (4).
13. Lift the retractor (3) in a upwards direction.
14. Tilt the retractor on a 30 degree angle making sure that the locking tab (1) is clear.
15. Remove the dust cover (2) from the centre pillar (if required).

Installation Procedure - Type A (Fixed D-Ring) - From 8 Jun 2007

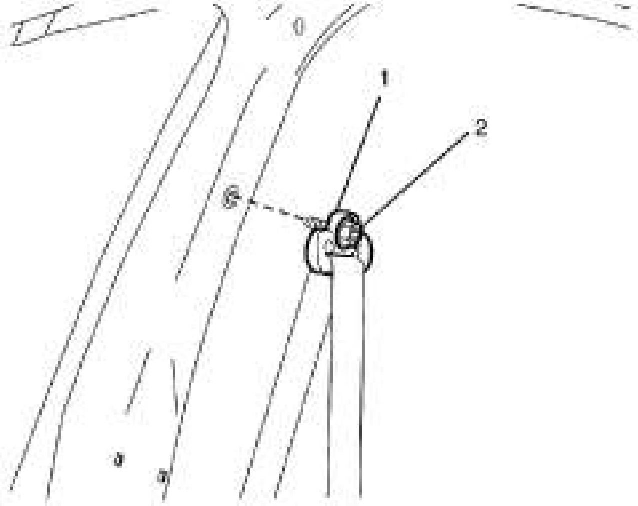


1. Install the front seat belt dust cover (2) to the vehicle (if removed).

   Notice: Refer to Fastener Notice in the Preface section.

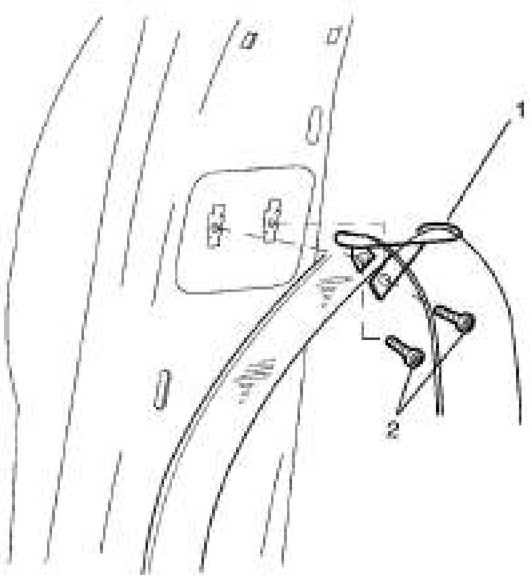
2. Install the front seat belt retractor (3) to the vehicle.
3. Make sure that the locking tab (1) is seated correctly.
4. Secure the retractor (3) with the bolt (4).

   Tighten
   Tighten the bolt (4) to 43 N·m (32 lb ft).



5. Install the front seat belt upper guide assembly (1).

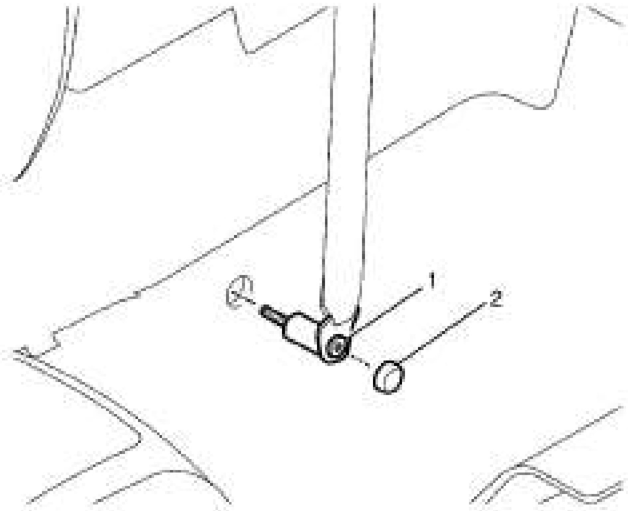
Tighten
Tighten the front seat belt upper guide bolt (2) to 43 N·m (32 lb ft).



6. Install the intermediate seat belt guide (1) to the vehicle. Secure the guide with the screws (2).

   Tighten
   Tighten the intermediate seat belt guide screws (2) to 3 N·m (27 lb in).

7. Install the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .
8. Install the lower centre panel trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
9. Install the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
10. Install the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
11. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement .

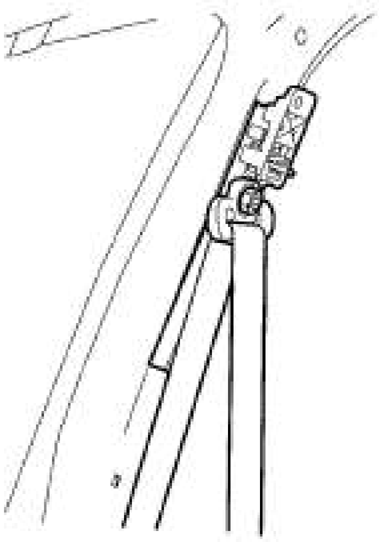


12. Install the front seat belt lower anchor bolt assembly (1).

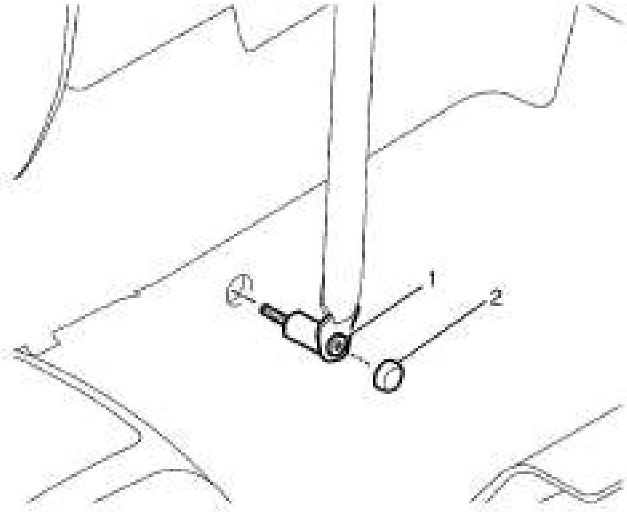
    Tighten
    Tighten the front seat belt lower anchor bolt (1) to 43 N·m (32 lb ft).

13. Install the front seat belt lower anchor bolt trim cover (2).
14. Move the front seat back to original position.

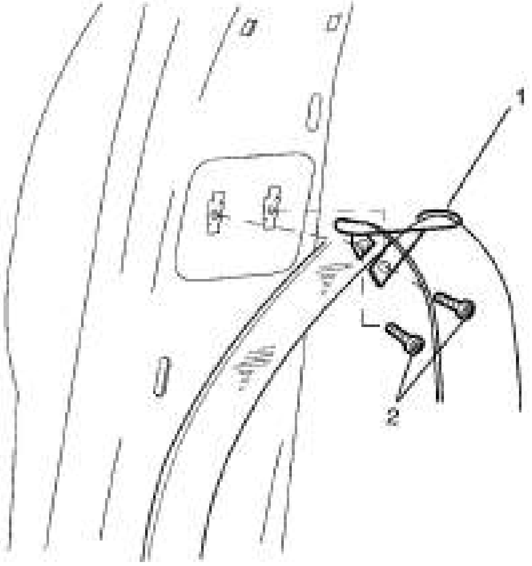
Removal Procedure - Type B (Adjustable D-Ring) - Up to 8 Jun 2007



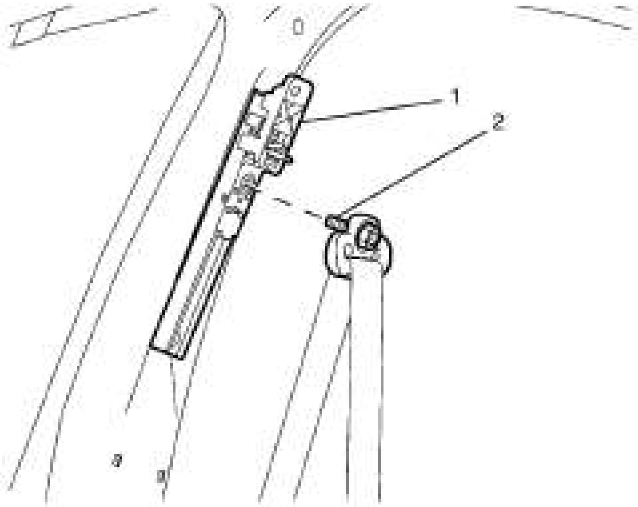
1. Move the seat all the way forward towards the front of the vehicle, to gain access to the seat belt.
2. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .
3. Remove the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
4. Remove the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
5. Remove the lower centre pillar trim plate. Refer to Center Pillar Lower Trim Panel Replacement .
6. Remove the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .



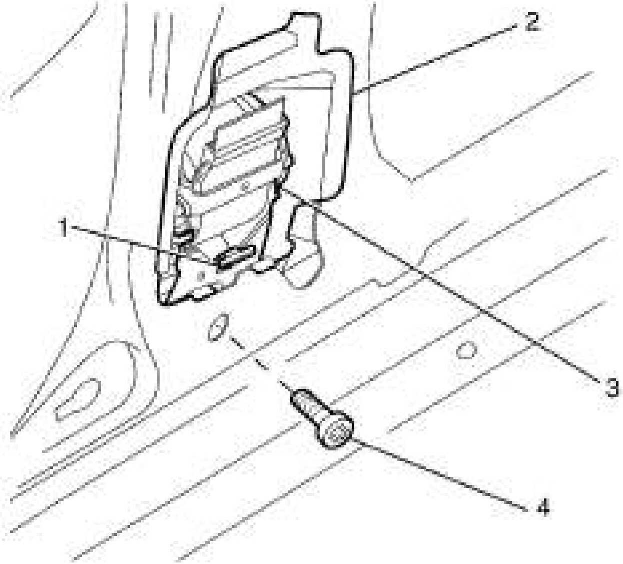
7. Remove the front seat belt lower anchor bolt cover (2).
8. Remove the front seat belt lower anchor assembly (1).



9. Remove the intermediate seat belt guide screws (2) and the intermediate seat belt guide (1).

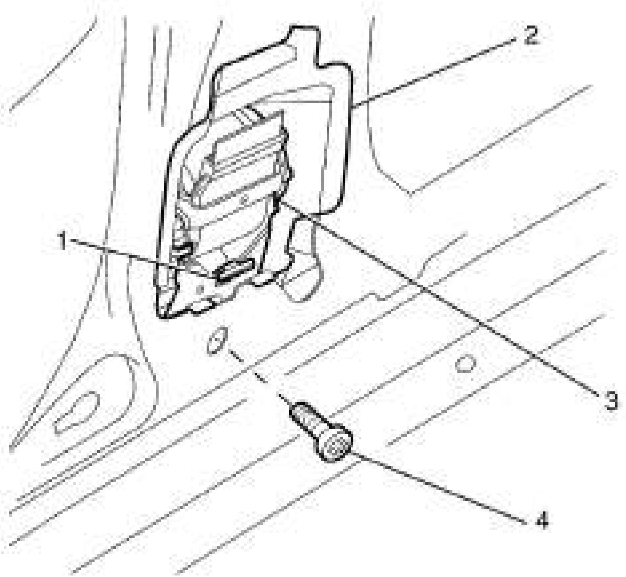


10. Remove the front seat belt upper guide bolt assembly (2) holding the D-ring belt guide to the height adjuster assembly (1).



11. Remove the front seat belt retractor bolt (4).
12. Lift the retractor (3) in a upwards direction.
13. Tilt on a 30 degree angle making sure that the locking tab (1) is clear.
14. Remove the dust cover (2) from the centre pillar (if required).

Installation Procedure - Type B (Adjustable D-Ring) - Up to 8 Jun 2007

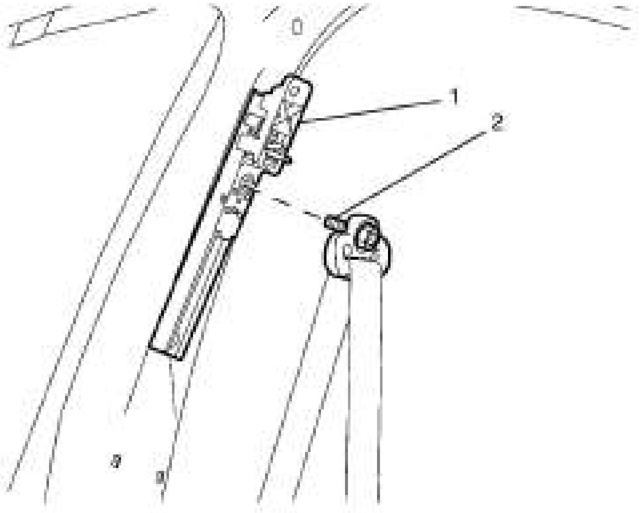


1. Install the front seat belt dust cover (2) to the vehicle (if removed).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the front seat belt retractor (3) to the vehicle.
3. Make sure that the locking tab (1) is seated correctly.
4. Secure the retractor (3) with the bolt (4).

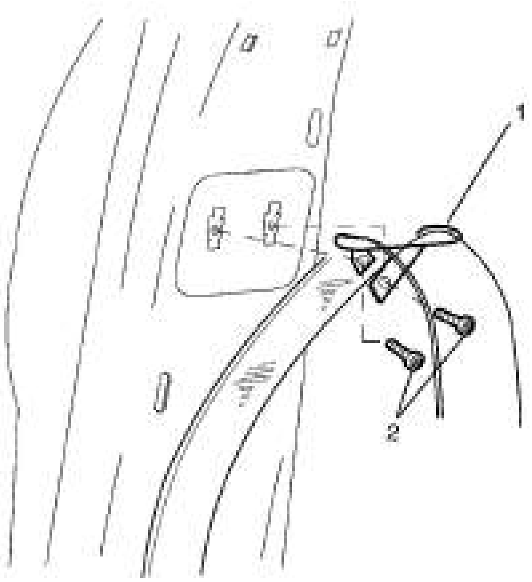
   Tighten
   Tighten the bolt (4) to 43 N·m (32 lb ft).



5. Install the front seat belt upper guide bolt assembly (2) holding the D-ring belt guide to the

height adjuster assembly (1).

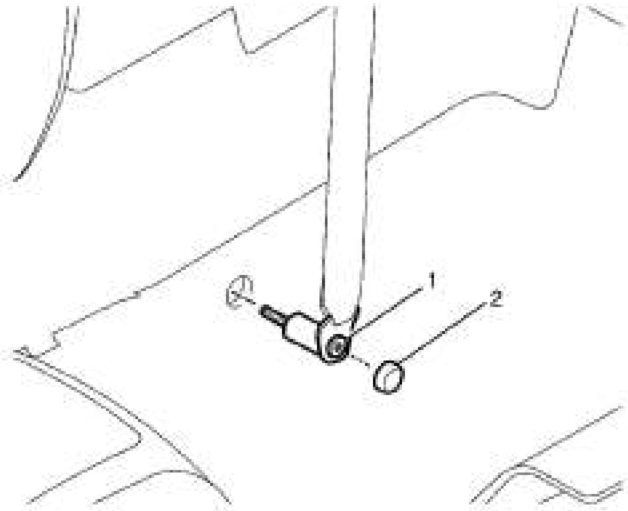
Tighten
Tighten the front seat belt upper guide bolt assembly (2) to 43 N·m (32 lb ft).



6. Install the intermediate seat belt guide (1) to the vehicle. Secure the guide with the screws (2).

   Tighten
   Tighten the intermediate seat belt guide screws (2) to 3 N·m (27 lb in).

7. Install the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .
8. Install the lower centre panel trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
9. Install the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
10. Install the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
11. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement .

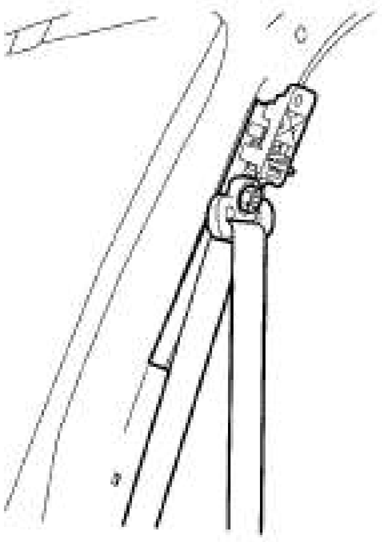


12. Install the front seat belt lower anchor bolt assembly (1).

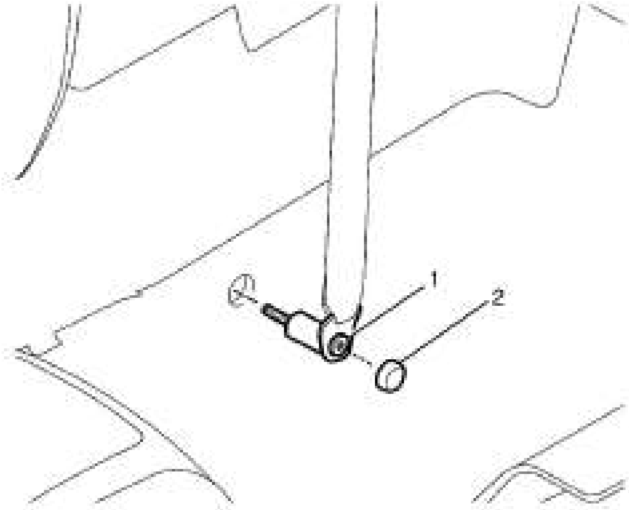
    Tighten
    Tighten the front seat belt lower anchor bolt to 43 N·m (32 lb ft).

13. Install the front seat belt lower anchor bolt trim cover (2).
14. Move the front seat back to original position.

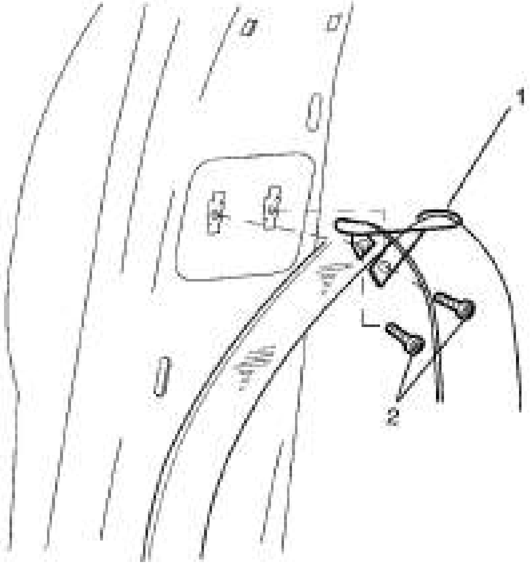
Removal Procedure - Type B (Adjustable D-Ring) - From 8 Jun 2007



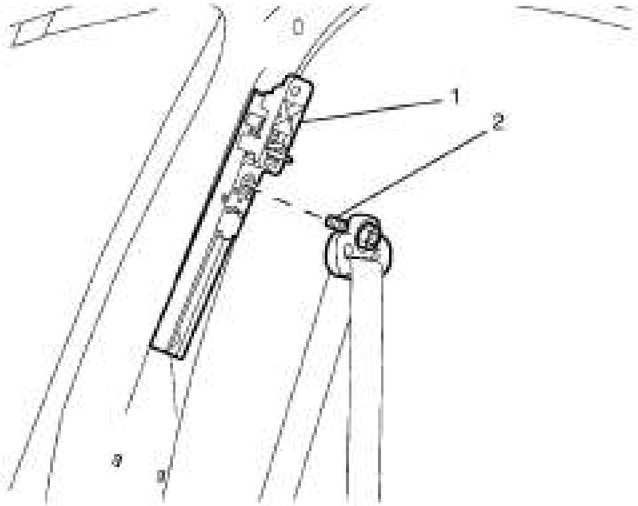
1. Move the seat all the way forward towards the front of the vehicle, to gain access to the seat belt.
2. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .
3. Remove the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
4. Remove the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
5. Remove the lower centre pillar trim plate. Refer to Center Pillar Lower Trim Panel Replacement .
6. Remove the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .



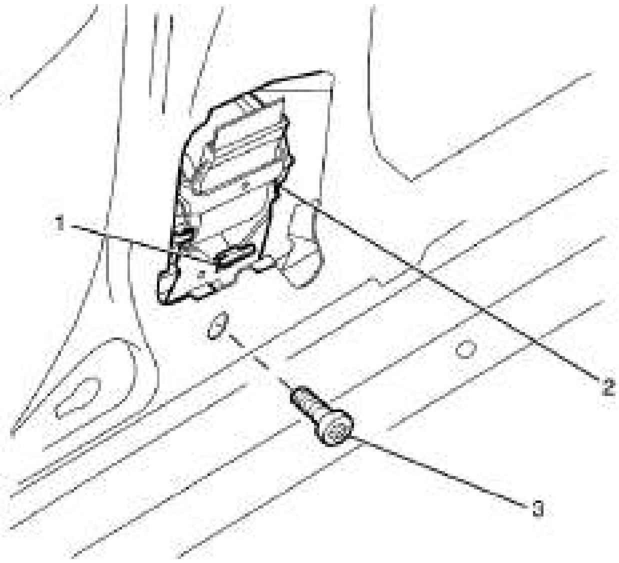
7. Remove the front seat belt lower anchor bolt cover (2).
8. Remove the front seat belt lower anchor assembly (1).



9. Remove the intermediate seat belt guide screws (2) and the intermediate seat belt guide (1).

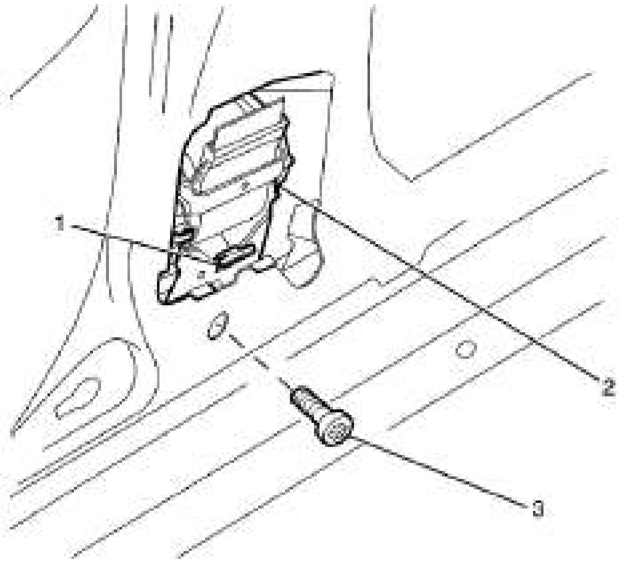


10. Remove the front seat belt upper guide bolt assembly (2) holding the D-ring belt guide to the height adjuster assembly (1).



11. Remove the front seat belt retractor bolt (4).
12. Lift the retractor (3) in a upwards direction.
13. Tilt on a 30 degree angle making sure that the locking tab (1) is clear.
14. Remove the dust cover (2) from the centre pillar (if required).

Installation Procedure - Type B (Adjustable D-Ring) - From 8 Jun 2007

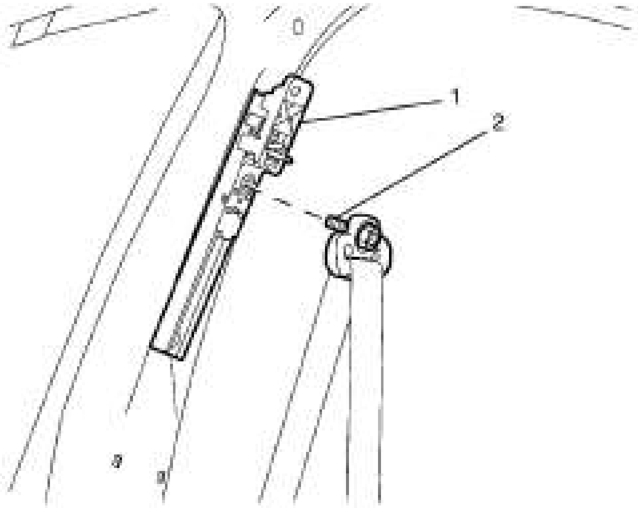


1. Install the front seat belt dust cover (2) to the vehicle (if removed).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the front seat belt retractor (3) to the vehicle.
3. Make sure that the locking tab (1) is seated correctly.
4. Secure the retractor (3) with the bolt (4).

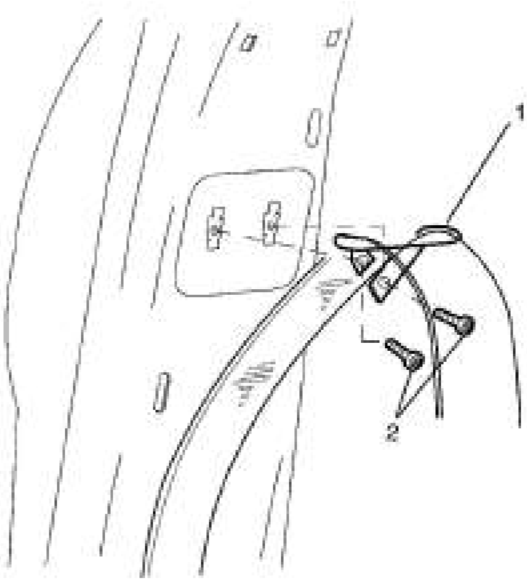
   Tighten
   Tighten the bolt (4) to 43 N·m (32 lb ft).



5. Install the front seat belt upper guide bolt assembly (2) holding the D-ring belt guide to the

height adjuster assembly (1).

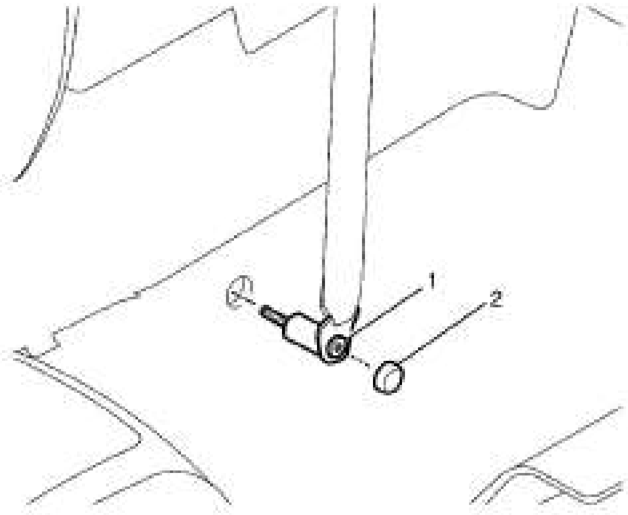
Tighten
Tighten the front seat belt upper guide bolt assembly (2) to 43 N·m (32 lb ft).



6. Install the intermediate seat belt guide (1) to the vehicle. Secure the guide with the screws (2).

   Tighten
   Tighten the intermediate seat belt guide screws (2) to 3 N·m (27 lb in).

7. Install the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .
8. Install the lower centre panel trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
9. Install the front and rear door sill trim plates. Refer to Door Sill Plate Replacement .
10. Install the front seat rail trim cover. Refer to Front Seat Replacement - Bucket .
11. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement .



12. Install the front seat belt lower anchor bolt assembly (1).

    Tighten
    Tighten the front seat belt lower anchor bolt to 43 N·m (32 lb ft).

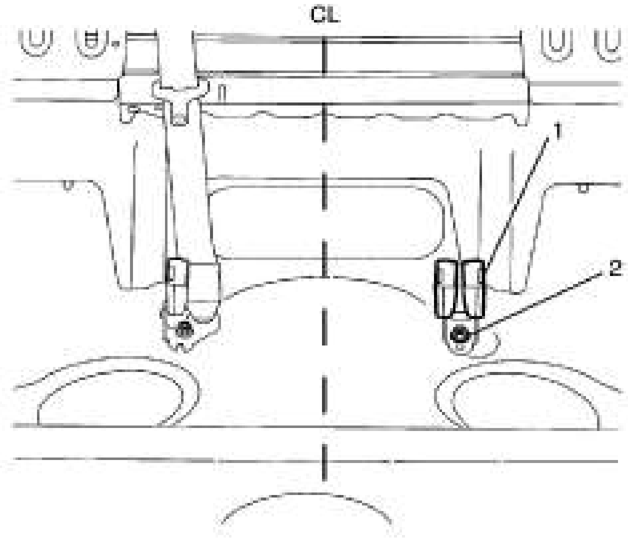
13. Install the front seat belt lower anchor bolt trim cover (2).
14. Move the front seat back to original position.

Rear Seat Belt Buckle Replacement (RHD)

Removal Procedure

Caution: Refer to SIR Caution in the Preface section.

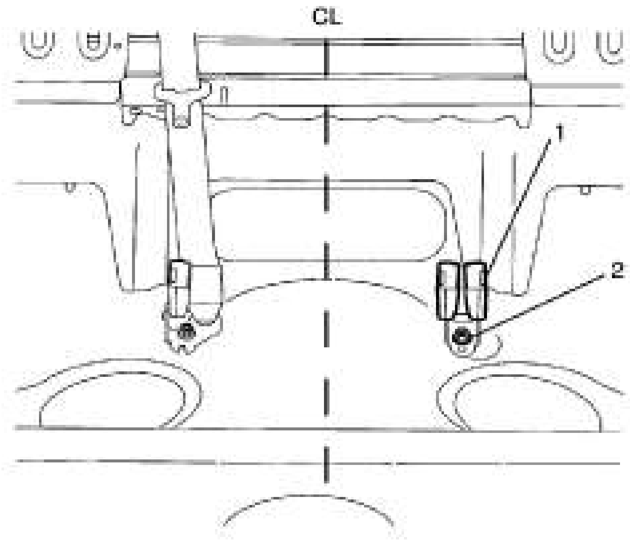
1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .



2. Remove the seat belt buckle nut (2).
3. Remove the rear seat belt twin buckle (1) from the floor pan.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



Important: Make sure buckle is parallel to vehicle centreline.

1. Install the rear seat belt buckles (1) to the floor pan.

   Tighten
   Tighten the seat belt buckle nut (2) to 43 N·m (31 lb ft).

2. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Seat Belts | Repair Instructions | **Document ID: 2097308**

Rear Seat Belt Buckle Replacement (Wagon)

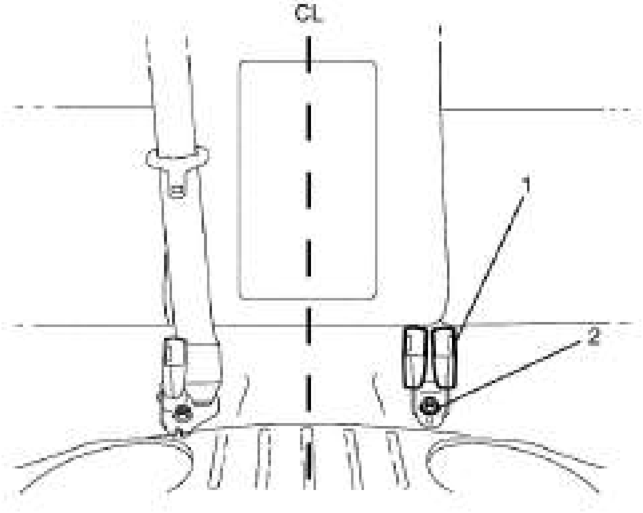
Removal / Installation Procedure - Right Rear

Important: The right rear seat belt buckle is an integral part of the centre rear seat belt retractor assembly and must be replaced as an assembly.

For replacement of the right rear seat belt buckle. Refer to Seat Belt Replacement - Center Rear.

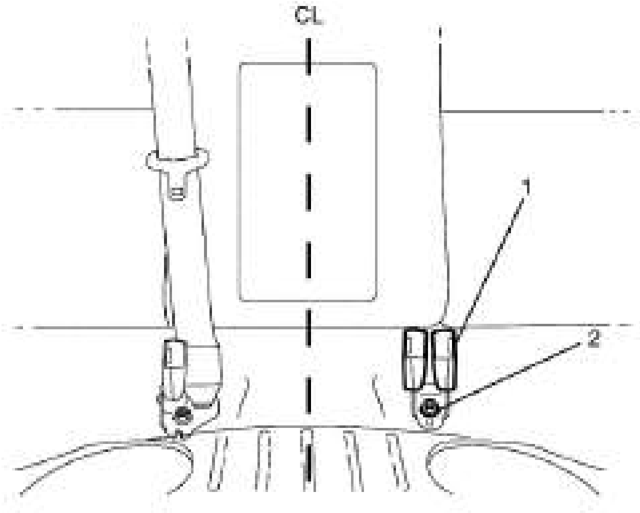
Removal Procedure - Centre / Left Rear

1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.



2. Remove the centre/left rear seat belt buckle nut (2).
3. Remove the centre/left rear seat belt buckle (1) from the vehicle.

Installation Procedure



Important: Make sure the centre/left rear seat belt buckle is parallel to vehicle centreline as shown.

1. Install the centre/left rear seat belt buckle (1) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the centre/left rear seat belt buckle nut (2).

   Tighten
   Tighten the nut to 43 N·m (31 lb ft).

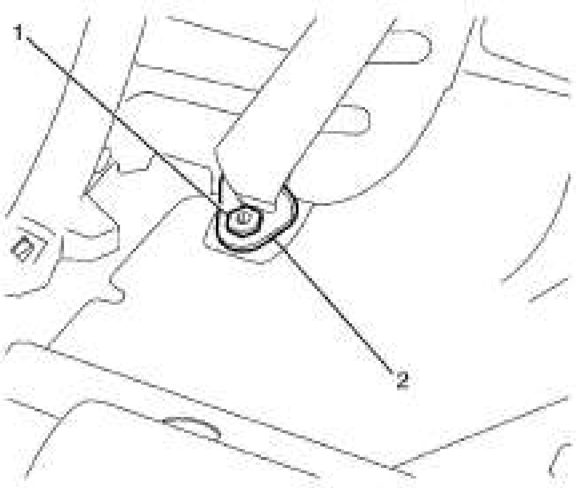
3. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Seat Belts | Repair Instructions | **Document ID: 1995556**

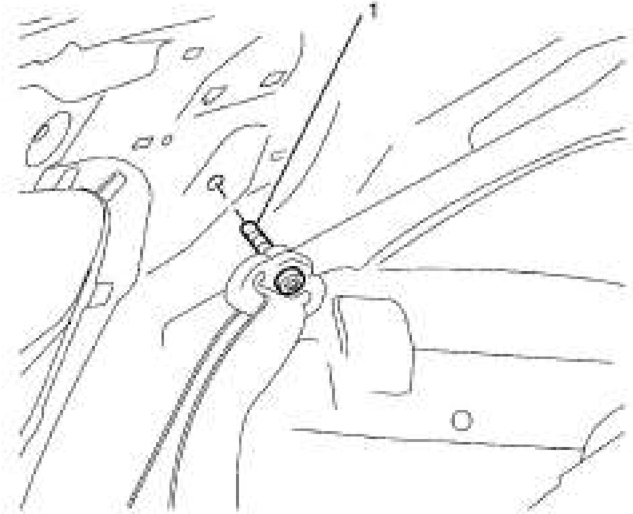
Rear Seat Belt Replacement (RHD)

Removal Procedure

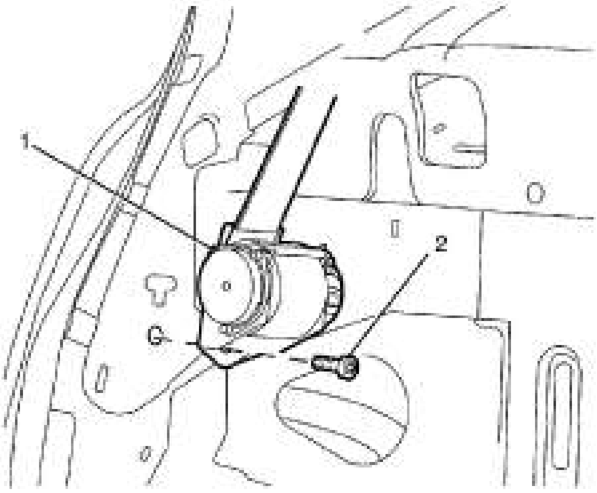
1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the rear seat back. Refer to Rear Seat Back Replacement.
3. Remove the upper rear quarter trim panel. Refer to Quarter Upper Trim Panel Replacement.



4. Remove the bolt (1) attaching the seat belt lower anchor (2) to the vehicle

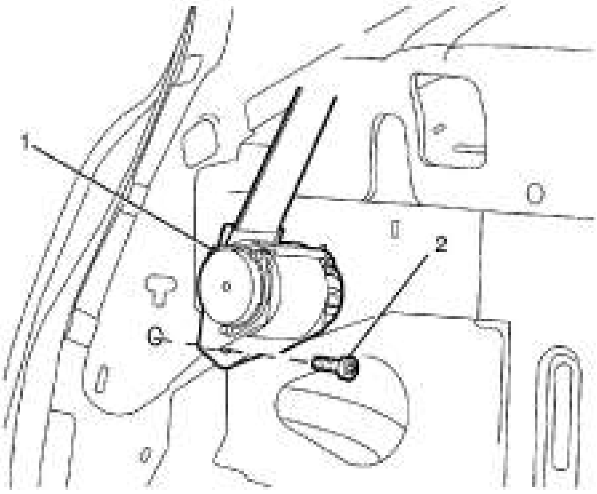


5. Remove the rear seat belt guide bolt assembly (1).



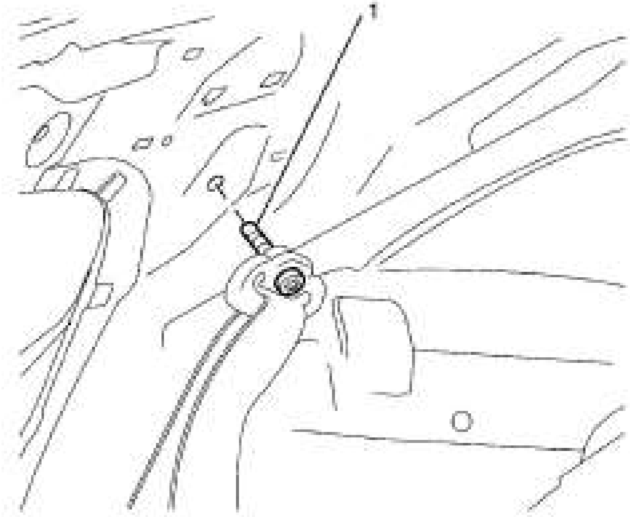
6. Remove the rear seat belt retractor bolt (2).
7. Lift the retractor (1) in a upwards direction and tilt on a 30 degree angle making sure that the locking tab is clear.

Installation Procedure



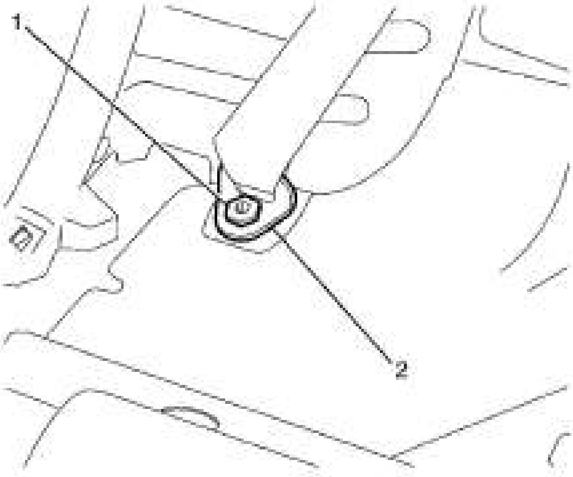
1. Replace the rear seat belt retractor assembly (1).
2. Remove the rear seat belt retractor bolt (2) .

Tighten
Tighten the intermediate rear seat belt retractor mounting bolt (2) to 43 N·m (31 lb ft).



3. Replace the rear seat belt guide bolt assembly (1).

Tighten
Tighten the rear seat belt guide mounting bolt (4) to 43 N·m (32 lb ft).



4. Replace the bolt (1) attaching the seat belt lower anchor (2) to the vehicle

Important: Make Sure the seat belt lower anchor is parallel to vehicle centreline as shown.

Tighten
Tighten the bolt (1) to 43 N·m (31 lb ft).

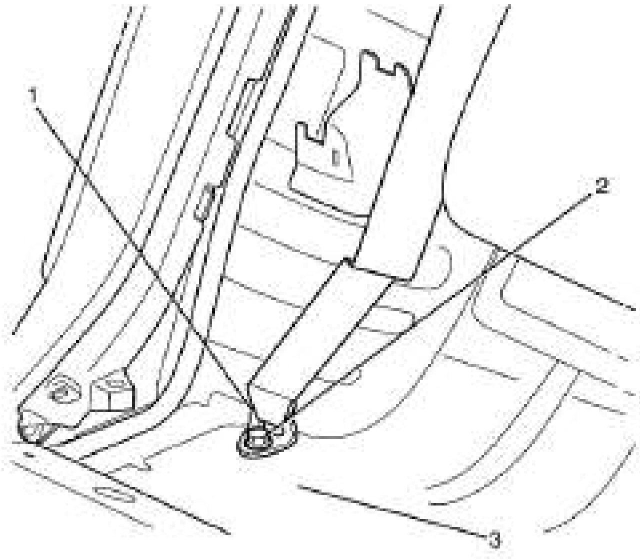
5. Replace the upper rear quarter trim panel. Refer to Quarter Upper Trim Panel Replacement.
6. Replace the rear seat cushion. Refer to Rear Seat Cushion Replacement.
7. Replace the rear seat back. Refer to Rear Seat Back Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Seat Belts | Repair Instructions | Document ID: 2126729

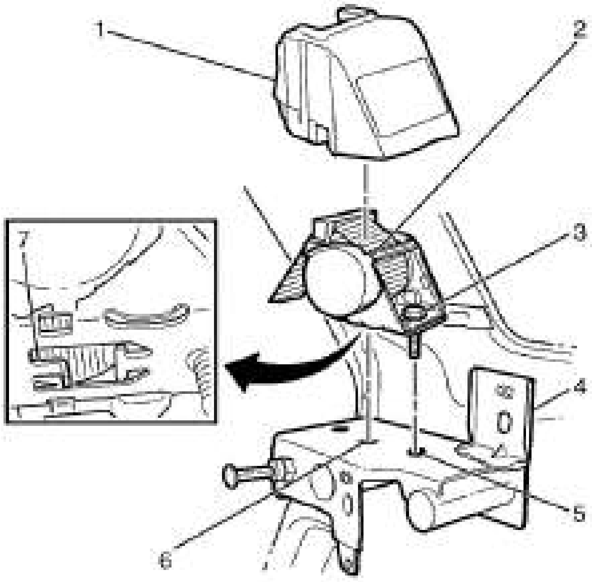
Rear Seat Belt Replacement (Sportwagon)

Removal Procedure

1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the rear seat back bolster. Refer to Rear Split Folding Seat Back Bolster Replacement.
3. Remove the body lock pillar lower trim. Refer to Body Lock Pillar Trim Panel Replacement.

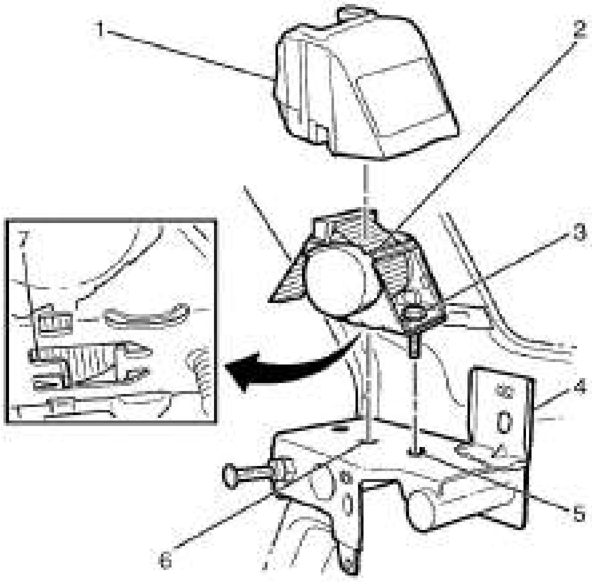


4. Remove the rear seat belt lower anchor bolt (2) from the vehicle body (3).
5. Remove the rear seat belt lower anchor (1) to the vehicle body (3).
6. Fold the seat back into the lowered position.
7. Remove the quarter inner trim finish panel. Refer to Quarter Inner Trim Finish Panel Replacement.
8. Remove the body lock pillar trim. Refer to Body Lock Pillar Trim Panel Replacement.
9. Thread the rear seat belt lower anchor through the body lock pillar trim.



10. Remove the rear seat belt retractor noise block (1) from the rear seat belt retractor (2).
11. Thread the rear seat belt lower anchor through the retractor noise block (1).
12. Remove the rear seat belt retractor bolt (3).
13. Remove the rear seat belt retractor (2) from the rear seat belt retractor mounting bracket (4).

Installation Procedure



Important: Make sure that the rear seat belt retractor bolt (3) is aligned and threads easily into the rear seat belt retractor mounting bracket captive nut before tightening with a hand tool.

Important: Make sure that the rear seat belt retractor dowel (7) locates into the rear seat belt retractor mounting bracket datum hole (6).

1. Install the rear seat belt retractor assembly (2) to the rear seat belt retractor mounting bracket (4).

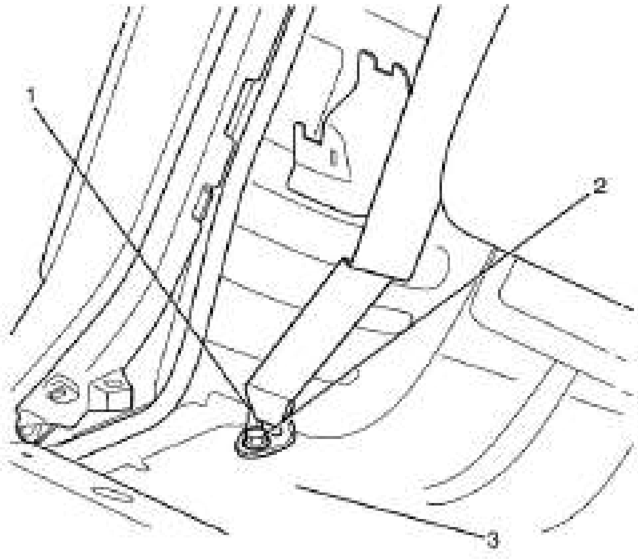
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the rear seat belt retractor bolt (3).

   Tighten
   Tighten the bolt to 43 N·m (32 lb ft).

3. Thread the rear seat belt lower anchor through the retractor noise block (1).
4. Install the rear seat belt retractor noise block (1) to the rear seat belt retractor (2).
5. Thread the rear seat belt lower anchor through the body lock pillar trim.
6. Install the body lock pillar trim. Refer to Body Lock Pillar Trim Panel Replacement.
7. Install the quarter inner trim finish panel. Refer to Quarter Inner Trim Finish Panel Replacement.
8. Fold the seat back into the upright position.

   Notice: Refer to Fastener Notice in the Preface section.



9. Install the rear seat belt lower anchor (1) to the vehicle body (3).
10. Install the rear seat belt lower anchor bolt (2) to the vehicle body (3).

    Tighten
    Tighten the bolt to 43 N·m (32 lb ft).

11. Install the body lock pillar lower trim. Refer to Body Lock Pillar Lower Trim Panel Replacement.
12. Install the seat back bolster. Refer to Rear Split Folding Seat Back Bolster Replacement.

13. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.
14. Check rear seat belt operation.

Repairs and Inspections Required After a Collision

Important: After a minor collision where no automatic restraint device was deployed, seat belt system replacement may not be necessary, unless some of the parts are torn, worn, or damaged. Restraint systems can be damaged in a collision. To help avoid injury and ensure that all parts in need of replacement are replaced:

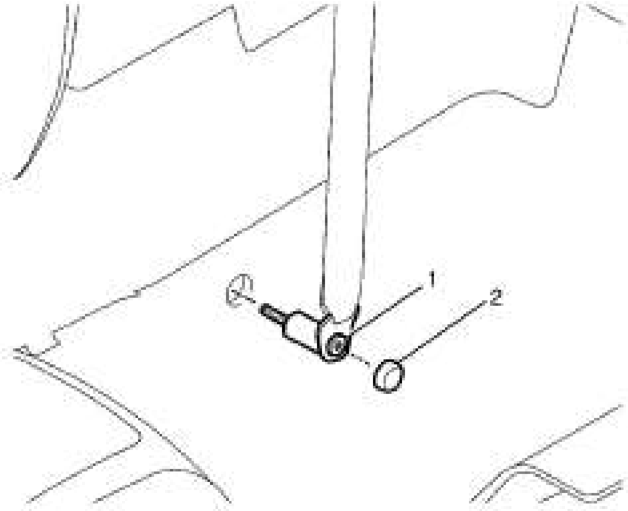
- Replace any seat belt system that was in use during the collision serious enough to deploy any automatic restraint device such as air bags and seat belt pretensioners. This not only includes seat belt systems in use by people of adult size, but seat belt systems used to secure child restraints, infant carriers and booster seats, including child restraint anchor fittings and top tether anchorages.
- Replace any seat belt system that has torn, worn, or damaged components. This not only includes adult seat belt systems, but built-in child restraints and child restraint anchor fittings components, if any.
- Replace any seat belt system if you are doubtful about its condition. This not only includes adult seat belt systems, but built-in child restraints, child restraint anchor fittings components, and any restraint system used to secure infant carriers, child restraints, and booster seats.
- Do NOT replace single seat belt system components in vehicles that have been in a collision as described above. Always replace the entire seat belt system with the buckle, guide and retractor assembly, which includes the latch and webbing material.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Seat Belts | Repair Instructions | **Document ID: 1974880**

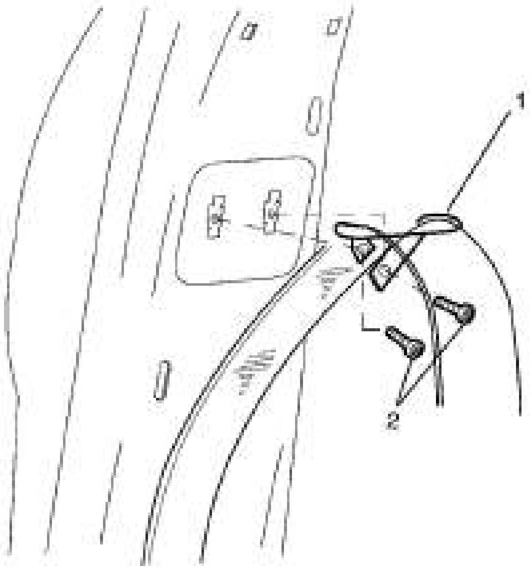
Seat Belt Height Adjuster Replacement - Front (RHD)

Removal Procedure

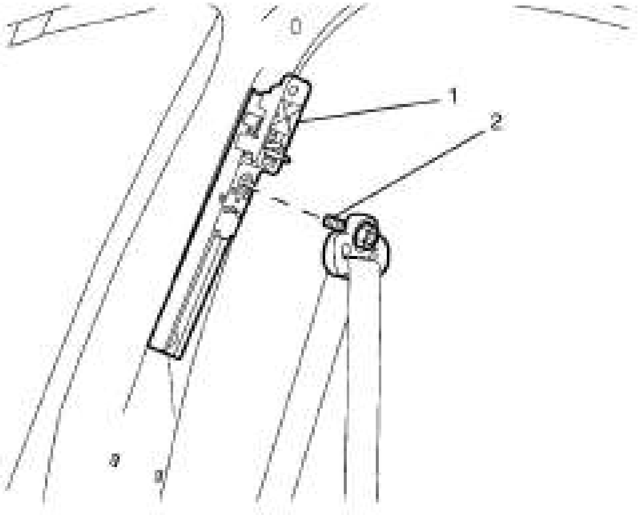
1. Remove the door sill trim plate. Refer to Door Sill Plate Replacement.
2. Remove the lower centre pillar trim plate. Refer to Center Pillar Lower Trim Panel Replacement .
3. Remove the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement.
4. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.



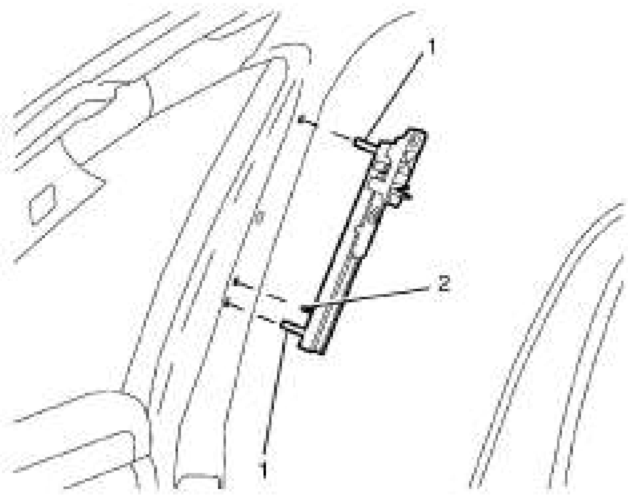
5. Remove the front seat belt lower anchor bolt cover (2).
6. Remove the front seat belt lower anchor bolt assembly (1).
7. Move the seat all the way forward towards the front of the vehicle, to gain access to the seat belt.



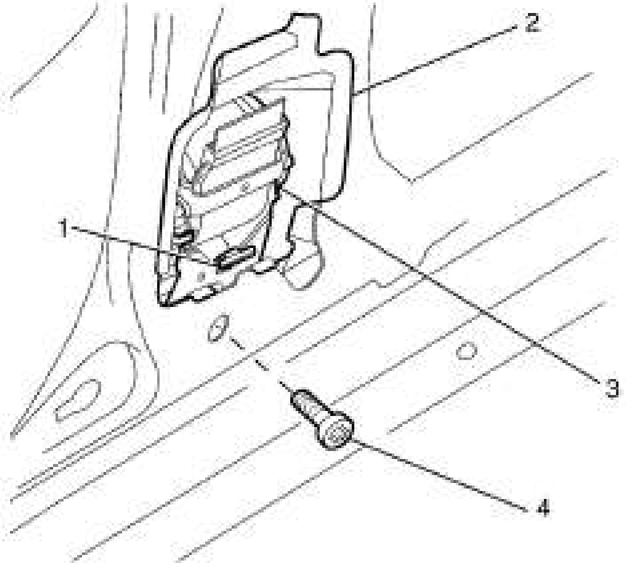
8. Remove the intermediate seat belt guide screws (2).
9. Remove the intermediate seat belt guide (1).



10. Remove the front seat belt D-Ring seat belt guide (2) to the height adjuster assembly (1).



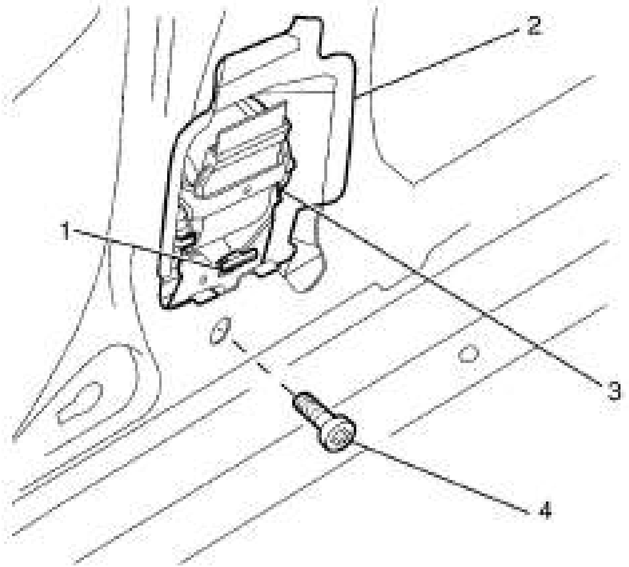
11. Move the height adjuster to gain access to the bolts (1). Remove the height adjuster from the vehicle. Remove the seat belt height adjuster (if required).



12. Remove the front seat belt retractor bolt (4).
13. Lift the retractor (3) in a upwards direction and tilt on a 30 degree angle making sure that the locking tab (1) is clear.
14. Remove the dust cover (2) from the centre pillar (if required).

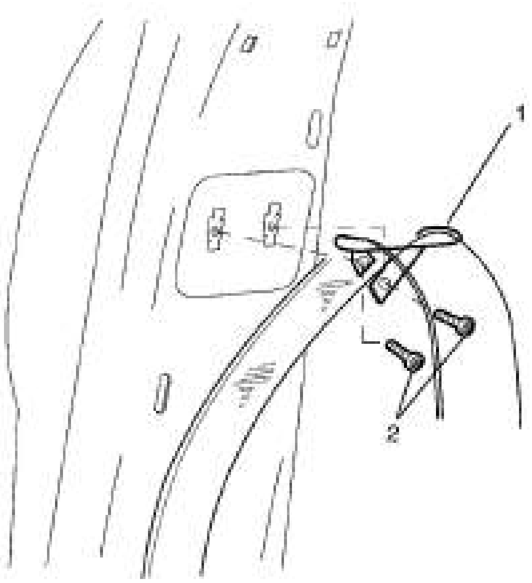
Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the front seat belt dust cover (2) to the vehicle (if removed).
2. Install the front seat belt retractor (3) to the vehicle.
3. Making sure that the locking tab (1) is seated correctly.
4. Secure the retractor (3) with the bolt (4).

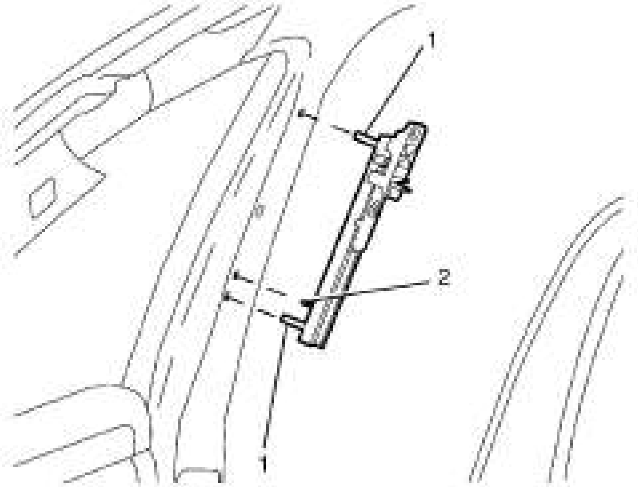
   Tighten
   Tighten the bolt (4) to 43 N·m (31 lb ft).



5. Install the intermediate seat belt guide (1) to the vehicle. Secure the guide with the screws (2).

   Tighten

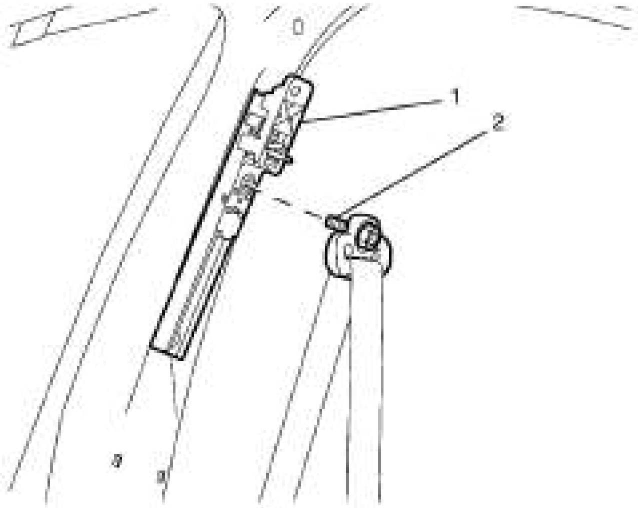
Tighten the intermediate seat belt guide screws to 2 N·m (18 lb in).



Important: Install a new height adjuster assembly (if required) and tighten.

6. Install the seat belt height adjuster bolts (1) to the vehicle. Make sure the seat belt height locating pin (2) is seated correctly before tightening.

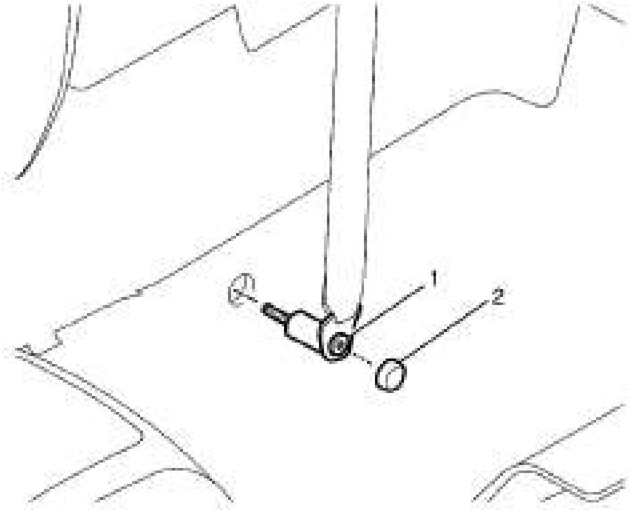
   Tighten
   Tighten the bolts (1) to 30 N·m (24 lb ft).



7. Install the front seat belt upper guide assembly (2) to the height adjuster assembly (1).

   Tighten
   Tighten the front seat belt upper guide bolt assembly to 43 N·m (32 lb ft).

8. Install the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement.
9. Install the lower centre panel trim panel. Refer to Center Pillar Lower Trim Panel Replacement.
10. Install the door sill trim plate. Refer to Door Sill Plate Replacement.
11. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.



12. Install the front seat belt lower anchor assembly (1).

    Tighten
    Tighten the bolt to 42.5 N·m (31 lb ft).

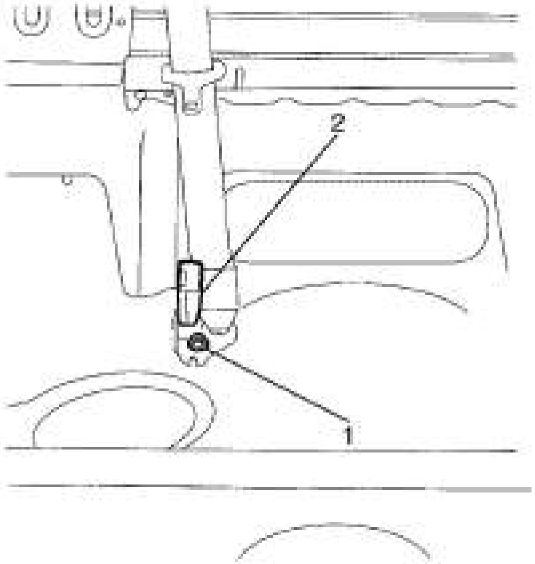
13. Install the front seat belt lower anchor bolt trim cover (2).
14. Move the front seat back to original position.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Seat Belts | Repair Instructions | Document ID: 1997065

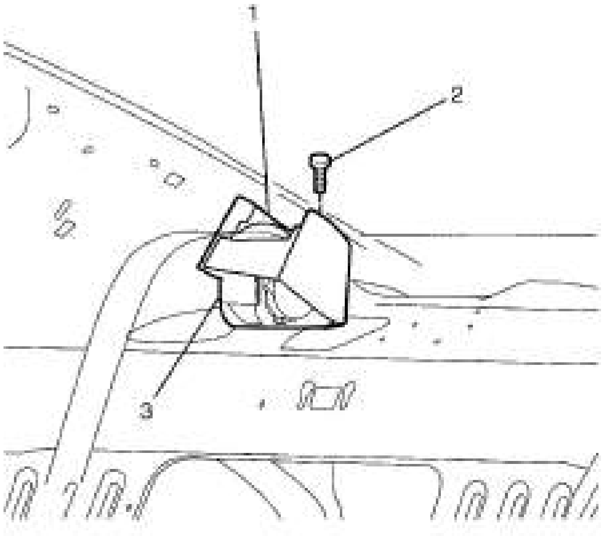
Seat Belt Replacement - Center Rear (RHD)

Removal Procedure

1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the rear seat back. Refer to Rear Seat Back Replacement.
3. Remove the rear shelf trim panel. Refer to Rear Window Shelf Trim Panel Replacement.



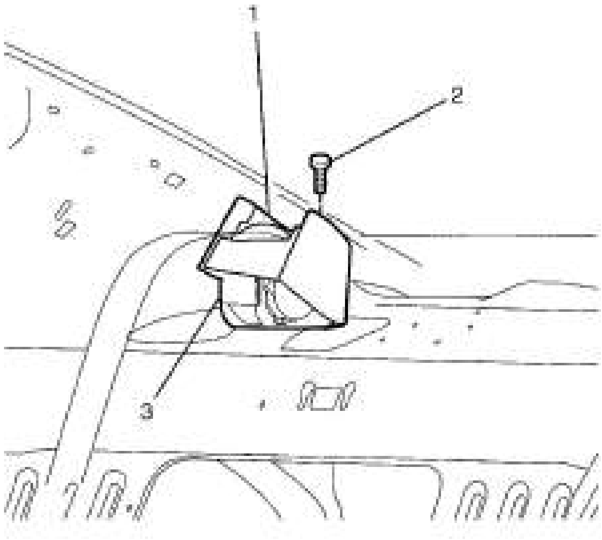
4. Remove the rear seat centre belt anchor nut (1).
5. Remove the anchor mounting bracket (2) from the vehicle.



6. Remove the rear seat centre belt noise block (1).

7. Remove the retractor bolt (2).
8. Remove the seat belt retractor (3).

Installation Procedure



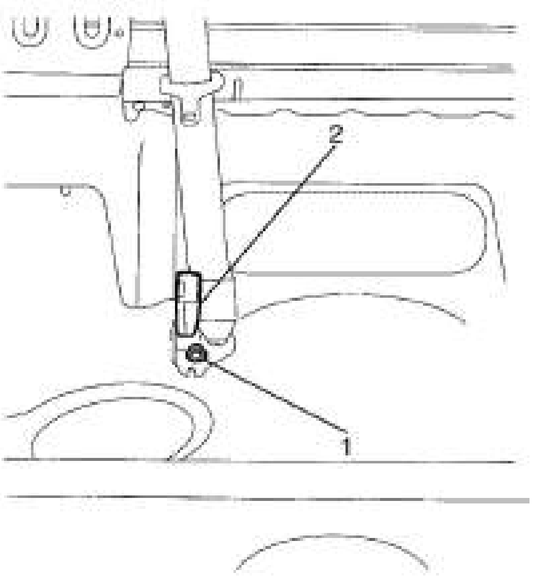
Important: Make Sure the retractor is parallel to vehicle centre line.

1. Install the centre seat belt retractor (3) to the rear window shelf. Make sure the retainer tab engages the notch in the shelf.
2. Install the retractor bolt (2) and seat belt retractor noise block (1).

   Notice: Refer to Component Fastener Tightening Notice in the Preface section.

3. Install the centre seat belt retractor fastener (2).

   Tighten
   Tighten the fastener to 43 N·m (32 lb ft).



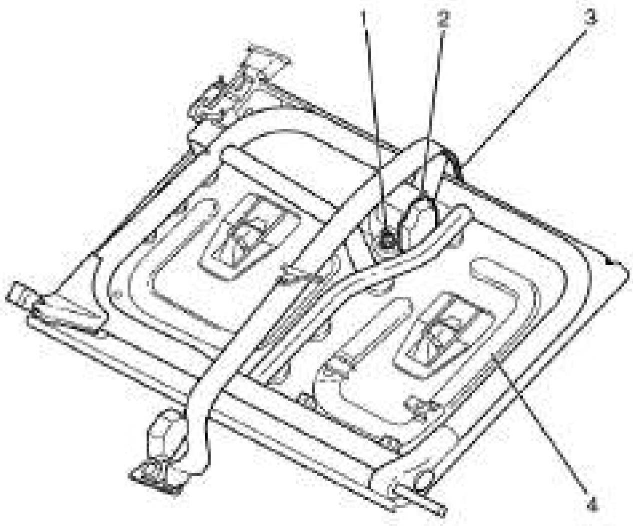
Important: Make Sure the centre belt anchor is parallel to vehicle centreline.

4. Install the rear seat centre belt anchor nut (1).
5. Remove the anchor mounting bracket (2) from the vehicle.
6. Install the rear shelf trim panel. Refer to Rear Window Shelf Trim Panel Replacement.
7. Install the rear seat back. Refer to Rear Seat Back Replacement.
8. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.

Seat Belt Replacement - Center Rear (Sportwagon)

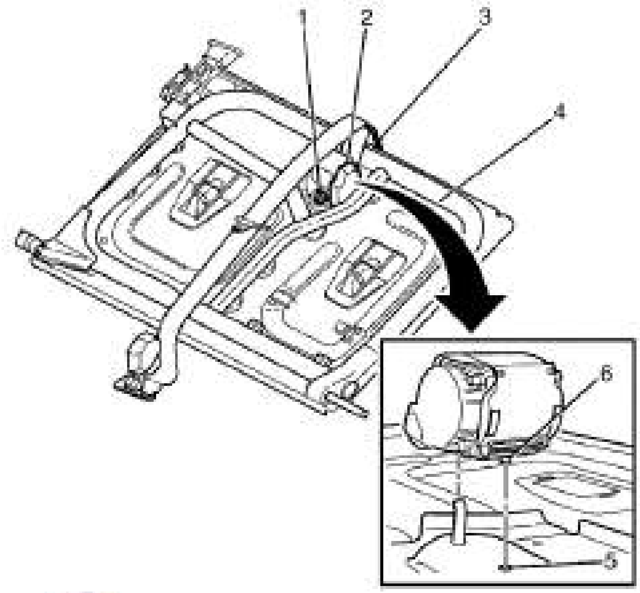
Removal Procedure

1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the right rear seat back assembly. Refer to Rear Split Folding Seat Back Replacement.
3. Remove the right rear seat cover and pad. Refer to Rear Split Folding Seat Back Cushion Cover and Pad Replacement.



4. Remove the seat belt retractor to seat frame retaining nut (1).
5. Detach the seat belt retractor (2) from the seat frame assembly (4).
6. Thread the belt and buckle through the guide bracket (3) and remove the seat belt retractor (2).

Installation Procedure



1. Thread the belt and buckle through the guide bracket (3) and locate the seat belt retractor (2) to the seat frame assembly (4).

   Important: Make sure that the seat belt retractor dowel (6) locates into the seat frame assembly datum hole (5).

2. Install the seat belt retractor (1) to the seat frame assembly (4).

   Notice: Refer to Fastener Notice in the Preface section.

   Important: A NEW nut must be used when installing the rear seat belt retractor (2).

3. Tighten the seat belt retractor to seat frame retaining nut (1).

   Tighten
   Tighten the nut to 43 N·m (32 lb ft).

4. Install the right rear seat cover and pad. Refer to Rear Split Folding Seat Back Cushion Cover and Pad Replacement.
5. Install the right rear seat back assembly. Refer to Rear Split Folding Seat Back Replacement.
6. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.

Diagnostic Starting Point - Seat Belts

Begin the system diagnosis by reviewing the Seat Belt System Description and Operation. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists and will also help you determine if the condition described by the customer is normal operation.

Refer to Symptoms - Seat Belts. In order to identify the correct procedure for diagnosing the system and where the procedure is located.

Operational and Functional Checks

Important: If the vehicle has been in a collision, refer to Repairs and Inspections Required After a Collision in Seat Belts. For additional information.

Perform the following inspection of the driver and passenger seat:

1. Ignition ON. Verify proper operation of the seat belt reminder lamp with the belt buckled and with the belt unbuckled. Refer to Seat Belt System Description and Operation in Seat Belts.
2. Inspect the shoulder belt guide in order to make sure that the following conditions are met:
   - The seat belt webbing is seated flat in the guide slot.
   - The seat belt webbing does not bind.
3. Verify that the seat belt buckle faces inboard and is accessible.
4. Verify that the seat belt retractor units are securely attached.
5. Verify that the seat belt anchor bolts are secure.
6. Fully extend the seat belt webbing. Verify that the seat belt webbing does not have any twists or tears.
7. Allow the seat belt webbing to retract. Verify that the seat belt webbing returns freely and completely back into the retractor.
8. Snap the seat belt latch plate into the buckle.
9. Sharply tug on the seat belt latch plate and the buckle. Verify that the seat belt latch plate and the buckle remain locked when tugged.
10. Push the button on the buckle.
    - Verify that the seat belt latch plate releases easily from the buckle.
    - Verify that the button returns to its original position.

Perform the following steps to inspect the left and right seat belts:

1. Inspect the shoulder belt guide in order to make sure that the following conditions are met:
   - The seat belt webbing is seated flat in the guide slot.
   - The seat belt webbing does not bind.
2. Verify that the seat buckle is accessible.
3. Verify that the seat belt retractor units are securely attached.
4. Verify that the seat belt anchor bolts are secure.
5. Fully extend the seat belt webbing. Verify that the seat belt webbing does not have any twists or tears.
6. Allow the seat belt webbing to retract. Verify that the seat belt webbing returns freely and completely back into the retractor.
7. Snap the seat belt latch plate into the buckle.
8. Sharply tug on the seat belt latch plate and the buckle. Verify that the seat belt latch plate and the buckle remain locked when tugged.
9. Push the button on the buckle.
   - Verify that the seat belt latch plate releases easily from the buckle.
   - Verify that the button returns to its original position.

Perform the following steps to inspect the centre rear seat belts:

1. Verify that the centre seat belts are accessible.
2. Verify that the centre seat belt retractor unit is securely attached.

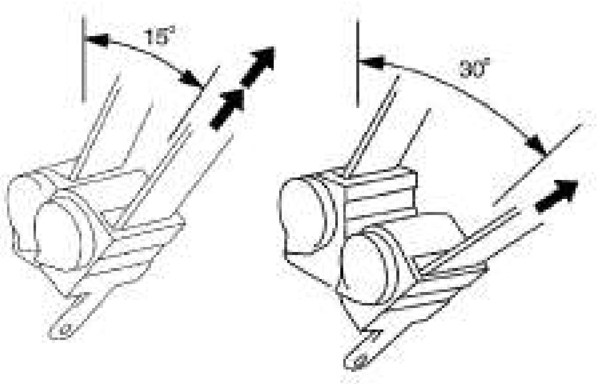
3. Verify that the seat belt anchor bolts are secure.
4. Verify that the seat belt buckle anchor bolts are secure.
5. Fully extend the centre seat belt webbing. Verify that the seat belt webbing does not have any twists or tears.
6. Allow the centre seat belt webbing to retract. Verify that the seat belt webbing returns freely and completely back into the retractor.
7. Snap the seat belt latch plate into the buckle.
8. Sharply tug on the seat belt latch plate and the buckle. Verify that the seat belt latch plate and the buckle remain locked when tugged.
    - Verify that the seat belt latch plate releases easily from both buckles.
    - Verify that the buttons return to their original positions.

For information on removal of the rear seats cushions refer to Rear Seat Cushion Replacement in Seats.

Emergency Locking Retractors

1. Fasten the seat belts, an assistant is needed when the retractor under test is not part of the driver seat belt.
2. Accelerate the vehicle slowly to 16 km/h and apply the brakes firmly.
3. Verify that the seat belt locks when braking firmly.
4. If the belt does not lock, proceed with the following steps.

Important: When performing this check , note the position the retractor is mounted.



4.1. Remove the seat belt retractor assembly.

4.2. Tilt the seat belt retractor slowly.

4.3. Make sure that the seat belt webbing can be pulled from the retractor at an inclination from the vehicle position of 15 degrees or less and cannot be pulled from the retractor at an inclination of 30 degrees or more.

4.4. If the seat belt retractor does not operate as described, replace the retractor assembly. Refer to the following procedures:

- Front Seat Belt Replacement in Seat Belts
- Rear Seat Belt Replacement in Seat Belts
- Seat Belt Replacement - Center Rearin Seat Belts

Seat Belt Indicator Circuit Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Driver Seat Belt Sensor Signal	1, B0072 02	2, B0072 05	2, B0072 05	2, B0072 01	B0072 08
Driver Seat Belt Sensor Low Reference	--	2, B0072 05	2, B0072 05	2	B0072 08

1. Indicator will remain ON with seat belt buckled.

2. Indicator will illuminate only for the bulb test.

Circuit/System Description

The driver seat belt switch is a 2-wire switch wired to the inflatable restraint sensing and diagnostic module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The SDM sends the status of the driver seat belt via serial data to the instrument panel cluster (IPC). After receiving the message, the IPC controls the illumination of the driver seat belt indicator.

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

1. Ignition ON, with a scan tool perform the IPC Display Test and verify the driver seat belt indicator is illuminated for 5 seconds.

   If the indicator does not illuminate, replace the IPC.
2. Monitor the scan tool Driver Seat Belt Switch parameter while connecting and disconnecting the seat belt. The parameter should display Buckled and Not Buckled when changing seat belt states.

Circuit / System Testing

> **Important:** When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
>
> - Seat belt switch
> - Seat belt switch harness connector
> - SDM
> - SDM wiring harness connector

1. Ignition OFF, disconnect the harness connector at the seat belt switch.
2. Ignition OFF, test for less than 1 ohm between the low reference circuit terminal A and ground.

   If greater than the specified range, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the SDM.
3. Ignition ON, verify the scan tool Driver Seat Belt Switch parameter displays Buckled.

   If not the specified value, test the signal circuit for a short to ground. If the circuit tests normal replace the SDM.
4. Install a 3A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the scan tool Driver Seat Belt Switch parameter displays Not Buckled.

   If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the SDM.
5. If all circuits test normal, test or replace the seat belt switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the seat belt switch.

2. With the seat belt buckled, test for infinite resistance between the signal circuit terminal B and the low reference terminal A.

   If less than the specified value, replace the seat belt switch.
3. With the seat belt unbuckled, test for less than 1 ohm between the signal circuit terminal B and the low reference terminal A.

   If greater than the specified range, replace the seat belt switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Front Seat Belt Replacement
- Control Module References for SDM and IPC replacement, setup, and programming

Seat Belt Service Precautions

Important: If the vehicle has been in a collision, refer to Repairs and Inspections Required After a Collision in Seat Belts. For additional information.

- Do not bleach or dye the seat belt webbing. Use only the following items in order to clean the seat belt webbing:
  - A mild soap and water solution.
  - A soft brush or cloth.
  - Rinse with fresh water.
- Keep sharp edges and damaging objects away from the seat belts. Avoid bending or damaging any part of the seat belt buckle or the latch plate. Replace any seat belts which are cut or damaged in any way.
- Use only the correct seat belt anchor bolts/screws and tighten the anchor bolts/screws to the correct torque value. Refer to Fastener Tightening Specifications. When installing seat belt anchor bolts, start the bolt by hand to ensure that the bolt is threaded straight.
- Some seat belts and retractors require service as a set, with service replacement parts only. Do not attempt to repair to individual components that require service as a set.
- Verify that the replacement part number is correct for the vehicle at that seating position. Do not substitute a seat belt from a different seating position.

Symptoms - Seat Belts

Important: Review the seat belt system description and operation in order to familiarise yourself with the system and how it functions. Refer to Seat Belt System Description and Operation.

Visual / Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat belt system. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to the following symptom diagnostic procedure in order to diagnose the symptom:

Seat Belt System Description and Operation (Sedan)

Description

The Occupant Protection System (OPS) is designed to restrain and protect occupants of the vehicle during a collision. This is achieved by the use of:

- Lap-sash inertia reel seat belt assemblies fitted in all seating positions.
- Seat belt pretensioners which are incorporated in the front drivers and passenger seat belt buckles.
- A dual stage drivers airbag which is incorporated in the steering wheel.
- A dual stage passenger airbag which is incorporated in the instrument panel.
- Side impact inflatable restraints which are incorporated in the front driver and passenger seats, where fitted.
- Side impact inflatable restraints (curtain airbags) which are incorporated in the roof, where fitted.
- Active head restraints which are incorporated in the front seat assemblies, where fitted.

Locking of the inertia reel seat belt is automatic. Deployment of the seat belt pretensioners and inflatable restraints is controlled by a sensing diagnostic module (SDM), which is mounted on the floor panel beneath the centre console. The SDM has an internal velocity sensor and two external impact sensors mounted to the front of the vehicle to detect frontal collisions, while side impact sensor assemblies fitted to each side of the vehicle detect side impacts.

Front Seat Belt System

The front seat belt system includes the following components:

- Driver and passenger seat belt retractors which are located behind the centre pillar lower trim panel and are attached to the vehicle body.
- Driver and passenger seat belt buckles which are located near the centre console side of the seats and are attached to the seat frame.
- The system also includes a seat belt switch in the drivers seat buckle which controls a warning indicator lamp and a tone alarm.

Rear Seat Belt System

The rear seat belt system includes the following components:

- The rear seat belt retractors are located behind the body lock pillar trims and are attached to the vehicle body.
- The centre rear seat belt retractor is located in the rear seat and is attached to the rear seat frame assembly.
- The centre rear seat belt buckle and the outer rear seat belt buckles are located in the seat cushion and are attached to the vehicle body.

Child Seat Restraint System

Important: : A child in a rear-facing child restraint can be seriously injured if the front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in the front seat of this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored. Passengers should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

Fasten Safety Belt Indicator (ISO Symbol) (Red)

The fasten safety belt indicator may only be ON when the vehicle is in RUN mode. The instrument panel cluster (IPC) illuminates the fasten safety belt indicator under the following conditions:

- During the bulb check.
- The inflatable restraint sensing and diagnostic module (SDM) sends the status of the driver seat belt switch to the IPC. If the seat belt is unfastened, the IPC will illuminate the fasten safety belt indicator for approx. 20 seconds or until the seat belt is fastened. If the seat belt is unfastened within 8 seconds following the bulb check, the SDM sends a request to the IPC for 5 chimes to sound.

Seat Belt System Description and Operation (Sportwagon)

Description

Important: If the vehicle has been in a collision, refer to Repairs and Inspections Required After a Collision for additional information.

The vehicle has front and rear seat belts that are the primary means of occupant restraint. The seat belts help to keep the occupants inside the passenger compartment and to gradually reduce the impact forces during the following events:

- Frontal impact type collisions
- Rear impact type collisions
- Side impact type collisions
- Roll-over type collisions

All seat belt retractors have emergency locks. The seat belt retractors remain unlocked during normal operation and under normal driving conditions in order to allow free movement to the upper body of each occupant. The seat belt retractor mechanism emergency lock engages preventing any movement of the seat belt when the following conditions occur:

- A rapid extraction of the seat belt webbing from the retractor
- An abrupt change in vehicle speed
- An abrupt change in vehicle direction
- Operation of the vehicle on a steep upgrade
- Operation of the vehicle on a downgrade

Front Seat Belt System

The front seat belt system includes the following components:

- The driver and passenger seat belt retractors which are located behind the centre pillar lower trim panels and are attached to the vehicle body.
- The driver and passenger seat belt pretensioner buckles which are attached to the console side of the seat frame.
- The seat belt reminder switch in the drivers seat belt buckle.

The driver and passenger seat belt pretensioner buckles are controlled by the sensing and diagnostic module (SDM). In the event of a front, rear or angled impact the SDM deploys the driver and passenger seat belt pretensioners. When deployed the pretensioner decreases in length tightening the seat belt and securing the occupant into the seat, reducing the severity and extent of injuries. The driver's seat belt switch in the driver seat buckle controls a seat belt reminder warning lamp and an audible chime.

Rear Seat Belt System

The rear seat belt system includes the following components:

- The left and right rear seat belt retractors which are located behind the body lock pillar trims and are attached to the vehicle body.
- The centre rear seat belt retractor which is located under the rear parcel shelf and is attached to the vehicle body (Sedan).
- The centre rear seat belt retractor is located in the rear seat and is attached to the rear seat frame assembly (Sportwagon).
- The centre rear seat belt buckle and the outer rear seat belt buckles are located under the seat cushion and are attached to the vehicle body.

Child Seat Restraint System

Important: : A child in a rear-facing child restraint can be seriously injured if the front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in the front seat of this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored.

Fasten Safety Belt Indicator (ISO Symbol) (Red)

The seat belt reminder switch is wired to the SDM, which sends a message via GMLAN to the instrument panel cluster (IPC) on the status of the seat belt buckle. The IPC activates the seat belt warning lamp and an audible chime. If the seat belt is not fastened when the ignition is ON, the seat belt warning lamp will illuminate and a chime will sound for approximately 20 seconds. If the seat belt is not fastened and the vehicle speed reaches 25 Km/h, the seat belt warning lamp will flash, the chime will sound and the Fasten Seat Belt message is displayed in the drivers multi function display until the seat belt is fastened.

Diagnostic Starting Point - SIR

Begin the system diagnosis by reviewing the SIR System Description and Operation. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists and will also help you determine if the condition described by the customer is normal operation.

DTC B0012 or B0013

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B0012 01: Driver Frontal Deployment Loop Stage 1 Short to Battery

DTC B0012 02: Driver Frontal Deployment Loop Stage 1 Short to Ground

DTC B0012 08: Driver Frontal Deployment Loop Stage 1 Signal Invalid

DTC B0012 0D: Driver Frontal Deployment Loop Stage 1 Resistance Above Threshold

DTC B0012 0E: Driver Frontal Deployment Loop Stage 1 Resistance Below Threshold

DTC B0013 01: Driver Frontal Deployment Loop Stage 2 Short to Battery

DTC B0013 02: Driver Frontal Deployment Loop Stage 2 Short to Ground

DTC B0013 08: Driver Frontal Deployment Loop Stage 2 Signal Invalid

DTC B0013 0D: Driver Frontal Deployment Loop Stage 2 Resistance Above Threshold

DTC B0013 0E: Driver Frontal Deployment Loop Stage 2 Resistance Below Threshold

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Steering Wheel Module Stage 1 High Control	B0012 02	B0012 0D	B0012 08	B0012 01	B0012 0E
Steering Wheel Module Stage 1 Low Control	B0012 02	B0012 0D	B0012 08	B0012 01	B0012 0E
Steering Wheel Module Stage 2 High Control	B0013 02	B0013 0D	B0013 08	B0013 01	B0013 0E
Steering Wheel Module Stage 2 Low Control	B0013 02	B0013 0D	B0013 08	B0013 01	B0013 0E

Circuit/System Description

During a frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy the steering wheel module. The SDM performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. There are 2 shorting bars used within the steering wheel module coil connector which will short together both steering wheel module stage 1 high circuit and steering wheel module stage 1 low circuit and both steering wheel module stage 2 high circuit and steering wheel module stage 2 low circuit when the connector is disconnected. This will help to prevent unwanted deployment of the inflator module during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

B0012 01 Stage 1 or B0013 01 Stage 2

The steering wheel module high and/or low control circuit is shorted to voltage for 2 seconds.

B0012 02 Stage 1 or B0013 02 Stage 2

The steering wheel module high and/or low control circuit is shorted to ground for 2 seconds.

B0012 08 Stage 1 or B0013 08 Stage 2

The steering wheel module high and/or low control circuit is invalid during SDM initialization.

B0012 0D Stage 1 or B0013 0D Stage 2

The steering wheel module deployment loop resistance is more than 5.5 ohms for 2 seconds.

B0012 0E Stage 1 or B0013 0E Stage 2

The steering wheel module deployment loop resistance is less than 1.7 ohms for 2 seconds.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployment.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present
- A history DTC will clear after 100 fault-free ignition cycles

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

Important: Refer to SIR Service Precautions.

When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Steering wheel coil module
- SDM module
- Steering wheel coil module wiring harness connector
- SDM wiring harness connector

Important: The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

1. Ignition OFF, disconnect the appropriate harness connector at the inflatable restraint steering wheel module.
2. Ignition ON, verify that the appropriate scan tool Driver Airbag Stage 1 or Stage 2 Squib Circuit Resistance parameter is greater than 5.4 ohms at the control circuits.

   If less than the specified range, test the control circuits for a short to ground. If the circuits test normal, replace the SDM.
3. Connect a fused jumper wire between the appropriate control circuit terminals listed below:
   - Steering wheel module stage 1 terminal 1 X1 and terminal 2 X1
   - Steering wheel module stage 2 terminal 1 X2 and terminal 2 X2
4. Ignition ON, verify that the appropriate scan tool Driver Airbag Stage 1 or Stage 2 Squib Circuit Resistance parameter is less than 1.2 ohms at the control circuits.

If greater than the specified range, test the control circuits for a short to voltage or an open/high resistance. If the circuits test normal, replace the SDM.

5. If all circuits test normal, replace the inflatable restraint steering wheel module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Circuit/System Testing

Important: Refer to SIR Service Precautions.

When removing the connectors, inspect for damage or corrosion. Damage or corrosion to the following requires repair or replacement of the affected component/connector:

- Side impact module- driver
- SDM module
- Side impact module wiring harness connector
- SDM wiring harness connector

Important: The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shoring-bars within the connector allowing the deployment circuit to operate properly.

1. Ignition OFF, disconnect the harness connector at the driver inflatable restraint side impact module.
2. Ignition ON, verify that the scan tool Driver Side Airbag Squib Circuit Resistance parameter is greater than 5.4 ohms at the control circuits.

   If less than the specified range, test the control circuits for a short to ground. If the circuits test normal, replace the SDM.
3. Connect a fused jumper wire in between the side impact module terminal 1 X1 and terminal 2 X1.
4. Ignition ON, verify that the scan tool Driver Side Airbag Squib Circuit Resistance parameter is less than 1.2 ohms at the control circuits.

   If greater than the specified range, test the control circuits for a short to voltage or an open/high resistance. If the circuits test normal, replace the SDM.
5. If all circuits test normal, replace the driver inflatable restraint side impact module.

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy the seat belt pretensioner - driver. The SDM performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. A shorting bar used within the seat belt pretensioner - driver connector which will short together both seat belt pretensioner -

driver high and low circuits when the connector is disconnected, this will help to prevent unwanted deployment of the inflator module during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

B0015 01

The seat belt pretensioner - driver high and/or low control circuit is shorted to voltage for 2 seconds.

B0015 02

The seat belt pretensioner - driver high and/or low control circuit is shorted to ground for 2 seconds.

B0015 08

The seat belt pretensioner - driver high and/or low control circuit is invalid during SDM initialization.

B0015 0D

The seat belt pretensioner - driver deployment loop resistance is more than 5.5 ohms for 2 seconds.

B0015 0E

The seat belt pretensioner - driver deployment loop resistance is less than 1.1 ohms for 2 seconds.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear after 100 fault-free ignition cycles.

Circuit/System Testing

Important: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Seat belt buckle pretensioner - driver
- SDM module
- Seat belt buckle pretensioner - driver wiring harness connector
- SDM wiring harness connector

Important: The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shoring-bars within the connector allowing the deployment circuit to operate properly.

1. Ignition OFF, disconnect the harness connector at the driver seat belt buckle pretensioner.
2. Ignition ON, verify that the scan tool Driver Pretensioner Circuit Resistance parameter is greater than 5.4 ohms at the control circuits.

   If less than the specified range, test the control circuits for a short to ground. If the circuits test normal, replace the SDM.
3. Connect a fused jumper wire in between the seat belt buckle pretensioner terminal 1 and terminal 2.
4. Ignition ON, verify that the scan tool Driver Pretensioner Circuit Resistance parameter is less than 1.2 ohms at the control circuits.

   If greater than the specified range, test the control circuits for a short to voltage or an open/high resistance. If the circuits test normal, replace the SDM.
5. If all circuits test normal, replace the driver seat belt buckle pretensioner.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Seat Belt Buckle Pretensioner Replacement.

I/P Module Stage 2 Low Control	B0020 02	B0020 0D	B0020 0E	B0020 01	B0020 08

Circuit/System Description

If a malfunction is detected, a DTC will be stored in non-volatile memory. During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy the instrument panel (I/P) module. The SDM performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. There are 2 shorting bars used within the I/P module connector which will short together both I/P module stage 1 high and low circuits, and both I/P module stage 2 high and low circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the inflator module during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

B0019 01 Stage 1 or B0020 01 Stage 2

The I/P module high and/or low control circuit is shorted to voltage for 2 seconds.

B0019 02 Stage 1 or B0020 02 Stage 2

The I/P module high and/or low control circuit is shorted to ground for 2 seconds.

B0019 08 Stage 1 or B0020 04 Stage 2

The I/P module high and/or low control circuit is invalid during SDM initialization.

B0019 0D Stage 1 or B0020 0D Stage 2

The I/P module deployment loop resistance is more than 5.5 ohms for 2 seconds.

B0019 0E Stage 1 or B0020 0E Stage 2

The I/P module deployment loop resistance is less than 1.1 ohms for 2 seconds.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear after 100 fault-free ignition cycles.

DTC B0052 or B0053

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B0052: Deployment Commanded

DTC B0053: Deployment Commanded with Loop DTCs Present

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) contains a sensing device that converts vehicle velocity changes into an electrical signal. The SDM compares this electrical signal to a value stored in memory. When the generated signal exceeds the stored value, the SDM performs additional signal processing and compares the generated signals to values stored in memory. When 2 of the generated signals exceed the stored values, the SDM will cause current to flow through the deployment loops, deploying the air bags and/or pretensioners causing DTC B0052 or B0053 to set.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

B0052

- The SDM detects a frontal impact of sufficient force to warrant deployment of the frontal modules.
- The SDM detects a side impact of sufficient force to warrant deployment of a side impact module and/or roof rail module.
- The SDM has deployed the seat belt pretensioner for 3 separate deployments.

B0053

SDM commands inflators deployment with loop faults present.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM records crash data.

Conditions for Clearing the DTC

After an air bag deployment or 3 separate pretensioner deployments the DTC becomes latched and cannot be cleared.

Circuit/System Verification

Important:

- The seat belt pretensioners may deploy for impacts that are not severe enough to warrant frontal or side air bag deployment. The SDM is capable of sustaining 3 pretensioner deployment events, or one frontal or side deployment event. After the maximum number of deployments has occurred, DTC B0052 sets and becomes a latched code, which cannot be cleared.
- When DTC B0053 is accompanied by additional DTCs, other than B0052, repair the malfunction causing the other DTCs before replacing the SDM.

1. Ignition OFF, verify no signs of inflator module or pretensioner deployment exist.
   If any signs of deployment exist, refer to Repairs and Inspections Required After a Collision.
2. Verify DTC B0053 is not set.
   If DTC B0053 is set along with additional DTCs, other than B0052, repair the malfunction causing the DTCs before replacing the SDM.
3. Verify DTC B0052 is not set.

If the DTC resets, replace the SDM.

DTC Descriptor

DTC B0055 00: Side Airbag Deployment Commanded

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) contains a sensing device that converts vehicle velocity changes into an electrical signal. The SDM compares this electrical signal to a value stored in memory. When the generated signal exceeds the stored value, the SDM performs additional signal processing and compares the generated signals to values stored in memory. When 2 of the generated signals exceed the stored values, the SDM will cause current to flow through the inflator modules, deploying the side air bags and causing DTC B0055 to set.

This DTC is set when the SDM has commanded an air bag deployment with no faults present.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

- The SDM detects a frontal impact of sufficient force to warrant deployment of the frontal inflator modules.
- The SDM detects a side impact of sufficient force to warrant deployment of a side inflator module and/or roof rail module.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM records crash data.

Conditions for Clearing the DTC

DTC B0055 is a latched code and cannot be cleared.

Circuit/System Verification

1. Ignition OFF, Verify that the vehicle does not show any signs of side impact or frontal inflator module deployment.

   If the vehicle displays any signs of inflator deployment, refer to Repairs and Inspections Required After a Collision.
2. Verify DTC B0055 is not set.

   If DTC B0055 is set, replace the SDM.

DTC B0072

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B0072 01: Driver Seat Belt Sensor Circuit Short to Voltage

DTC B0072 02: Driver Seat Belt Sensor Circuit Short to Ground

DTC B0072 05: Driver Seat Belt Sensor Circuit Short to Battery or Open

DTC B0072 08: Driver Seat Belt Sensor Circuit Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Seat Belt Sensor Driver Low Reference	--	B0072 05, 2	B0072 05, 2	2	B0072 08
Seat Belt Sensor Driver Signal	B0072 02, 1	--	B0072 05, 2	B0072 01, 2	B0072 08
1. Indicator will remain ON with seat belt buckled 2. Indicator will illuminate only for the bulb test					

Circuit/System Description

The inflatable restraint seat belt buckle switch is within the seat belt buckle and provides an input to the inflatable restraint sensing and diagnostic module (SDM). The SDM supplies a low reference circuit and a seat belt switch signal circuit to determine a buckled or unbuckled condition. The SDM monitors the seat belt switch circuits and if a fault is detected a DTC will be set.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

B0072 01

The SDM detects the seat belt sensor circuit is shorted to voltage for 2 seconds.

B0072 02

The SDM detects the seat belt sensor circuit is shorted to ground for 2 seconds.

B0072 05

The SDM detects the seat belt sensor circuit is open for 2 seconds.

B0072 08

The SDM detects the seat belt sensor signal circuit is invalid for 2 seconds.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM will store the DTC.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear after 250 fault-free ignition cycles.

Circuit / System Verification

Ignition ON, observe the scan tool Driver Seat Belt Switch parameter while buckling and unbuckling the seat belt. The reading should be Not Buckled when the seat belt is unbuckled and the seat belt switch is closed. The reading should be Buckled when the seat belt is buckled and the seat belt switch is open.

Circuit / System Testing

Important: When removing connectors, inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector:

- Seat belt sensor.
- SDM.
- Seat belt sensor wiring harness connector.
- SDM wiring harness connector.

1. Ignition OFF, disconnect the harness connector of the seat belt switch.
2. Test for less than 1 ohm between low reference circuit terminal A and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the SDM.
3. Ignition ON, verify the scan tool Driver Seat Belt switch parameter is Buckled.

   If not the specified value, test the signal circuit for a short to ground. If the circuit tests normal, replace the SDM.
4. Connect a 3A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the scan tool Driver Seat Belt Switch parameter is Not Buckled.

   If not the specified value, test the signal circuit for short to voltage or an open/high resistance. If the circuit tests normal, replace the SDM.
5. If the circuits test normal, replace the seat belt buckle switch.

Repair Instructions

DTC Descriptors

DTC B0079 01: Driver Seat Position Sensor Circuit Short to Battery

DTC B0079 02: Driver Seat Position Sensor Circuit Short to Ground

DTC B0079 05: Driver Seat Position Sensor Circuit Short to Battery or Open

DTC B0079 08: Driver Seat Position Sensor Circuit Signal Invalid

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Seat Position Sensor Driver Low Reference	B0079 02	B0079 05	B0079 05	B0079 01	B0079 08
Seat Position Sensor Driver Signal	B0079 02	B0079 05	B0079 05	B0079 01	B0079 08

Circuit/System Description

The inflatable restraint seat position sensor (SPS) is used to determine the proximity of a front driver or passenger seat position with respect to the frontal air bag. The SPS interfaces with the sensing and diagnostic module (SDM). The state of the SPS allows the SDM to disable stage 2 of the frontal air bag for a front seat that is forward of a forward/rearward point in seat track travel. The SPS is a hall effect sensor that is mounted on the outboard seat track of the driver and passenger seats. The seat track includes a metal bracket that shunts the SPS magnetic circuit creating 2 states of seat position. The shunted state represents a rearward seat position. The non-shunted state represents a forward position. The SPS provides 2 current ranges, one range for the shunted state and a second range for a non-shunted state. These 2 states are inputs to the SDM, state 1 (shunted) being the rearward threshold and state 2 (non-shunted) being the forward threshold. When the SDM receives input from a SPS that state 1 threshold is reached (seat is rearward), the SDM will not disable stage 2 deployment, if required by the deployment sensors. When state 2 threshold is reached (seat is forward), the SDM will disable stage 2 deployment on the side the seat is forward. The SDM monitors the SPS circuit and if a fault is detected, the SDM will set codes B0079 and defaults to disabling stage 2 frontal deployment.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

B0079 01

The SDM detects the SPS signal circuit is shorted to voltage for 2 seconds.

B0079 02

The SDM detects the SPS signal circuit is shorted to ground for 2 seconds.

B0079 05

The SDM detects the SPS signal circuit is shorted to voltage or open for 2 seconds.

B0079 08

The SDM detects the SPS signal circuit is invalid for 500 milliseconds.

Action Taken When the DTC Sets

- The SDM defaults the SPS to seat forward threshold.
- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear after 250 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Right Front Side Impact Low Reference	B0086 02	B0086 04	B0086 04	B0086 01	B0086 3A

Circuit/System Description

The inflatable restraint front end sensor utilizes a unidirectional 2-wire circuit. The front end sensor modulates current on the interface to send ID, state of health, and deployment commands to the inflatable restraint sensing and diagnostic module (SDM). The SDM serves as a power source and a ground for the front end sensor. When the ignition is turned ON and input power from the SDM is first detected, the front end sensor responds by performing internal diagnostics and sending an ID to the SDM. The SDM considers the ID to be valid if the response time is less than 5 seconds. The front end sensor continually communicates status messages to the SDM, which determines if a fault is present in the front end sensor circuit. When a fault is detected, the SDM may reset the front end sensor up to 2 times by removing and reapplying power to it. If the fault is still present, the SDM will set a DTC.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

All of the following conditions exist for 2 seconds:

B0083 01 or B0084 01

- The front end sensor has been shorted to voltage.
- The SDM has not received a message from the front end sensor for more than 5 milliseconds.

B0083 02 or B0084 02

- The front end sensor has been shorted to ground.
- The front end sensor current has been above 23 mA for longer than 5 milliseconds.

B0083 04 or B0084 04

The front end sensor circuit is open.

B0083 39 or B0084 39

- The SDM has received a NOK message from the front end sensor.

- The SDM has not received a message.

B0083 3A or B0084 3A

- The SDM has received an ID message from the front end sensor, which does not match the ID stored in the SDM memory.
- The SDM has reset the front end sensor twice without detecting the correct ID message.

B0083 71 or B0084 71

The SDM has received invalid serial data from the front end sensor.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SIR System is disabled and no deployments are allowed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear after 250 fault-free ignition cycles.

Circuit/System Testing

Important: Refer to SIR Service Precautions.

When removing connectors, inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector:

- Front end sensor
- SDM module
- Front end sensor wiring harness connector
- SDM wiring harness connector

1. Ignition OFF, disconnect the X1 and X2 harness connectors at the SDM and the appropriate front end sensor.
2. Ignition ON, test for less than 1 volt between the appropriate front end sensor low reference circuit terminal 2 and ground.

   If greater than the specified range, test the circuit for a short to voltage.
3. Ignition ON, test for less than 1 volt between the appropriate front end sensor signal circuit terminal 1 and ground.

   If greater than the specified range, test the circuit for a short to voltage.
4. Test for infinite resistance between the appropriate front end sensor signal circuit terminal 1 and ground.

   If less than the specified value, test the circuit for a short to ground.
5. Test for less than 1 ohm between the appropriate front end low reference circuit terminals listed below:
   - With LHD left front end sensor terminal 2 and SDM terminal 19 X1.
   - With RHD left front end sensor terminal 2 and SDM terminal 24 X2.
   - With LHD right front end sensor terminal 2 and SDM terminal 24 X2.
   - With RHD right front end sensor terminal 2 and SDM terminal 19 X1.

   If greater than the specified range, test the circuit for an open/high resistance.
6. Test for less than 1 ohm between the appropriate front end sensor signal circuit terminals listed below:
   - With LHD left front end sensor terminal 1 and SDM terminal 20 X1.
   - With RHD left front end sensor terminal 1 and SDM terminal 23 X2.
   - With LHD right front end sensor terminal 1 and SDM terminal 23 X2.
   - With RHD right front end sensor terminal 1 and SDM terminal 20 X1.

   If greater than the specified range, test the circuit for an open/high resistance.
7. If all circuits test normal, replace the appropriate front end sensor.

   If the DTC resets, replace the SDM.

Right Front Side Impact Sensor High Signal	B0086 02	B0086 04	B0086 04	B0086 01	B0086 3A
Right Front Side Impact Low Reference	B0086 02	B0086 04	B0086 04	B0086 01	B0086 3A

Circuit/System Description

The inflatable restraint side impact sensor utilizes a unidirectional 2-wire circuit. The side impact sensor modulates current on the interface to send ID, state of health, and deployment commands to the inflatable restraint sensing and diagnostic module (SDM). The SDM serves as a power source and a ground for the side impact sensor. When the ignition is turned ON and input power from the SDM is first detected, the side impact sensor responds by performing internal diagnostics and sending an ID to the SDM. The SDM considers the ID to be valid if the response time is less than 5 seconds. The side impact sensor continually communicates status messages to the SDM, which determines if a fault is present in the side impact sensor circuit. When a fault is detected, the SDM may reset the side impact sensor up to 2 times by removing and reapplying power to it. If the fault is still present, the SDM will set a DTC.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

All of the following conditions exist for 2.5 seconds:

B0085 01 or B0086 01

- The side impact sensor (SIS) has been shorted to voltage.
- The SDM has not received a message from the SIS for more than 2.5 milliseconds

B0085 02 or B0086 02

- The side impact sensor has been shorted to ground.
- The side impact sensor current has been above 23 mA for longer than 5 milliseconds.

B0085 04 or B0086 04

The SIS circuit is open

B0085 39 or B0086 39

- The SDM has received a NOK message from the side impact sensor.
- The SDM has not received a message.

B0085 71 or B0086 71

The SDM has received invalid serial data from the side impact sensor.

B0085 3A or B0086 3A

- The SDM has received an ID message from the side impact sensor, which does not match the ID stored in the SDM memory.
- The SDM has reset the side impact sensor twice without detecting the correct ID message.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SIR System is disabled and no deployments are allowed.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Circuit / System Testing

Important: Refer to SIR Service Precautions.

When removing connectors, inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector:

- Side Impact sensor
- SDM module
- Side Impact sensor wiring harness connector
- SDM wiring harness connector

1. Ignition OFF, disconnect the X2 harness connector at the SDM and the harness connector at the appropriate side impact sensor.
2. Ignition ON, test for less than 1 volt between the appropriate side impact sensor low reference circuit terminal 2 and ground.

   If greater than the specified range, test the circuit for a short to voltage
3. Ignition ON, test for less than 1 volt between the appropriate side impact sensor signal circuit terminal 1 and ground.

   If greater than the specified range, test the circuit for a short to voltage.
4. Test for infinite resistance between the appropriate side impact sensor signal circuit terminal 2 and ground.

   If less than the specified value, test the circuit for a short to ground.
5. Test for less than 1 ohm between the appropriate side impact sensor low reference circuit terminals listed below:
   - With LHD left side impact sensor terminal 2 and SDM terminal 25 X2.

- With RHD left side impact sensor terminal 2 and SDM terminal 28 X2.
- With LHD right side impact sensor terminal 2 and SDM terminal 28 X2.
- With RHD right side impact sensor terminal 2 and SDM terminal 25 X2.

  If greater than the specified range, test the circuit for an open/voltage resistance.

6. Test for less than 1 ohm between the appropriate side impact sensor signal circuit terminals listed below:
   - With LHD left side impact sensor terminal 1 and SDM terminal 26 X2.
   - With RHD left side impact sensor terminal 1 and SDM terminal 27 X2.
   - With LHD right side impact sensor terminal 1 and SDM terminal 27 X2
   - With RHD right side impact sensor terminal 1 and SDM terminal 26 X2

   If greater than the specified range, test the circuit for an open/high resistance.
7. If all circuits test normal, replace the appropriate side impact sensor.
8. Reconnect all SIR components. Ignition ON, verify the DTC does not set as current.

   If the DTC resets as current, replace the SDM.

DTC B1001

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1001 3A: SDM Option Configuration Error

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) stores a primary data key, which is a 4-digit number, and a secondary data key, which is a portion of the vehicle identification number (VIN). When the ignition is turned ON, the SDM compares this information to the information stored in the body control module (BCM) over the serial data communication circuit. If there is a mismatch between the information stored in the SDM and BCM, DTC B1001 will set.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

- The 4-digit primary data key stored in the SDM does not match the 4 digits stored in the BCM.
- The VIN stored in the BCM does not match that of the vehicle.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM disables all deployments.

Conditions for Clearing the DTC

- The last 4-digit Primary Data Key in the SDM match the last 4 digits stored in the BCM.
- The VIN that is stored in the SDM matches the VIN stored in the BCM.

Diagnostic Aids

This DTC is an indication that an incorrect SDM is installed in the vehicle, or that the SDM and/or the BCM was replaced without reprogramming the BCM with the new information.

Circuit/System Verification

Important: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- SDM
- SDM wiring harness

1. Ignition ON, verify the scan tool Secondary Key Status displays Valid.
   If not the specified value, verify the scan tool Received VIN Digits 2-7 match the vehicle VIN , if the VIN does not match, reprogram the BCM. If the VIN matches, reprogram the SDM.
2. Ignition ON, verify the scan tool Primary Key Status displays Valid.
   If not the specified value, verify the scan tool SDM Primary Key matches the Received Primary Key, if the key does not match, perform the Setup SDM Primary Key in BCM procedure.
3. With a scan tool, verify DTC B1001 is not set.
   If the DTC is set, replace the SDM.

DTC Descriptors

DTC B1016 00: Vehicle Identification Number (VIN) Not Programmed

Circuit/System Description

This code indicates that the inflatable restraint sensing and diagnostic module (SDM) has received an invalid vehicle identification number (VIN) from the body control module (BCM).

Conditions for Running DTC

- System voltage is between 9-16 volts.
- Ignition switch is in the ON position.

Conditions for Setting the DTC

- VIN is not programmed in the SDM.
- Communication is lost between the SDM and BCM.

Conditions for Clearing the DTC

- VIN number is reprogrammed.
- A valid VIN is received from the BCM.

DTC B1325 07: System Voltage High Voltage

Circuit / System Description

With the ignition in either the ACC or ON positions, the inflatable restraint sensing and diagnostic module (SDM) should receive a 12V power supply. DTC B1325 will set to indicate the B+ positive supplied to the SDM is below the threshold.

Conditions for Setting the DTCs

This DTC runs continuously once the following condition is met:

The supplied power to the SDM is between 9 - 16V.

Action Taken When the DTC Sets

A warning lamp will illuminate.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC can be cleared using a scan tool.

Reference Information

Schematic Reference

SIR Schematics

Connector End View Reference

Component Connector End Views

Scan Tool Reference

Control Module References

Circuit / System Testing

1. Ignition OFF, wait for 30 seconds, and then disconnect the X1 harness connector at the SDM
2. Ignition ON, verify a test lamp illuminates between the B+ circuit terminal 22 X1 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open high resistance.
3. If all circuits test normal, replace the SDM

Repair Instructions

Important: Always perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for SDM replacement, setup, and programming

DTC B1370

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B1370 01: Device Ignition 1 Circuit Short to Battery

DTC B1370 06: Device Ignition 1 Circuit Short to Ground or Open

DTC Descriptor

DTC B1370 06: Device Ignition 1 Circuit Short to Ground or Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition 1 Voltage	B1370 06	B1370 06	--	--

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) monitors the ignition 1 signal from the ignition switch. When the vehicle ignition switch is placed in the RUN or CRANK position, the switch supplies voltage to the SDM ignition 1 input terminal. If an open or short to ground in this SDM ignition 1 circuit is detected, then DTC B1370 will set.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

The SDM detects a short to ground or an open in the ignition 1 voltage circuit for at least 2 seconds when the ignition switch is in RUN or CRANK.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.

- The SDM determines its power mode only from the GMLAN power mode messages and discards the ignition 1 input for the remainder of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Circuit/System Testing

Important: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- SDM
- SDM wiring harness

1. Ignition OFF, disconnect the X1 harness connector at the SDM and the X2 harness connector at the underhood fuse block.
2. Ignition OFF, test for greater than 1 ohm between the ignition 1 voltage circuit terminal 21 X1 and ground.

   If less then the specified value, test the circuit for a short to ground.
3. Ignition OFF, test for less than 1 ohm between the ignition 1 voltage circuit terminal 21 X1 and the underhood fuse block terminal 17 X2.

   If greater then the specified range, test the circuit for an open/high resistance.
4. If all circuits test normal, replace the SDM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for SDM replacement, setup, and programming

---

Air Bag Indicator Circuit Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit / System Description

When the ignition is turned ON, the instrument panel cluster (IPC) flashes the air bag indicator 7 times for a bulb check. The inflatable restraint sensing and diagnostic module (SDM) performs diagnostic tests on the SIR system during the bulb check. If any malfunction exists the SDM will request the IPC to illuminate the air bag indicator steady, via serial data. If a preexisting malfunction exists, the air bag indicator will illuminate steady immediately after the ignition is turned ON. If the ignition 1 voltage is outside of the normal operating voltage range 9-16 volts, the SDM will command the IPC to turn the air bag indicator ON with no DTCs present, then disables all deployment loops.

Diagnostic Aids

A DTC B1370 may set if the ignition 1 circuit is outside the 9-16 volts range.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Verify SDM DTCs are not set.
   If any DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Ignition OFF, monitor the IPC, ignition ON. The SIR warning indicator should flash then turn OFF.
   If the SIR warning indicator continually flashes, program the SDM.
3. Perform the Display Test in Instrument Panel Cluster/Special Functions. The Air Bag indicator should turn ON and OFF as commanded.
   If the air bag indicator does not illuminate as expected, replace the IPC.
4. If all circuits test normal, replace the SDM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- SIR/SRS Wiring Repairs
- Control Module References for IPC and SDM replacement, setup, and programming

SIR Disabling and Enabling

- SIR component location affects how a vehicle should be serviced. There are parts of the SIR system installed in various locations around a vehicle. To find the location of the SIR components refer to SIR Component Views.
- There are several reasons for disabling the SIR system, such as repairs to the SIR system or servicing a component near or attached to an SIR component. There are several ways to disable the SIR system depending on what type of service is being performed. The following information covers the proper procedures for disabling/enabling the SIR system.

Condition	Action
If the vehicle was involved in an accident with an air bag deployment.	Disconnect the negative battery cable(s) *. Refer to Battery Negative Cable Disconnection and Connection.
When performing SIR diagnostics.	Follow the appropriate SIR service manual diagnostic procedure(s) *
When removing or replacing an SIR component or a component attached to an SIR component.	Disconnect the negative battery cable(s) *
If the vehicle is suspected of having shorted electrical wires.	Disconnect the negative battery cable(s) *
When performing electrical diagnosis on components other than the SIR system.	Remove the SIR/Air bag fuse(s) when indicated by the diagnostic procedure to disable the SIR system
* DTCs will be lost when the negative battery cable is disconnected.	

Disabling Procedure - Negative Battery Cable

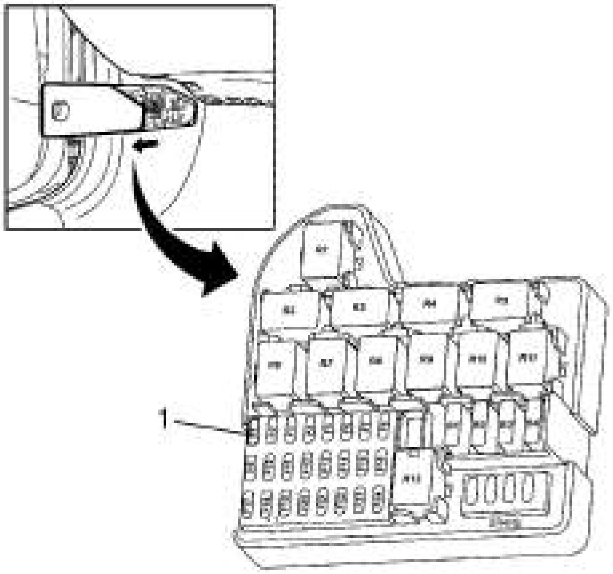
1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Ignition OFF.
3. Disconnect the negative battery cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
4. Wait 2 minutes before removing the fuse.

Enabling Procedure - Negative Battery Cable

1. Ignition OFF.
2. Connect the negative battery cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
3. Ignition ON. The AIR BAG indicator will flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to Diagnostic System Check - Vehicle.

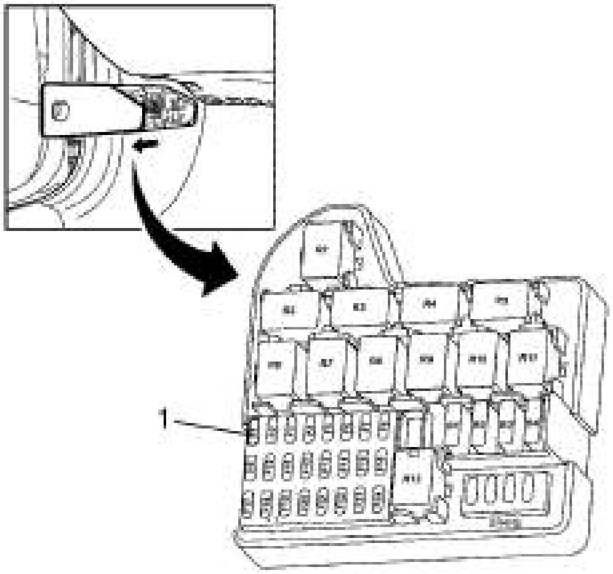
Disabling Procedure - Air Bag Fuse

Important: The SDM may have more than one fused power input. To ensure there is no unwanted SIR deployment, personal injury, or unnecessary SIR system repairs, remove all fuses supplying power to the SDM. With all SDM fuses removed and the ignition switch in the ON position, the AIR BAG warning indicator illuminates. This is normal operation, and does not indicate a SIR system malfunction.



1. Locate and remove the 10 amp fuse (1) supplying power to the SDM. Refer to SIR Schematics.
2. Wait 2 minutes before working on the system.

Enabling Procedure - Air Bag Fuse



1. Ignition OFF.

2. Install the 10 amp fuse (1) supplying power to the SDM. Refer to SIR Schematics.
3. Ignition ON. The AIR BAG indicator will flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle, if the AIR BAG warning indicator does not operate as described. Refer to Diagnostic System Check - Vehicle.

Symptoms - SIR

Important: Complete the following steps before using the symptom tables:

1. Perform the Diagnostic System Check - Vehicle , before using the symptom tables in order to verify that all of the following are true:
   - There are no diagnostic trouble codes (DTCs) set.
   - The inflatable restraint sensing and diagnostic module (SDM) can communicate via the serial data link.
2. Review the SIR system description and operation in order to familiarize yourself with the system functions. Refer to SIR System Description and Operation .

Visual / Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the SIR system. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Poor electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to Air Bag Indicator Circuit Malfunction in order to diagnose the symptom.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Supplemental Inflatable Restraints | Repair Instructions | **Document ID: 1995487**

Driver or Passenger Seat Side Inflatable Restraint Module Replacement (RHD)

Removal Procedure

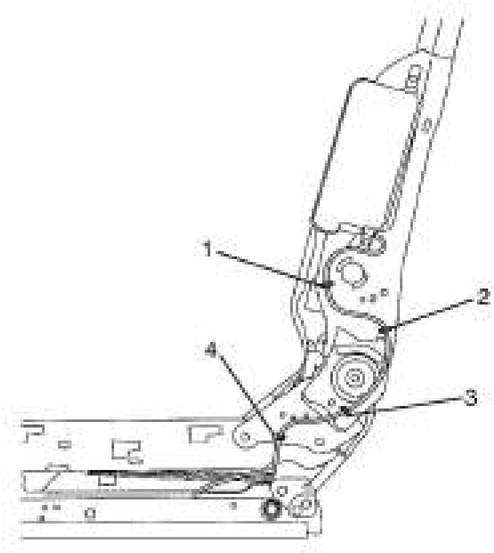
Caution: This vehicle is equipped with a Supplemental Inflatable Restraint (SIR) System. Failure to follow the correct procedure could cause the following conditions:

- Air bag deployment
- Personal injury
- Unnecessary SIR system repairs

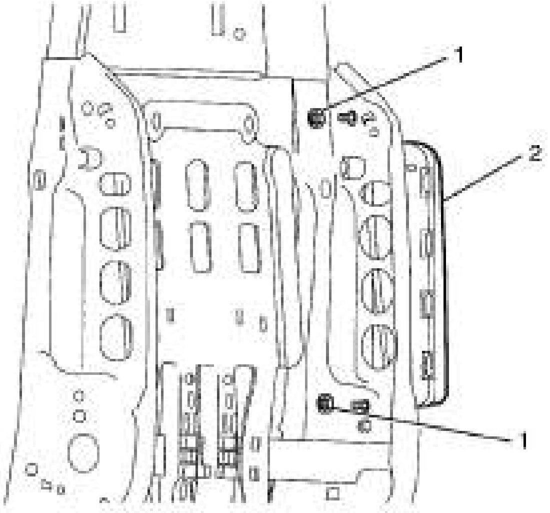
In order to avoid the above conditions, observe the following guidelines:

- Refer to SIR Component Views in order to determine if you are performing service on or near the SIR components or the SIR wiring.
- If you are performing service on or near the SIR components or the SIR wiring, disable the SIR system. Refer to Disabling the SIR System.

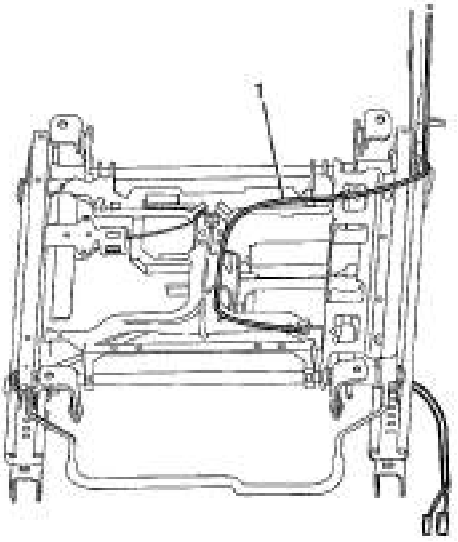
1. Disable the SIR system. Refer to SIR Disabling and Enabling.
2. Remove the front seat. Refer to Front Seat Replacement - Bucket.
3. Remove the front seat back trim cover. Refer to Front Seat Back Cushion Cover and Cushion Pad Replacement.



4. Remove the module wiring harness (1), (2), (3) and (4) from the side of seat frame.



5. Remove the 2 bracket retaining nuts (1) holding the module (2) to the seat frame.

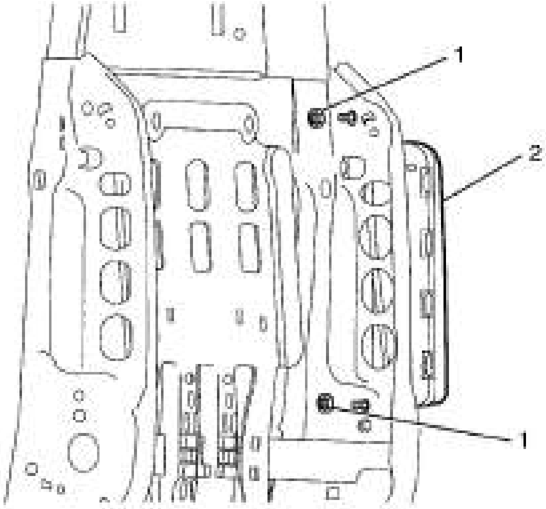


6. Remove the module wiring harness (1) from under the seat frame.
7. Fully deploy the module before disposal. If the module was replaced under warranty, fully deploy and dispose of the module after the required retention period. Refer to Inflator Module Handling and Scrapping.

Installation Procedure

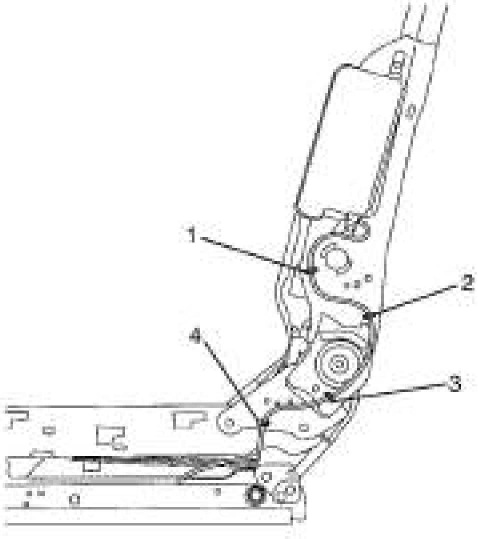
1. Install a new inflatable restraint side impact module to the seat frame.

   Notice: Refer to Fastener Notice in the Preface section.

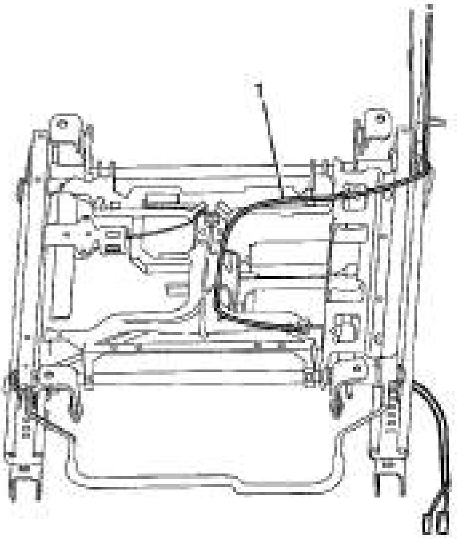


2. Install the module (2) to the seat frame and install the 2 retaining nuts (1).

   Tighten
   Tighten the nuts to 6 N·m (53 lb in).



3. Install the module wiring harness (1), (2), (3) and (4) to the seat.



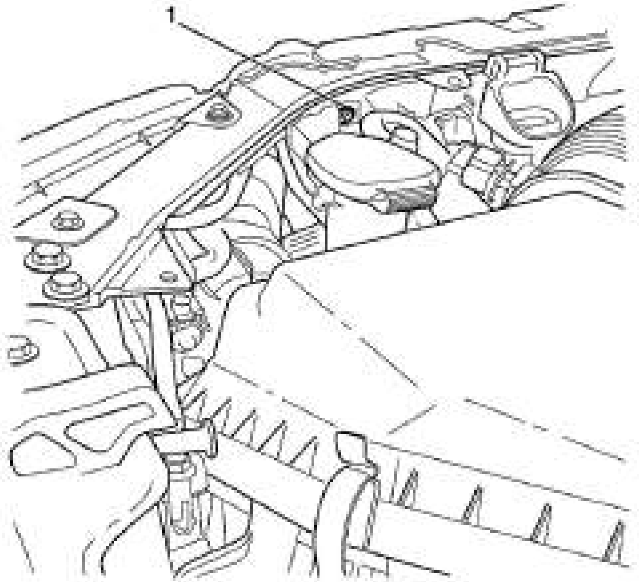
4. Install the module wiring harness (1) through the underside of the seat frame.
5. Install the front seat back trim cover. Refer to Front Seat Back Cushion Cover and Cushion Pad Replacement.
6. Install the front seat. Refer to Front Seat Replacement - Bucket.
7. Enable the SIR system. Refer to SIR Disabling and Enabling.
8. If re-programming is required. Refer to Control Module References.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Supplemental Inflatable Restraints | Repair Instructions | **Document ID: 1995329**

Inflatable Restraint Front End Sensor Replacement

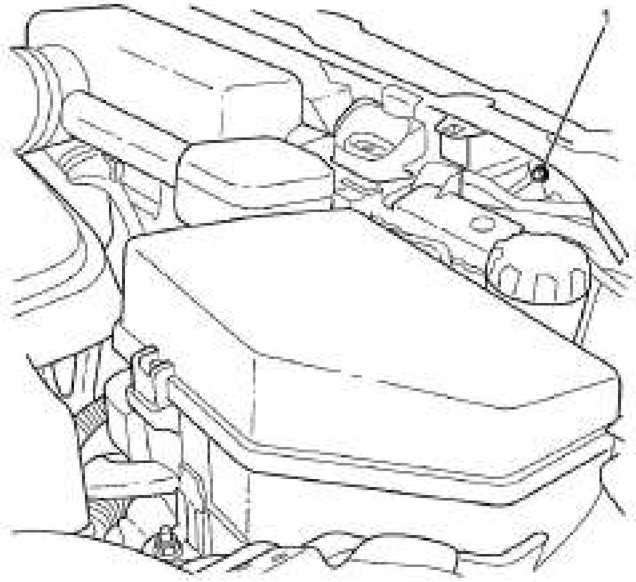
Removal Procedure

1. Disable the SIR. Refer to SIR Disabling and Enabling .
2. Remove the Radiator Air Upper Baffle and Deflector (if fitted). Refer to Radiator Air Upper Baffle and Deflector Replacement

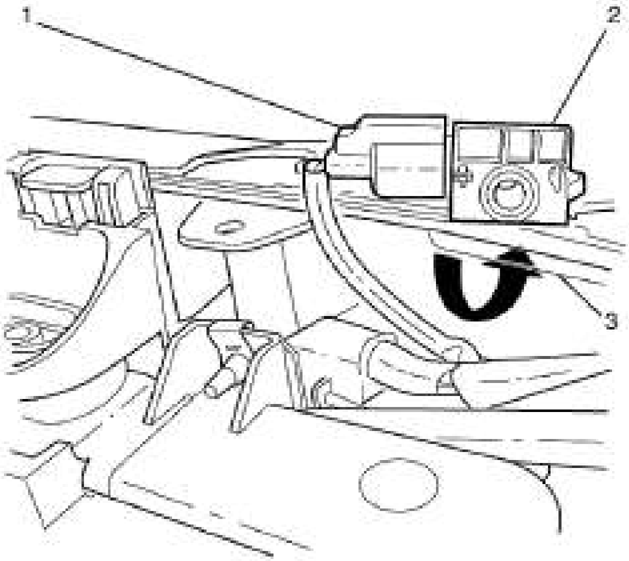


Important: The radiator top mounts can be taken off and the radiator lent back to aid in removal.

3. Remove the left front impact sensor to front end module retaining bolt (1).

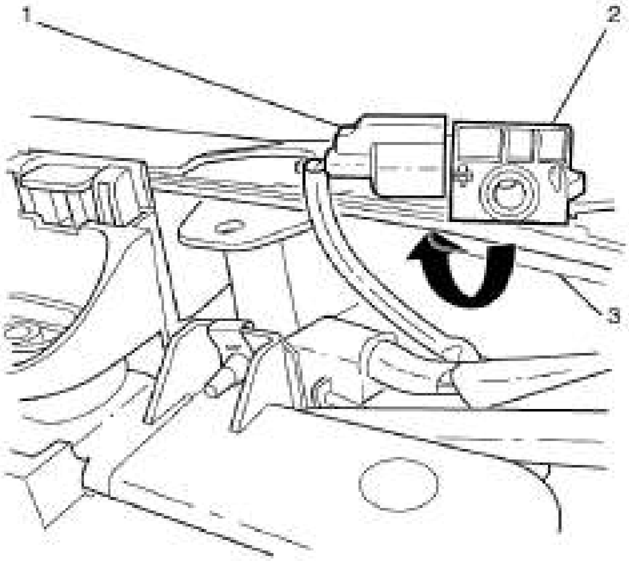


4. Remove the right front impact sensor to front end module retaining bolt (1).



5. Remove the front impact sensors (2) from the front end module (3).
6. Remove the front impact sensor electrical connections (1).

Installation Procedure

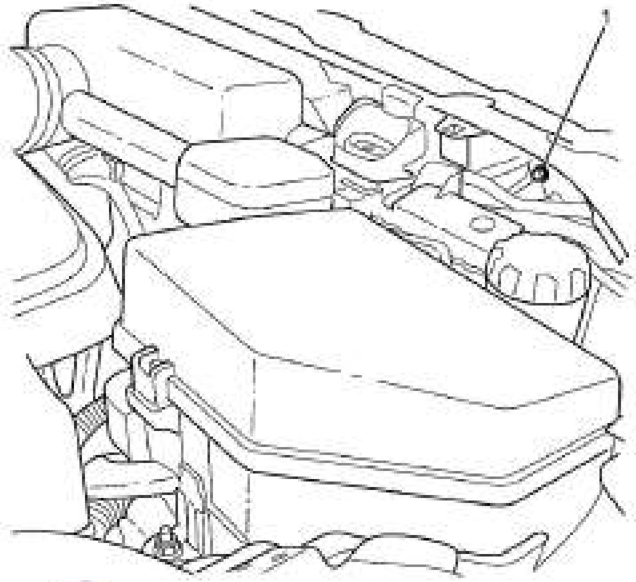


1. Install the front impact sensor electrical connections (1).

Important: Locating lugs will hold the NEW sensors in place.

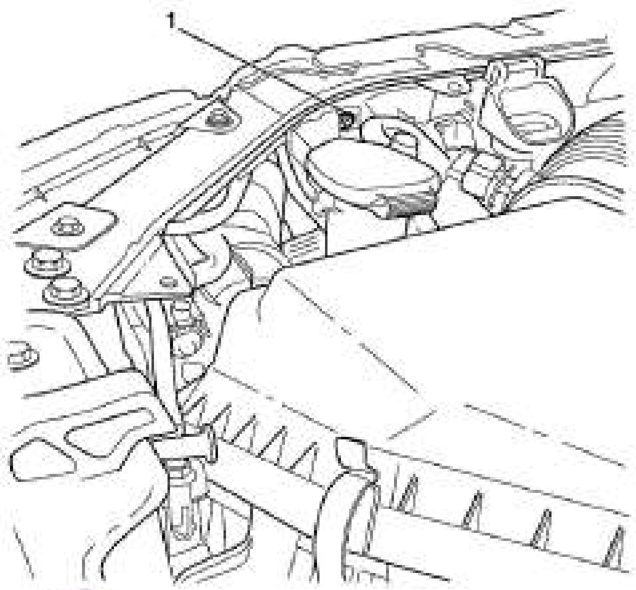
2. Install the NEW front impact sensors (2) to the front end module (3).

   Notice: Refer to Fastener Notice in the Preface section.



3. Install the right front impact sensor to front end module retaining bolt (1).

   Tighten
   Tighten the retaining bolt to 9 N·m (80 lb in).



Important: The radiator top mounts can be taken off and the radiator lent back to aid in installation.

4. Install the left front impact sensor to front end module retaining bolt (1).

   Tighten
   Tighten the retaining bolt to 9 N·m (80 lb in).

5. Install the Radiator Air Upper Baffle and Deflector (if fitted). Refer to Radiator Air Upper Baffle and Deflector Replacement
6. Enable the SIR. Refer to SIR Disabling and Enabling .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Supplemental Inflatable Restraints | Repair Instructions | **Document ID: 1995356**

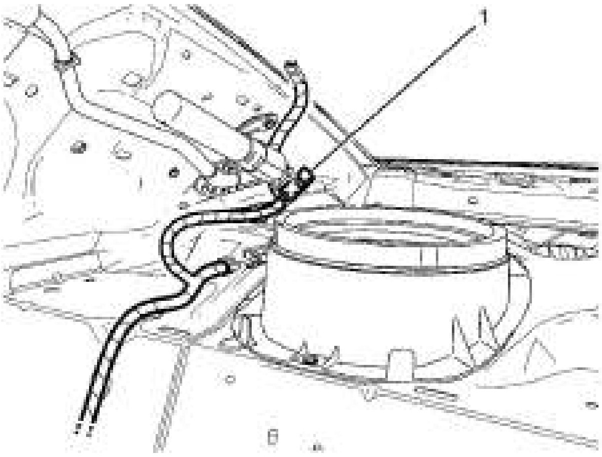
Inflatable Restraint Roof Side Rail Module Replacement - Front (RHD)

Removal Procedure

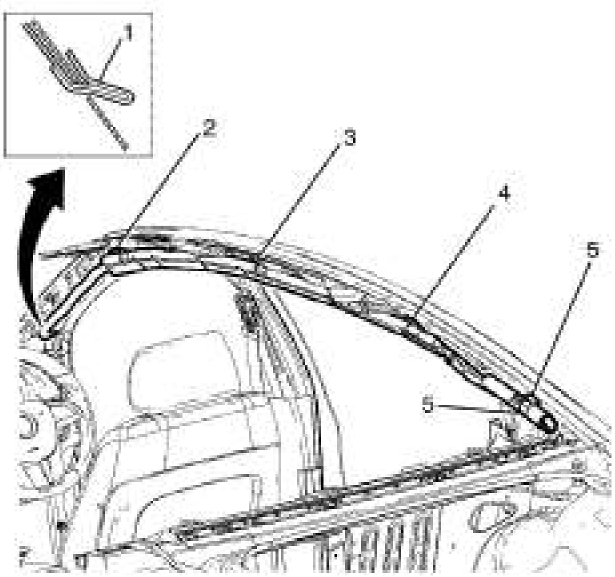
Caution: Refer to SIR Caution in the Preface section.

Caution: Refer to SIR Inflator Module Handling and Storage Caution in the Preface section.

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Remove the windshield garnish moulding. Refer to Windshield Garnish Molding Replacement .
3. Remove the sunshade from the headliner. Refer to Sunshade Replacement .
4. Remove the assist handles from the headliner. Refer to Assist Handle Replacement .
5. Remove the lower centre pillar trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
6. Remove the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .
7. Remove the rear window shelf trim panel. Refer to Rear Window Shelf Trim Panel Replacement .
8. Remove the rear quarter pillar trim panel. Refer to Quarter Lower Rear Trim Panel Replacement .
9. Remove the rear quarter pillar trim panel. Refer to Quarter Upper Trim Panel Replacement .
10. Lower the headliner in order to gain access to the roof rail module. Refer to Headlining Trim Panel Replacement .



11. Disconnect the harness connector (1) from the roof rail module.



12. Remove the following roof rail bolts in sequence (5), (4), (3), and (2), then unhook the tether (1).
13. With the aid of an assistant lift the roof rail upwards towards the roof making sure to unhook the mounting points on the roof.
14. For deployment procedure. Refer to Inflator Module Handling and Scrapping .

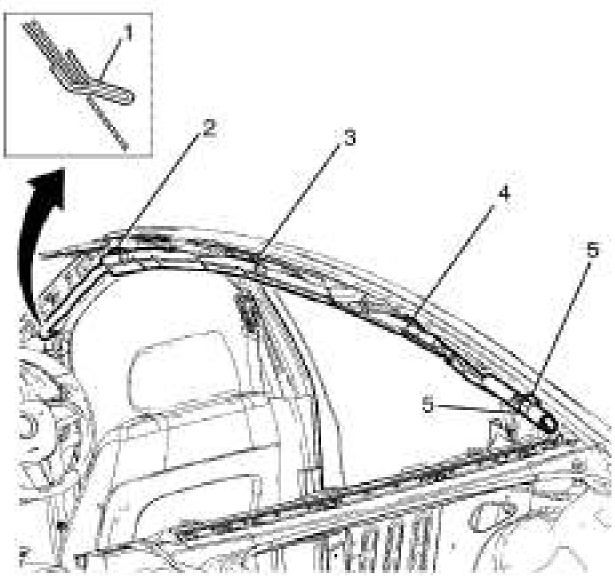
Installation Procedure

Caution: Refer to SIR Caution in the Preface section.

Caution: Refer to SIR Inflator Module Handling and Storage Caution in the Preface section.

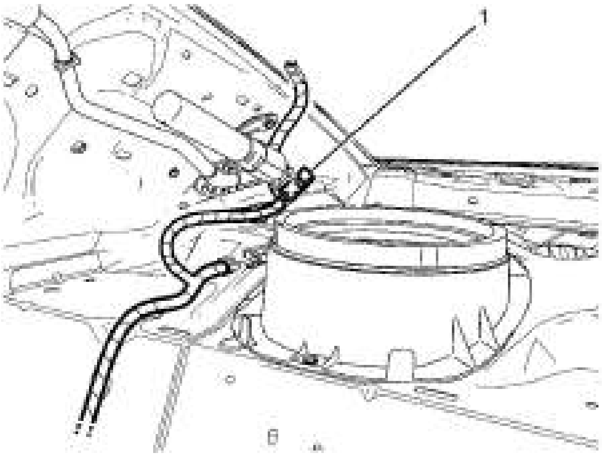
Caution: In order to prevent accidental deployment of the air bag which could cause personal injury, do not dispose of an undeployed inflator module as normal shop waste. The undeployed inflator module contains substances that could cause severe illness or personal injury if the sealed container is damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed inflator module. Failure to dispose of an inflator module as instructed may be a violation of federal, state, province, or local laws.

1. Remove any dirt, grease, or other impurities from the mounting surface.
2. With the aid of an assistant carefully replace the roof rail upwards towards the roof making sure the hooks are seated correctly in place on the roof.



3. Install the mounting fasteners to the inflatable restraint roof rail module in the following order (2), (3), (4), (5) and then the tether hook (1).

   Tighten
   Tighten the fasteners to 6 N·m (53 lb in).



4. Re-connect the harness connector (1) to the roof rail module.
5. Raise the headliner. Refer to Headlining Trim Panel Replacement .
6. Install the rear quarter pillar trim panel. Refer to Quarter Upper Trim Panel Replacement .
7. Install the rear quarter pillar trim panel. Refer to Quarter Lower Rear Trim Panel Replacement .
8. Install the rear window shelf trim panel. Refer to Rear Window Shelf Trim Panel

Replacement .

9. Install the upper centre pillar trim panel. Refer to Center Pillar Upper Trim Panel Replacement .
10. Install the lower centre pillar trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
11. Install the windshield garnish moulding. Refer to Windshield Garnish Molding Replacement .
12. Install the sunshade from the headliner. Refer to Sunshade Replacement .
13. Install the assist handles from the headliner. Refer to Assist Handle Replacement .
14. Enable the SIR system. Refer to SIR Disabling and Enabling .
15. If re-programming is required. Refer to Control Module References .

Inflatable Restraint Sensing and Diagnostic Module Replacement (RHD)

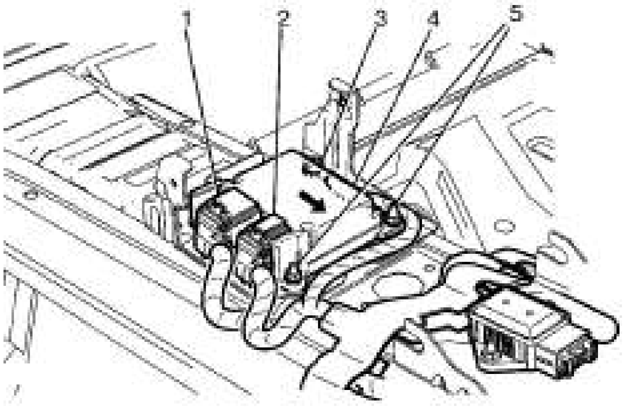
Removal Procedure

Caution: Refer to SIR Caution in the Preface section.

Caution: Do not strike or jolt the inflatable restraint side impact sensor (SIS). Before applying power to the SIS make sure that it is securely fastened. Failure to observe the correct installation procedures could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

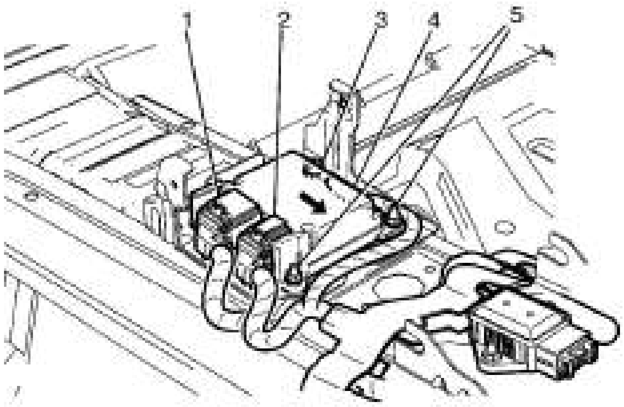
1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Remove the centre console. Refer to Front Floor Console Replacement .

Important: The sensing and diagnostic module (SDM) (4) is shown with the carpet removed for illustration purposes only. Removal of the front carpet or the front seats is not necessary to service the SDM (4).



3. Disconnect the SDM electrical connectors (1) and (2) from the SDM (4).
4. Remove the SDM to transmission tunnel retaining nuts (5).
5. Disconnect the SDM earth strap bolt (3).
6. Remove the SDM (4).

Installation Procedure



1. Install the SDM (4) horizontally to the transmission tunnel, making sure the arrow on the SDM toward the front of the vehicle.
2. Connect the SDM earth strap bolt (3).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the SDM to transmission tunnel retaining nuts (5).

   Tighten
   Tighten the nuts to 10 N·m (89 lb in).

4. Connect the SDM electrical connectors (1) and (2) from the SDM (4).
5. Install the centre console. Refer to Front Floor Console Replacement .
6. Return the driver and the passenger seats to the original position.
7. Enable the SIR system. Refer to SIR Disabling and Enabling .

   Important: After programming the SDM, the SDM is then locked to the vehicle and it will not be possible to swap between other vehicles.

8. Refer to Inflatable Restraint Sensing and Diagnostic Module Programming and Setup .
9. Program the new SDM primary key into the BCM.

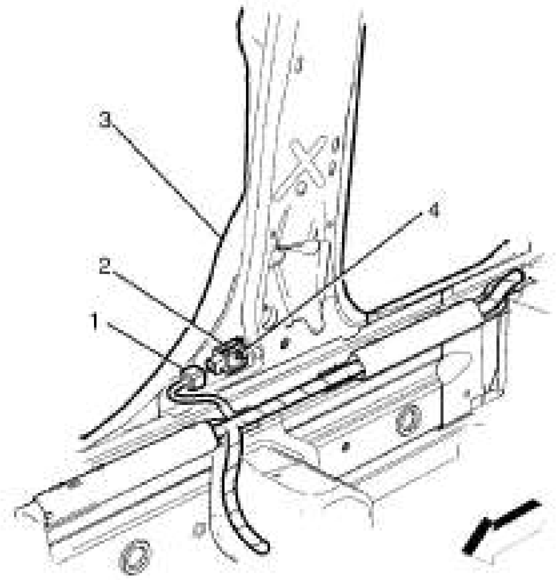
   Important: The AIR BAG indicator may remain ON after the SDM has been replaced. If the indicator remains ON after enabling the SIR system, perform the diagnostic system check and follow the steps thoroughly to ensure that the SDM is set properly.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Supplemental Inflatable Restraints | Repair Instructions | Document ID: 1995259

Inflatable Restraint Side Impact Sensor Replacement (RHD)

Removal Procedure

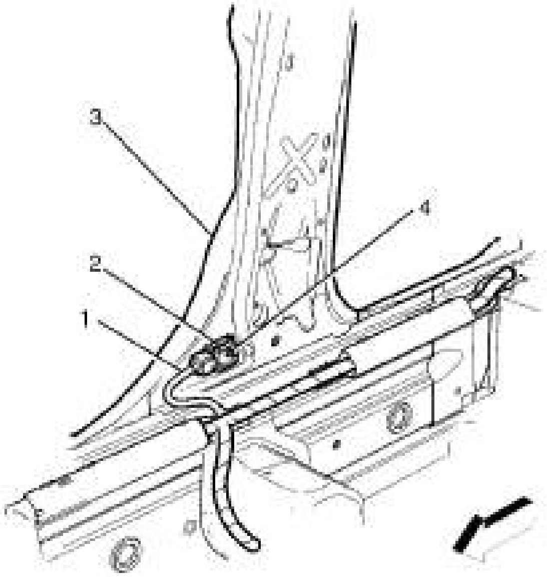
1. Disable the SIR. Refer to SIR Disabling and Enabling .
2. Remove the lower centre pillar trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
3. Remove the door sill plate. Refer to Door Sill Plate Replacement .



4. Disconnect the side impact sensor electrical connector (1) from the side impact sensor (2).
5. Remove the side impact sensor (2) securing bolt (4)
6. Remove the side impact sensor (2) from the centre pillar (3).

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the side impact sensor (2) to the centre pillar (3).
2. Install the side impact sensor (2) securing bolt (4)

   Tighten
   Tighten the retaining bolt (4) to 9 N·m (80 lb in).

3. Connect the side impact sensor electrical connector to the side impact sensor (1).
4. Install the door sill plate. Refer to Door Sill Plate Replacement .
5. Install the lower centre pillar trim panel. Refer to Center Pillar Lower Trim Panel Replacement .
6. Enable the SDM. Refer to SIR Disabling and Enabling .
7. Ignition ON, observe the air bag warning indicator in the instrument panel cluster. The warning indicator should be illuminated for approximately five seconds. During this period the SDM performs a wiring and self-check. If no system faults are detected, the air bag warning indicator will be switched off.

   Important: If the warning indicator remains illuminated, a warning is shown in the instrument panel cluster multi-function display and an audible alarm chimes, or the warning indicator illuminates two seconds after it was originally switched off, a fault is present.

Inflator Module Handling and Scrapping (LWBRHD)

Handling Procedure

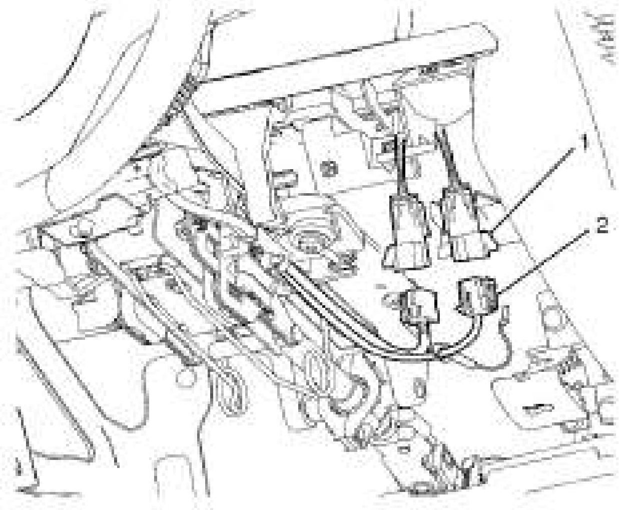
1. Do not apply power to a inflatable restraint except as specified.
2. Do not attempt to make any repairs to the inflatable restraint assembly or front/side-impact sensors. A damaged or defective component must be replaced.
3. Do not weld, solder, braze, hammer, machine drill, or otherwise heat any SIR component.
4. When handling a deployed inflatable restraint assembly or pretensioner:
   - Always wear gloves and safety glasses
   - Wash hands with mild soap and water afterwards. The surface of these components may contain chemicals as a result of the gas generated during combustion which can irritate your skin
5. When handling a steering column:
   - During any service operation that requires removal and reinstallation of a steering column fitted with an inflatable restraint assembly, always carry the steering column with two hands and with the steering wheel away from your body
   - Do not set a steering column on the floor with the steering wheel facing towards the floor
6. When carrying out steering gear removal and installation procedures, remove the ignition key from the lock and ensure the steering column is locked. If this operation is not carried out and the steering wheel is spun while the steering gear is removed, the clock spring coil will be destroyed. This will result in the SDM setting a DTC, and non-deployment of the steering wheel inflatable restraint assembly.

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

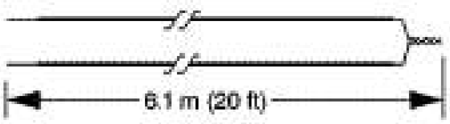
Important: Deploy the inflator modules inside of the vehicle when destroying the vehicle or when salvaging the vehicle for parts. This includes but is not limited to the following situations:

- The vehicle has completed its useful life
- Irreparable damage occurs to the vehicle in a non-deployment type accident
- Irreparable damage occurs to the vehicle during a theft
- The vehicle is being salvaged for parts to be used on a vehicle with a different VIN as opposed to rebuilding as the same VIN

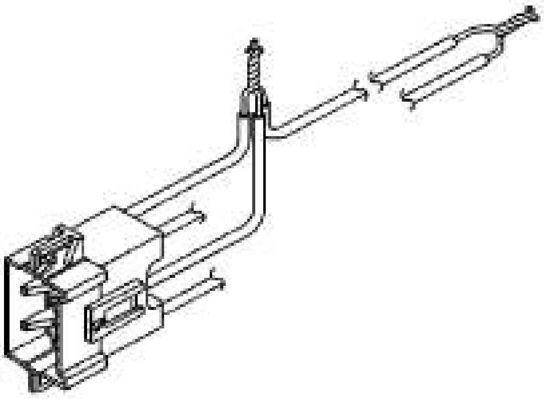
1. Turn the ignition switch to the OFF position.
2. Remove the ignition key.
3. Put on safety glasses.
4. Remove all loose objects from the front seats.
5. Disable the SIR system. Refer to SIR Disabling and Enabling .



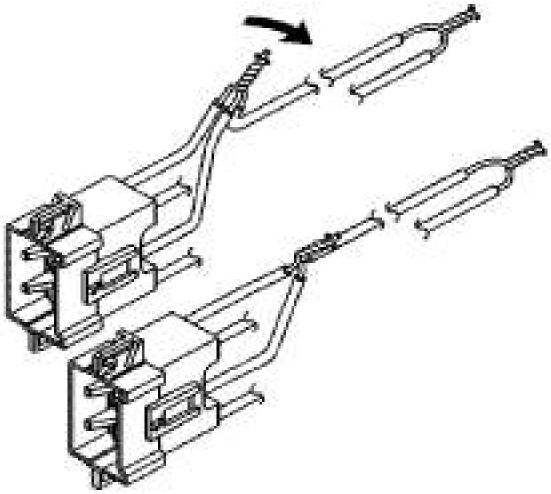
6. Disconnect the steering wheel module yellow connector (2) from vehicle harness yellow connector (1).
7. If vehicle is equipped with dual stage air bag the steering wheel module and I/P module will each have 4 wires. Refer to Component Connector End Views , for determining high and low circuits.
8. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
9. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



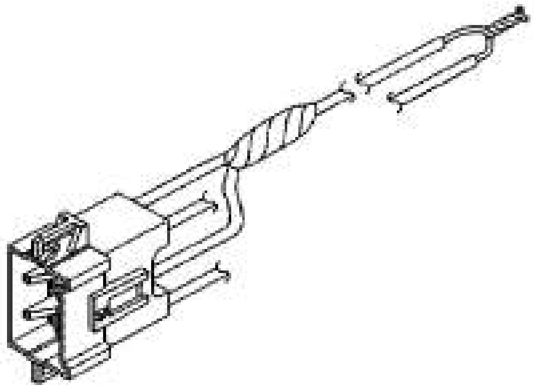
10. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. Use these wires to fabricate the driver deployment harness.
11. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
12. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the inflator module.



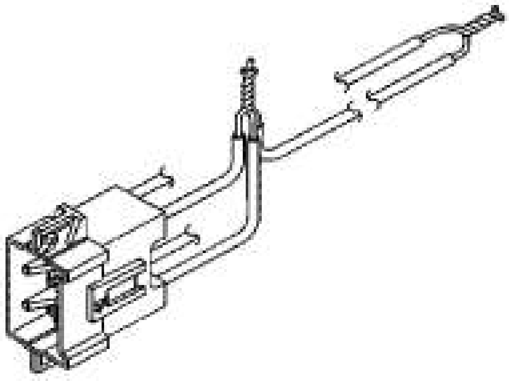
13. Twist together 2 connector wire leads (the high circuits from both stages of the steering wheel module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
14. Inspect that the 3-wire connection is secure.



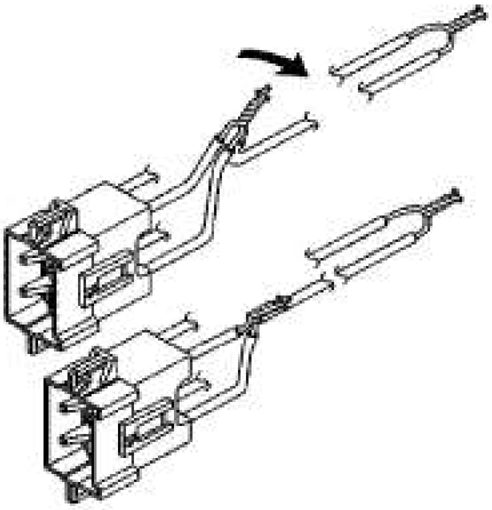
15. Bend flat the twisted connection.



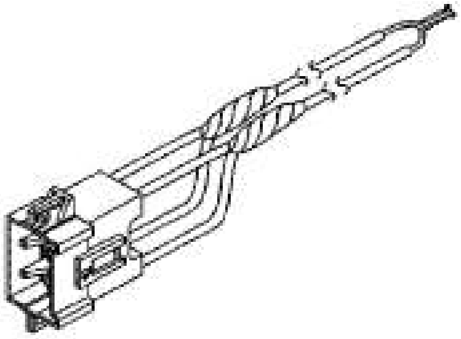
16. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



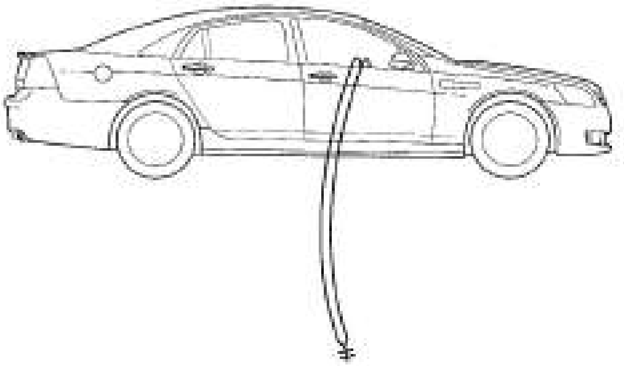
17. Twist together 2 connector wire leads (the low circuits from both stages of the steering wheel module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
18. Inspect that the 3-wire connection is secure.



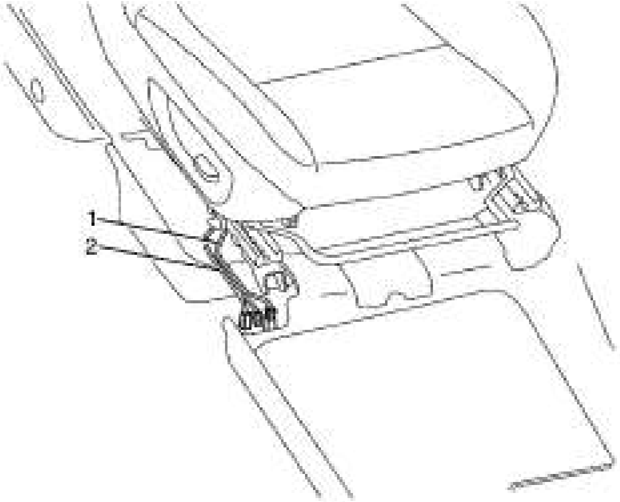
19. Bend flat the twisted connection.



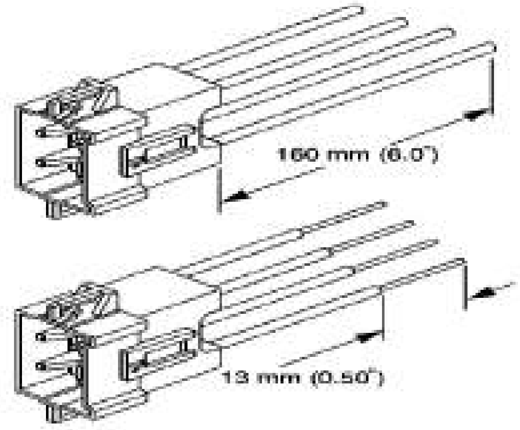
20. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
21. Connect the deployment harness to the steering wheel module in-line connector.



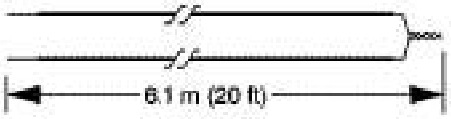
22. Route the deployment harness out of the driver side of the vehicle.



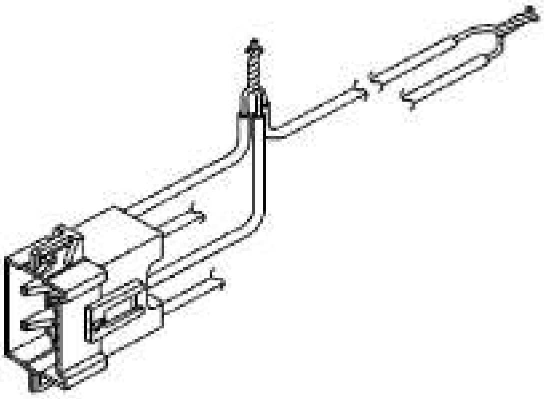
23. Disconnect the driver side air bag/pretensioner yellow connector (1) from the vehicle wiring harness located under the front of driver seat.



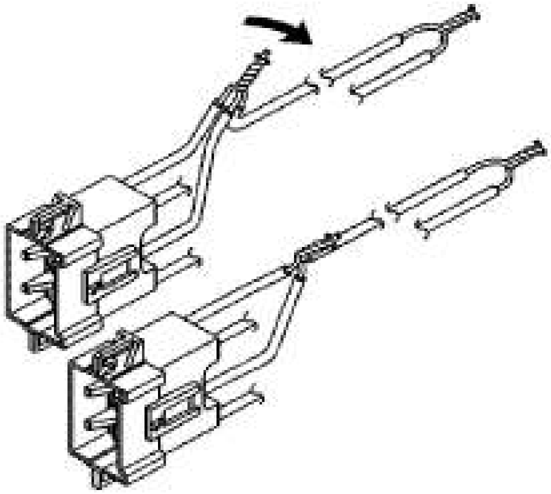
24. Cut the 4 SIR wires (2 for side air bag and 2 for pretensioner) leading to the yellow harness connector from the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
25. Strip 13 mm (0.5 in) of insulation from all 4 SIR wires connector leads (2 for side air bag and 2 for pretensioner).



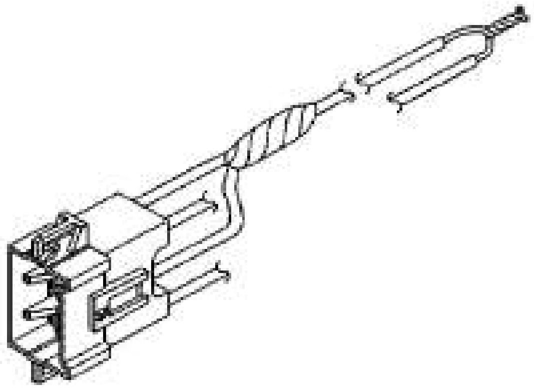
26. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. Use these wires to fabricate the deployment harness.
27. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
28. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the side air bag module and pretensioner.



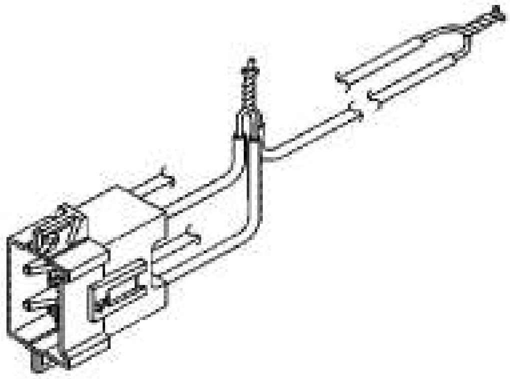
29. Twist together 2 connector wire leads (the high circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
30. Inspect that the 3-wire connection is secure.



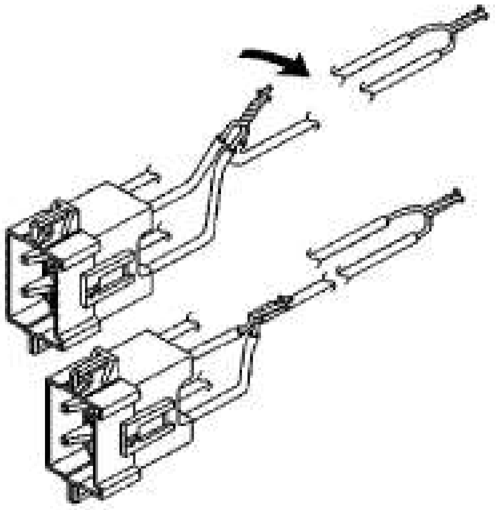
31. Bend flat the twisted connection.



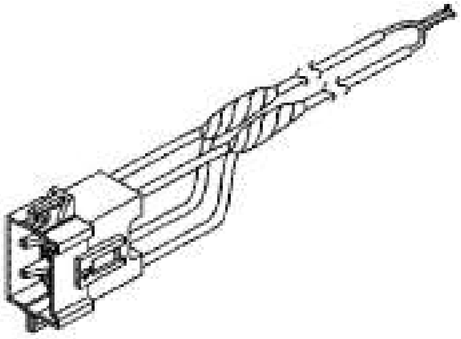
32. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



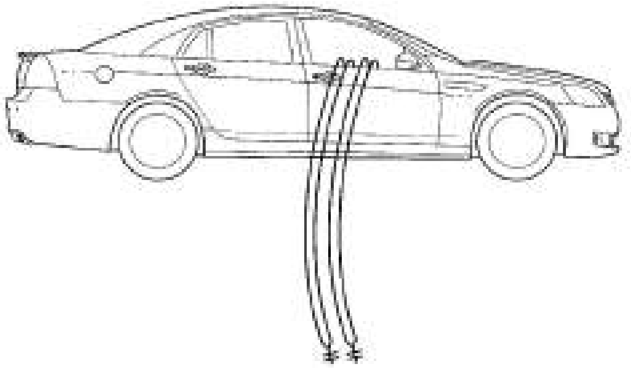
33. Twist together 2 connector wire leads (the low circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
34. Inspect that the 3-wire connection is secure.



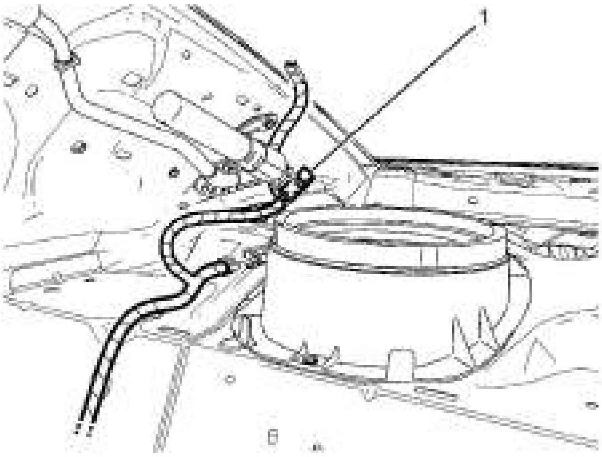
35. Bend flat the twisted connection.



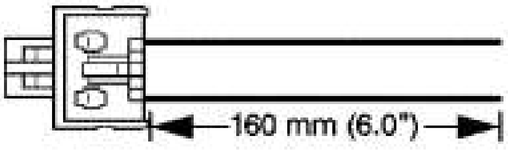
36. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
37. Connect the deployment harness to the driver side air bag/pretensioner yellow connector.

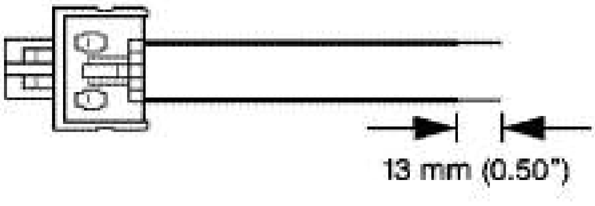


38. Route the deployment harness out of the driver side of the vehicle.

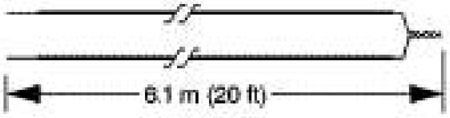


39. Disconnect the left/driver roof rail yellow harness connector (1) from the left roof rail air bag.

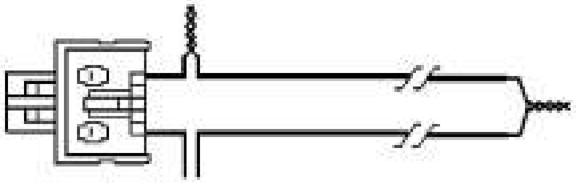




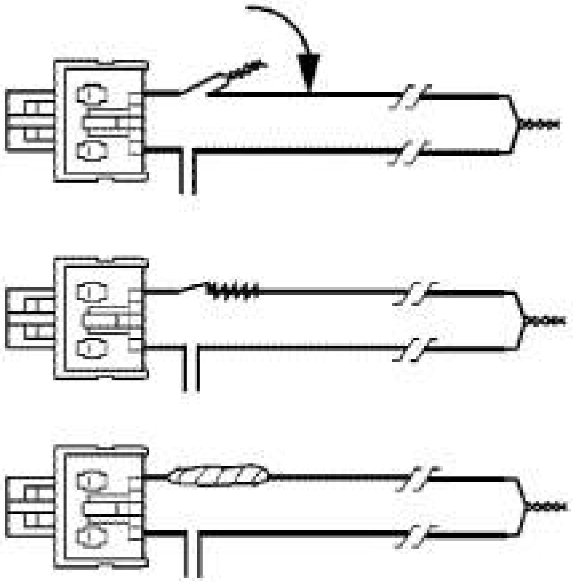
40. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
41. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



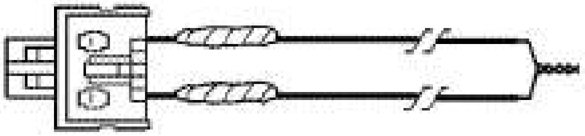
42. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
43. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
44. Twist together one end from each of the wires in order to short the wires.



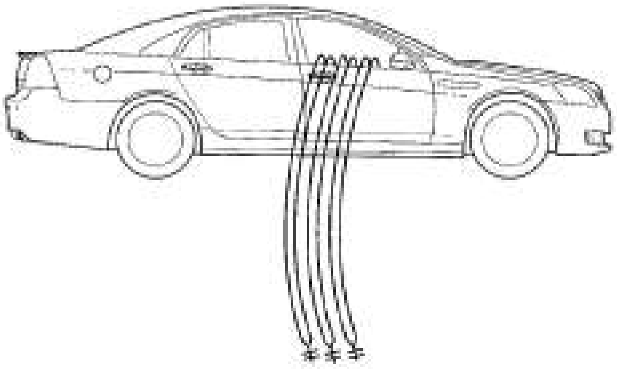
45. Twist together one connector wire lead to one deployment wire.



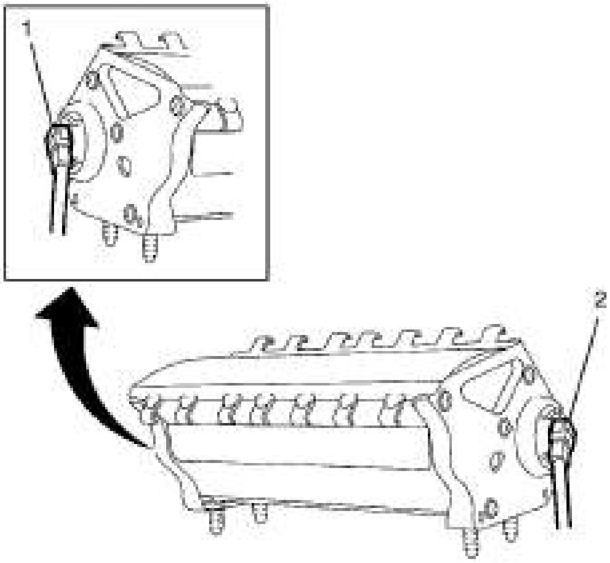
46. Bend flat the twisted connection.
47. Secure and insulate the connection using electrical tape.



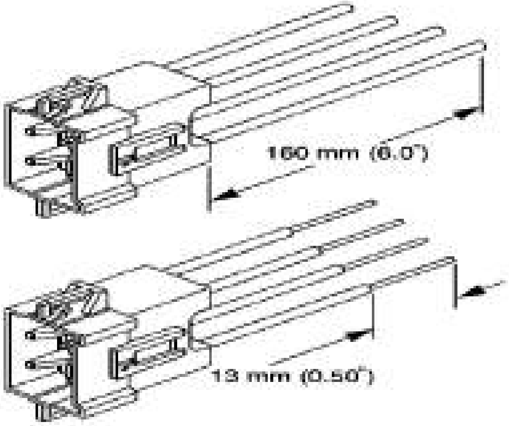
48. Twist together, bend, and tape the remaining connector wire lead to the remaining deployment wire.
49. Connect the deployment harness to the roof rail module yellow connector.



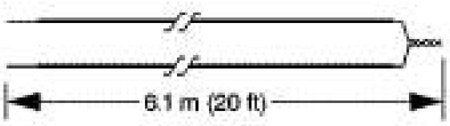
50. Route the deployment harness out of the driver side of the vehicle.



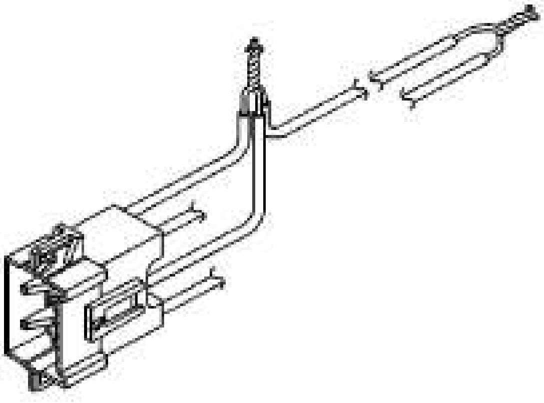
51. Disconnect the I/P module yellow harness connector (1) from the vehicle harness connector (2).



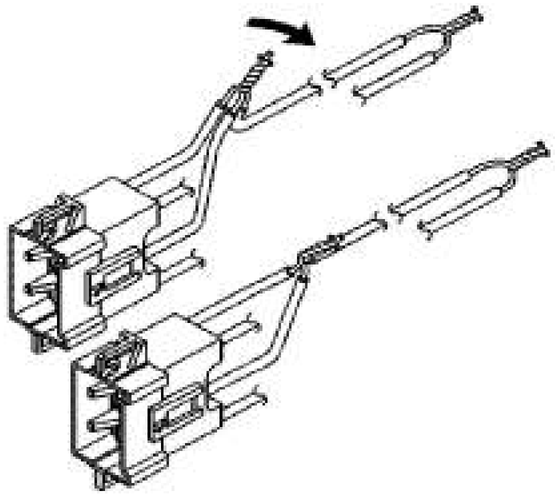
52. If vehicle is equipped with dual stage air bags the I/P module will each have 4 wires. Refer to Component Connector End Views , for determining high and low circuits.
53. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
54. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



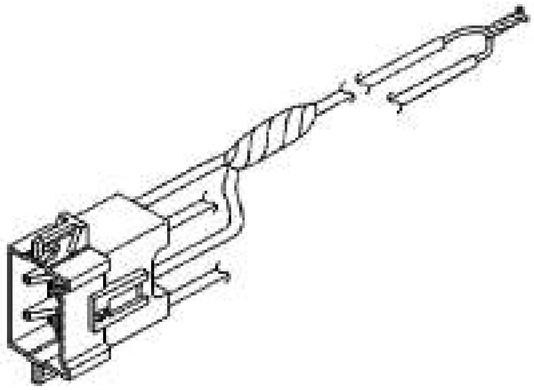
55. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
56. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
57. Twist together one end from each of the wires in order to short the wires.



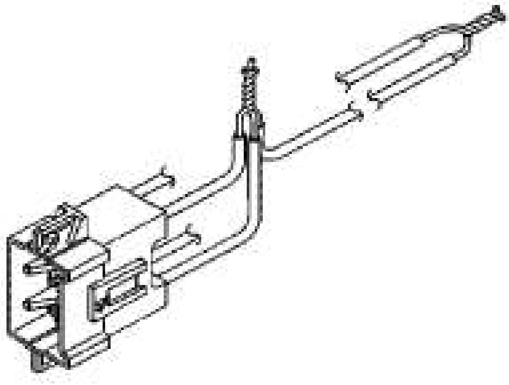
58. Twist together 2 connector wire leads (the high circuits from both stages of the steering wheel module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
59. Inspect that the 3-wire connection is secure.



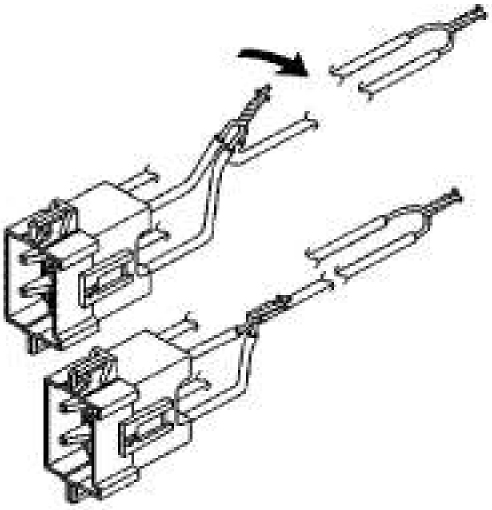
60. Bend flat the twisted connection.



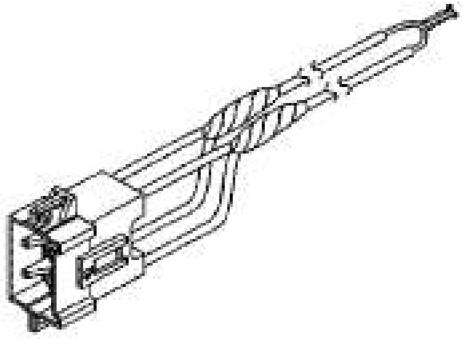
61. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



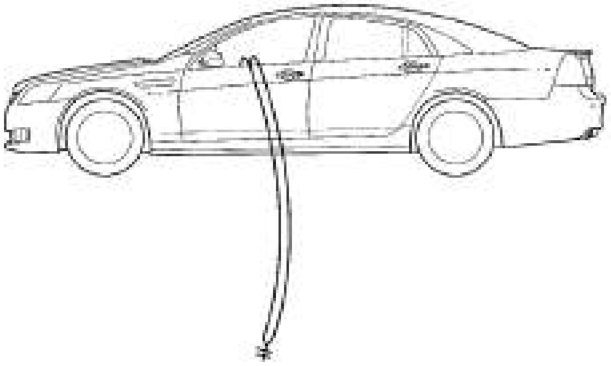
62. Twist together 2 connector wire leads (the low circuits from both stages of the I/P module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
63. Inspect that the 3-wire connection is secure.



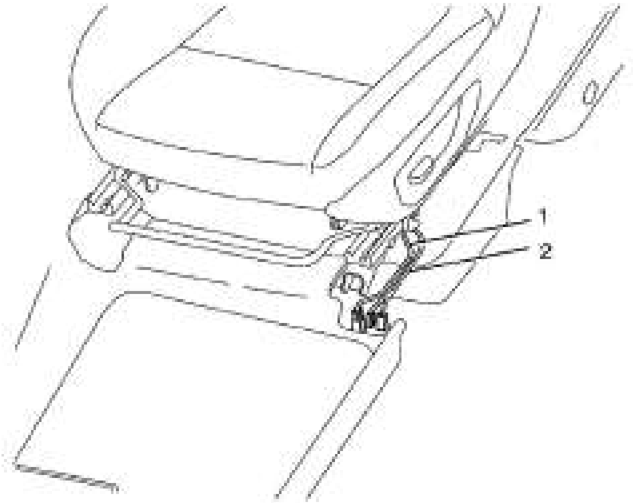
64. Bend flat the twisted connection.



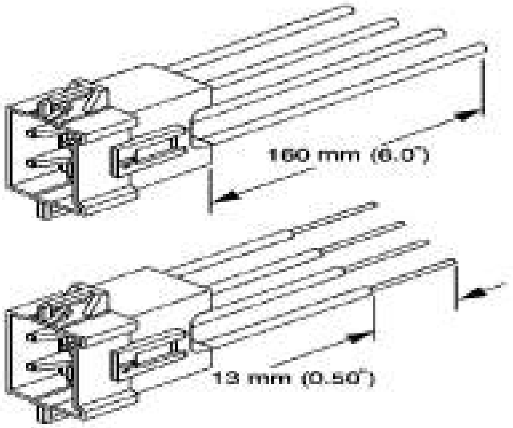
65. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
66. Connect the deployment harness to the I/P module in-line connector.



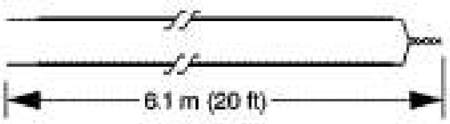
67. Route the deployment harness out of the passenger side of the vehicle.



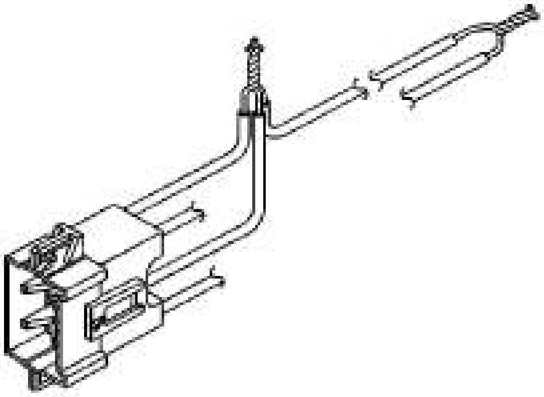
68. Disconnect the passenger side air bag/pretensioner yellow connector (1) from the vehicle wiring harness located under the front of driver seat.



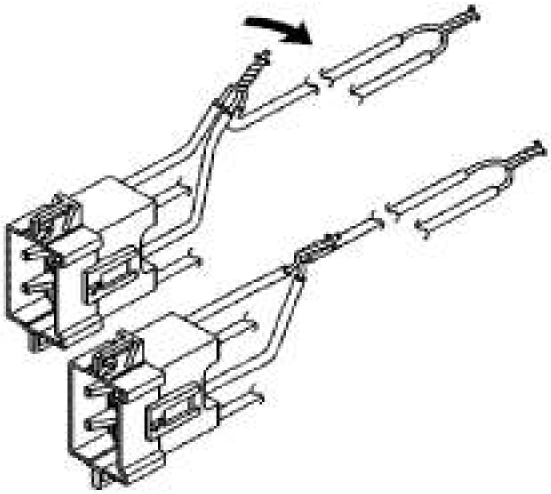
69. Cut the 4 SIR wires (2 for side air bag and 2 for pretensioner) leading to the yellow harness connector from the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
70. Strip 13 mm (0.5 in) of insulation from all 4 SIR wires connector leads (2 for side air bag and 2 for pretensioner).



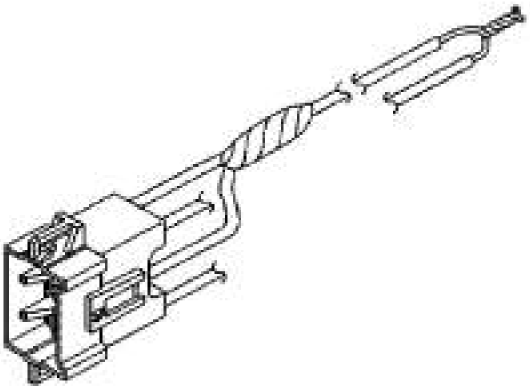
71. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. Use these wires to fabricate the deployment harness.
72. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
73. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the side air bag module and pretensioner.



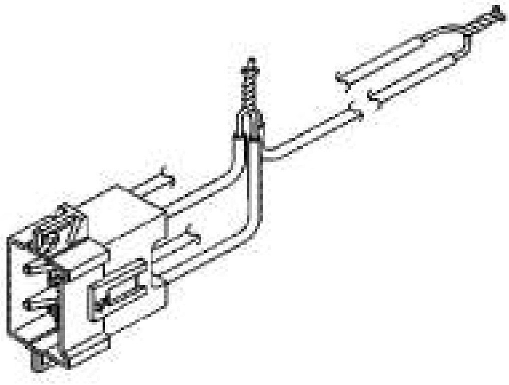
74. Twist together 2 connector wire leads (the high circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
75. Inspect that the 3-wire connection is secure.



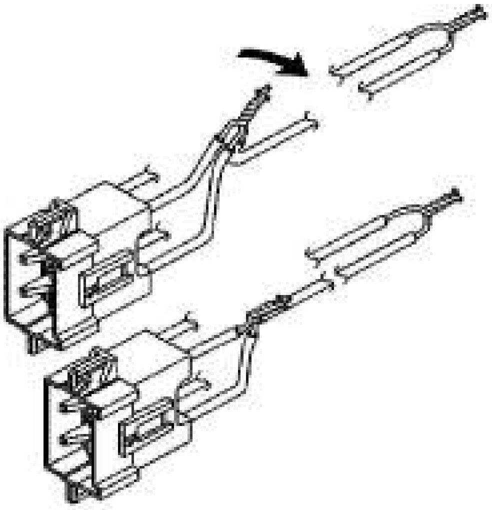
76. Bend flat the twisted connection.



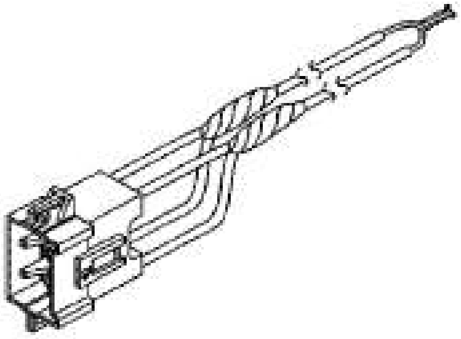
77. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



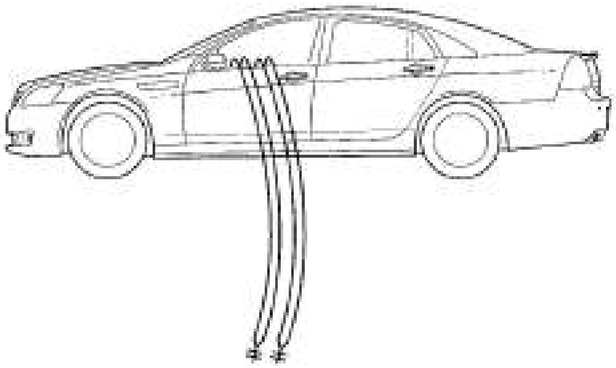
78. Twist together 2 connector wire leads (the low circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
79. Inspect that the 3-wire connection is secure.



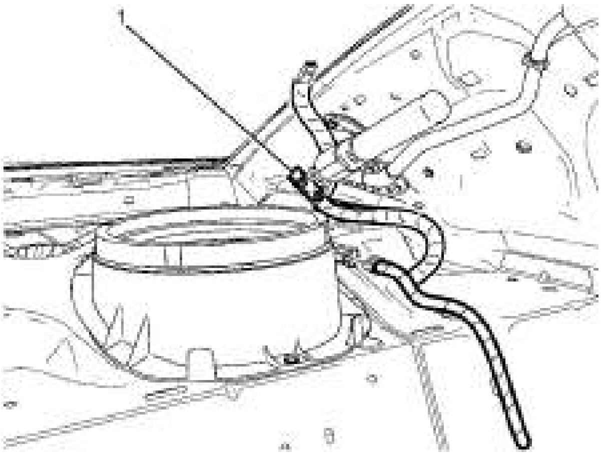
80. Bend flat the twisted connection.



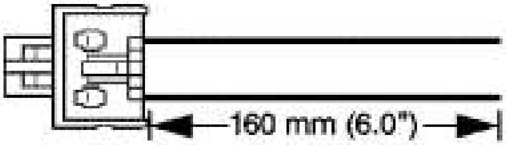
81. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
82. Connect the deployment harness to the passenger side air bag/pretensioner yellow connector.

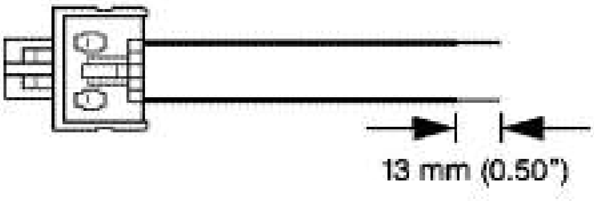


83. Route the deployment harness out of the passenger side of the vehicle.

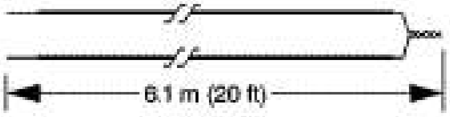


84. Disconnect the right/passenger roof rail air bag yellow harness connector (1) from the right roof rail air bag.

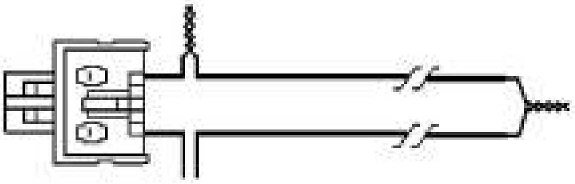




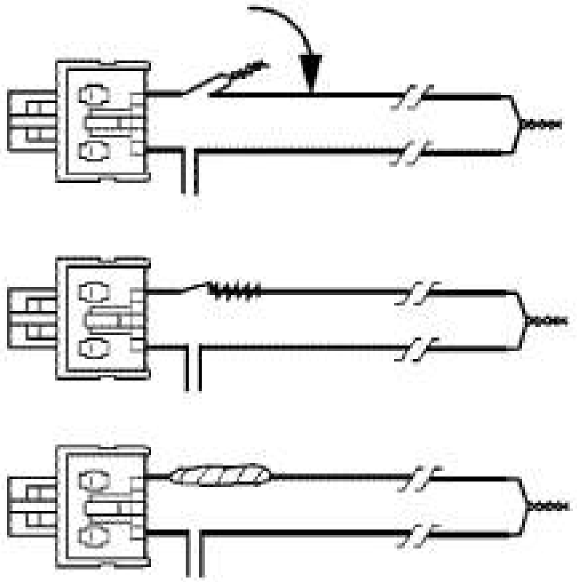
85. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
86. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



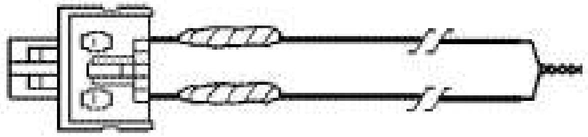
87. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
88. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
89. Twist together one end from each of the wires in order to short the wires.



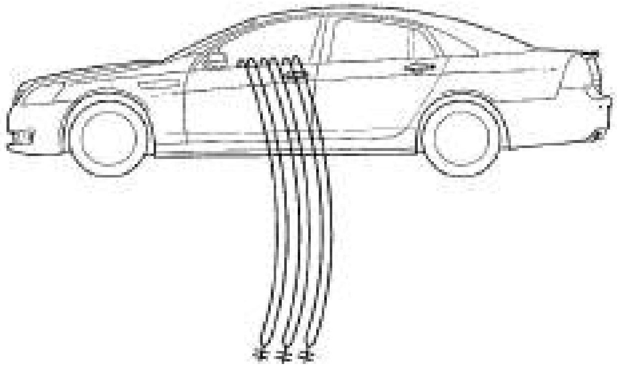
90. Twist together one connector wire lead to one deployment wire.



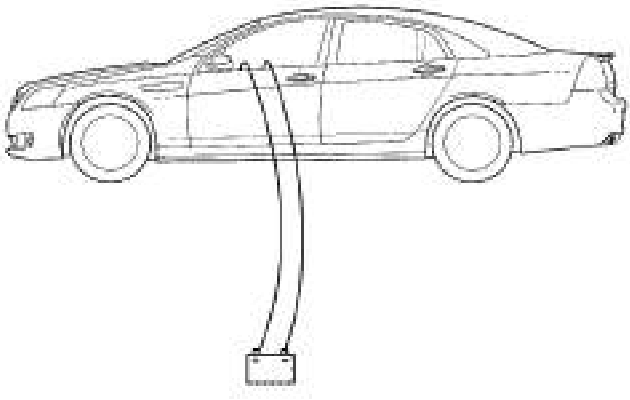
91. Bend flat the twisted connection.
92. Secure and insulate the connection using electrical tape.



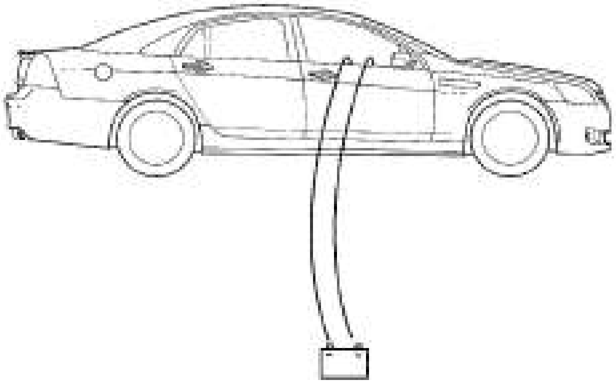
93. Twist together, bend, and tape the remaining connector wire lead to the remaining deployment wire.
94. Connect the deployment harness to the roof rail module yellow connector.



95. Route the deployment harness out of the passenger side of the vehicle.



96. Completely cover the windshield and front door window openings with a drop cloth.
97. Stretch out all of the deployment harness wires on the right side of the vehicle to their full length.
98. Deploy each deployment loop one at a time.
99. Place a power source, 12 V minimum/2 A minimum (i.e., a vehicle battery) near the shorted end of the harnesses.
100. Separate the one set of wires and touch the wires ends to the power source in order to deploy the inflator modules, doing one module at a time.
101. Disconnect the deployment harness from the power source and twist the wire ends together.
102. Continue the same process with the remaining deployment harnesses that are available.



103. Stretch out all of the deployment harness wires on the left side of the vehicle to their full length.
104. Deploy each deployment loop one at a time.
105. Place a power source, 12 V minimum/2 A minimum (i.e., a vehicle battery) near the shorted end of the harnesses.
106. Separate the one set of wires and touch the wires ends to the power source in order to deploy the inflator modules, doing one module at a time.
107. Disconnect the deployment harness from the power source and twist the wire ends together.
108. Continue the same process with the remaining deployment harnesses that are available.
109. Remove the drop cloth from the vehicle.
110. Disconnect all harnesses from the vehicle.
111. Discard the harnesses.
112. Scrap the vehicle in the same manner as a non-SIR equipped vehicle.
113. If one or all of the inflator modules did not deploy, perform the following steps to remove the undeployed module(s) from the vehicle:
    - Inflatable Restraint Steering Wheel Module Replacement .
    - Inflatable Restraint Instrument Panel Module Replacement .
    - Driver or Passenger Seat Side Inflatable Restraint Module Replacement .
    - Inflatable Restraint Roof Side Rail Module Replacement - Front .

Deployment Procedure - (Out Of Vehicle)

Refer to TAS (Technical Assistant Service) for further instructions.

Inflator Module Handling and Scrapping (SWBRHD)

Handling Procedure

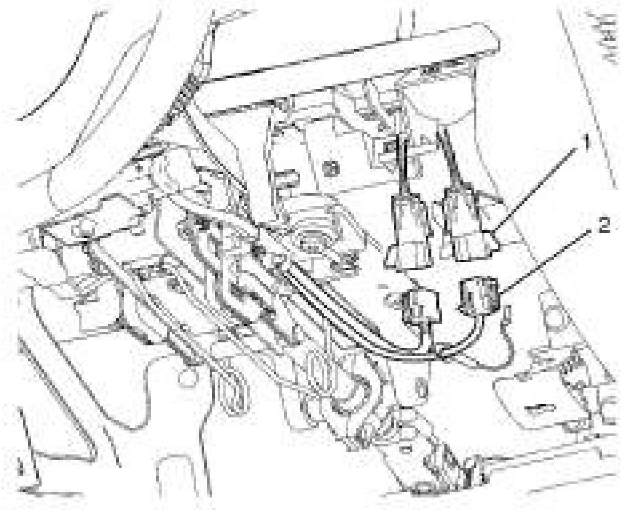
1. Do not apply power to a inflatable restraint except as specified.
2. Do not attempt to make any repairs to the inflatable restraint assembly or front/side-impact sensors. A damaged or defective component must be replaced.
3. Do not weld, solder, braze, hammer, machine drill, or otherwise heat any SIR component.
4. When handling a deployed inflatable restraint assembly or pretensioner:
   - Always wear gloves and safety glasses
   - Wash hands with mild soap and water afterwards. The surface of these components may contain chemicals as a result of the gas generated during combustion which can irritate your skin
5. When handling a steering column:
   - During any service operation that requires removal and reinstallation of a steering column fitted with an inflatable restraint assembly, always carry the steering column with two hands and with the steering wheel away from your body
   - Do not set a steering column on the floor with the steering wheel facing towards the floor
6. When carrying out steering gear removal and installation procedures, remove the ignition key from the lock and ensure the steering column is locked. If this operation is not carried out and the steering wheel is spun while the steering gear is removed, the clock spring coil will be destroyed. This will result in the SDM setting a DTC, and non-deployment of the steering wheel inflatable restraint assembly.

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

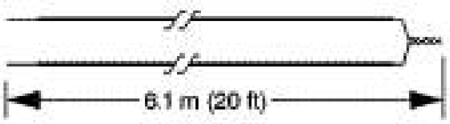
Important: Deploy the inflator modules inside of the vehicle when destroying the vehicle or when salvaging the vehicle for parts. This includes but is not limited to the following situations:

- The vehicle has completed its useful life
- Irreparable damage occurs to the vehicle in a non-deployment type accident
- Irreparable damage occurs to the vehicle during a theft
- The vehicle is being salvaged for parts to be used on a vehicle with a different VIN as opposed to rebuilding as the same VIN

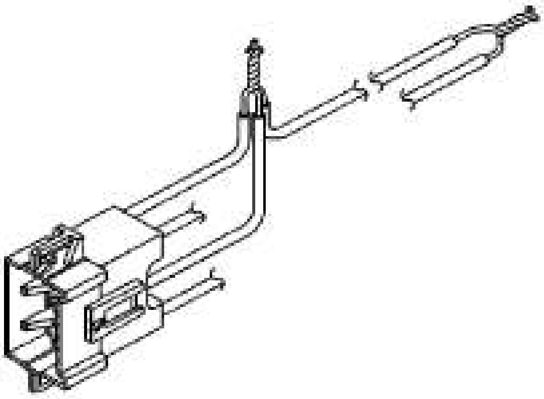
1. Turn the ignition switch to the OFF position.
2. Remove the ignition key.
3. Put on safety glasses.
4. Remove all loose objects from the front seats.
5. Disable the SIR system. Refer to SIR Disabling and Enabling.



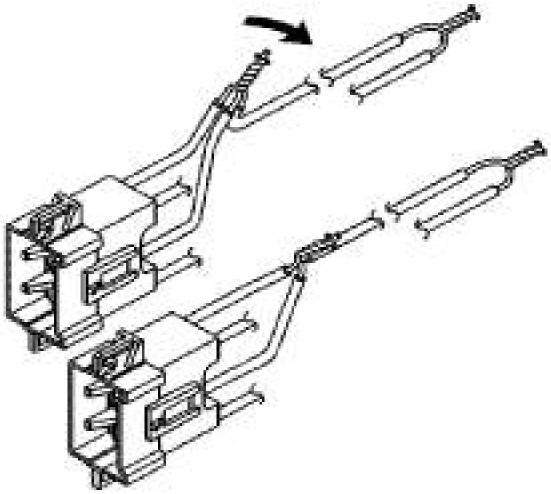
6. Disconnect the steering wheel module yellow connector (2) from vehicle harness yellow connector (1).
7. If vehicle is equipped with dual stage air bag the steering wheel module and I/P module will each have 4 wires. Refer to Component Connector End Views , for determining high and low circuits.
8. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
9. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



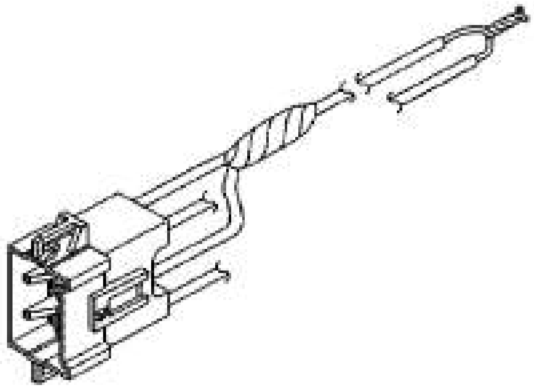
10. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. Use these wires to fabricate the right deployment harness.
11. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
12. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the inflator module.



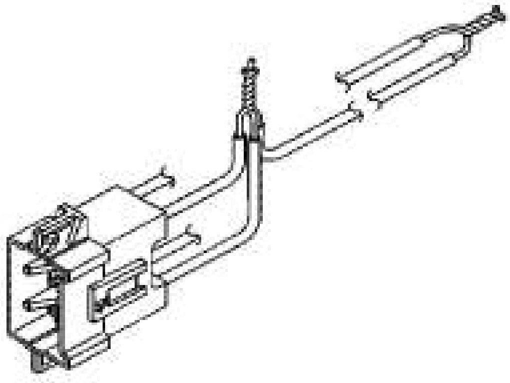
13. Twist together 2 connector wire leads (the high circuits from both stages of the steering wheel module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
14. Inspect that the 3-wire connection is secure.



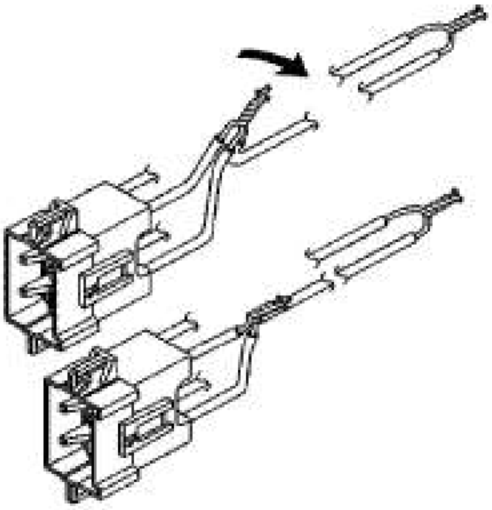
15. Bend flat the twisted connection.



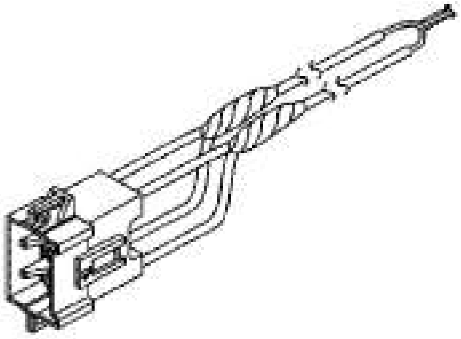
16. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



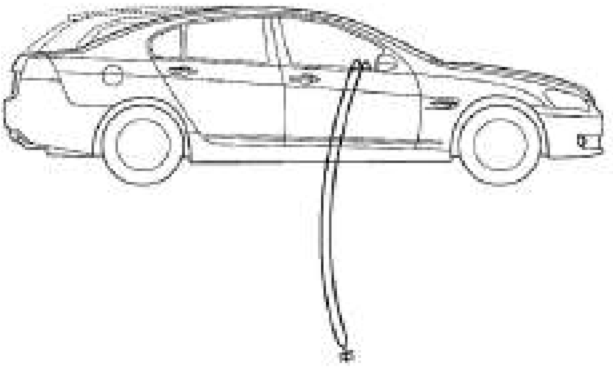
17. Twist together 2 connector wire leads (the low circuits from both stages of the steering wheel module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
18. Inspect that the 3-wire connection is secure.



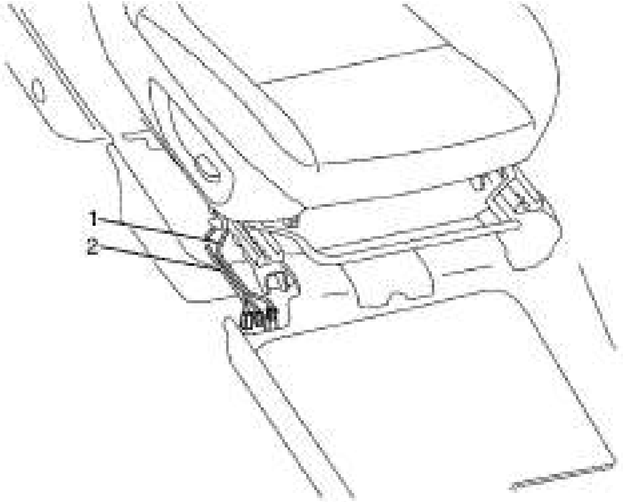
19. Bend flat the twisted connection.



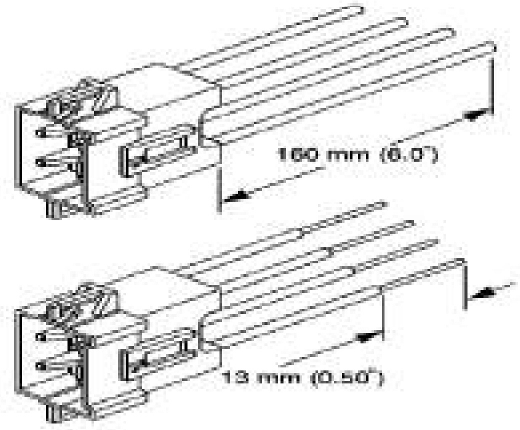
20. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
21. Connect the deployment harness to the steering wheel module in-line connector.



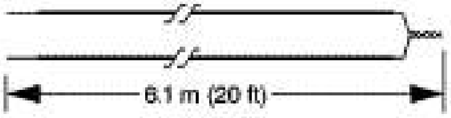
22. Route the deployment harness out of the right side of the vehicle.



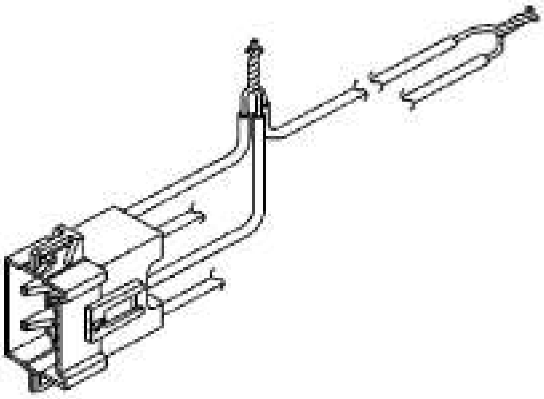
23. Disconnect the right side air bag/pretensioner yellow connector (1) from the vehicle wiring harness located under the front right seat.



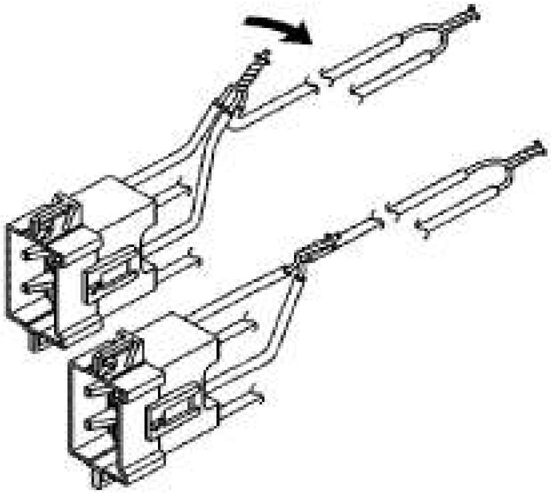
24. Cut the 4 SIR wires (2 for side air bag and 2 for pretensioner) leading to the yellow harness connector from the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
25. Strip 13 mm (0.5 in) of insulation from all 4 SIR wires connector leads (2 for side air bag and 2 for pretensioner).



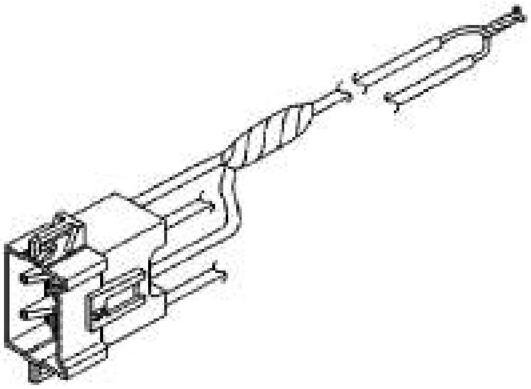
26. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. Use these wires to fabricate the deployment harness.
27. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
28. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the side air bag module and pretensioner.



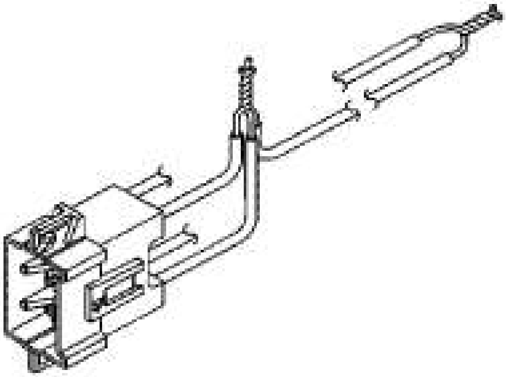
29. Twist together 2 connector wire leads (the high circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
30. Inspect that the 3-wire connection is secure.



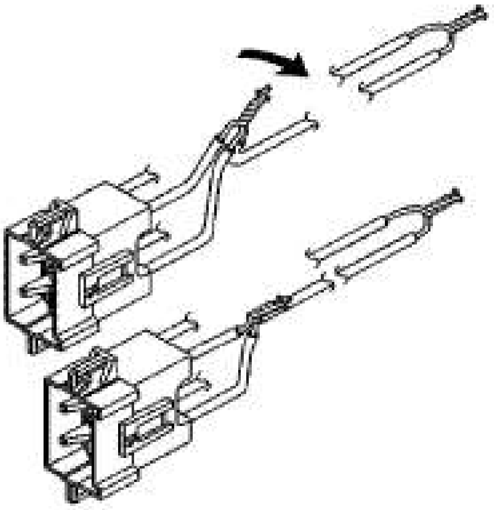
31. Bend flat the twisted connection.



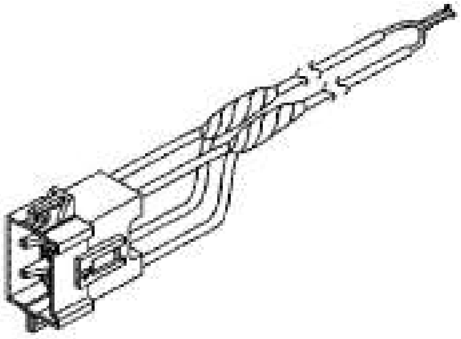
32. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



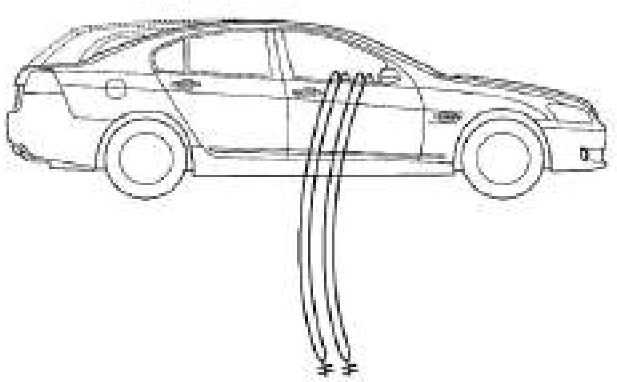
33. Twist together 2 connector wire leads (the low circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
34. Inspect that the 3-wire connection is secure.



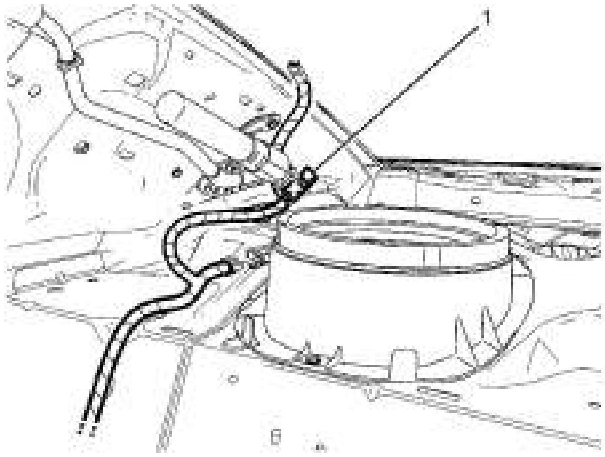
35. Bend flat the twisted connection.



36. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
37. Connect the deployment harness to the right side air bag/pretensioner yellow connector.

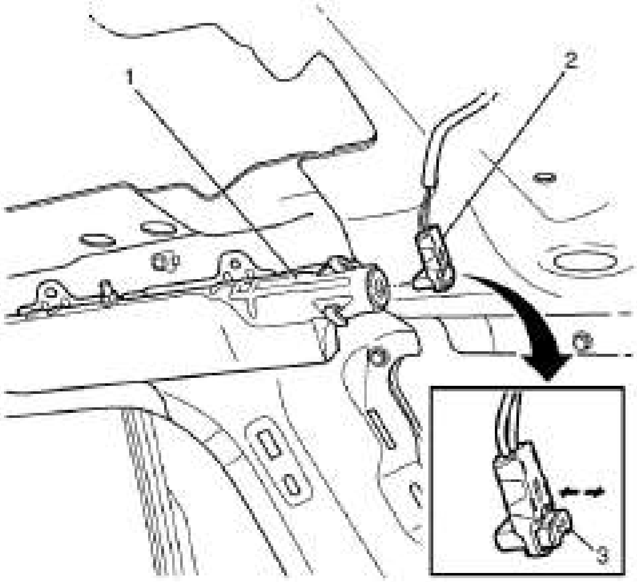


38. Route the deployment harness out of the right side of the vehicle.



Important: This step applies to sedan vehicles only.

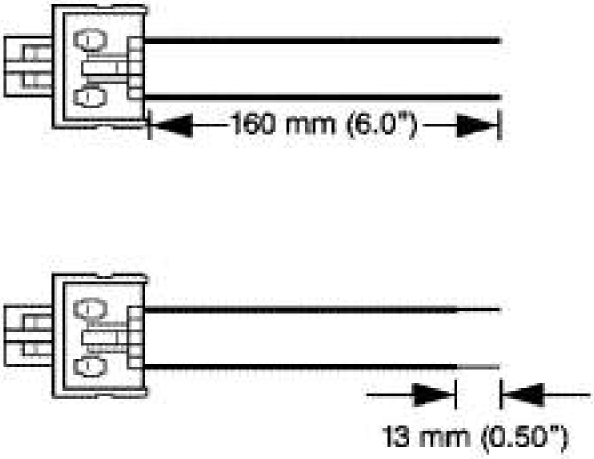
39. Disconnect the right roof rail yellow harness connector (1) from the right roof rail module.



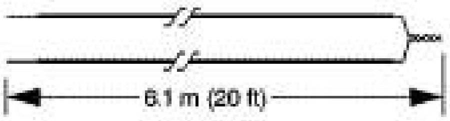
Important: This step applies to sportwagon vehicles only.

Important: The right roof rail module electrical connector retaining clip (3) must be released prior to removing the right roof rail module electrical connector (2).

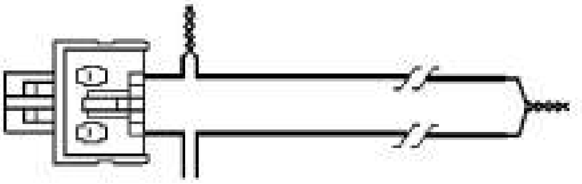
40. Disengage the right roof rail module electrical connector retaining clip (3) from the right roof rail module electrical connector (2).
41. Disconnect the right roof rail module electrical connector (2) from the right roof rail module (1).



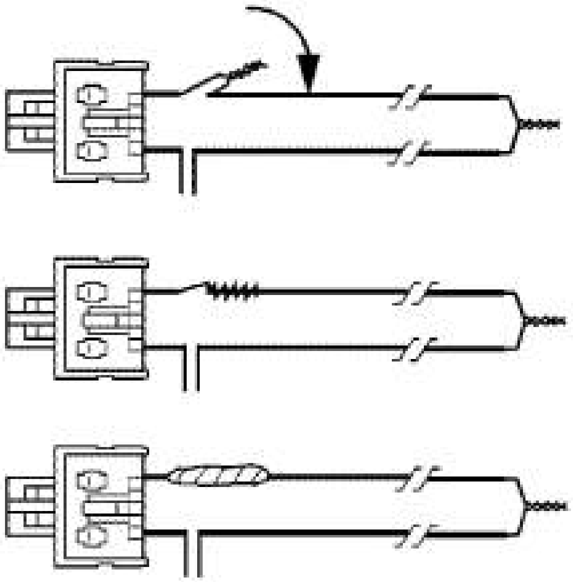
42. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
43. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



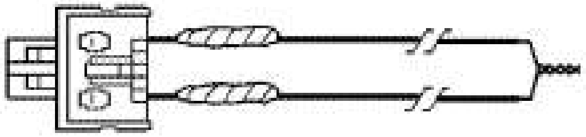
44. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
45. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
46. Twist together one end from each of the wires in order to short the wires.



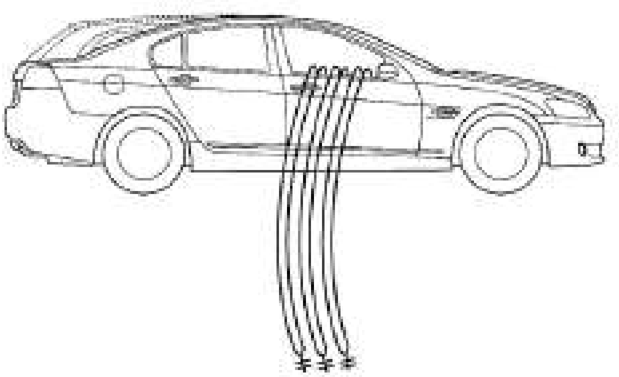
47. Twist together one connector wire lead to one deployment wire.



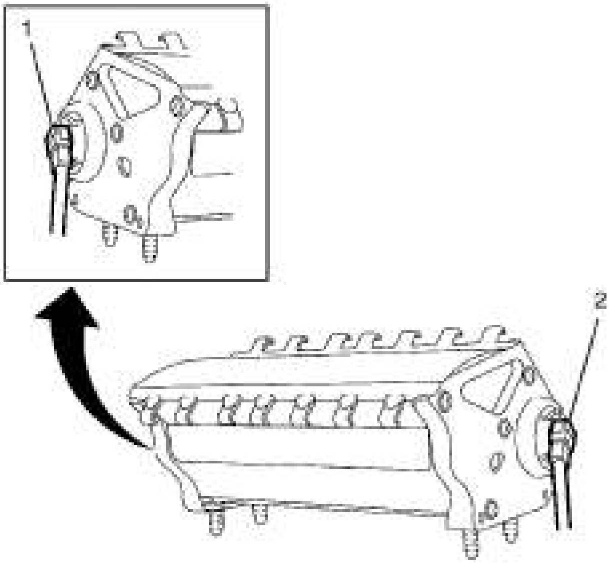
48. Bend flat the twisted connection.
49. Secure and insulate the connection using electrical tape.



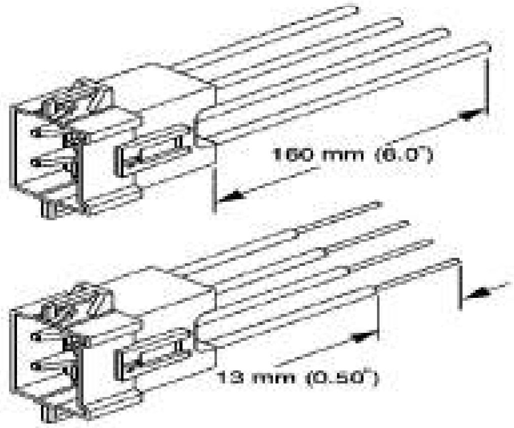
50. Twist together, bend, and tape the remaining connector wire lead to the remaining deployment wire.
51. Connect the deployment harness to the roof rail module yellow connector.



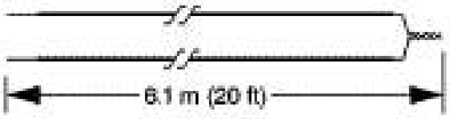
52. Route the deployment harness out of the right side of the vehicle.



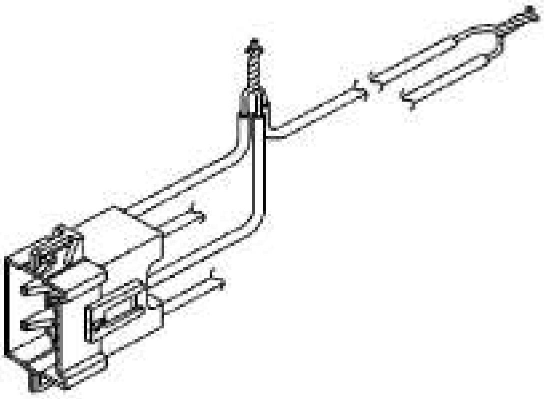
53. Disconnect the I/P module yellow harness connector (1) from the vehicle harness connector (2).



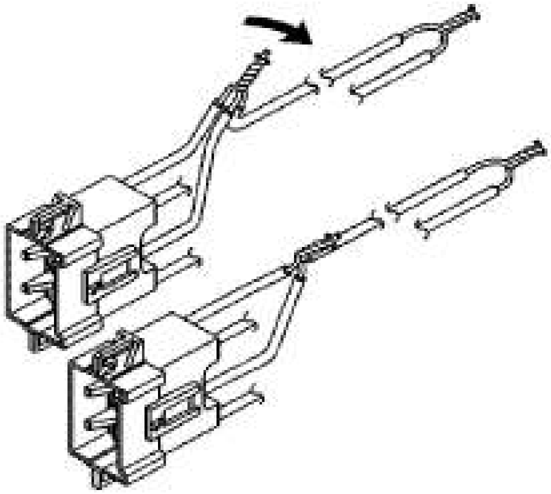
54. If vehicle is equipped with dual stage air bags the I/P module will each have 4 wires. Refer to Component Connector End Views , for determining high and low circuits.
55. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
56. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



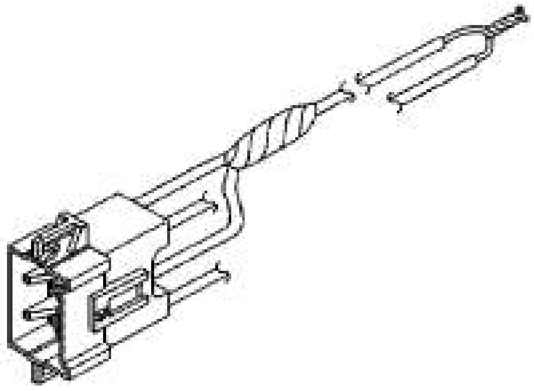
57. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. These wires will be used to fabricate the left deployment harness.
58. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
59. Twist together one end from each of the wires in order to short the wires.



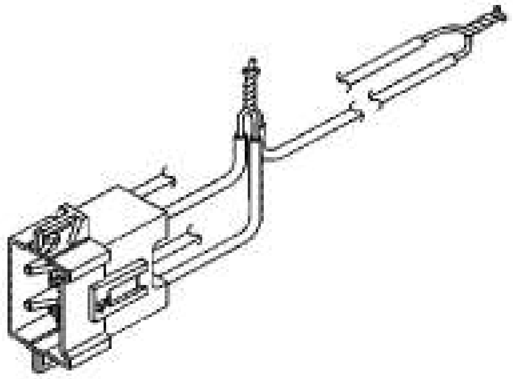
60. Twist together 2 connector wire leads (the high circuits from both stages of the steering wheel module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
61. Inspect that the 3-wire connection is secure.



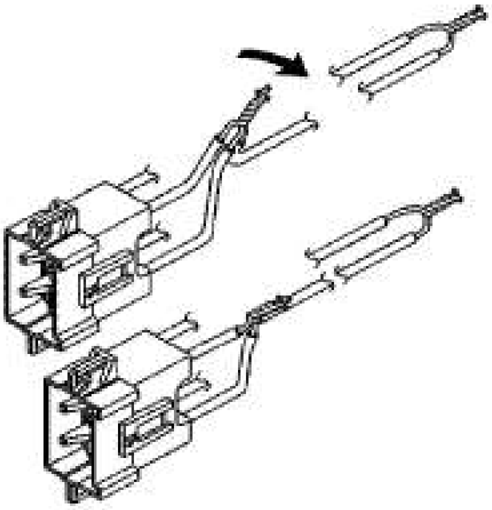
62. Bend flat the twisted connection.



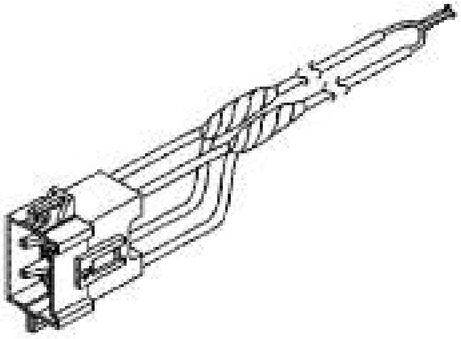
63. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



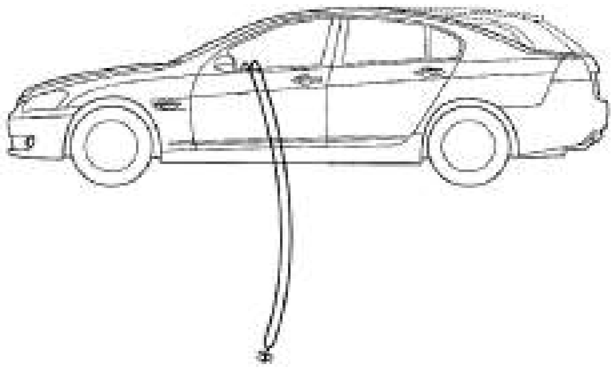
64. Twist together 2 connector wire leads (the low circuits from both stages of the I/P module) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
65. Inspect that the 3-wire connection is secure.



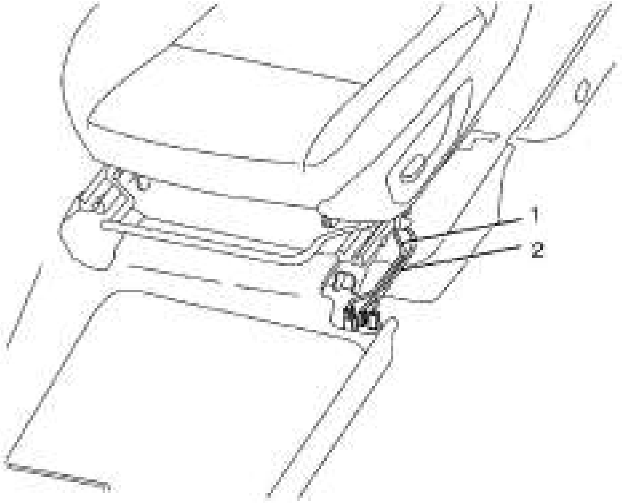
66. Bend flat the twisted connection.



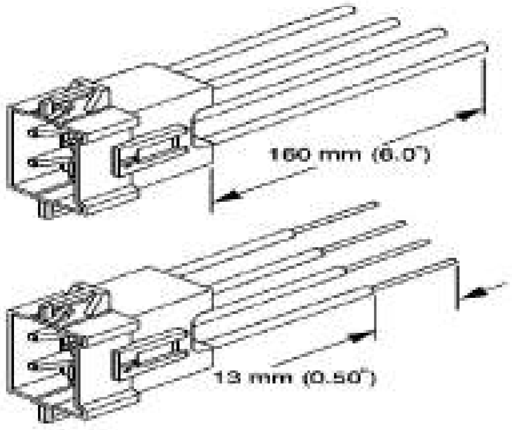
67. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
68. Connect the deployment harness to the I/P module in-line connector.



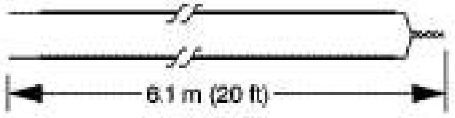
69. Route the deployment harness out of the left side of the vehicle.



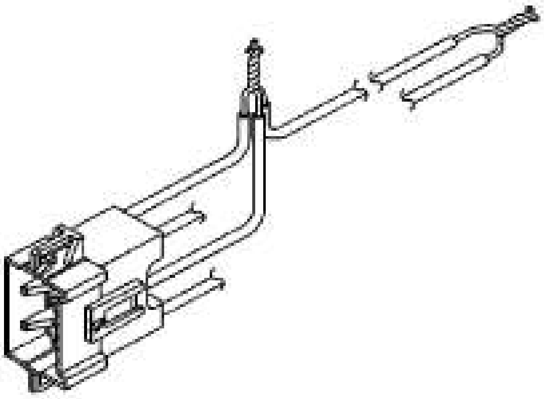
70. Disconnect the left side air bag/pretensioner yellow connector (1) from the vehicle wiring harness located under the front left seat.



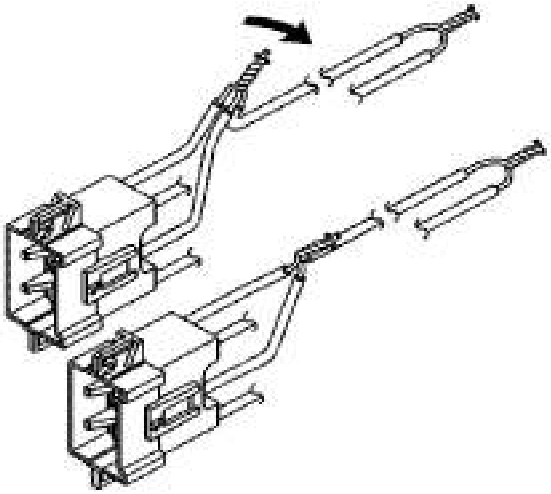
71. Cut the 4 SIR wires (2 for side air bag and 2 for pretensioner) leading to the yellow harness connector from the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
72. Strip 13 mm (0.5 in) of insulation from all 4 SIR wires connector leads (2 for side air bag and 2 for pretensioner).



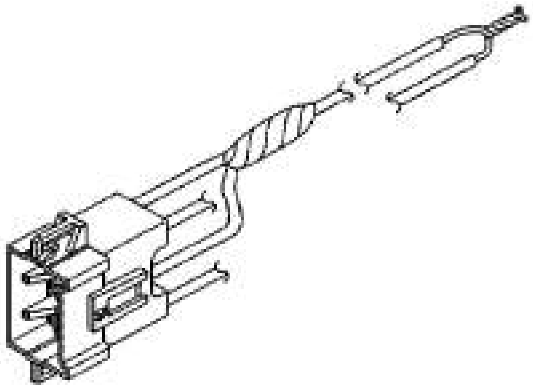
73. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. Use these wires to fabricate the deployment harness.
74. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
75. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the side air bag module and pretensioner.



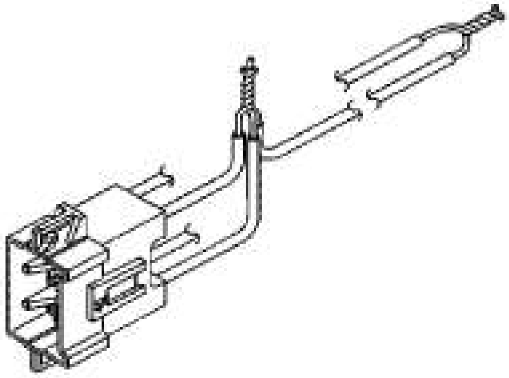
76. Twist together 2 connector wire leads (the high circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views , in order to determine the correct circuits.
77. Inspect that the 3-wire connection is secure.



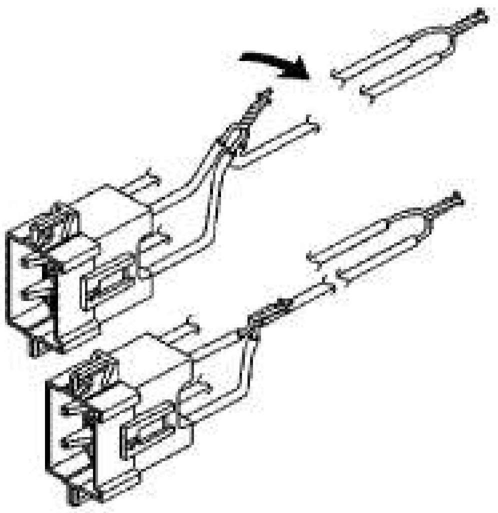
78. Bend flat the twisted connection.



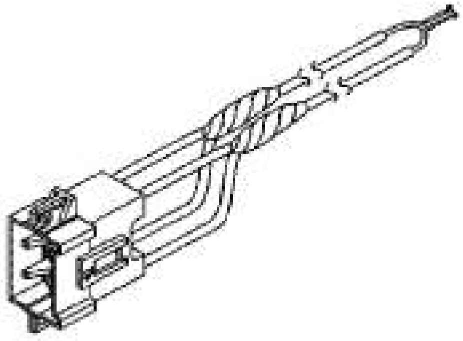
79. Secure and insulate the 3-wire connection to deployment harness using electrical tape.



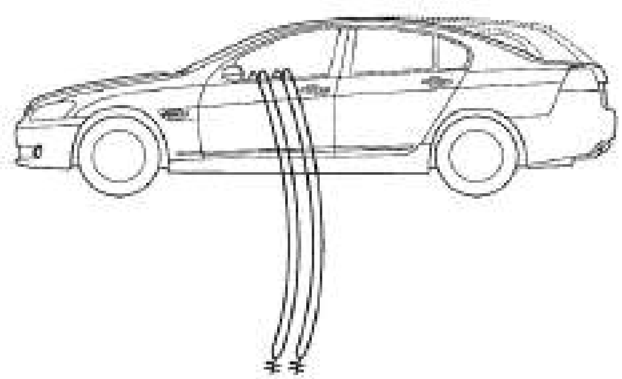
80. Twist together 2 connector wire leads (the low circuits from side air bag and pretensioner) to one sets of deployment wires. Refer to Component Connector End Views in order to determine the correct circuits.
81. Inspect that the 3-wire connection is secure.



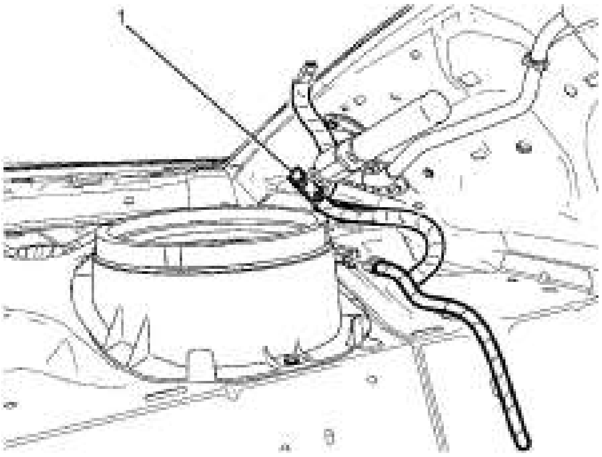
82. Bend flat the twisted connection.



83. Secure and insulate the 3-wire connection to deployment harness using electrical tape.
84. Connect the deployment harness to the left side air bag/pretensioner yellow connector.

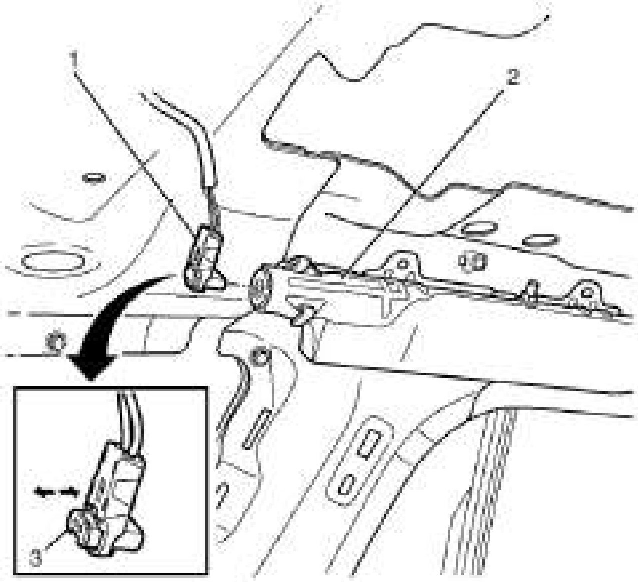


85. Route the deployment harness out of the left side of the vehicle.



Important: This step applies to sedan vehicles only.

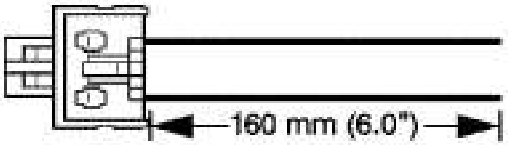
86. Disconnect the left roof rail air bag yellow harness connector (1) from the left roof rail module.

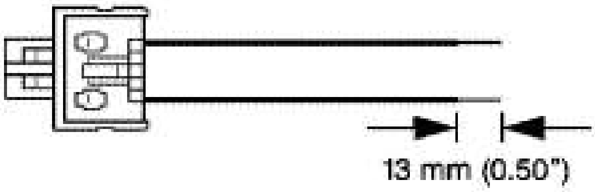


Important: This step applies to sportwagon vehicles only.

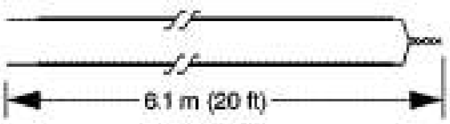
Important:: The left roof rail module electrical connector retaining clip (3) must be released prior to removing the left roof rail module electrical connector (1).

87. Disengage the left roof rail module electrical connector retaining clip (3) from the left roof rail module electrical connector (1).
88. Disconnect the left roof rail module electrical connector (1) from the left roof rail module (2).

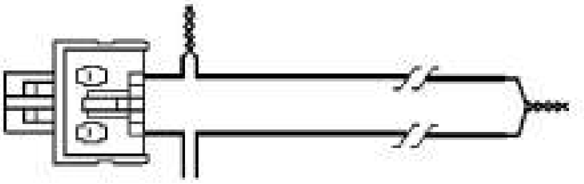




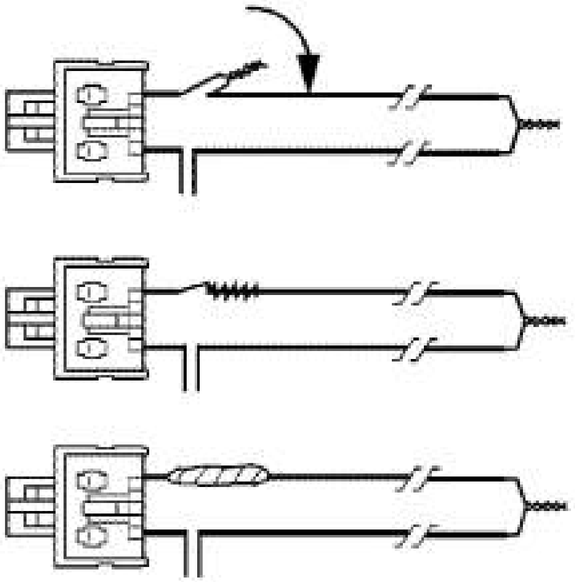
89. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
90. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.



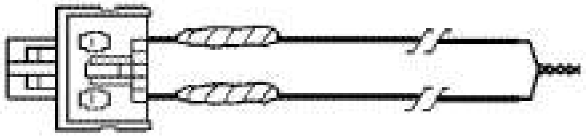
91. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gage) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
92. Strip 13 mm (0.5 in) of insulation from both ends of the wires cut in the previous step.
93. Twist together one end from each of the wires in order to short the wires.



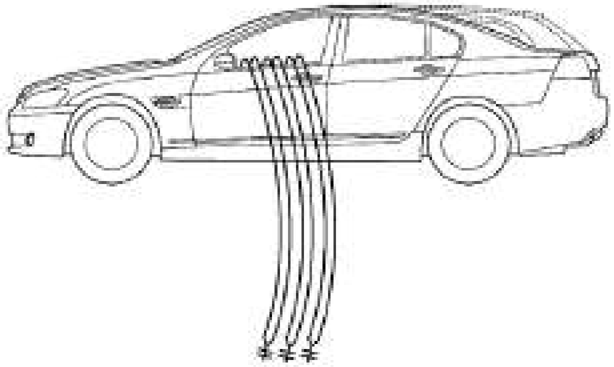
94. Twist together one connector wire lead to one deployment wire.



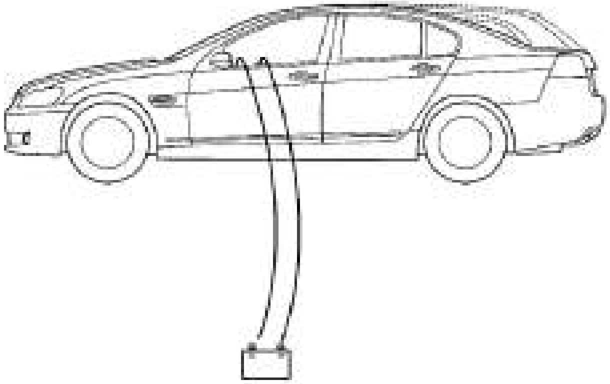
95. Bend flat the twisted connection.
96. Secure and insulate the connection using electrical tape.



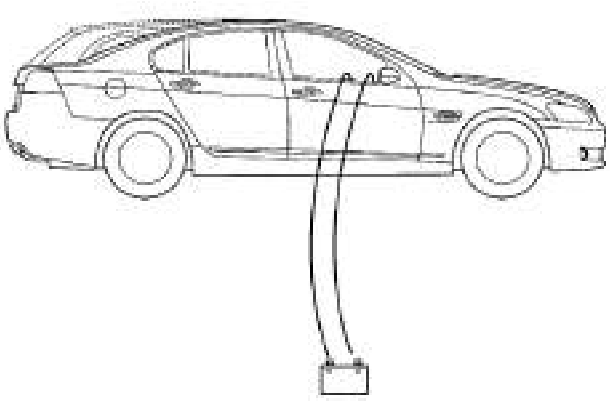
97. Twist together, bend, and tape the remaining connector wire lead to the remaining deployment wire.
98. Connect the deployment harness to the roof rail module yellow connector.



99. Route the deployment harness out of the left side of the vehicle.



100. Completely cover the windshield and front door window openings with a drop cloth.
101. Stretch out all of the deployment harness wires on the left side of the vehicle to their full length.
102. Deploy each deployment loop one at a time.
103. Place a power source, 12 V minimum/2 A minimum (i.e., a vehicle battery) near the shorted end of the harnesses.
104. Separate the one set of wires and touch the wires ends to the power source in order to deploy the inflator modules, doing one module at a time.
105. Disconnect the deployment harness from the power source and twist the wire ends together.
106. Continue the same process with the remaining deployment harnesses that are available.



107. Stretch out all of the deployment harness wires on the right side of the vehicle to their full length.
108. Deploy each deployment loop one at a time.
109. Place a power source, 12 V minimum/2 A minimum (i.e., a vehicle battery) near the shorted end of the harnesses.
110. Separate the one set of wires and touch the wires ends to the power source in order to deploy the inflator modules, doing one module at a time.
111. Disconnect the deployment harness from the power source and twist the wire ends together.
112. Continue the same process with the remaining deployment harnesses that are available.
113. Remove the drop cloth from the vehicle.
114. Disconnect all harnesses from the vehicle.
115. Discard the harnesses.
116. Scrap the vehicle in the same manner as a non-SIR equipped vehicle.
117. If one or all of the inflator modules did not deploy, perform the following steps to remove the undeployed module(s) from the vehicle:
    - Steering Wheel Inflatable Restraint Module Replacement.
    - Instrument Panel Inflatable Restraint Module Replacement.
    - Driver or Passenger Seat Side Inflatable Restraint Module Replacement.
    - Inflatable Restraint Roof Side Rail Module Replacement - Front.

Deployment Procedure - (Out Of Vehicle)

Refer to TAS (Technical Assistant Service) for further instructions.

Instrument Panel Inflatable Restraint Module Replacement

Important: Due to the clipping design of the passenger air bag (PAB) module it is extremely difficult to remove from the plastic cradle which is vibration welded to the underside of the Instrument Panel (IP) pad and the metal clips of the PAB would most likely be bent in removing from a pad assembly. This may result in the air bag being deployed incorrectly in an accident should it be re-used with the new IP pad assembly. If replacing the PAB for any reason you *must* also replace the IP pad assembly.

Refer to Instrument Panel Upper Trim Pad Replacement.

Pretensioner Handling and Scrapping

Handling Procedure

1. Do not carry a seat belt pretensioner by it's wiring harness lead.
2. Do not apply power to a pretensioner except as specified.
3. Do not attempt to make any repairs to the pretensioner assembly. A damaged or defective component must be replaced.
4. Do not weld, solder, braze, hammer, machine drill, or otherwise heat any SIR component.

Deployment Procedure - (In Vehicle)

Refer to Inflator Module Handling and Scrapping .

Deployment Procedure - (Out Of Vehicle)

Refer to TAS (Technical Assistant Service) for further instructions.

Repairs and Inspections Required After a Collision

Accident With or Without Air Bag Deployment - Component Inspections

Important: After any collision, inspect the following components as indicated. If you detect any damage, replace the component. If you detect any damage to the mounting points or mounting hardware, repair the component or replace the hardware as needed.

- The instrument panel (IP) area - inspect for bending, twisting, buckling, or any other type of damage
- The steering column, inspect for excessive movement (check for shear capsule separation)
- The seat belts - perform the seat belt operational and functional checks Repairs and Inspections Required After a Collision .
- The IP mounting points and brackets - inspect for bending, twisting, buckling, or any other type of damage
- The seats and seat mounting points - inspect for bending, twisting, buckling, or any other type of damage
- The door and garnish trim
- The roof and headliner mounting points
- Front end sensors

Accident With Frontal Air Bag Deployment - Component Replacement and Inspections

Important: The following must be replaced after a accident:

- Inflatable restraint SDM, refer to Inflatable Restraint Sensing and Diagnostic Module Replacement .
- Front end sensors, refer to Inflatable Restraint Front End Sensor Replacement .
- Seat belt pretensioners, refer to Seat Belt Buckle Pretensioner Replacement .
- Driver air bag, refer to Inflatable Restraint Steering Wheel Module Replacement . Inflatable Restraint Instrument Panel Module Replacement .
- Steering column, refer to Steering Column Replacement .
- Steering wheel, refer to Steering Wheel Replacement .
- Coil and the coil electrical harness, refer to Inflatable Restraint Steering Wheel Module Coil Replacement .
- All occupied seat belts. Refer to Seat Belts.
- All occupied seats. Refer to Seats.

Important: Inspect all mounting points and mounting hardware for after a accident

- Mounting points or mounting hardware for the I/P module, steering wheel module, SDM, and pretensioner - inspect for any damage and repair or replace each component as needed

Accident With Side Air Bag Deployment - Component Replacement and Inspections

Important: The following must be replaced after a accident:

- Inflatable restraint side impact sensors (SIS), on the side of the impact, refer to Driver or Passenger Seat Side Inflatable Restraint Module Replacement .
- Inflatable restraint roof rail module, on the side of the impact (if fitted), refer to Inflatable Restraint Roof Side Rail Module Replacement - Front .
- The steering column, inspect for excessive movement (check for shear capsule separation).
- Inflatable restraint sensing and diagnostic module (SDM), refer to Inflatable Restraint Sensing and Diagnostic Module Replacement .
- Side impact air bags, on the side of impact (Replace the seat assembly), refer to Driver or Passenger Seat Side Inflatable Restraint Module Replacement .
- All occupied seat belts including seat belt on impacted side. Refer to Seat Belts.
- Seat belt pretensioner. Refer to Seat Belt Buckle Pretensioner Replacement .
- A, B and C pillars and headliner when roof rail module has deployed. refer to Collision Repair.
- Mounting points or mounting hardware for the Side Impact Sensor (SIS), on the side of impact - inspect for any damage and repair or replace each component as needed
- Mounting points or mounting hardware for the roof rail module on the side of impact - inspect for any damage and repair or replace each component as needed
- Mounting points or mounting hardware for the SDM - inspect for any damage and repair or replace each component as needed

Sensor Replacement Guidelines

Important: The SIR front/side air bag sensor replacement policy requires replacing sensors in the area of accident damage. The area of accident damage is defined as the portion of the vehicle which is crushed, bent, or damaged due to a collision. An example of this would be a moderate collision where the front of the vehicle impacts a tree. The SIR front sensor must be replaced.

- Replace the sensor whether or not the air bags have deployed.
- Replace the sensor even if it appears to be undamaged.

> **Important:** Sensor damage which is not visible, such as slight bending of the mounting bracket or cuts in the wire insulation, can cause improper operation of the SIR/side air bag sensing system. Do not try to determine whether the sensor is undamaged. Replace the sensor. Also, if you follow a diagnostic trouble code (DTC) table and a malfunctioning sensor is indicated, replace the sensor.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Supplemental Inflatable Restraints | Repair Instructions | **Document ID: 2100372**

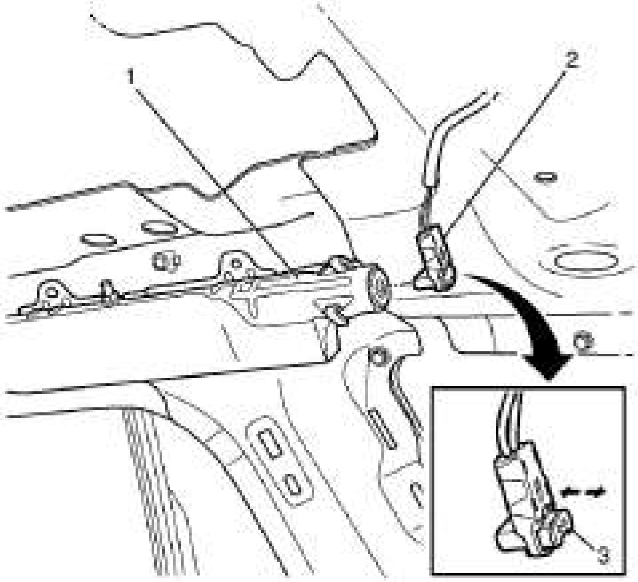
Roof Side Rail Inflatable Restraint Module Replacement (Sportwagon)

Removal Procedure

Caution: Refer to SIR Caution in the Preface section.

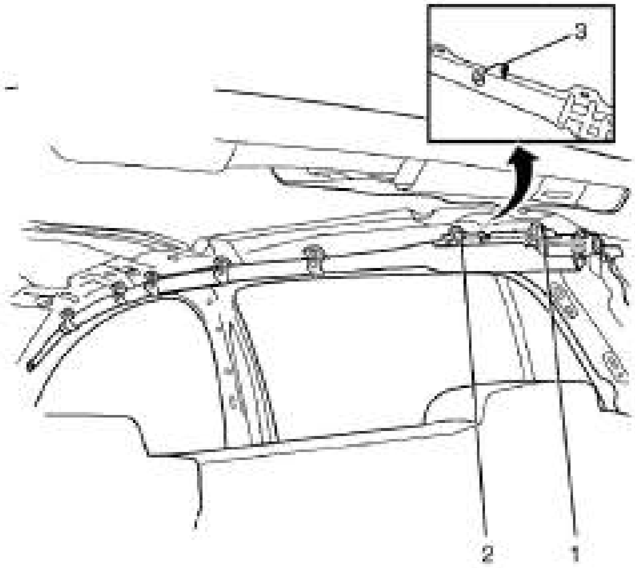
Caution: Refer to SIR Inflator Module Handling and Storage Caution in the Preface section.

1. Disable the SIR system. Refer to SIR Disabling and Enabling.
2. Remove the headlining. Refer to Headlining Trim Panel Replacement.

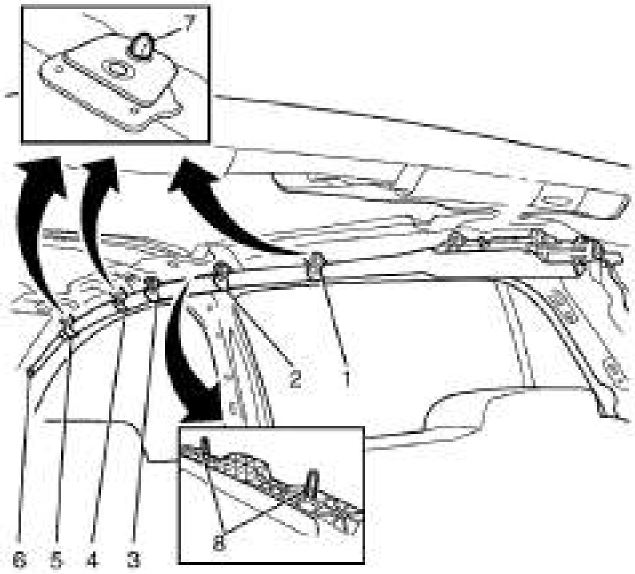


Important: The roof rail module electrical connector retaining clip (3) must be released prior to removing the roof rail module electrical connector (2).

3. Disengage the roof rail module electrical connector retaining clip (3) from the roof rail module electrical connector (2).
4. Disconnect the roof rail module electrical connector (2) from the roof rail module (1).



5. Remove the roof rail module bolts (1), (2).
6. With the aid of an assistant carefully lift the roof rail module up towards the roof to unhook the mounting point (3).



7. Remove the following roof rail module bolts in sequence (1), (2), (3), (4), (5), (6).
8. Release the datum pins (7), (8) from the vehicle.
9. Remove the roof rail module from the vehicle.
10. For deployment procedure. Refer to Inflator Module Handling and Scrapping.

Installation Procedure

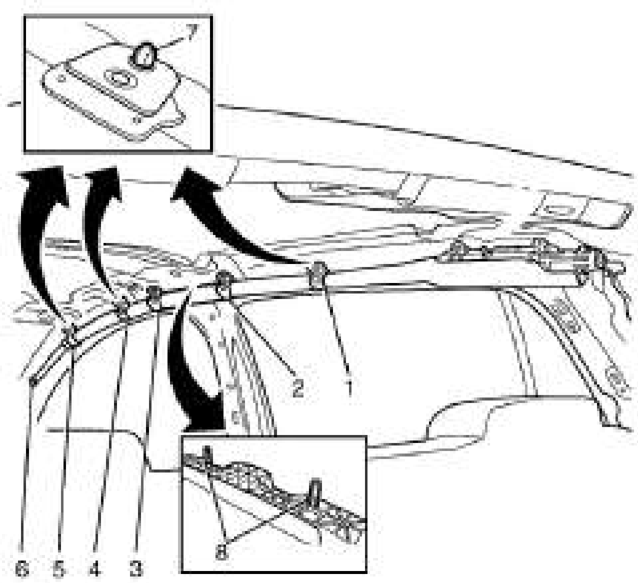
Caution: Refer to SIR Caution in the Preface section.

Caution: Refer to SIR Inflator Module Handling and Storage Caution in the Preface section.

Caution: In order to prevent accidental deployment of the air bag which could cause personal injury, do not dispose of an undeployed inflator module as normal shop waste. The undeployed inflator module contains substances that could cause severe illness or personal injury if the sealed container is damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed inflator module. Failure to dispose of an inflator module as instructed may be a violation of federal, state, province, or local laws.

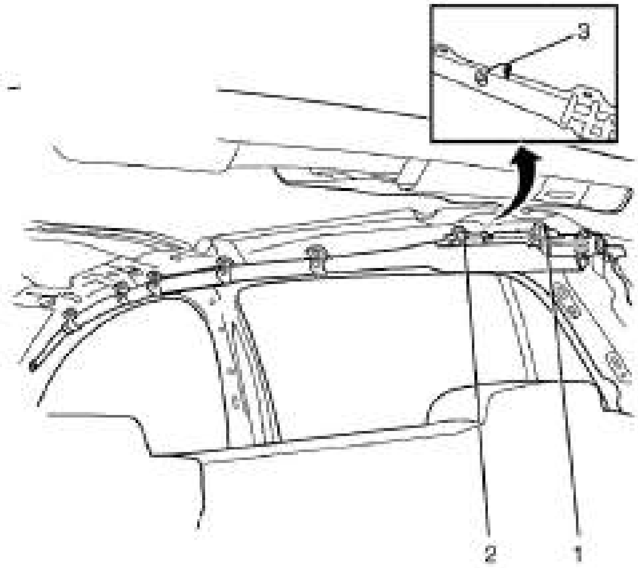
1. Remove any dirt, grease, or other impurities from the mounting surface.

   Notice: Refer to Fastener Notice in the Preface section.



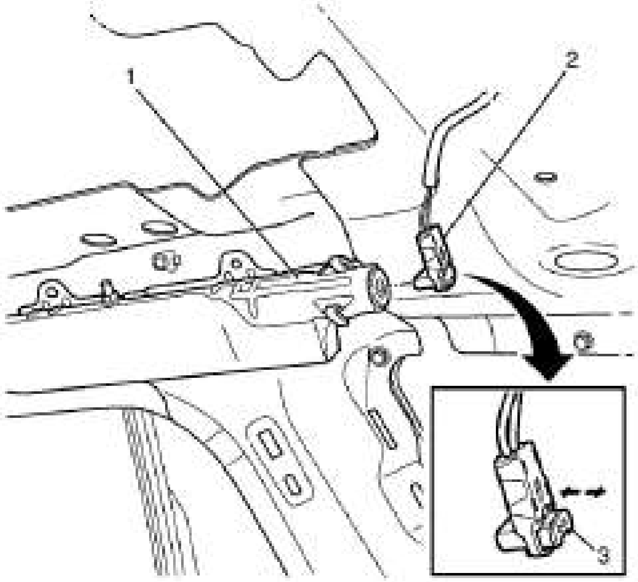
2. With the aid of an assistant carefully position the roof rail module up towards the roof making sure the datum pins (7) and (8) are correctly seated in place on the roof.
3. Install the roof rail module bolts to the roof in the following sequence (6), (5), (4), (3), (2), (1).
4. Tighten the roof rail module bolts to the roof in the following sequence (6), (5), (4), (3), (2), (1).

   Tighten
   Tighten the bolts to 7 N·m (62 lb in).



5. With the aid of an assistant carefully hook the mounting point (3) to the roof.
6. Install the roof rail module bolts to the roof in the following sequence (2), (1).
7. Tighten the roof rail module bolts to the roof in the following sequence (2), (1).

   Tighten
   Tighten the bolts to 7 N·m (62 lb in).



Important : Make sure the roof rail module electrical connector retaining clip (3) seats into the roof rail module electrical connector (2).

8. Install the roof rail module electrical connector (2) to the roof rail module (1).

9. Engage the roof rail module electrical connector retaining clip (3) into the roof rail module electrical connector (2).
10. Install the headliner. Refer to Headlining Trim Panel Replacement.
11. Enable the SIR system. Refer to SIR Disabling and Enabling.
12. If re-programming is required. Refer to Control Module References.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Supplemental Inflatable Restraints | Repair Instructions | **Document ID: 1995548**

Seat Belt Buckle Pretensioner Replacement (RHD)

Removal Procedure

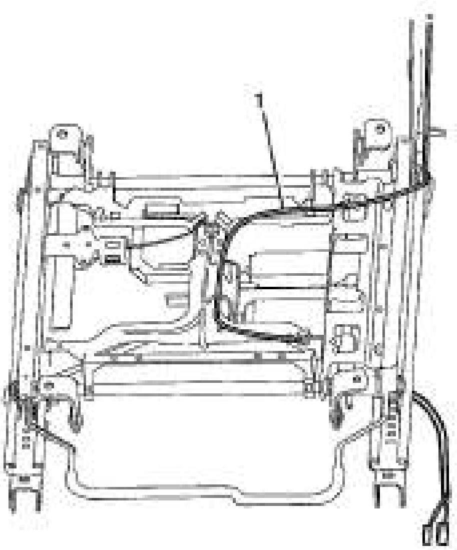
Caution: Refer to SIR Caution in the Preface section.

Caution: Refer to SIR Inflator Module Handling and Storage Caution in the Preface section.

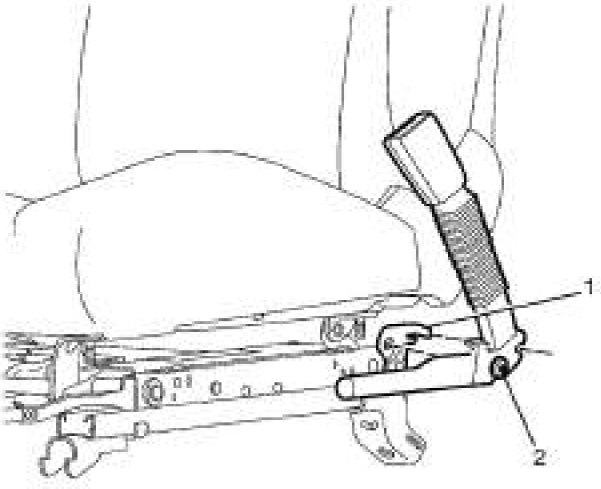
1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Remove the front seat. Refer to Front Seat Replacement - Bucket .

Important: Note the wiring and connector routing during the removal, in order to route the wiring properly during assembly.

3. Remove the seat.

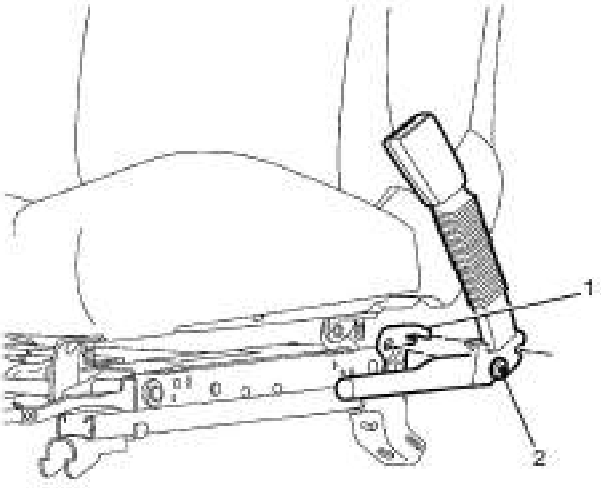


4. With the seat on the work bench, lay the seat on it side and remove the wiring harness (1) from the underside of the seat rail.



5. Remove the pretensioner bolt (2) and the pretensioner (1) from the seat.
6. Fully deploy the buckle pretensioner before disposal. If the buckle pretensioner was replaced under warranty, fully deploy and dispose of the module after the required retention period. Refer to Pretensioner Handling and Scrapping .

Installation Procedure



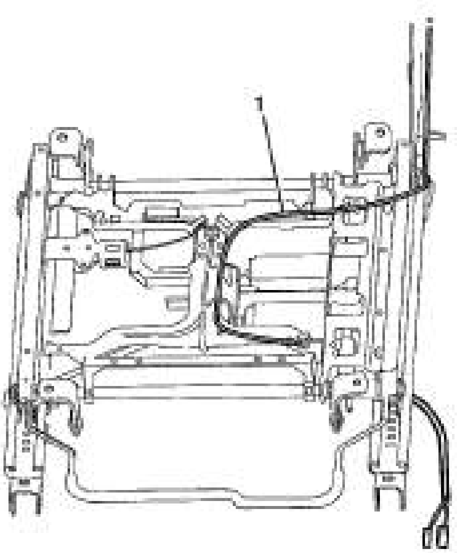
Important: The pretensioner has a locating tab that ensures the pretensioner is in the proper position.

1. Align the locating tab to the slot and install the pretensioner (1) to the seat.

Notice: Refer to Fastener Notice in the Preface section.

2. Install the bolt (2) while holding the pretensioner in place.

Tighten
Tighten the bolt to 43 N·m (32 lb ft).



3. With the seat on the work bench, lay the seat on it side and install the wiring harness (1) to the underside of the seat rail.
4. Install the seat. Refer to Front Seat Replacement - Bucket .
5. Enable the SIR system. Refer to SIR Disabling and Enabling .

SIR Service Precautions (RHD)

General Service Instructions

Caution: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling . Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

Important: The sensing and diagnostic module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the SIR modules. Deployment power may be available for up to 2 minutes after disconnecting the vehicle power. Disabling the SIR system prevents deployment of the SIR modules from the reserved energy supply.

Important: The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose inflator modules to temperatures above 65 °C (147 °F)
- Verify the correct replacement part number. Do not substitute a component from a different vehicle
- Use only original Holden replacement parts available from your authorized Holden dealer. Do not use salvaged parts for repairs to the SIR system

Important: Discard any of the following components if it has been dropped from a height of 96 cm (3 ft) or greater:

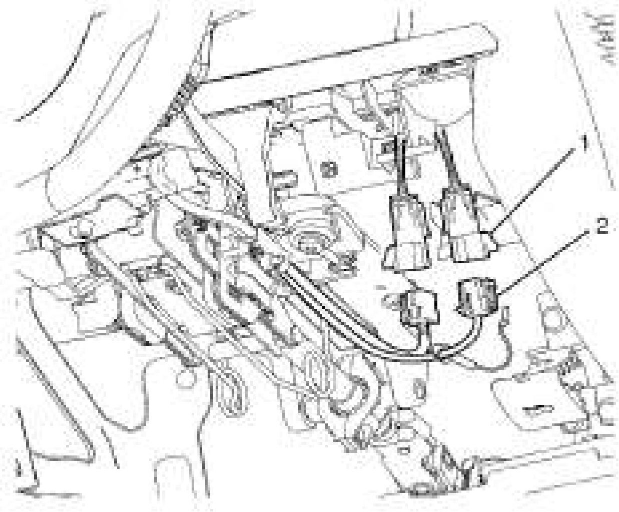
- Inflatable restraint SDM
- Inflatable restraint instrument panel (I/P) module
- Inflatable restraint steering wheel module
- Inflatable restraint steering wheel module clock-spring coil
- Inflatable restraint roof side rail modules
- Inflatable restraint side impact sensors (SIS)
- Inflatable restraint seat belt pretensioners
- Electronic front sensors
- Front seat (with side impact module)

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Supplemental Inflatable Restraints | Repair Instructions | **Document ID: 1995242**

Steering Wheel Inflatable Restraint Module Coil Replacement (RHD)

Removal Procedure

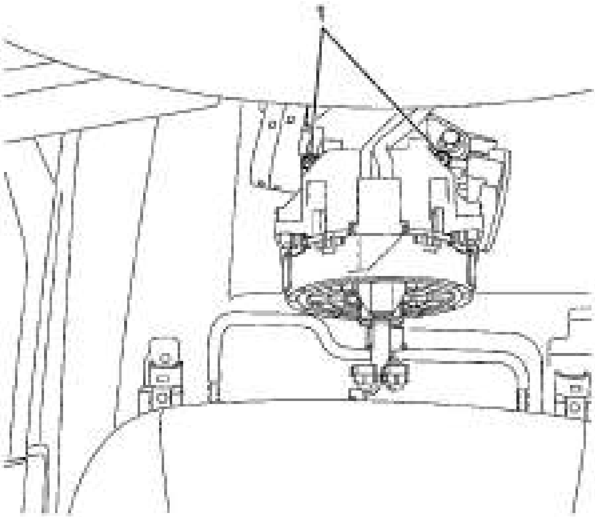
1. Disable the SIR. Refer to SIR Disabling and Enabling.
2. Remove inflatable restraint steering wheel module. Refer to Inflatable Restraint Steering Wheel Module Replacement.
3. Remove the steering wheel. Refer to Steering Wheel Replacement.
4. Remove the steering column trim covers. Refer to Steering Column Trim Covers Replacement.
5. Remove the turn signal switch from the SIR steering wheel module coil assembly. Refer to Turn Signal Switch Replacement.
6. Remove the windshield wiper and washer switch from the SIR steering wheel module coil assembly. Refer to Windshield Wiper and Washer Switch Replacement.



7. Disconnect the SIR steering wheel module coil connector (2) from the I/P harness (1)

   Important: If the SIR coil module is to be reused, it must be re-fitted in the same position as when removed.

8. Place some tape around the SIR steering wheel module coil assembly before removing from the steering column.



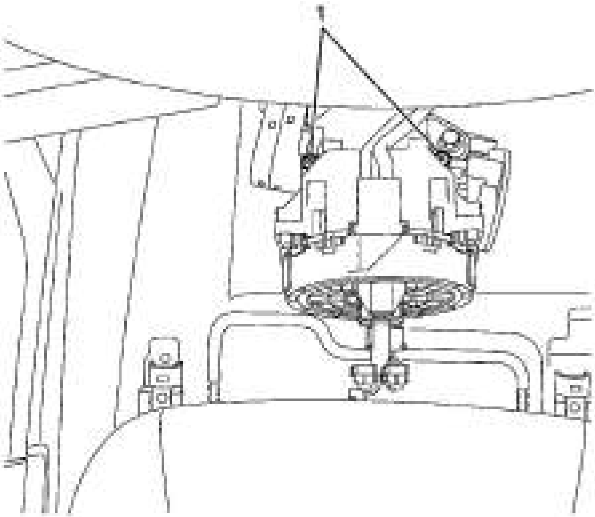
9. Remove the SIR steering wheel module coil assembly to steering column retaining screws (1).
10. Remove the SIR steering wheel module coil assembly.

Installation Procedure

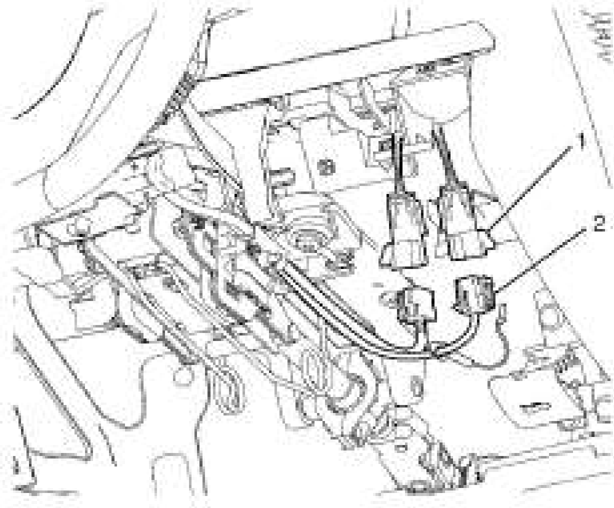
Notice: The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.

Important: If the existing SIR steering wheel module coil assembly is to be reinstalled, the SIR steering wheel module coil assembly must be fitted in the same position as when removed.

1. Install the SIR steering wheel module coil assembly. (If the original SIR steering wheel module coil assembly is being reused, remove the tape after installing the SIR coil module assembly.)



2. Install the SIR steering wheel module coil assembly to steering column retaining screws (1).

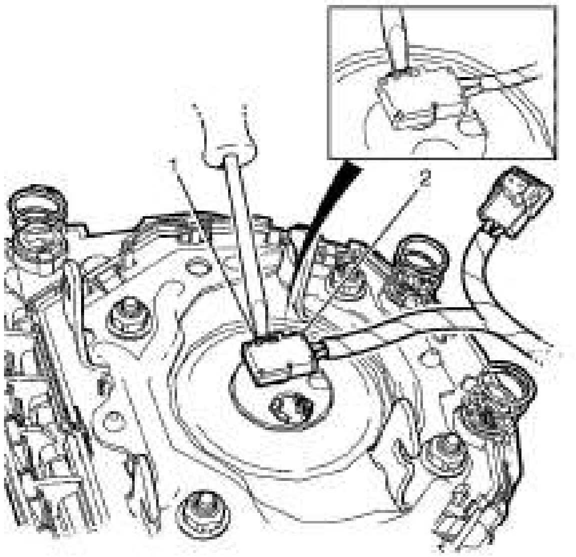


3. Connect the SIR steering wheel module coil assembly connector (2) to the I/P harness (1).
4. Install the windshield wiper and washer switch to the SIR steering wheel module coil assembly. Refer to Windshield Wiper and Washer Switch Replacement.
5. Install the turn signal switch to the SIR steering wheel module coil assembly. Refer to Turn Signal Switch Replacement.
6. Install steering column trim covers. Refer to Steering Column Trim Covers Replacement.
7. Install the steering wheel. Refer to Steering Wheel Replacement.
8. Install the inflatable restraint steering wheel module to the steering wheel. Refer to Inflatable Restraint Steering Wheel Module Replacement.
9. Enable the SIR system. Refer to SIR Disabling and Enabling.
10. Calibrate the steering angle sensor. Refer to Steering Angle Sensor Centering.
11. If re-programming is required. Refer to Control Module References.

Steering Wheel Inflatable Restraint Module Replacement

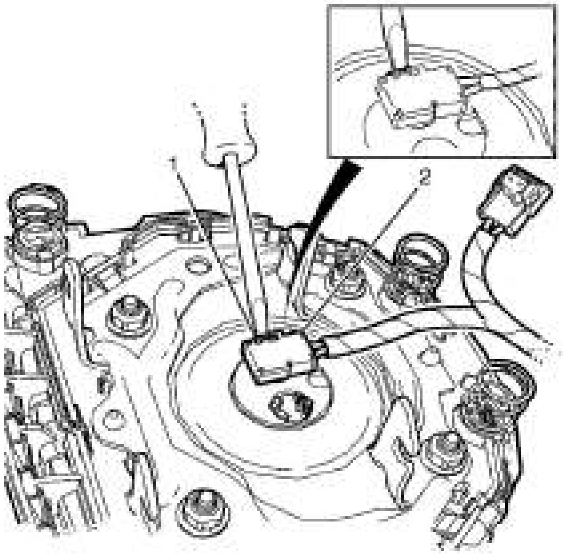
Removal Procedure

1. Disable the SDM, refer to SIR Disabling and Enabling .
2. Rotate the steering wheel 90 degrees from the straight-ahead position to expose the access aperture hole in the rear of the steering wheel hub.
3. Using tool no. EL-48508 , insert into the aperture and pivot towards the instrument panel moving the tool in an outward direction. This will relieve the tension on the spring-loaded retaining clips. The inflatable restraint assembly will move slightly away from the steering wheel. Rotate the steering wheel 180 degrees to expose the remaining access aperture hole. Repeat for other side.
4. Carefully lift the steering wheel inflatable restraint assembly away from the steering wheel and disconnect the wiring harness connectors (Orange and Blue) from the rear assembly.



5. Using a suitable tool, press in on the locking tab (1) while lifting the connector (2) away from the module.
6. Remove the black earth connector from the bottom of the steering wheel inflatable restraint assembly.
7. Refer to Inflator Module Handling and Scrapping .

Installation Procedure



1. Connect the wiring harness connectors (2) to the corresponding colours on the inflatable restraint steering wheel module.
2. Connect the black earth connector on the bottom of the steering wheel inflatable restraint assembly.
3. Align the steering wheel module firmly into the steering wheel assembly applying even pressure to the module until you hear a click.
4. Enable the SIR system. Refer to SIR Disabling and Enabling .
5. After replacing the module, deploy the old module before disposal. If the module replaced under warranty, fully deploy and dispose of the module after the required retention period. Refer to Inflator Module Handling and Scrapping .
6. If re-programming is required. Refer to Control Module References .

SIR System Description and Operation

SIR System Overview

Supplemental Restraint System (SIR) is a generic term for all air bag inflators/modules including driver, passenger, side impact, curtain bag and also includes pyrotechnic seat belt buckle and all associated hardware and wiring.

Air bags are supplemental restraint systems that are designed to work in conjunction with seat belts to reduce the severity and extent of injuries to the occupants of a vehicle in the event of an accident. When a condition or impact of sufficient force occurs, a sensor or sensors send an electrical signal to the diagnostic unit. The diagnostic unit (SDM) determines the type and severity of the collision and which of the SIR components are to be deployed. An electrical signal is then sent to the SIR's, which ignites the energetic materials and deploys the SIR.

Each inflator module has a deployment loop that is controlled by the inflatable restraint Sensing and Diagnostic Module (SDM), which is mounted inside of the vehicle. The SDM determines the severity of a collision and commands deployment of each inflator module. The SDM performs continuous diagnostic monitoring of the SIR system electrical components. Upon detection of a circuit malfunction, the SDM will set a diagnostic trouble code (DTC) and inform the driver by commanding the instrument panel cluster (IPC) to turn the AIR BAG indicator ON. The steering column is designed to absorb energy and compress during frontal collisions in order to decrease the chance of injury to the driver.

Dual Stage Inflator Module

Dual stage inflator modules contain a housing, inflatable air bag, 2 initiating devices, canister of gas generating material and, in some cases, stored compressed gas. The 2 initiators are part of the frontal deployment loop. The function of the frontal deployment loops are to supply current through the steering wheel and instrument panel (I/P) inflator modules to deploy the air bags. The inflator modules have 2 stages of deployment, which varies the amount of restraint to the occupant according to the collision severity. For moderate frontal collisions, the inflator modules deploy at less than full deployment (low deployment) which consists of stage 1 of the inflator module. For more severe frontal collisions, a full deployment is initiated which consists of stage 1 and stage 2 of the inflator module. The current passing through the initiators ignites the material in the canister producing a rapid generation of gas and is some cases, the release of compressed gas. The gas produced from this reaction rapidly inflates the air bag. Once the air bag is inflated, it quickly deflates through the air bag vent holes and/or the bag fabric.

Each dual stage inflator module is equipped with a shorting bar located in the connectors of the module. The shorting bar shorts the inflator module deployment loop circuitry to prevent unwanted deployment of the air bag when it is disconnected.

Frontal SIR System Description

The frontal supplemental restraint system (SIR) consists of the following components:

- SIR warning indicator located in the instrument panel cluster (IPC).
- Inflatable restraint dual stage instrument panel module. (Passenger's Airbag).

- Inflatable restraint sensing and diagnostic module (SDM).
- Inflatable restraint dual stage steering wheel module. (Driver's Airbag).
- Inflatable restraint steering wheel module clock-spring.
- Inflatable restraint wiring harnesses.
- Driver and passenger buckle pretensioners.
- Driver seat position switch.

A frontal collision of sufficient force will deploy the frontal air bags. The SDM contains a sensing device that converts vehicle velocity changes to an electrical signal. In the event of a frontal collision, the SDM receives a signal from the electronic frontal sensor which assists the SDM in determining the severity of the collision. The SDM compares these signals to a value stored in memory. When the generated signals exceed the stored value, the SDM will cause current to flow through the frontal deployment loops simultaneously deploying the frontal air bags. The SDM, I/P module, steering wheel module, steering wheel module coil, seat belt pretensioner and the connecting wires make up the frontal deployment loops. The SDM continuously monitors the deployment loops for malfunctions and turns the AIR BAG indicator ON if a fault is detected.

Inflatable Restraint Sensing and Diagnostic Module (SDM)

The sensing and diagnostic module (SDM) is a microprocessor and the control centre for the supplemental restraint system (SIR) . This SDM has 2 fused power inputs; one fuse is for the battery voltage and the other fuse is for the ignition voltage.

The SDM uses vehicle battery voltage as its main power input. The SDM then uses the vehicles GMLAN Serial Data Communication line and the ignition voltage logic input for enabling or disabling the SIR deployment loops. The SDM communicates with internal sensors and several external sensors. In the event of a collision, the SDM compares the signals from the internal and external sensors to values stored in memory. When the generated signals exceed the stored value, the SDM will cause current to flow through the appropriate deployment loops to deploy the seat belt pretensioner's and air bag(s) if required.

If the force of the impact is not sufficient to warrant inflator module deployment, the SDM may still deploy the seat belt pretensioners. The SDM records the SIR system status when a deployment occurs and turns the SIR warning lamp indicator located in the instrument panel cluster (IPC) ON. As soon as 3 distinct deployment commands (representing different events) have been issued to all belt pretensioner, or the SDM commands any front and/or side air bag to deploy once, the SDM shall be considered to not be reusable. The SDM performs continuous diagnostic monitoring of the SIR system electrical components and circuitry when the ignition is turned ON. If the SDM detects a malfunction, a DTC will be stored and the SDM will command the SIR warning lamp indicator ON, notifying the driver that a malfunction exist.

Inflatable Restraint Steering Wheel Module Coil

The steering wheel module coil is attached to the steering column and is located under the steering wheel. The steering wheel module coil consists of 2 or more current-carrying coils. The coils allow the rotation of the steering wheel while maintaining continuous electrical contact between the steering wheel module deployment loop and the steering wheel module. Four coil wires are used for the steering wheel module deployment loops. Additional coil wires are used for accessories that are attached to the steering wheel, depending on the vehicle model. The steering wheel module coil connector is located near the base of the steering column. The connector contains a shorting bar that shorts the steering wheel module coil deployment loop circuitry to prevent unwanted deployment of the steering wheel module when the connector is disconnected.

Inflatable Restraint Front End Sensor's

The front end sensor's, also known as the electronic frontal sensor's (EFS), are equipped on vehicles to supplement the Supplemental Restraint System (SIR) performance. The front end sensor's are an electronic sensor and is not part of the deployment loops, but instead provides an input to the sensing and diagnostic module (SDM). The front end sensor can assist in determining the severity of some frontal collisions. The SDM contains a microprocessor which performs calculations using the measured acceleration and compares these calculations to a value stored in memory. When the generated calculations exceed the stored value, the SDM will cause current to flow through the frontal deployment loops deploying the frontal air bags.

Inflatable Restraint Side Impact Sensors

The side impact sensor (SIS) contains a sensing device which monitors vehicle acceleration and velocity changes to detect side collisions that are severe enough to warrant air bag deployment. The SIS is not part of the deployment loop, but instead provides an input to the sensing and diagnostic module (SDM). The SDM contains a microprocessor that performs calculations using the measured acceleration and compares these calculations to a value stored in memory. When the generated calculations exceed the stored value, the SDM will cause current to flow through the deployment loops deploying the side air bags and curtain airbag's (if fitted).

Seat Belt Buckle Pretensioner

The seat belt pretensioner is a device that tightens a seat belt in the event of an accident. When a frontal, side (if side airbag's are fitted) or rear impact of sufficient force occurs, sensors send an activation signal to the pretensioning device. Upon deployment the pretensioning device tightens the seat belt webbing by reducing the length of the anchor line of the buckle. The intended purpose is to couple the occupant to the vehicle at an early stage, thereby reducing the load on the occupant and the severity and extent of injuries to the occupant.

During deployment the energetic materials pyrotechnic pretensioners are consumed in the reaction, therefore these devices can not be reused or repaired and must be replaced after a deployment.

Inflatable Restraint Steering Wheel Module

The "Driver air bag" or "Driver SIR" is an inflatable crash protection device deployed from the steering wheel. This system is activated when a frontal impact, up to 30 degrees off the centerline of the vehicle, of sufficient force occurs. The bag itself is shaped like a round pillow and inflates to the size of a large donut.

Inflatable Restraint Instrument Panel Module

The "Passenger air bag" or "Passenger SIR" is an inflatable crash protection device deployed from the passenger side instrument panel. This system is activated when a frontal impact, up to 30 degrees off the centerline of the vehicle, of sufficient force occurs. The bag itself is shaped like a rectangular pillow.

Inflatable Restraint Side Impact Module

The side impact air bag is located in the sides of the front seats. It deploys in a side impact collision to protect the occupant. Side impact air bags offer protection to the occupant, with bag fill timed to provide protection during an impact event.

Important: A side impact airbag only deploys on the side of the vehicle that is struck.

Inflatable Restraint Roof Rail Module

The "roof rail air bag" or "Curtain air bag stows unseen along the vehicle's interior roof rail. During a side impact the air bag deploys downwards from the vehicle's roof rail, providing protection for the front and rear occupants head.

Important: A curtain air bag only deploys on the side of the vehicle that is struck.

Inflatable Restraint Wiring Harness

The inflatable restraint wiring harness connects the inflator modules, the sensing and diagnostic module (SDM), the deployment loops, and the serial data circuit together using weather-packed connectors (where required). Supplemental restraint system (SIR) connectors are yellow for easy identification. When repairing SIR wiring harnesses, follow the proper SIR/SRS Wiring Repairs.

SIR Warning Indicator

The SIR warning lamp indicator, located in the instrument panel cluster (IPC), is used to notify the driver of supplemental inflatable restraint (SIR) system malfunctions and to verify that the sensing and diagnostic module (SDM) is communicating with the IPC. When the ignition is turned ON, the SDM is supplied with ignition positive voltage. The SDM requests the IPC to flash the SIR warning lamp indicator seven times. While flashing the indicator, the SDM conducts tests on all SIR system components and circuits. If no malfunctions are detected, the SDM will communicate with the IPC through the GMLAN serial data circuit and command the SIR warning lamp indicator OFF. The SDM provides continuous monitoring of the air bag circuits by conducting a sequence of checks. If a malfunction is detected the SDM will store a diagnostic trouble code (DTC) and command the IPC to turn the SIR warning lamp indicator ON via GMLAN serial data. The presence of a SIR system malfunction could result in non-deployment of the air bags or deployment in conditions less severe than intended. The SIR warning lamp indicator will remain ON until the malfunction has been repaired.

Steering Wheel and Column

The steering wheel and column are designed to absorb energy when driver contact is made with steering wheel or inflated module. When the driver applies load to the inflator module or the steering wheel, the column will compress downward, absorbing some of the impact and helping to reduce bodily injuries to the driver. The steering wheel and column must be inspected for damages after a collision.

Diagnostic Starting Point - Theft Deterrent

Begin the system diagnosis with the Diagnostic System Check - Vehicle . The Diagnostic System Check will provide the following information:

- The identification of the control modules which command the system
- The ability of the control modules to communicate through the serial data circuit
- The identification of any stored diagnostic trouble codes (DTCs) and their status

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B0983

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B0983 00: Security System Indicator 2 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Security Indicator Control	B0983	B0983	B0983	--

Circuit/System Description

The security indicator is controlled by the body control module (BCM) based on commands from the immobilizer system or the content theft deterrent (CTD) system. With the ignition OFF, the security indicator is commanded by the CTD system. With the ignition ON, the security indicator is commanded by the immobilizer system.

The security indicator is located in the instrument panel cluster (IPC) and is supplied B+ at all times. When the immobilizer or CTD system requests the indicator be commanded ON, the BCM grounds the security indicator control circuit, illuminating the indicator.

Conditions for Running the DTC

The security indicator is commanded ON.

Conditions for Setting the DTC

The BCM detects a short to voltage, short to ground, or an open/high resistance on the security indicator control circuit.

Action Taken When the DTC Sets

The security indicator is disabled.

Conditions for Clearing the DTC

- A current DTC will clear when the condition for setting the DTC is no longer present.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Circuit/System Verification

Arm the CTD system. The security indicator should illuminate and/or flash during the arming sequence.

Circuit/System Testing

1. Ignition OFF, disconnect the X3 harness connector at the BCM.
2. Ignition ON, verify the security indicator is not illuminated.
   If the security indicator is illuminated, test the control circuit terminal 7 for a short to ground. If the circuit tests normal, replace the IPC.
3. Install a 10A fused jumper wire between the control circuit terminal 7 and ground. Verify the security indicator is illuminated.
   If the security indicator is not illuminated, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the IPC.
4. If all circuits test normal, replace the BCM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for BCM or IPC replacement, setup, and programming

Symptoms - Theft Deterrent

Important: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Content Theft Deterrent (CTD) Description and Operation.

Visual / Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Keyless Entry System. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Content Theft Deterrent Malfunction
- Security Indicator Malfunction
- Theft Deterrent Alarm Malfunction

Content Theft Deterrent Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The content theft deterrent (CTD) system is a software based system in which the body control module (BCM) actively monitors certain inputs to determine if unauthorized vehicle access is being attempted. Based on inputs such as the door ajar switches, the rear compartment ajar switch, and the hood ajar switch, the BCM determines whether a CTD alarm is warranted. If unauthorized access is being detected, the BCM will pulse the vehicle horn and flash the turn signals as a means of theft deterrence.

Control Module References for scan tool information

Circuit/System Verification

1. Individually open and close each vehicle door while observing the door ajar

indicator/message. The indicator/message should accurately transition between the door ajar and door closed state when each door is opened and closed.

If the door ajar indicator/message does not properly transition when each door is opened and closed, refer to Door Ajar Indicator Malfunction.

2. Completely lower the driver door window and close all vehicle doors.
3. Ignition OFF, arm the CTD system using the keyless entry system by pressing the transmitter LOCK button twice. Verify the scan tool CTD Status parameter displays Armed.

   If not the specified value, refer to Keyless Entry System Malfunction.
4. Without disarming the system, reach in through the open driver window, unlock and open the driver door. Verify the scan tool Content Theft Mode parameter displays False.

   If not the specified value, replace the BCM.
5. With the door open, verify the vehicle horn is pulsing and the exterior lamps are flashing.

   If the horn is not pulsing, refer to Horns Malfunction.

   If the exterior lights are not flashing, refer to Turn Signal Lamps and/or Indicators Malfunction.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Tilt Sensor Function Inoperative (Genuine Accessory)

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit/System Description

This diagnostic procedure should be used in the case of the following: The alarm has been armed, a 30 second period has elapsed to enable the alarm system to complete the full arming cycle and the alarm siren does not sound when the vehicle inclination angle is changed. The alarm module registers the current vehicle inclination when the alarm system is armed. If the inclination angle of the vehicle is changed while the alarm system is in an armed state, then the alarm siren should sound. The tilt feature inoperative may be caused by the following:

- Tilt sensor not mounted securely.
- Tilt sensor incorrectly connected.
- Short circuit to ground or incorrect function of the disable switch.

Circuit/System Testing

Tilt Sensor not Securely Mounted

1. Locate the tilt sensor mounting bolts.
2. Ensure that the bolt holding the mounting bracket is tightened to 6 Nm.
3. Ensure that the plastic case of the tilt sensor is firmly attached to the mounting bracket.
4. Ensure that the harness connector is firmly connected to the tilt sensor.

Tilt Sensor Incorrectly Connected

1. Ensure that the harness connecter terminal 2 is vacant.
2. Test for less than 1.0 ohm of resistance between the tilt sensor harness connector terminal 4 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect the alarm module harness connector and from inside the vehicle, enable the alarm system with the remote transmitter key. Test for 4.8-5.2 volts between the tilt sensor 5-volt reference circuit terminal 1 and ground.

   If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage.
4. Disconnect the alarm module harness connector and test for less than 1.0 ohm of resistance between the alarm module harness connector terminal 4 and the tilt sensor harness connector terminal 3

   If greater than the specified range, test the circuit for an open/high resistance.
5. Test for infinite resistance between the alarm module harness connector terminal 4 and ground.

   If not the specified value, replace the alarm module harness.
6. Replace the tilt sensor and test the alarm operation.

   If alarm system is still inoperative, replace the alarm module.

Short Circuit to Ground or Incorrect Function of the Disable Switch

1. Ignition OFF, alarm module connector and disable switch disconnected.
2. Test for infinite resistance between the alarm module harness connector terminal 11 and ground.

   If not the specified value, replace the alarm module harness.
3. Connect the disable switch.
4. While pressing the disable switch button, test for less than 1.0 ohm resistance between the alarm module harness connector terminal 11 and ground.

   If not the specified value, replace the disable switch.
5. Release the disable button and test for infinite resistance between the alarm module harness connector terminal 11 and ground.

   If not the specified value, replace the disable switch.

Repair Instructions

For component removal and installation refer to the accessory fitting instructions.

Ultrasonic Sensor Function Inoperative (Genuine Accessory)

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit/System Description

After the alarm system has been armed, causing movement inside the cabin of the vehicle, will cause the alarm siren to be activated. The alarm movement detection feature consists of two ultrasonic sensors and an ultrasonic module. The one sensor transmits an ultrasonic signal and the other sensor receives the ultrasonic signal. When there is a distortion of the ultrasonic sound waves, the ultrasonic module will interpret this as movement. The ultrasonic module will relay this information to the alarm module which in turn will activate the siren. Inoperative ultrasonic function can be caused by the following:

- Ultrasonic sensor sensitivity set too low.
- Ultrasonic sensor wiring damaged.
- The ultrasonic sensors incorrectly connected to the ultrasonic module.
- Short circuit to ground or incorrect function of the disable switch.
- Incorrect or poor wiring connections between the alarm module and the body control module.
- Tilt sensor incorrectly connected to the alarm module

Circuit/System Testing

Ultrasonic Sensor Sensitivity Set Too Low

1. Ignition OFF, locate the ultrasonic module sensitivity adjustment screw.
2. Using a suitable flat blade screwdriver, turn the ultrasonic sensitivity adjustment screw until the marker indicates a higher value. A setting of between 2 and 3 is recommended (do not set to a value of 1).

   Function test the alarm ultrasonics before reassembling the vehicle. Adjust the ultrasonic sensitivity if further adjustment is necessary.

Ultrasonic Sensor Wiring Damaged

1. Locate the ultrasonic sensor wiring.
2. Inspect the ultrasonic sensors harness routing, ensuring that the cables are not pinched or damaged.
3. Inspect the ultrasonic sensor connectors at the ultrasonic module for damage.

Ultrasonic Sensors Incorrectly Connected to the Ultrasonic Module

1. Locate the 2-terminal connector socket on the ultrasonics module marked 'RED'. Ensure that one of the wires that is on the plug connector that connects to the socket marked 'RED' is in fact RED.
2. Locate the 2-terminal connector socket on the ultrasonics module marked 'BLACK'. Ensure that one of the wires that is on the plug connector that connects to the socket marked 'BLACK' is either BLACK or WHITE.
3. Ensure that the 4-terminal connector is firmly connected to the centre location on the ultrasonics module.

Short Circuit to Ground or Incorrect Function of the Disable Switch

1. Ignition OFF, alarm module connector and disable switch disconnected.
2. Test for infinite resistance between the alarm module harness connector terminal 11 and ground.

   If not the specified value, replace the alarm module harness.
3. Connect the disable switch.
4. While pressing the disable button, test for less than 1.0 ohm resistance between the alarm module harness connector terminal 11 and ground.

   If not the specified value, replace the disable switch.
5. Release the disable button and test for infinite resistance between the alarm module harness connector terminal 11 and ground.

   If not the specified value, replace the disable switch.

Incorrect or Poor Wiring Connections Between the Alarm Module and the Body Control Module

1. Ignition OFF, alarm module connector disconnected.
2. Locate the body control module (BCM) connectors X5 and X6
3. Test for less than 1 ohm resistance between the BCM harness connector terminal X6-16 and the alarm module harness connector terminal 8.

   If not the specified value, replace the harness.
4. Test for less than 1 ohm resistance between the BCM harness connector terminal X5-18 and the alarm module harness connector terminal 2.

   If not the specified value, replace the harness.

Tilt Sensor Incorrectly Connected to the Alarm Module

If the tilt sensor is incorrectly connected to the alarm module the alarm module may not initialize. Refer to the diagnostic procedure for the tilt sensor wiring.

Repair Instructions

For component removal and installation refer to the accessory fitting instructions.

Security Indicator Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Security Indicator Control	2	1	1	--
1. Security Indicator Inoperative 2. Security Indicator ON At All Times				

Circuit/System Description

The security indicator is controlled by the body control module (BCM) based on commands from the immobilizer system or the content theft deterrent (CTD) system. With the ignition OFF, the security indicator is commanded by the CTD system. With the ignition ON, the security indicator is commanded by the immobilizer system.

The security indicator is located in the instrument panel cluster (IPC) and is supplied B+ at all times. When the immobilizer or CTD system requests the indicator be commanded ON, the BCM grounds the security indicator control circuit, illuminating the indicator.

Control Module References for scan tool information

Circuit/System Verification

Arm the CTD system. The security indicator should illuminate and/or flash during the arming sequence.

Circuit/System Testing

1. Ignition OFF, disconnect the X3 harness connector at the BCM.
2. Ignition ON, verify the security indicator is not illuminated.
   If the security indicator is illuminated, test the control circuit terminal 7 for a short to ground. If the circuit tests normal, replace the IPC.
3. Install a 10A fused jumper wire between the control circuit terminal 7 and ground. Verify the security indicator is illuminated.
   If the security indicator is not illuminated, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the IPC.
4. If all circuits test normal, replace the BCM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for BCM or IPC replacement, setup, and programming

Theft Deterrent Alarm Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Coil B+	1	1	--	--
Relay Switch B+	1	1	--	--
Relay Coil Control	1	1	1	--
Relay Switch Control	1	1	2	--
1. Theft Deterrent Alarm Siren always OFF 2. Theft Deterrent Alarm Siren always ON				

Circuit/System Description

The alarm siren monitors the alarm enable signal circuit and will sound an audible alarm when the body control module indicates a event has occurred that requires an alarm. The alarm siren also monitors its own voltage circuits independent of the body control module. In the event of the interruption of voltage to the alarm siren, the alarm will sound.

Circuit/System Verification

Ignition ON, command the Alarm Siren ON and OFF with a scan tool. Listen and feel for the relay to turn ON and OFF.

Circuit/System Testing

1. Ignition OFF, disconnect the horn relay.
2. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 87 and ground.

   If the test lamp illuminates, test the control circuit for a short to voltage.
3. Verify that a test lamp illuminates between the B+ circuit terminal 30 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the horn relay.
4. Verify that a test lamp illuminates between the B+ circuit terminal 85 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the horn relay.
5. Disconnect the harness connector at the alarm siren.
6. Test for less than 5 Ω between the ground circuit terminal A X2 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect the harness connector at the alarm siren.
8. Connect a 15 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87. Verify the alarm siren is activated.

   If the alarm siren does not activate, test the control circuit for an open/high resistance.If the circuit tests normal and the control circuit fuse is open, test the control circuit for a short to ground. If the circuit tests normal, test or replace the alarm siren.
9. Connect a test lamp between the B+ circuit terminal 86 and the control circuit terminal 85.
10. Command the Alarm Siren ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

    If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the body control module.

    If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the body control module.
11. If all circuits test normal, test or replace the horn relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the content theft relay.

2. Test for 60 - 120 ohms between terminals 85 and 86.

   If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If not the specified value, replace the relay.
4. Install a 15A fused jumper wire between relay terminal 85 and 12V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 ohms between terminals 30 and 87.

   If greater than the specified range, replace the relay.

Repair Instructions

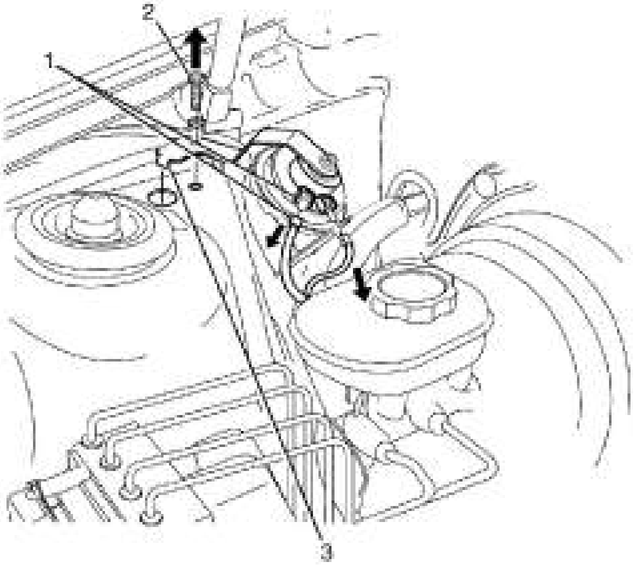
Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Theft Deterrent Alarm Replacement
- for BCM replacement, setup, and programming

Theft Deterrent Alarm Replacement (RHD)

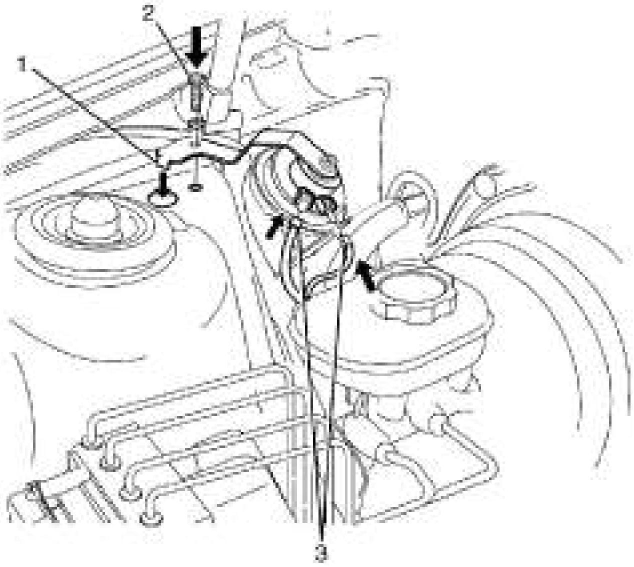
Removal Procedure

1. Open the Hood.



2. Disconnect the electrical connectors (1) from the theft deterrent horn assembly.
3. Remove the theft deterrent horn assembly to vehicle body retaining bolt (2).
4. Pull the theft deterrent horn assembly (3) upward in order to remove it from the vehicle.

Installation Procedure



1. Align the theft deterrent horn assembly in original position. Be sure to align "tang" (1) in the correct position.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the theft deterrent horn to vehicle body retaining bolt (2).

   Tighten
   Tighten the bolt to 8 N·m (6 lb ft).

3. Connect the electrical connectors (3) to the theft deterrent horn assembly.
4. Close the hood.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Safety and Security | Theft Deterrent | Repair Instructions | **Document ID: 1977462**

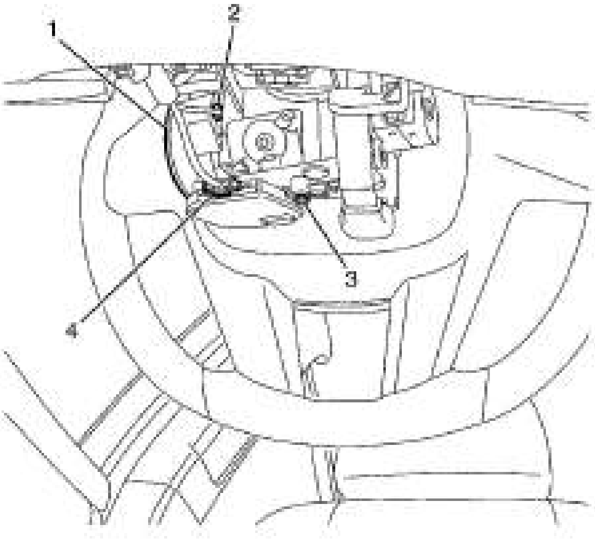
Theft Deterrent Module Replacement (RHD)

Removal Procedure

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to SIR Caution in the Preface section.

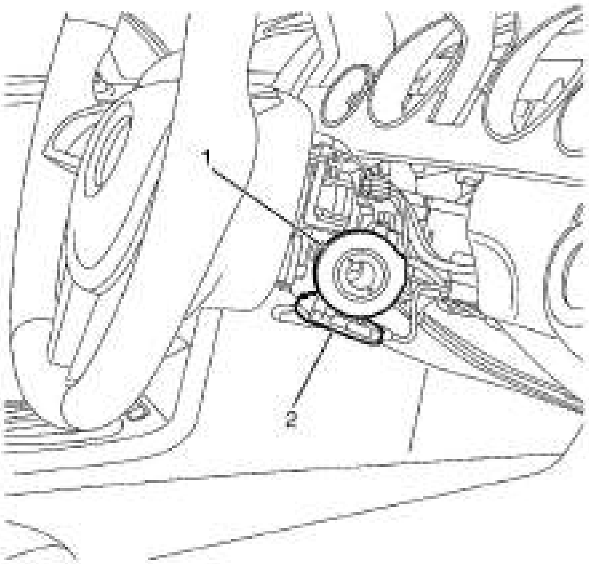
2. Disable the SIR system. Refer to SIR Disabling and Enabling .
3. Remove the steering column trim covers. Refer to Steering Column Trim Covers Replacement .



4. Disconnect the theft deterrent module (TDM) electrical connector (4).

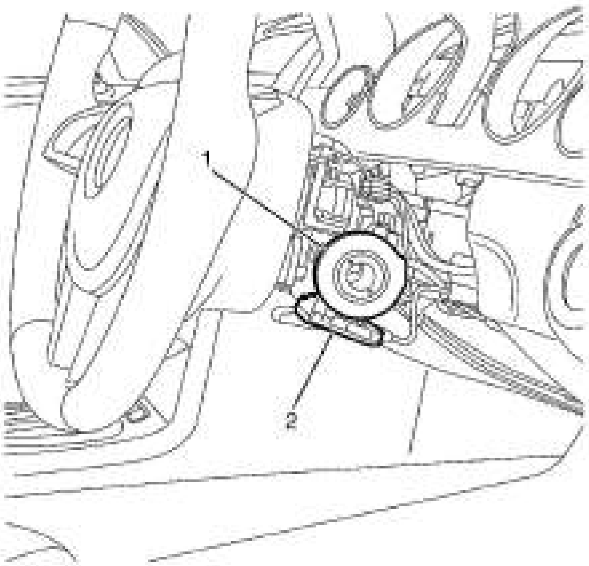
   Important: Rotate the ignition lock cylinder lamp socket counter-clockwise to disengage the locking tangs and pull to detach the ignition lock cylinder lamp socket (2) from the TDM.

5. Detach the ignition lock cylinder lamp socket (2) from the TDM (1).
6. Remove the TDM to steering column assembly retaining screw (3).



7. Remove the TDM (1) from the steering column assembly (2).

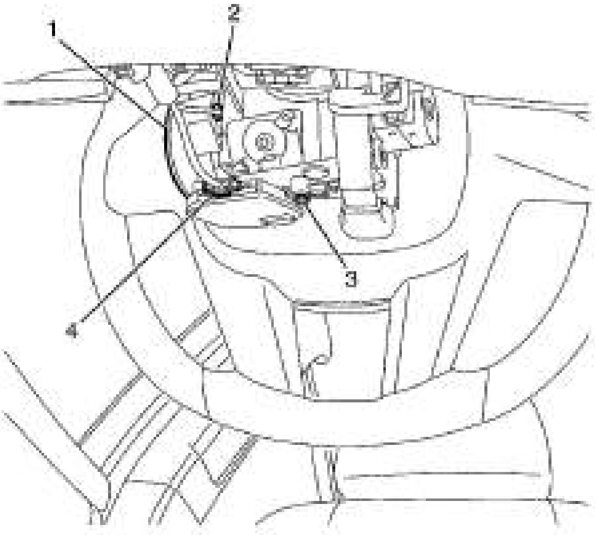
Installation Procedure



Important: Make sure the locating pin on the steering column assembly (2) is aligned with the TDM (1).

1. Install the TDM (1) to the steering column assembly (2).

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the TDM to steering column assembly retaining screw (3).

   Tighten
   Tighten the screw to 3 N·m (27 lb in).

   Important: Rotate the ignition lock cylinder lamp socket clockwise to engage the locking tangs and attach the ignition lock cylinder lamp socket (2) to the TDM.

3. Attach the ignition lock cylinder lamp socket (2) to the TDM (1).
4. Connect the theft deterrent module (TDM) electrical connector (4).
5. Install the steering column trim covers. Refer to Steering Column Trim Covers Replacement .
6. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .
7. Enable the SIR system. Refer to SIR Disabling and Enabling .
8. Program the TDM. Refer to Theft Deterrent Control Module Programming and Setup .

Content Theft Deterrent (CTD) Description and Operation

The content theft deterrent (CTD) system, when armed, is designed to deter vehicle content theft by pulsing the horns and exterior lamps for approximately 30 seconds when an unauthorized vehicle entry is detected. However, the CTD System does not affect engine starting.

An unauthorized entry can be any of the following with the CTD System armed:

- When the rear compartment has been opened without the use of the keyless entry system.
- When the hood has been opened without disarming the CTD system.
- When any door is opened without being unlocked using the keyless entry transmitter.

The components of the system are:

- The body control module
- The door ajar switches
- The hood ajar switch
- The rear compartment lid ajar switch

Arming the CTD System

Important: The content theft deterrent (CTD) system can be armed with the windows open.

Use the following procedure in order to arm the system:

1. Turn OFF the ignition.
2. Exit the vehicle.
3. Lock the doors with either the LOCK button on the transmitter or by the driver door external key cylinder lock.
4. If the doors are open when locking is requested, a warning of 5 horn chirps will occur.
5. The system will arm approximately 30 seconds from the time that the system has entered the locked state. When the indicator transitions to flashing slowly, the system is armed.

Disarming an Armed System / Silencing an Alarm

If system arming has been requested by the keyless entry transmitter, it must be disarmed.

Important: Manually unlocking the doors does not disable the CTD armed mode. Also, disconnecting the battery or pulling fuses does not disable the armed mode, as the body control module (BCM) stores the CTD status in memory.

To disarm the CTD system perform one of the following:

1. Press the UNLOCK button on the keyless entry transmitter.
2. Insert a valid key into the ignition and start the vehicle.

Simulated Armed Mode

If a vehicle remains disarmed with all doors and rear compartment lid closed for an extended time period (60 seconds), the CTD system will enter Simulated Armed Mode. In Simulated Armed Mode, the system activates the alarm indicator to replicate the armed mode by flashing slowly. However if the power mode changes or if any doors or the rear compartment lid are opened, the CTD system will turn off the lamp and not activate the alarm.

CTD Circuit Description

The following is a description of each component used in the content theft deterrent (CTD) system:

Body Control Module (BCM)

The CTD system is an internal function of the body control module (BCM) which utilizes serial data and various switch inputs to perform CTD functions. When the BCM detects an unauthorized entry, it activates the horns and exterior lamps.

When the BCM detects an unauthorized entry from the drivers door, the BCM will first enter the pre-alarm mode. The pre-alarm mode will command short chirps from the horn. If after 10 seconds the unauthorized entry still exists, the BCM will transition to the alarm mode. The horn and lamps will pulse for 30 seconds. Following the 30 second alarm period is a 5 second time-out. The CTD system will then re-arm.

Door Ajar Switches

The CTD system uses the integrated door ajar switches in the door latches as one method to activate the alarm. The BCM monitors all door ajar switches via a discrete input from each door ajar switch. If the BCM receives a ground signal from a door ajar switch when the CTD system is armed, the BCM activates the alarm.

Inputs

The BCM monitors the following inputs:

- The driver and passenger door ajar switches
- The hood ajar switch
- The rear compartment lid ajar switch
- The transmitter LOCK/UNLOCK buttons; an internal function of the BCM
- The Passkey status--The BCM uses the Passkey status for disarming the system or silencing and alarm when the correct vehicle key is used to start the vehicle.

Outputs

The BCM controls the following:

- The horn relay
- The exterior lights

Theft Systems Description and Operation

The vehicle theft deterrent (VTD) system functions are provided by the theft deterrent module (TDM) and the engine control module (ECM). When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coil surrounding the ignition lock cylinder. This exciter coil is part of the TDM. The energized transponder transmits a signal that contains its unique value, which is received by the TDM. The TDM then compares this value to a value stored in memory. If the ignition key is recognised as valid, the TDM performs a module substitution check where the identities of the instrument panel cluster (IPC), body control module (BCM), infotainment unit (IRC), rear seat entertainment (RSE) and sensing diagnostic module (SDM) control units are checked. If they are recognised as valid components, the TDM will send the fuel enable password to the ECM via the BCM using the GMLAN. If the transponders unique value is incorrect or module substitution has been detected, the TDM will send the fuel disable password to the ECM. It is important to note that while it is referred to as the fuel enable/disable password, the vehicles starter may also be disabled, preventing engine cranking.

When the ECM receives the TDM fuel enable password, the ECM will challenge the password. The ECM sends this challenge back to the TDM via the BCM using the GMLAN. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The components of the VTD system are as follows:

- Body Control Module (BCM)
- Theft Deterrent Module (TDM)
- Engine Control Module (ECM)
- Ignition key (Transponder)
- Security warning lamp

Theft Deterrent Module (TDM)

Vehicles with steering column mounted ignition switches have the exciter integral with the theft deterrent module (TDM), which is located within the steering column. The TDM can learn up to 10 keys (transponder values).

The TDM uses the following inputs: battery voltage, ignition switched voltage and ground circuit. The theft deterrent control module uses the following outputs: password exchange and challenge/response with the engine control module (ECM).

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched to accessories (ACC), the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the theft deterrent control module. The theft deterrent control module then compares this value to the learned key code stored in memory. If the ignition key is recognised as valid, the TDM performs a module substitution check where the identities of the instrument panel cluster (IPC), body control module (BCM), infotainment unit (IRC), rear seat entertainment (RSE) and sensing diagnostic module (SDM) control units are checked. The theft deterrent control module then performs one of the following functions:

- If the transponder value and control units match the values and identification stored in the TDM memory, the TDM will send the fuel enable message to the ECM via the BCM using the GMLAN.
- If the transponders unique value does not match either or both the values and/or identification stored in the TDM memory, the TDM will send the fuel disable message to the ECM via the BCM using the GMLAN.
- If the TDM is unable to measure the ignition key transponder value, the TDM will not send any messages to the ECM.

Engine Control Module (ECM)

When the engine control module (ECM) receives the theft deterrent module (TDM) fuel enable password, the ECM will challenge the password. The ECM sends this challenge back to the TDM via the serial data circuit. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The ECM will disable vehicle starting if any of the following conditions occur:

- The fuel enable password is invalid.
- The fuel disable password is sent by the TDM.
- No passwords are received--There is no communication with the TDM.
- The TDM calculated response to the challenge does not equal the calculation performed by the ECM.
- Module substitution has occurred.

The Ignition Key (Transponder)

The ignition key for Passkey III+ (PK3+) equipped vehicles is a standard ignition key with a transponder located in the plastic head of the key. The transponder value is fixed and unable to be changed. The vehicle theft deterrent (VTD) system uses the ignition key transponder value to determine if a valid ignition key is being used to start the vehicle. There are approximately 3 trillion possible transponder values. There are no visible electrical contacts.

Ignition keys have a black plastic head for full access operation of the vehicle. Ignition keys perform the following functions:

- Start the vehicle.
- Lock/unlock all of the door locks and rear compartment.
- Lock/unlock all of the storage compartments.

Module Substitution Detection

Module substitution detection is achieved by building an immobiliser chain made out of five control units which contain the VIN. When the ignition is switched to the ACC position, the TDM will request and compare the identities of each control unit to the identity stored in the TDM memory. This is called a module substitution check.

The following control units are in the immobiliser chain:

- Instrument panel cluster (IPC)
- Body control module (BCM)
- Infotainment unit (IRC)
- Rear seat entertainment (RSE)
- Sensing diagnostic module (SDM)

Two out of the five control units (IPC, BCM, IRC, RSE or SDM), are required to respond with the correct VIN to allow vehicle starting. Therefore, if only one unit is missing or reports with an incorrect VIN, vehicle starting is still enabled.

Diagnostic Starting Point - Seats

Begin the system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B0997

DTC Descriptor

DTC B0997 31: Memory Seat and Mirror Module Checksum Error

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit / System Description

The EEPROM (Electrically Erasable Programmable Read Only Memory) is part of the printed circuit board housed within the memory seat module (MSM). It stores variables required for the operation of the power seat system.

DTC B0997 will set if the EEPROM checksum is incorrect. The testing of the EEPROM checksum occurs every time the ignition is turned on. The DTC is reset when the EEPROM checksum is tested as being correct. The DTC is logged as a History DTC.

Conditions for Running the DTC

The MSM runs the program to detect an internal fault or compatibility concern when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The MSM internal EEPROM has failed or is corrupt.

Action Taken When the DTC Sets

The system will set the DTC and disable itself.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- The DTC can be cleared using a scan tool.

DTC Descriptors

DTC B1370 03: MSM Wake Up Circuit Short to Ground

DTC B1370 07: MSM Wake Up Circuit Short to Battery

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
MSM Wake-Up Signal	B1370 03	1	B1370 07	--

1. Power seats and memory recall functions are inoperative

Circuit/System Description

Whenever the memory seat module (MSM) is in the sleep mode, the seat interface module (SIM) must apply a voltage signal through the wake-up signal circuit to the MSM before power seat or memory functions are allowed.

Conditions for Running the DTC

The MSM is active.

Conditions for Setting the DTC

BB1370 03

The SIM senses that the MSM wake-up control circuit is shorted to ground.

BB1370 07

The SIM senses that the MSM wake-up control circuit is shorted to B+.

Action Taken When the DTC Sets

Power seats and memory recall functions are disabled.

Conditions for Clearing the DTC

- The current DTC clears when the fault is no longer present.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Memory Seat Switch Signal 3	1	1	B1410 01	--
Memory Mirror Switch Signal M	1	1	B2765 01	1
1. Memory recall is inoperative				

Circuit/System Description

Reference voltage from the seat interface module (SIM) is supplied at all times to the memory seat switch. When a memory recall switch is pressed, reference voltage is applied through the switch contacts and the signal circuit to the SIM indicating the memory recall request. The SIM serves as a interface and applies a reference voltage through the appropriate memory signal circuit to the memory seat module (MSM) indicating the memory seat request. The MSM then commands the driver seat motors and the exterior mirrors to move to the appropriate seat and mirror positions stored in memory.

Conditions for Running the DTC

The MSM is active.

Conditions for Setting the DTC

B1390 01

The SIM will set this DTC if it senses that the memory 1 switch signal is active for more than 50 seconds.

B1400 01

The SIM will set this DTC if it senses that the memory 2 switch signal is active for more than 50 seconds.

B1410 01

The SIM will set this DTC if it senses that the memory 3 switch signal is active for more than 50 seconds.

B2765 10

The SIM will set this DTC if it senses that the memory M switch signal is active for more than 50 seconds.

Action Taken When the DTC Sets

The memory recall function for the particular memory button is disabled.

Conditions for Clearing the DTC

- The current DTC will clear when the switch circuit setting the DTC is no longer active.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

   - Memory 1 terminal 9
   - Memory 2 terminal 8
   - Memory 3 terminal 19
   - Memory M terminal 19
3. Ignition ON, command the appropriate memory position listed below ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
   - Button 1 Input
   - Button 2 Input
   - Button 3 Input
   - Button M Input

   If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal replace the SIM.

   If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal replace the SIM.
4. If all circuits test normal, replace the MSM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for SIM and MSM replacement, setup, and programming

1. Power seat inoperative 2. Scan Tool Does Not Communicate with Low Speed GMLAN Device				

Circuit Description

When the power seat switches are pressed, they send a 12 volt signal through the switch signal circuits to the memory seat module (MSM). The MSM then commands the driver seat motors to move in response to the switch signals.

Conditions for Running the DTC

The MSM must be powered and cannot have DTC B1327 Battery Positive Low as an active DTC for this DTC to set.

Conditions for Setting the DTC

- If a seat switch circuit continues to be active for 30 seconds after a motor controlled by that switch reaches the end of its travel, the switch will be considered shorted and the MSM will set the DTC.
- A short to voltage on a switch signal circuit.

Action Taken When the DTC Sets

- A motor output driven in response to a switch considered failed, is deactivated for both directions.
- All memory recall commands are ignored.
- The MSM will respond to any other switch signal that has not set a DTC.

Conditions for Clearing the DTC

- The current DTC will clear when the switch circuit setting the DTC is no longer active.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Circuit/System Verification

Ignition ON, observe the scan tool Memory Seat Module seat switch parameters while pressing the appropriate seat directional switches. The reading should change between Inactive and Active.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the seat adjuster switch.
2. Ignition ON, verify the scan tool seat switch parameters listed below are Inactive.
   - Front Vertical Switch
   - Rear Vertical Switch
   - Horizontal Switch
   - Recline Switch

   If not the specified value, test the appropriate signal circuit listed below for a short to voltage. If the circuit tests normal, replace the MSM.
   - Front vertical upward switch terminal 10
   - Front vertical downward switch terminal 7

- Rear vertical upward switch terminal 9
- Rear vertical downward switch terminal 8
- Horizontal forward switch terminal 3
- Horizontal rearward switch terminal 6
- Recline forward switch terminal 2
- Recline rearward switch terminal 4

3. If all circuits test normal, test or replace the seat adjuster switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the seat adjuster switch.
2. Test for infinite resistance between the B+ terminal 5 and each signal terminal listed below with the switch in the open position.
   - Front vertical upward switch terminal 10
   - Front vertical downward switch terminal 7
   - Rear vertical upward switch terminal 9
   - Rear vertical downward switch terminal 8
   - Horizontal forward switch terminal 3
   - Horizontal rearward switch terminal 6
   - Recline forward switch terminal 2
   - Recline rearward switch terminal 4

   If not the specified value, replace the seat adjuster switch.
3. Test for less than 1 Ω between the B+ terminal 5 and each signal terminal listed below with the appropriate switch in the closed position.
   - Front vertical upward switch terminal 10
   - Front vertical downward switch terminal 7
   - Rear vertical upward switch terminal 9
   - Rear vertical downward switch terminal 8
   - Horizontal forward switch terminal 3
   - Horizontal rearward switch terminal 6
   - Recline forward switch terminal 2
   - Recline rearward switch terminal 4

   If greater than the specified range, replace the seat adjuster switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Power Seat Switch Replacement
- Control Module References for MSM replacement, setup, and programming

DTC B1825, B2355, B2365, or B2375

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

This diagnostic procedure supports the following DTCs:

DTC B1825 00: Recline Position Sensor Fault

DTC B2355 00: Front Vertical Position Sensor Fault

DTC B2365 00: Rear Vertical Position Sensor Fault

DTC B2375 00: Horizontal Position Sensor Fault

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Front Vertical Motor Position Sensor 5 V Reference	B2355 00	B2355 00	B2355 00	--
Front Vertical Motor Position Sensor Signal	B2355 00	B2355 00	B2355 00	--
Front Vertical Motor Position Sensor Ground	--	B2355 00	--	--
Horizontal Motor Position Sensor Signal	B2375 00	B2375 00	B2375 00	--
Horizontal Motor Position Sensor Ground	--	B2375 00	--	--
Rear Vertical Motor Position Sensor 5 V Reference	B2365 00	B2365 00	B2365 00	--
Rear Vertical Motor Position Sensor Signal	B2365 00	B2365 00	B2365 00	--
Rear Vertical Motor Position Sensor Ground	--	B2365 00	--	--
Recline Motor Position Sensor Signal	B1825 00	B1825 00	B1825 00	--
Recline Motor Position Sensor Ground	--	B1825 00	--	--

Circuit Description

The seat and lumbar motors are equipped with position sensors internal to the motor. The sensors are monitored by the memory seat module (MSM) and are used to determine seat positions when storing or recalling memory settings. The seat front vertical and rear vertical motors use 3 wire hall effect type position sensors while the seat horizontal and recline motors use 2 wire hall effect type position sensors. The MSM supplies the 3 wire hall effect position sensors with a separate 5 V reference circuit and signal circuit while ground is provided at G304. The MSM supplies the 2 wire hall effect position sensors with a signal circuit while ground is also provided at G304. During seat motor operation, the hall effect position sensor provides a determined number of pulse signals for every revolution of the motor shaft. These pulse signals (Steps) range from 0 - 65,535. High scan tool step values indicate forward or upward seat positions while low step values indicate rearward or downward seat positions.

Conditions for Running the DTC

The MSM must be powered and can not have B1327 as an active DTC for this DTC to set.

Conditions for Setting the DTC

The MSM does not detect position sensor movement while the adjuster motor is active.

Action Taken When the DTC Sets

The MSM disables the memory recall commands of the motor monitored by the sensor. The motor will respond to manual positioning commands.

Conditions for Clearing the DTC

- The DTC will clear when the fault is no longer present.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool seat position sensor parameters listed below while commanding the appropriate seat motor Up and Down or Forward and Rearward using the seat adjuster switch. Each parameter should change between 0 and 65,535 Steps.

- Front Vertical Position Sensor
- Horizontal Position Sensor
- Rear Vertical Position Sensor
- Recline Position Sensor

Circuit/System Testing

B1825 00 or B2375 00

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor.
2. Test for less than 5.0 Ω between the appropriate ground circuit terminal listed below and ground.
   - Seat horizontal sensor terminal 3
   - Seat recline sensor terminal 2

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for 4.8 - 5.2 V between the 5 V reference circuit terminal 4 and ground while commanding the seat motor ON with a scan tool.

   If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the MSM.

   If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the MSM.
4. If all circuits test normal, test or replace the appropriate motor.

B2355 00 or B2365 00

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor.
2. Test for less than 5.0 Ω between the ground circuit terminal 2 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for 4.8 - 5.2 V between the 5 V reference circuit terminal 4 and ground while commanding the seat motor ON with a scan tool.

   If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the MSM.

If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the MSM.

4. Test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground while commanding the seat motor ON with a scan tool.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the MSM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the MSM.
5. If all circuits test normal, test or replace the appropriate seat motor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Seat Adjuster Motor Replacement - Horizontal
- Seat Adjuster Motor Replacement - Vertical
- Front Seat Horizontal Adjuster Position Sensor Replacement

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1831 00: Lumbar Forward Switch Stuck

DTC B1836 00: Lumbar Rearward Switch Stuck

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lumbar Forward Switch Signal	1	1	B1831 00	--
Lumbar Rearward Switch Signal	1	1	B1836 00	--
1. Lumbar Support Inoperative				

Circuit/System Description

When the lumbar switches are pressed, they send 12 V signal through the switch signal circuit to the memory seat module (MSM). The MSM interprets the signal and commands the lumbar motor to move in response to the switch signals.

Conditions for Running the DTC

The MSM must be powered.

Conditions for Setting the DTC

- If a lumbar switch circuit is active in one direction and the switch for the opposite direction is pressed, this DTC will set.
- A short to voltage on a switch signal circuit.

Action Taken When the DTC Sets

- A motor output driven in response to a switch considered failed, is deactivated for both directions.

- All memory recall commands are ignored.
- The MSM will respond to any other switch signal that has not set a DTC.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history, 3 seconds after the fault is no longer present and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

DTC B1851

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1851 00: Lumbar Position Sensor Fault

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lumbar Horizontal Position Sensor Signal	B1851 00	B1851 00	B1851 00	--
Memory Seat/Mirror Sensor Low Reference	--	B1851 00	--	--

Circuit/System Description

The lumbar position sensor that set this diagnostic trouble code (DTC) is directly attached to the motor it monitors. It receives a signal circuit and ground from the memory seat module (MSM). The sensor sends a voltage signal that varies with the movement of the lumbar support through the signal circuit to the MSM. Then based on this voltage signal, the MSM determines the position of the lumbar.

Conditions for Running the DTC

The MSM must be powered.

Conditions for Setting the DTC

If the MSM sees the voltage signal from this sensor as either lower than 0.25 V or higher than 4.75 V, the sensor will be considered out of range and the MSM will set this DTC.

Action Taken When the DTC Sets

All memory recall functions will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set to history, when the MSM sees the analog input from the sensor as between 0.25 V and 4.75 V and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Circuit/System Verification

Ignition ON, observe the scan tool MSM Lumbar Position Sensor parameter. The reading should be between 0.25 V and 4.75 V and change while adjusting the lumbar position.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the seat lumbar motor.
2. Test for less than 2 Ω between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the MSM.
3. Ignition ON, verify the scan tool Lumbar Position Sensor parameter is greater than 4.75 V.

   If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the MSM.
4. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool Lumbar Horizontal Sensor parameter is less than 0.25 V.

   If greater than the specified range, test the signal circuit for short to voltage or an open/high resistance. If the circuit tests normal, replace the MSM.

5. If all circuits test normal, test or replace the lumbar position sensor.

DTC Descriptors

DTC B3907 02: Button PCB Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Seat Adjuster Memory Switch 12 Volt Reference	B3907 02, 1	1	--	--
Memory Seat Switch Signal 1	1	1	B1390 01	--
Memory Seat Switch Signal 2	1	1	B1400 01	--
Memory Seat Switch Signal 3	1	1	B1410 01	--
Memory Mirror Switch Signal	1	1	B2765 01	1
1. Memory recall is inoperative				

Circuit/System Description

Reference voltage from the seat interface module (SIM) is supplied at all times to the memory seat switch. When a memory recall switch is pressed, reference voltage is applied through the switch contacts and the signal circuit to the SIM indicating the memory recall request. The SIM serves as a interface and applies a reference voltage through the appropriate memory signal circuit to the memory seat module (MSM) indicating the memory seat request. The MSM then commands the driver seat motors and the exterior mirrors to move to the appropriate seat and mirror positions stored in memory.

Conditions for Running the DTC

The SIM is powered.

Conditions for Setting the DTC

The button PCB assembly is shorted to ground.

Action Taken When the DTC Sets

The memory recall function is disabled.

Conditions for Clearing the DTC

- The current DTC clears when the fault is no longer present.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Circuit/System Verification

Ignition ON, observe the scan tool SIM Input parameters listed below while pressing the appropriate memory 1, 2, 3, and M switches. The readings should change between Inactive and Active.

- Button 1 Input Status
- Button 2 Input Status
- Button 3 Input Status
- Button M Input Status

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the memory seat switch.
2. Ignition ON, verify that a test lamp illuminates between the 12 V reference circuit terminal 6 and ground.

   If the test lamp does not illuminate, test the 12 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the SIM.
3. Ignition ON, verify the scan tool SIM Input parameters listed below are Inactive:
   - Button 1 Input Status
   - Button 2 Input Status
   - Button 3 Input Status
   - Button M Input Status

   If not the specified value, test the appropriate signal circuit for a short to voltage. If the circuit tests normal, replace the SIM.
4. Install a 3 A fused jumper wire between the 12 V reference circuit terminal 6 and the signal circuit terminals listed below. Verify the appropriate scan tool SIM Memory Button Input Status parameter is Active between each test.
   - Button 1 Input Status
   - Button 2 Input Status
   - Button 3 Input Status
   - Button M Input Status

   If not the specified value, test the appropriate signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the SIM.
5. If all circuits test normal, test or replace the memory seat switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the memory seat switch.
2. Test for infinite resistance between the 12 V reference terminal 6 and each signal terminal listed below with the switch in the open position:
   - Memory 1 terminal 1
   - Memory 2 terminal 2
   - Memory 3 terminal 3
   - Memory M terminal 4

   If not the specified value, replace the memory seat switch.
3. Test for less than 2 Ω between the 12 V reference terminal 6 and each signal terminal listed below with the appropriate switch in the closed position:
   - Memory 1 terminal 1
   - Memory 2 terminal 2
   - Memory 3 terminal 3
   - Memory M terminal 4

   If greater than the specified range, replace the memory seat switch.

DTC Descriptor

DTC U1401: No Communication with MSM (Memory Seat and Mirror Module)

Circuit/System Description

The SIM continuously sends a communication signal to the MSM. Upon receiving the signal, the MSM sends a reply signal, confirming that it can communicate.

Conditions for Running the DTC

The SIM is active.

Conditions for Setting the DTC

The SIM does not receive a response from the MSM for 10 or more consecutive seconds.

Action Taken When the DTC Sets

The memory recall function is disabled.

Conditions for Clearing the DTC

- The current DTC will clear when the SIM receives a communication reply from the MSM.
- The history DTC will clear after 50 fault-free ignition cycles have occurred.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Seat Lumbar Switch B+	1, 2	1, 2	--	--
Driver Seat Lumbar Forward Switch Signal	1, 2	1	B1831 00	--
Driver Seat Lumbar Rearward Switch Signal	1, 2	1	B1836 00	--
Lumbar Motor Rearward Control	1	1	--	--
Lumbar Motor Forward Control	1	1	--	--
1. Lumbar support inoperative 2. Power seats inoperative				

Circuit/System Description

Battery voltage is supplied at all times to the memory seat module (MSM) from the seat interface module (SIM) and the Power Seats circuit breaker located in the I/P fuse block. This voltage is used by the MSM for logic power and to drive the driver seat adjuster motors, recline motor and the lumbar motor.

The lumbar motor is reversible. For example, when the lumbar switch is operated to move the lumbar support forward, battery voltage is applied through the switch contacts and the lumbar horizontal forward switch signal circuit to the MSM. In response to this signal, the MSM applies battery voltage through the lumbar horizontal motor forward control circuit and ground through the lumbar horizontal motor rearward control circuit to the motor. The motor runs to drive the lumbar support forward toward the occupant's back until the switch is released. Moving the lumbar support rearward works similarly to moving the lumbar support forward, except that battery positive voltage and ground are applied on the opposite circuits causing the motor to run in the opposite direction. The MSM also controls the lumbar motor during memory recall functions.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool MSM Lumbar Switch parameter while pressing the lumbar switch in both directions. The reading should change between Inactive and Forward or Backward.

> If the reading does not change between the specified values, refer to the Lumbar Switch Circuit Test.
>
> If the lumbar switch inputs to the MSM function normal, refer to the Lumbar Motor Control Circuit Test.

Circuit/System Testing

Lumbar Switch Circuit Test

1. Ignition OFF, disconnect the harness connector at the lumbar switch.
2. Ignition ON, verify that a test lamp illuminates between the 12 V reference circuit terminal 3 and ground.

   If the test lamp does not illuminate, test the 12 V reference circuit for an open/high resistance.
3. Verify the scan tool MSM Lumbar Switch parameter is Inactive.

   If not the specified value, test the appropriate signal circuit listed below for a short to voltage. If the circuit tests normal, replace the MSM.

   - Lumbar forward terminal 2
   - Lumbar rearward terminal 4
4. Install a 3 A fused jumper wire between the B+ circuit terminal 3 and the appropriate signal circuit terminal listed below. Verify the scan tool Lumbar Switch parameter is Forward or Backward.

- Lumbar forward terminal 2
- Lumbar rearward terminal 4

  If not the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the MSM.

5. If all circuits test normal, test or replace the lumbar switch.

Lumbar Motor Control Circuit Test

1. Ignition OFF, disconnect the X1 harness connector at the lumbar motor.
2. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2.
3. Ignition ON, command the Lumbar Motor in the Forward and Rearward directions with a scan tool. The test lamp should turn ON when commanding the forward and rearward states.

   If the test lamp is always OFF during either of the commands, test the control circuits for an open/high resistance. If the circuits test normal replace the MSM.
4. If all circuits test normal, test or replace the lumbar motor.

Component Testing

Lumbar Switch

1. Ignition OFF, disconnect the harness connector at the lumbar switch.
2. Test for infinite resistance between the 12 V reference terminal 3 and the signal terminals listed below with the switch in the open position.
   - Lumbar forward switch terminal 2
   - Lumbar rearward switch terminal 4

   If not the specified value, replace the lumbar switch.
3. Test for less than 1 Ω between the 12 V reference terminal 3 and the signal terminals listed below with the appropriate switch in the closed position.
   - Lumbar forward switch terminal 2
   - Lumbar rearward switch terminal 4

   If greater than the specified range, replace the lumbar switch.

Lumbar Motor

1. Ignition OFF, disconnect the harness connector at the lumbar motor.

   Note: When performing the following tests, make sure that the lumbar is not already in the position the test is attempting to produce.

2. Install a 30 A fused jumper wire between control terminal 1 and 12 V. Momentarily install a jumper wire between control terminal 2 and ground. The lumbar motor should operate in the FORWARD direction.

   If the motor does not perform as specified, replace the lumbar motor.
3. Reverse the jumper wires. The lumbar motor should operate in the REARWARD direction.

   If the motor does not perform as specified, replace the lumbar motor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Front Seat Lumbar Control Switch Replacement
- Seat Lumbar Sub System Replacement
- Control Module References for MSM replacement, programming, and setup.

Lumbar Support Inoperative (Without Memory A45)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Seat Adjuster Switch B+	1, 2	1, 2	--	--
Lumbar Motor Rearward Control	1, 2	1	--	--
Lumbar Motor Forward Control	1, 2	1	--	--
Seat Adjuster Switch Ground	--	1, 2	--	--
1. Lumbar support inoperative 2. Power seats inoperative				

Circuit/System Description

Power seat lumbar support without memory is completely controlled through the seat adjuster switch. Battery voltage is supplied at all times to the seat switch through the SEAT 25A circuit breaker located in the I/P fuse block. When the lumbar switches are in an inactive state, the switch contacts are closed to the switch ground circuit.

The lumbar motor is reversible. For example, when the lumbar horizontal forward switch is pressed to move the lumbar support forward, battery voltage is applied through the switch contacts and the lumbar motor forward control circuit to the motor. The motor is grounded through the lumbar motor rearward switch contacts and the lumbar motor rearward control circuit to the motor. The motor runs in order to drive the lumbar support forward toward the occupants back until the switch is released. Moving the lumbar support rearward works similarly to moving the lumbar support forward, except that battery positive voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction.

Circuit/System Verification

Ignition ON, verify that all manual power seat functions operate when being controlled by the seat adjuster switches.

If all seat functions do not operate, refer to Power Seat Inoperative.

If all power seat functions operate normal, refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the lumbar motor.
2. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2.
3. Ignition ON, command the lumbar support FORWARD and REARWARD using the lumbar switch. The test lamp should turn ON when commanding the FORWARD and REARWARD states.

   If the test lamp is always OFF during either of the commands, test for a short to ground or an open high resistance on either control circuit. If the circuits test normal, test or replace the seat adjuster switch.
4. If all circuits test normal, test or replace the lumbar motor.

Component Testing

Lumbar Switch

1. Ignition OFF, disconnect the harness connector at the seat adjuster switch.
2. Test for infinite resistance the between B+ terminal 1 and each control terminal the with the switch in the open position.

   If not the specified value, replace the seat adjuster switch.
3. Test for less than 1 Ω between the B+ terminal 1 and each control terminal with the appropriate switch in the closed position.

   If greater than the specified range, replace the seat adjuster switch.
4. Test for less than 1 Ω between the ground terminal 2 and each control terminal with the switch in the open position.

If greater than the specified range, replace the seat adjuster switch.

Lumbar Motor

1. Ignition OFF, disconnect the harness connector at the lumbar motor.

   Note: When performing the following tests, make sure that the lumbar is not already in the position the test is attempting to produce.

2. Install a 30 A fused jumper wire between control terminal 1 and 12 V. Momentarily install a jumper wire between control terminal 2 and ground. The lumbar motor should operate in the FORWARD direction.

   If the motor does not perform as specified, replace the lumbar motor.
3. Reverse the jumper wires. The lumbar motor should operate in the REARWARD direction.

   If the motor does not perform as specified, replace the lumbar motor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Power Seat Switch Replacement
- Seat Lumbar Sub System Replacement

Memory Seat Feature Inoperative

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Memory Seat Switch Signal 2	1	1	B1400 01	--
Memory Seat Switch Signal 3	1	1	B1410 01	--
1. Memory recall is inoperative				

Circuit/System Description

Reference voltage from the seat interface module (SIM) is supplied at all times to the memory seat switch. When a memory recall switch is pressed, reference voltage is applied through the switch contacts and the signal circuit to the SIM indicating the memory recall request. The SIM serves as a interface and applies a reference voltage through the appropriate memory signal circuit to the memory seat module (MSM) indicating the memory seat request. The MSM then commands the driver seat motors and the exterior mirrors to move to the appropriate seat and mirror positions stored in memory.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that all manual power seat and lumbar functions operate when being controlled by the seat adjuster and lumbar switches.

   If any seat or lumbar function does not operate, refer to Power Seat Inoperative or Lumbar Support Inoperative.
2. Ignition ON, observe the scan tool SIM Input parameters listed below while pressing the appropriate memory 1, 2, and 3 switches. The readings should change between Inactive and Active.
   - Button 1 Input Status
   - Button 2 Input Status
   - Button 3 Input Status

   If not the specified value for all memory buttons, refer to the Memory Seat Switch Circuit Test.
3. Ignition ON, observe the scan tool MSM Input parameters listed below while pressing the appropriate memory 1, 2, and 3 switches. The readings should change between Not Pressed and Pressed.
   - Memory 1 Button
   - Memory 2 Button
   - Memory 3 Button

   If not the specified value for all memory buttons, refer to the SIM to MSM Circuit Test.
4. If all scan tool readings are normal, replace the MSM.

Circuit/System Testing

Memory Seat Switch Circuit Test

1. Ignition OFF, disconnect the harness connector at the memory seat switch.
2. Ignition ON, verify that a test lamp illuminates between the 12 V reference circuit terminal 6 and ground.

   If the test lamp does not illuminate, test the 12 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the SIM.

3. Ignition ON, verify the scan tool SIM Input parameters listed below are Inactive:
    - Button 1 Input Status
    - Button 2 Input Status
    - Button 3 Input Status
    - Button M Input Status

    If not the specified value, test the appropriate signal circuit for a short to voltage. If the circuit tests normal, replace the SIM.
4. Install a 3 A fused jumper wire between the 12 V reference circuit terminal 6 and the signal circuit terminals listed below. Verify the appropriate scan tool SIM Memory Button Input Status parameter is Active between each test.
    - Button 1 Input Status
    - Button 2 Input Status
    - Button 3 Input Status
    - Button M Input Status

    If not the specified value, test the appropriate signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the SIM.
5. If all circuits test normal, test or replace the memory seat switch.

SIM to MSM Circuit Test

1. Ignition OFF, disconnect the X3 harness connector at the MSM.
2. Connect a test lamp between the appropriate signal circuit listed below and ground:
    - Memory 1 terminal 9
    - Memory 2 terminal 8
    - Memory 3 terminal 19
    - Memory M terminal 18
3. Ignition ON, command the appropriate memory position listed below ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - Button 1 Input
    - Button 2 Input
    - Button 3 Input
    - Button M Input

    If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal replace the SIM.

    If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal replace the SIM.
4. If all circuits test normal, replace the MSM.

Component Testing

1. Ignition OFF, disconnect the harness connector at the memory seat switch.
2. Test for infinite resistance between the 12 V reference terminal 6 and each signal terminal listed below with the switch in the open position:
    - Memory 1 terminal 1
    - Memory 2 terminal 2
    - Memory 3 terminal 3

- Memory M terminal 4

  If not the specified value, replace the memory seat switch.

3. Test for less than 2 Ω between the 12 V reference terminal 6 and each signal terminal listed below with the appropriate switch in the closed position:
   - Memory 1 terminal 1
   - Memory 2 terminal 2
   - Memory 3 terminal 3
   - Memory M terminal 4

   If greater than the specified range, replace the memory seat switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Driver Seat Adjuster Memory Switch Replacement
- Control Module References for SIM and MSM replacement, setup, and programming

Power Seat Inoperative (With Memory A45)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

1. Power seat inoperative

2. Scan Tool Does Not Communicate with Low Speed GMLAN Device

Circuit/System Description

Battery voltage is supplied at all times to the memory seat module (MSM) from the seat interface module (SIM) and the Power Seats circuit breaker located in the I/P fuse block. This voltage is used by the MSM for logic power and to drive the driver seat adjuster motors, recline motor and the lumbar motor.

All motors are reversible. For example, when the seat switch is pressed to move the seat forward, battery voltage is applied through the switch contacts and the seat horizontal forward switch signal circuit to the MSM. In response to this signal, the MSM applies battery voltage through the seat horizontal motor forward control circuit and ground through the seat horizontal motor rearward control circuit to the motor. The motor runs to drive the seat forward until the switch is released. Moving the seat rearward works similarly to moving the seat forward, except that battery positive voltage and ground are applied on the opposite circuits causing the motor to run in the opposite direction.

- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool MSM seat adjuster switch parameters listed below while operating each adjuster switch in both directions. The reading should change between Inactive and the desired direction.
   - Front Vertical Switch
   - Horizontal Switch
   - Rear Vertical Switch
   - Recline Switch

   If any of the readings are Inactive or Invalid while the switch is pressed, refer to the Seat Adjuster Switch Circuit Test
2. If all scan tool readings are normal, refer to the Seat Motor Control Circuit Test.

Circuit/System Testing

Seat Adjuster Switch Circuit Test

1. Ignition OFF, disconnect the harness connector at the seat adjuster switch.
2. Ignition ON, verify that a test lamp illuminates between the 12 V reference circuit terminal 5 and ground.

   If the test lamp does not illuminate, test the 12 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the MSM.

3. Install a 3 A fused jumper wire between the appropriate signal circuit terminal listed below and the 12 V reference circuit terminal 5. Verify the appropriate scan tool MSM seat adjuster switch parameter is Forward/Rearward or Up/Down.
   - Front vertical up switch terminal 10
   - Front vertical down switch terminal 7
   - Rear vertical up switch terminal 9
   - Rear vertical down switch terminal 8
   - Horizontal forward switch terminal 3
   - Horizontal rearward switch terminal 6
   - Recline forward switch terminal 2
   - Recline rearward switch terminal 4

   If not the specified value, test the signal circuit for short to ground or an open/high resistance. If the circuit tests normal, replace the MSM.
4. If all circuits test normal, test or replace the seat adjuster switch.

Seat Motor Control Circuit Test

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor.
2. Connect a test lamp between the appropriate control circuit terminals listed below:
   - Front vertical motor terminal 1 and terminal 5
   - Rear vertical motor terminal 1 and terminal 5
   - Horizontal motor terminal 1 and terminal 2
   - Recline motor terminal 1 and terminal 5
3. Ignition ON, command the appropriate seat motor in the Up/Down or Forward/Rearward directions with a scan tool. The test lamp should turn ON when commanding the up and down or forward and rearward states.

   If the test lamp remains OFF during either of the commands, test the control circuits for a short to ground or an open/high resistance. If the circuits test normal replace the MSM.
4. If all circuits test normal, test or replace the seat motor.

Component Testing

Seat Adjuster Switch Test

1. Ignition OFF, disconnect the harness connector at the seat adjuster switch.
2. Test for infinite resistance between the 12 V reference terminal 5 and each signal terminal listed below with the switch in the open position:
   - Front vertical up switch terminal 10
   - Front vertical down switch terminal 7
   - Rear vertical up switch terminal 9
   - Rear vertical down switch terminal 8
   - Horizontal forward switch terminal 3
   - Horizontal rearward switch terminal 6
   - Recline forward switch terminal 2
   - Recline rearward switch terminal 4

   If not the specified value, replace the seat adjuster switch.

3. Test for less than 2 Ω between the 12 V reference terminal 5 and each signal terminal listed below with the appropriate switch in the closed position:
    - Front vertical up switch terminal 10
    - Front vertical down switch terminal 7
    - Rear vertical up switch terminal 9
    - Rear vertical down switch terminal 8
    - Horizontal forward switch terminal 3
    - Horizontal rearward switch terminal 6
    - Recline forward switch terminal 2
    - Recline rearward switch terminal 4

    If greater than the specified range, replace the seat adjuster switch.

Seat Motors

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor.

    Note: When performing the following tests, make sure that the seat is not already in the position the test is attempting to produce.

2. Install a 30 A fused jumper wire between control terminal 1 and 12 V. Momentarily install a jumper wire between control terminal 2 and ground. The seat motor should operate in the appropriate UP or FORWARD direction.
    If the motor does not perform as specified, replace the seat motor.
3. Reverse the jumper wires. The seat motor should operate in the appropriate DOWN or REARWARD direction.
    If the motor does not perform as specified, replace the seat motor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Power Seat Switch Replacement
- Seat Adjuster Motor Replacement - Horizontal
- Seat Adjuster Motor Replacement - Vertical
- Control Module References for MSM replacement, programming, and setup.

Power Seat Inoperative (Without Memory A45)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Recline Motor Forward Control	1	1	--	--
Recline Motor Rearward Control	1	1	--	--
Seat Adjuster Switch Ground	--	1	--	--
1. Power seat inoperative				

Circuit/System Description

The power seat is controlled through the seat adjuster switch. Battery voltage is supplied at all times to the seat adjuster switch through the Power Seats 20 A Circuit Breaker located in the instrument panel fuse block. When the seat adjuster switches are in an inactive state, the switch contacts are closed to the switch ground circuit.

All seat motors are reversible. For example, when the seat horizontal forward switch is pressed to move the entire seat forward, battery voltage is applied through the switch contacts and the seat horizontal motor forward control circuit to the motor. The motor is grounded through the horizontal motor rearward switch contacts and the horizontal motor rearward control circuit to the motor. The motor runs in order to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery positive voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction. All seat motors are powered this way.

Description and Operation

Power Seats System Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Circuit/System Verification

Operate the seat switches for the appropriate seat directional motors listed below in both directions. The seat should move in the commanded directions.

- Horizontal motor (AGB, AH5, AH8, AJ6, or AQ5)
- Front vertical motor (AGB, AH5, AH6, AH7, AH8, AJ6, or AQ5)
- Rear vertical motor (AGB, AH5, AH6, AH7, AH8, AJ6, or AQ5)
- Recline motor (AGB, AH5, or AH8)

If the power seat is inoperative in all directions, refer to the Seat Adjuster Switch Circuit Test.

If 1 or more of the seat adjuster motors operate, refer to the Seat Adjuster Motor Circuit Test.

Circuit/System Testing

Seat Adjuster Switch Circuit Test

1. Disconnect the harness connector at the seat adjuster switch.
2. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
   If greater than the specified range, test the ground circuit for an open/high resistance.

3. Verify that a test lamp illuminates between the appropriate B+ circuit terminal 1 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. If all circuits test normal, test or replace the seat adjuster switch.

Seat Adjuster Motor Circuit Test

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor.
2. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2.
3. Ignition ON, command the appropriate seat motor Up and Down or Forward and Rearward using the seat adjuster switch. The test lamp should turn ON when commanding the up and down or forward and rearward states.

   If the test lamp remains OFF for either of the commands, test the control circuits for a short to ground or an open/high resistance. If the circuits test normal, test or replace the seat adjuster switch.
4. If all circuits tests normal, test or replace the seat motor.

Component Testing

Seat Adjuster Switch Test

1. Ignition OFF, disconnect the harness connector at the seat adjuster switch.
2. Test for infinite resistance between the B+ terminal 1 and each control terminal listed below with the switch in the open position.
   - Seat front up terminal 3
   - Seat front down terminal 4
   - Seat rear up terminal 5
   - Seat rear down terminal 6
   - Horizontal forward terminal 7
   - Horizontal rearward terminal 8

   If not the specified value, replace the seat adjuster switch.
3. Test for less than 1 Ω between the B+ terminal 1 and each control terminal listed below with the appropriate switch in the closed position.
   - Seat front up terminal 3
   - Seat front down terminal 4
   - Seat rear up terminal 5
   - Seat rear down terminal 6
   - Horizontal forward terminal 7
   - Horizontal rearward terminal 8

   If greater than the specified range, replace the seat adjuster switch.
4. Test for less than 1 Ω between the ground terminal 2 and each control terminal listed below with the switch in the open position.
   - Seat front up terminal 3
   - Seat front down terminal 4
   - Seat rear up terminal 5
   - Seat rear down terminal 6

- Horizontal forward terminal 7
- Horizontal rearward terminal 8

  If greater than the specified range, replace the seat adjuster switch.

Seat Motors

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor.

   Note: When performing the following tests, make sure that the seat is not already in the position the test is attempting to produce.

2. Install a 30 A fused jumper wire between control terminal 1 and 12 V. Momentarily install a jumper wire between control terminal 2 and ground. The seat motor should operate in the appropriate UP or FORWARD direction.

   If the motor does not perform as specified, replace the seat motor.
3. Reverse the jumper wires. The seat motor should operate in the appropriate DOWN or REARWARD direction.

   If the motor does not perform as specified, replace the seat motor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Power Seat Switch Replacement
- Seat Adjuster Motor Replacement - Horizontal
- Seat Adjuster Motor Replacement - Vertical

Symptoms - Seats

Important: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following system descriptions:
   - Memory Seats Description and Operation.
   - Power Seats System Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

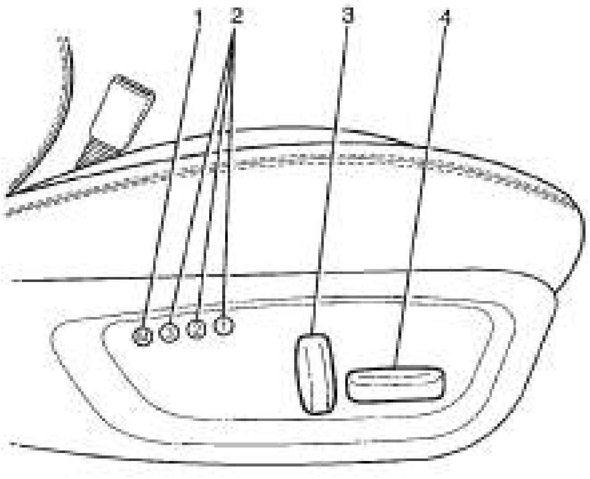
Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Lumbar Support Inoperative
- Memory Seat Feature Inoperative
- Power Seat Inoperative

Driver Seat Adjuster Memory Switch Replacement (RHD)

Seat Switch Identification

Type A Switch (8 Way)



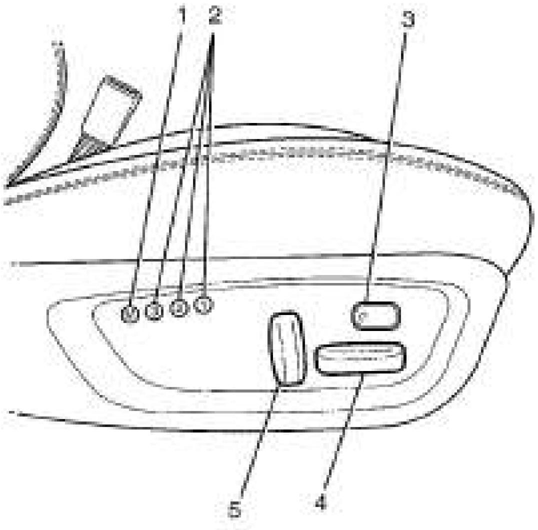
(1) Mirror Dip/Memory Store

(2) Seat Memory

(3) Recliner

(4) Fore/Up/Down/Tilt

Type B Switch (10 Way)



(1) Memory Dip/Memory Store
(2) Seat Memory
(3) Lumbar Switch
(4) Fore/Up/Down/Tilt
(5) Recliner

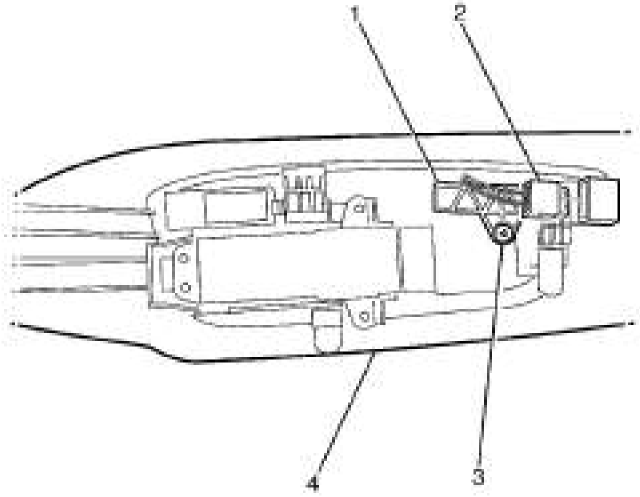
Removal Procedure - (Type A and B)

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

Caution: Refer to SRS Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket.
4. Remove the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement.

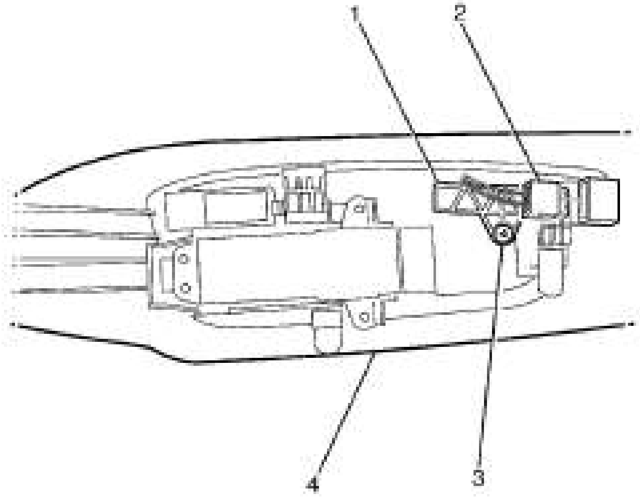


5. Disconnect the memory switch electrical connector (2).
6. Remove screw (3) attaching the memory position switch (1) to the front seat outer side cover (4).
7. Lift out the memory position switch assembly (1) from its recess in the side cover (4).
8. As required, each position switch button can be removed from the switch.

Installation Procedure

Important: Ensure buttons are installed as per removal.

1. As required, install the position button by pushing it into the memory position switch, listen for an audible click to confirm fitting



2. Install the seat memory position switch (1), into the its recess in the outer seat trim (4).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the memory position switch retaining screw (3).

   Tighten
   Tighten the retaining screw to 2.0 N·m (18 lb in).

4. Connect the memory switch electrical connector (2).
5. Install the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement.
6. Install the front seat. Refer to Front Seat Replacement - Bucket.

   Caution: Refer to SRS Caution in the Preface section.

7. Enable the SIR system. Refer to SIR Disabling and Enabling.

   Caution: Refer to Battery Disconnect Caution in the Preface section.

8. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
9. Test the seat for correct mechanical and electrical operation.

Front Seat Lumbar Control Switch Replacement

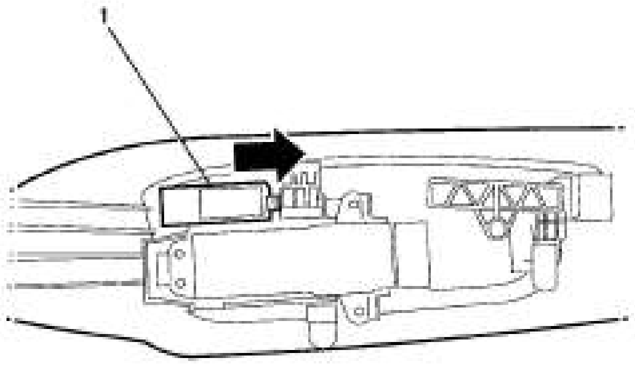
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

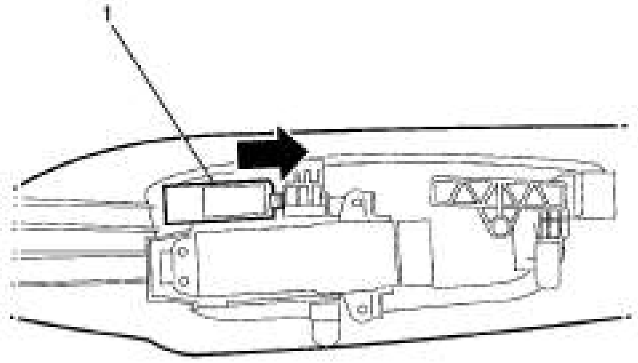
Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement .



5. Disconnect the electrical connectors (1).
6. Remove the lumbar support switch, by releasing the retaining tab as shown.

Installation Procedure



1. Install the lumbar support switch.
2. Connect the electrical connectors.
3. Install the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement .

Memory Seat Calibration

Calibration Procedure

The memory seat module uses position sensor inputs to establish soft stop locations for the adjuster motors several millimetres ahead of the physical limits of the adjuster assembly. After replacing a memory seat module or adjuster components, it may be necessary to reset the adjuster motor soft stop locations. When the repair procedure has been completed, operate the seat adjuster switch in every direction until the seat adjuster reaches its mechanical hard stop by repeatedly pressing and releasing the switch as necessary.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Power Seats | Repair Instructions | Document ID: 1988905

Memory Seat Control Module Replacement

Removal Procedure

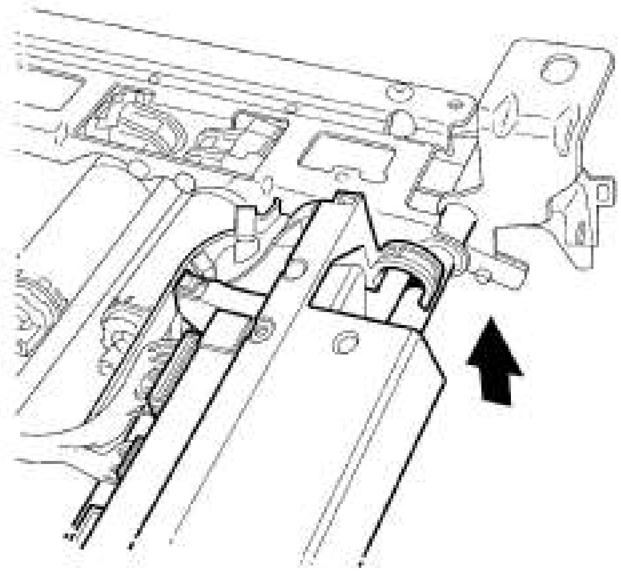
Caution: Refer to Battery Disconnect Caution in the Preface section.

Important: The seat memory seat module and seat interface module (MSM and SIM) are an integral part of the seat system and should only be replaced as a complete assembly.

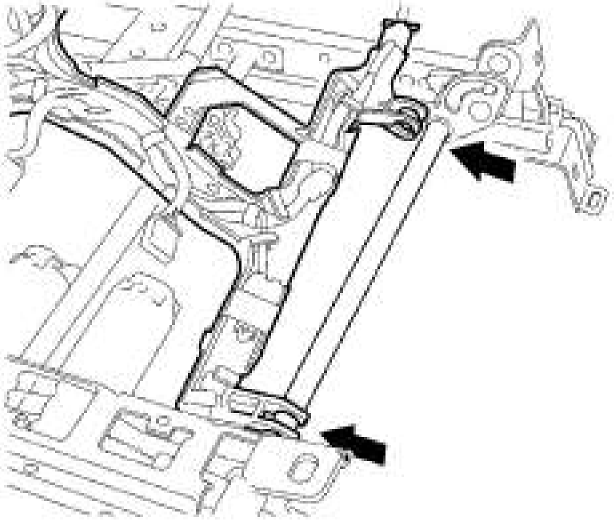
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to SIR Caution in the Preface section.

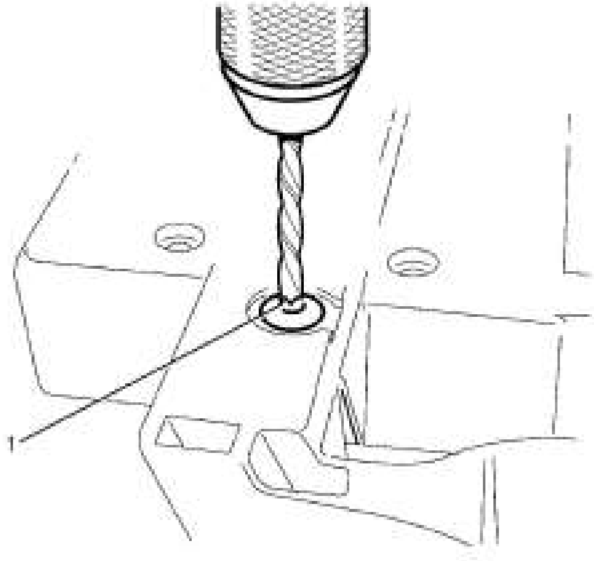
2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove the front seat adjuster. Refer to Front Seat Adjuster Replacement .
5. Disconnect the wiring harness connectors as required.



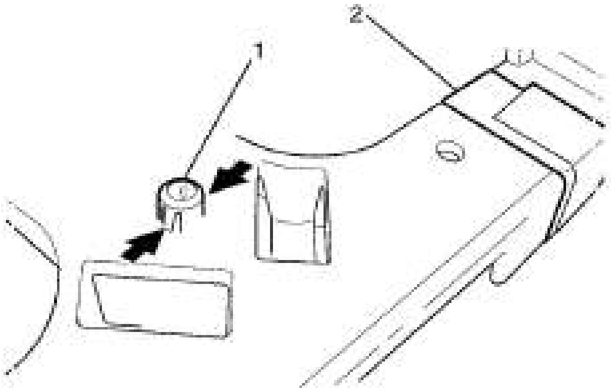
6. Unclip the cable tray from the seat adjuster.



7. Pull the cable tray forward to release it from the seat adjuster.

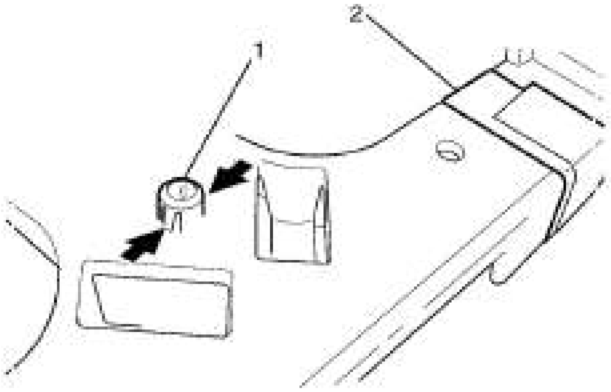


8. Using a 5mm drill bit drill out the pop rivet, (1) in two places, securing the memory seat module to the cable tray.
9. Carry out the above procedure for the seat interface module, (SIM), which is located on the memory seat module.



10. Remove the wiring harness from the cable tray by squeezing the tabs on the harness clips (1) and by removing the tape (2).

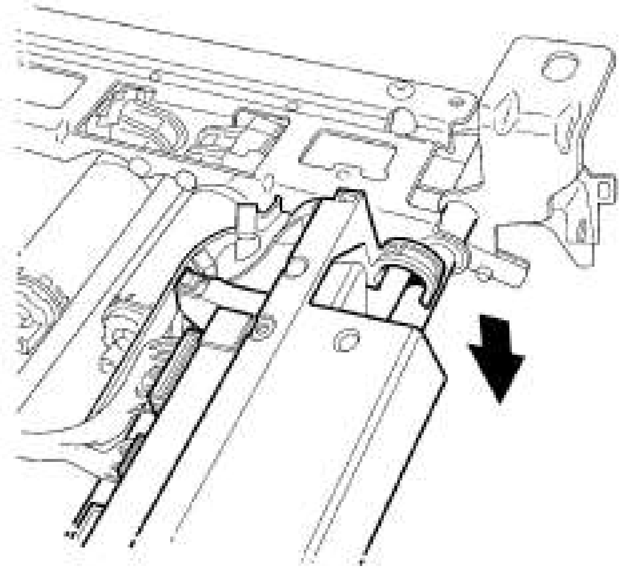
Installation Procedure



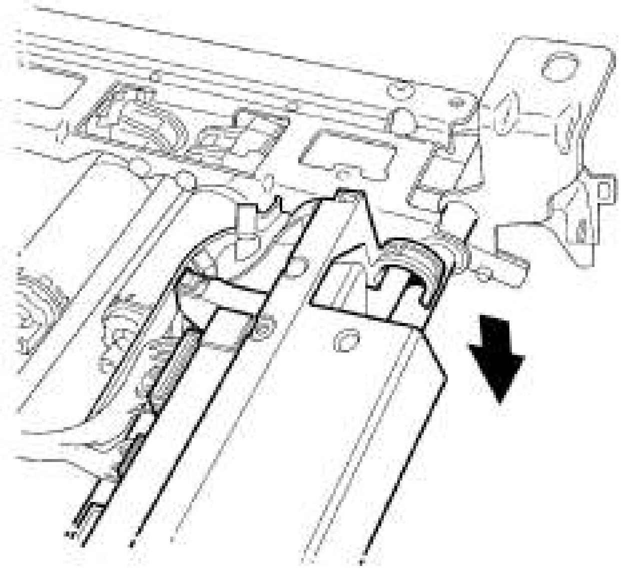
Important: Ensure the wiring harness is install as per removal.

1. Install the wiring harness to the cable tray and secure installing the wiring harness clip (1) listen fir an audible click to confirm fitting.
2. Install tape around the wiring harness.
3. Align the memory seat module with the cable tray.

4. Using a universal pop rivet gun and pop rivets secure the memory seat module to the cable tray.
5. Carry out the above procedure for the seat interface module, (SIM).
6. Align the memory seat module with the cable tray.
7. Using a universal pop rivet gun and pop rivets secure the memory seat module to the cable tray.
8. Carry out the above procedure for the seat interface module, (SIM).



9. Push the cable tray onto the seat adjuster backwards to secure it to the seat adjuster.



10. Clip the cable tray to the seat adjuster.
11. Connect the wiring harness connectors as required.
12. Install the front seat adjuster. Refer to Front Seat Adjuster Replacement .
13. Install the front seat. Refer to Front Seat Replacement - Bucket .

Caution: Refer to SIR Caution in the Preface section.

14. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.

    Caution: Refer to Battery Disconnect Caution in the Preface section.

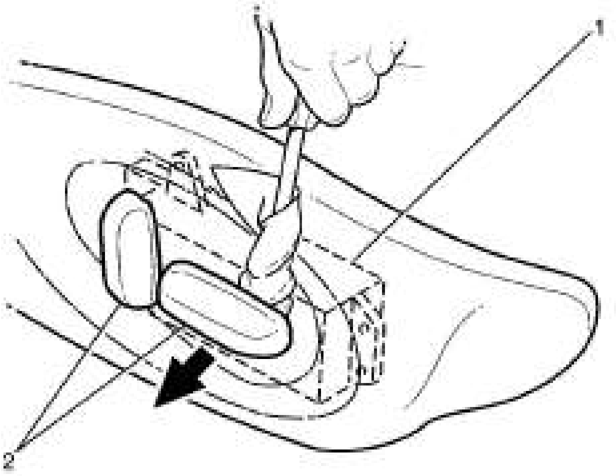
15. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
16. If re-programming is required. Refer to Control Module References .
17. Test the seat for correct mechanical and electrical operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Power Seats | Repair Instructions | Document ID: 1985772

Power Seat Switch Replacement (RHD)

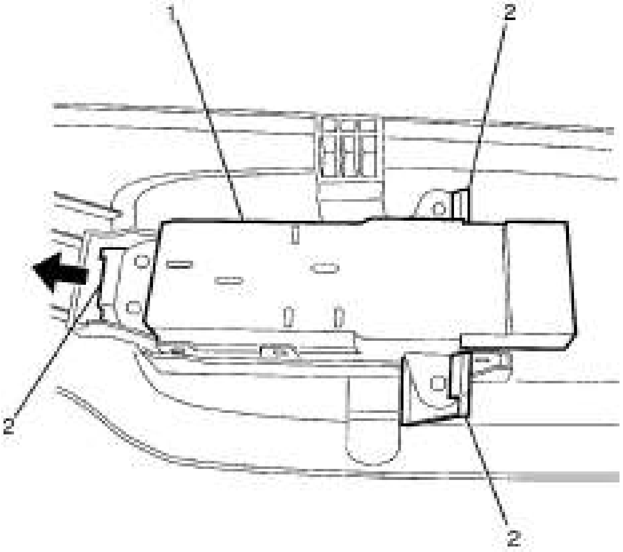
Removal Procedure

1. Remove the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement.



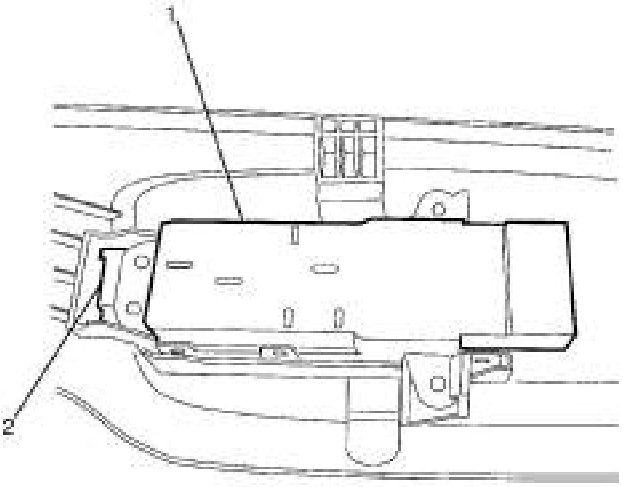
Important: Use an appropriate flat blade tool wrapped in a soft cloth.

2. Remove the power seat switch knobs (2) by gently prying the buttons off from the switch (1).

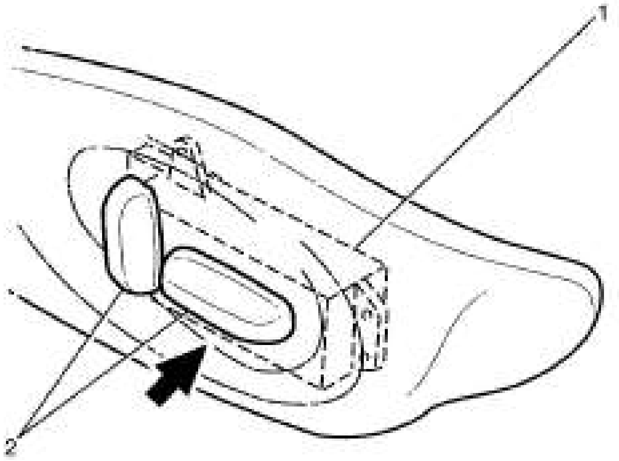


3. Remove the power seat switch (1) by releasing the retaining clips (2) and removing it out of its recess, located in the front seat trim panel.

Installation procedure



1. Install the power seat switch (1) into the its recess located in the outer trim panel, listen for an audible click from the retaining clip (2) to confirm fitting,



2. Install the power seat switch buttons (2) to the power seat switch, listen for an audible click to confirm fitting.
3. Install the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement.
4. Test the power seat switch for the correct operation.

Seat Adjuster Motor Replacement - Horizontal

The horizontal seat motor is not a serviceable item, if the horizontal seat motor requires replacing it must be replaced as an assembly. Refer to Front Seat Adjuster Replacement.

Seat Adjuster Motor Replacement - Vertical

The vertical seat motor is not a serviceable item, if the vertical seat motor requires replacing it must be replaced as an assembly. Refer to Front Seat Back Frame Replacement.

Memory Seats Description and Operation

The memory seat system consists of the following components:

- Memory Seat Switch
- Seat Adjuster Switch
- Seat Lumbar Switch
- Memory Seat Module (MSM)
- Seat Interface Module (SIM)
- Seat Horizontal Motor/Sensor
- Seat Front Vertical Motor/Sensor
- Seat Rear Vertical Motor/Sensor
- Seat Recline Motor/Sensor
- Seat Lumbar Motor/Sensor
- SEAT Circuit Breaker 20 A

Seat Interface Module and Memory Seat Module

The seat interface module (SIM) serves as an interface to the memory seat module (MSM) for serial data communications. It communicates with the MSM through a UART serial data line while it communicates with the vehicle through the low speed GMLAN serial data line. When the scan tool is used to observe MSM DTC information or scan tool data parameters, the SIM retrieves the information from the MSM via the UART serial data line, then gateways the information via the GMLAN serial data line that is displayed on the scan tool.

The SIM also serves as an interface to the MSM for memory recall operations. For memory recall operation refer to Memory Functions below.

SIM and MSM Power and Ground

Battery positive voltage is supplied at all times through the SEAT circuit breaker located in the I/P fuse block to the seat interface module (SIM). This voltage is used to power up SIM and the memory seat module (MSM). The MSM uses this voltage to apply power to the seat and lumbar motors. Ground for the SIM and MSM is provided at G304.

Seat Adjuster Switch and Lumbar Switch

Battery positive voltage is supplied at all times to the seat adjuster switch and lumbar switch from the SEAT circuit breaker located in the I/P fuse block. When the seat or lumbar switches are pressed they send a 12 V signal to the MSM. The MSM then commands the selected seat or lumbar motor to move in response to the switch signal.

Seat Motors

There are four seat motors and one lumbar that move the position of the seat. These are the seat horizontal motor, front vertical motor, rear vertical motor, recline motor and the lumbar motor. The horizontal motor moves the entire seat forward and rearward. The seat front and rear vertical motors may operate independently to tilt the front or rear of the seat cushion up and down. Or, both vertical motors can run simultaneously to move the entire seat up or down. The recline motor moves the angle of the seat back forward or rearward while the lumbar motor moves the lumbar support forward and rearward. Each motor contains a electronic circuit breaker (PTC), that opens in the event of a circuit overload and will reset only after voltage has been removed from the circuit.

All motors are reversible. For example, when the seat switch is operated to moved the entire seat forward, battery positive voltage is applied through the horizontal forward switch contacts and the power seat horizontal forward switch signal circuit to the MSM. In response to this signal, the MSM applies battery positive voltage through the driver seat horizontal motor forward control circuit to the horizontal motor. The MSM supplies ground to the motor through the driver seat horizontal motor rearward control circuit. The motor runs to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery positive voltage and ground are applied on the opposite circuits causing the motor to run in the opposite direction. All of the seat motors and the lumbar motor are powered this way.

Position Sensors

The seat and lumbar motors are equipped with position sensors internal to the motor. The sensors are monitored by the MSM and are used to determine seat and lumbar positions when storing or recalling memory settings. The seat front vertical and rear vertical motors use 3 wire hall effect type position sensors while the seat horizontal and recline motors use 2 wire hall effect type position sensors. The lumbar motor is equipped with a 2 wire potentiometer type position sensor. The MSM supplies the 3 wire hall effect position sensors with a separate 5 V reference circuit and signal circuit while ground is provided at G304. The MSM supplies the 2 wire hall effect position sensors with a signal circuit while ground is also provided at G304. During seat motor operation, the hall effect position sensor provides a determined number of pulse signals for every revolution of the motor shaft. These pulse signals (Steps) range from 0 - 65,535. The MSM monitors the step values from the signal circuits to determine seat motor positions. The MSM supplies the lumbar sensor with a signal and low reference circuits. The signal circuit voltage ranges from 0.25 - 4.75 V which is determined by the wiper location within the sensor. The MSM monitors this voltage signal to determine the lumbar position. High scan tool step or voltage readings indicate forward or upward seat/lumbar positions while low voltage or step readings indicate rearward or downward seat/lumbar positions.

Memory Functions

The current seat position may be recorded for 3 different drivers. To record a position, adjust the drivers seat to a comfortable position, then press and hold the appropriate button for 5 seconds, a double beep will sound each time a memory position is set. Once the MSM receives the memory set message, it records the steps/voltage from all seat/lumbar position sensors for the appropriate driver.

When a memory switch is pressed, battery voltage is applied through the switch contacts and the signal circuit to the SIM. The SIM interprets this signal then applies battery voltage through the appropriate signal circuit to the MSM indicating the memory request. In response to this signal, the MSM applies battery voltage to run the seat motors until the position sensor steps/feedback voltages equal the steps/feedback voltages stored in memory for the appropriate driver.

Memory recall will not work if the shift lever is out of NEUTRAL (N) or PARK (P).

Memory Inhibit/Enable

The memory seat module receives the ignition switch signal and the gear selector position via serial data messages. When the gear selector is in the PARK position and ignition switch is in the ON or OFF position, memory record and memory recall functions are all allowed. When the ignition switch is in the ON position and the gear selector is out of the PARK position, only memory record is allowed, all other memory seat functions are not allowed.

Power Seats System Description and Operation

The driver and passenger power seat systems each consist of the following components:

- Seat Adjuster Switch
- Seat Horizontal Motor
- Seat Front Vertical Motor
- Seat Rear Vertical Motor
- Seat Recline Motor
- Lumbar Motor (Passenger Seat only)
- SEAT Circuit Breaker 20 A

Seat Adjuster Switch

Battery positive voltage is supplied at all times to the driver and front passenger seat adjuster switches through a 20 A circuit breaker located in the I/P fuse block. Ground is provided to both switches from the ground stakes. When active the seat adjuster switches provide both power and ground to the selected seat motors.

Seat Motors

All seat and lumbar motors operate independently of each other. Each motor contains an electronic circuit breaker (PTC) that opens in the event of a circuit overload and will reset only after voltage has been removed from the circuit. There are four seat position motors and one lumbar motor. These are the horizontal motor, front vertical motor, rear vertical motor, seat back recline motor and the lumbar motor. The horizontal motor moves the entire seat forward and rearward. The seat vertical motors may operate independently to tilt the front or rear of the seat cushion up or down. Both motors can also run simultaneously to move the entire seat up or down. The recline motor moves the angle of the seat back forward or rearward while the lumbar motor moves the lumbar support forward and rearward.

All seat motors are reversible. For example, when the seat switch is operated to move the entire seat forward, battery positive voltage is applied through the switch contacts and the horizontal motor forward control circuit to the motor. The motor is grounded through the horizontal motor rearward switch contacts and the horizontal motor rearward control circuit to the motor. The motor runs in order to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery positive voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction. All of the other seat and lumbar motors are powered this way.

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Centre Rear Seat Belt Anchor to Body Retaining Nut (Sportwagon)	43 N·m	32 lb ft
Fire Extinguisher Assembly Retaining Bolts	18 N·m	13 lb ft

Driver or Passenger Seat Back Cushion Cover and Pad Replacement

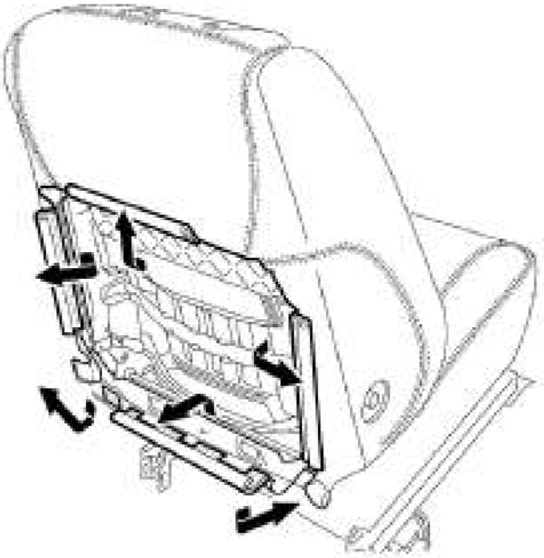
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

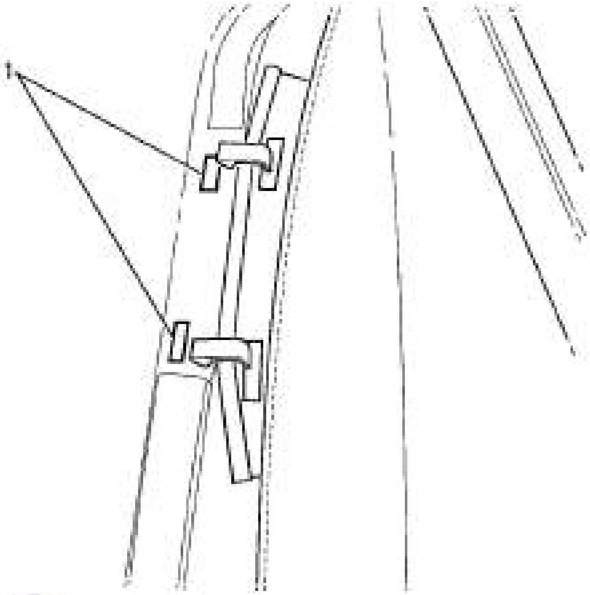
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to SIR Caution in the Preface section.

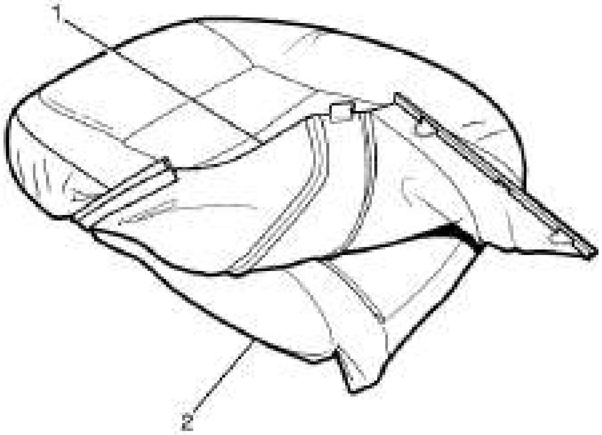
2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove the lumbar support knob assembly. Refer to Lumbar Support Knob Replacement .
5. Remove the seat-back assembly. Refer to Front Seat Back Replacement .
6. Remove the head restraints. Refer to Front Seat Head Restraint Replacement .
7. Remove the seat back trim. Refer to Front Seat Back Trim Replacement .
8. Remove the head restraint guides. Refer to Front Seat Head Restraint Guide Replacement .



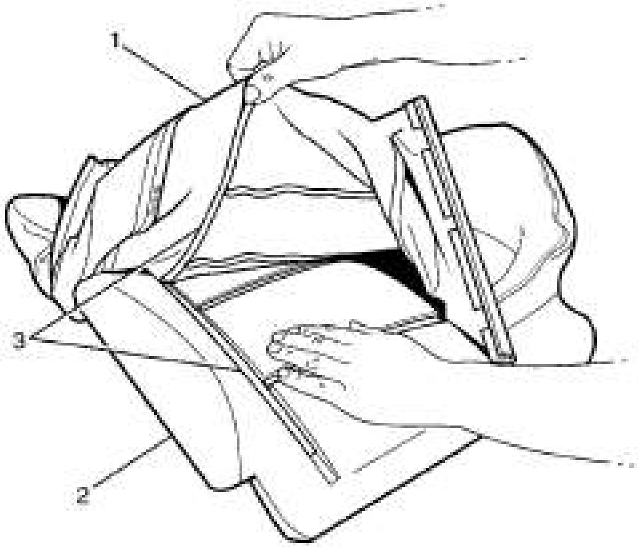
9. Disengage the J-strips away from the seat frame and the velcro tab at each lower corner.
10. Lift the cover and pad assembly up and away from the seat-back frame, manoeuvring it over the front seat dummy block insert assemblies.
11. Place pad and cover assembly on a clean and suitable work surface.



12. Detach the two securing hooks (1) located on the right hand side of the back.

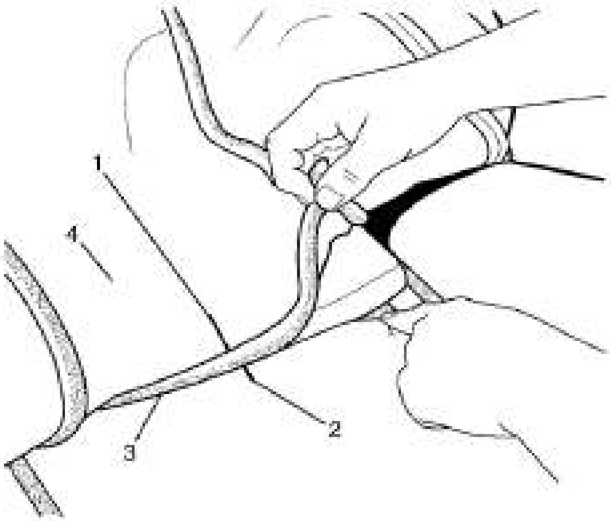


13. Fold the lower corners of the seat cushion cover (1) over the seat cushion pad (2).

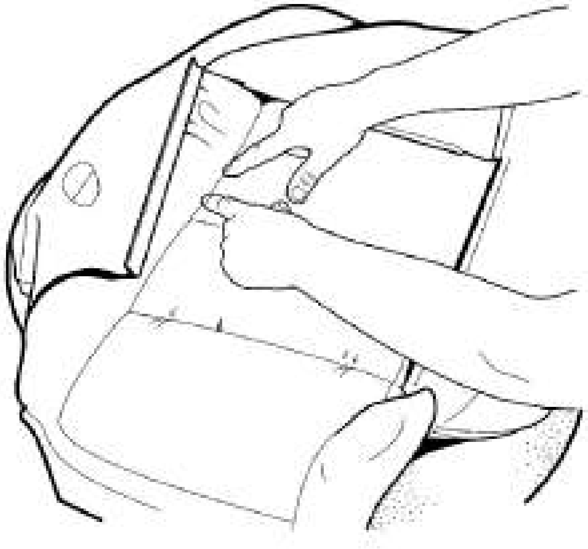


14. While holding the front seat cushion pad (1) pull the rear corners of the front seat cushion cover (2) forward and away from the pad to disengage the hook and loop strips (3).
15. Pull the cover up and over the forward edge of the pad.
16. Remove the seat cushion cover.

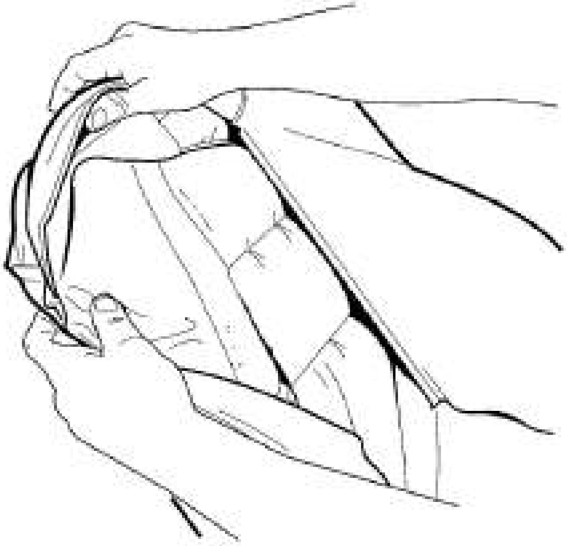
Installation Procedure



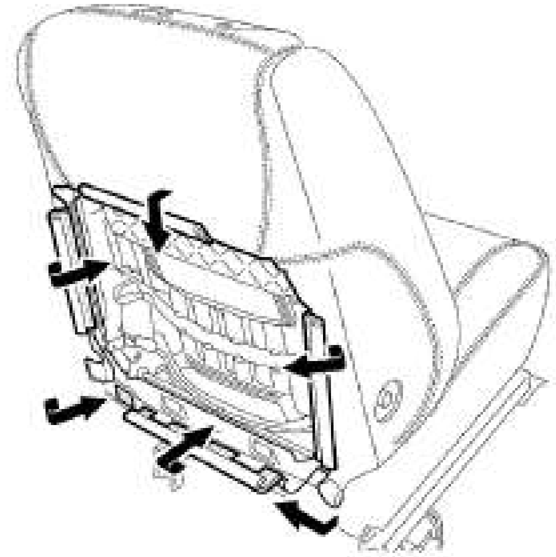
1. With the front seat-back cover (1) folded at the central horizontal strip of the hook and loop (2), align the centre mark (4) on the front seat-back pad.
2. Press the cover in the corresponding groove in the pad to engage the hook and loop.



3. With the cover folded at the two vertical strips of the hook and loop, press the cover firmly into the corresponding grooves in the pad.



4. Roll the upper corners of the seat cover over the pad.
5. Roll the sides of the seat cover over the pad.
6. Roll the lower corners of the seat cover over the pad.
7. Firmly run your finger in the seat cushion channels, to ensure a correct fitting.
8. Install the cover and pad assembly over from the seat-back frame, manoeuvring it over the front seat dummy block insert assemblies.



9. Engage the J-strips onto the seat frame and the velcro tab at each lower corner.
10. Install the head restraint guides. Refer to Front Seat Head Restraint Guide Replacement .
11. Install the seat back trim. Refer to Front Seat Back Trim Replacement .
12. Install the head restraints. Refer to Front Seat Head Restraint Replacement .
13. Install the seat-back assembly. Refer to Front Seat Back Replacement .
14. Install the lumbar support knob assembly. Refer to Lumbar Support Knob Replacement .
15. Install the front seat. Refer to Front Seat Replacement - Bucket .

    Caution: Refer to SIR Caution in the Preface section.

16. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
17. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
18. Test the seat for correct mechanical and electrical operation.

Driver or Passenger Seat Back Cushion Frame Replacement

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement .
5. Remove the front seat-back. Refer to Front Seat Back Replacement .
6. Remove the front seat-back cover. Refer to Front Seat Back Cushion Cover and Cushion Pad Replacement .
7. Discard the seat-back frame.

Installation Procedure

1. Install the front seat-back cover. Refer to Front Seat Back Cushion Cover and Cushion Pad Replacement .
2. Install the seat-back. Refer to Front Seat Back Replacement .
3. Install the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement .
4. Install the front seat. Refer to Front Seat Replacement - Bucket .

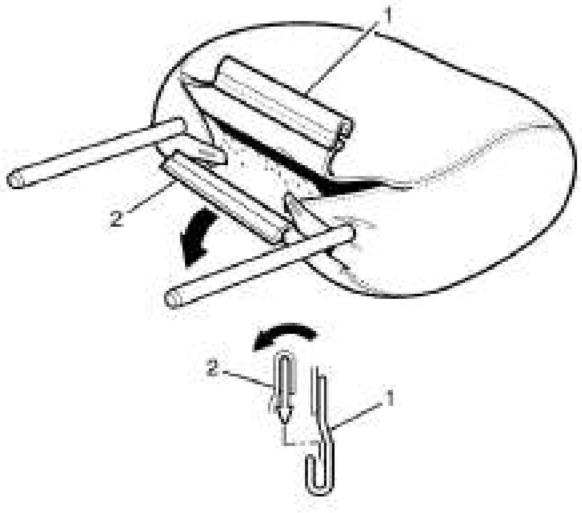
Caution: Refer to SIR Caution in the Preface section.

5. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
7. Test the seat for correct mechanical and electrical operation.

Driver or Passenger Seat Head Restraint Replacement (SWB)

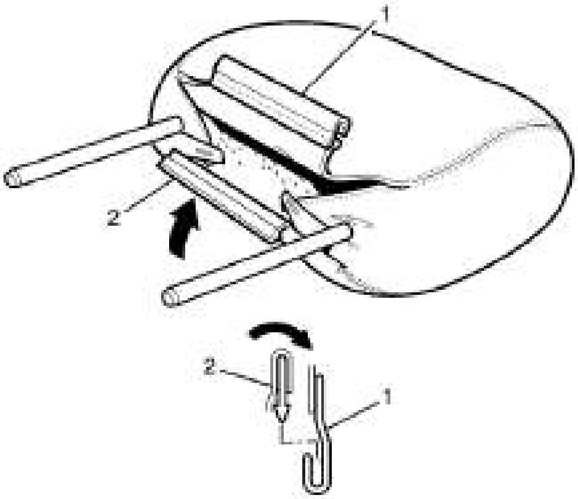
Removal Procedure

1. Remove the front seat head restraint. Refer to Front Seat Head Restraint Replacement.



2. Disengage the front head restraint cover J-strip by pulling the flap (1) back and out of flap (2) in the direction shown.
3. Pull out staples attaching cover side tabs.
4. Remove the front head restraint cover.

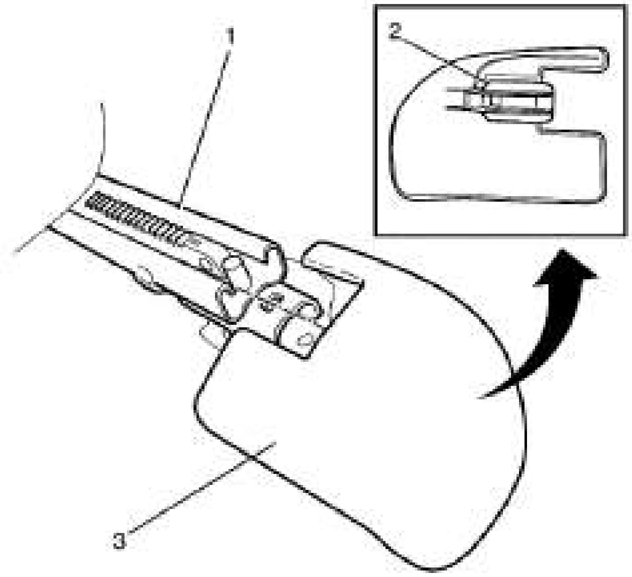
Installation Procedure



1. Install the head restraint cover.
2. Use staples to secure cover side tabs.
3. Engage the front head restraint cover J-strip by inter locking the flap (1) with flap (2) in the direction shown.
4. Install the front seat head restraint. Refer to Front Seat Head Restraint Replacement.

Driver or Passenger Seat Inner Adjuster Front Finish Cover Replacement

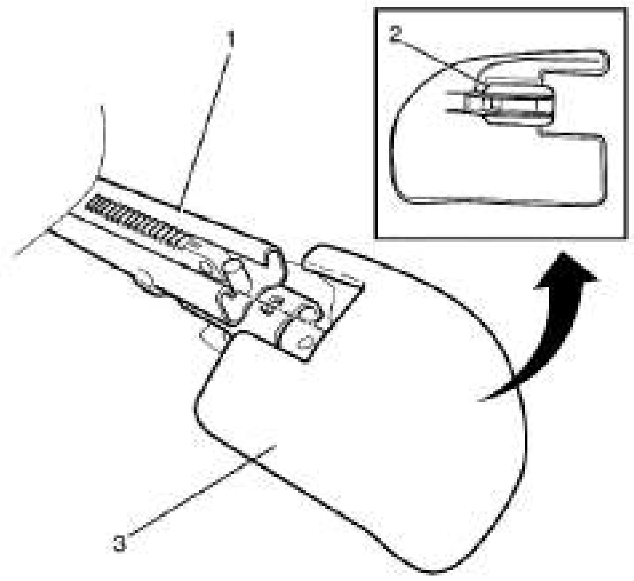
Removal Procedure



Important: Grasp the base of the front seat inner front track cover and disengage the retaining clip from the seat track (2).

Remove the front seat inner front track cover (3) from the seat track (1).

Installation Procedure



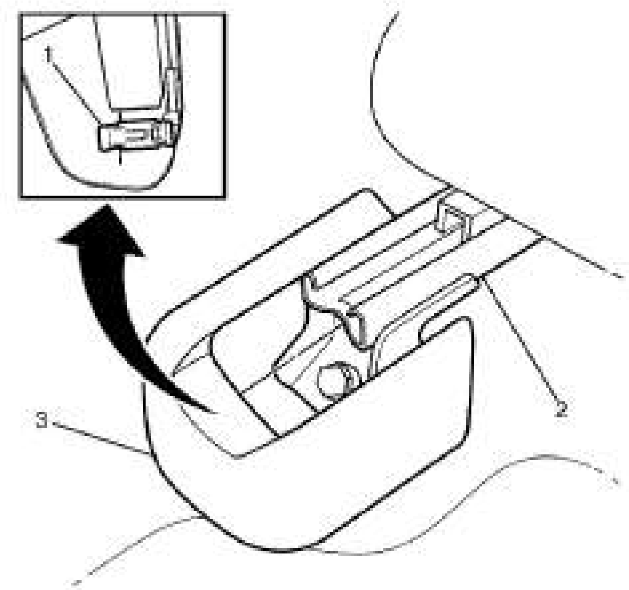
Important: Make sure to align the front seat inner front track cover (2) to the seat track (1). Listen for an audible click to indicate correct fitment of the retaining clip (2).

Install the front seat inner front track cover (3) to the seat track (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | Document ID: 2049017

Driver or Passenger Seat Inner Adjuster Rear Finish Cover Replacement

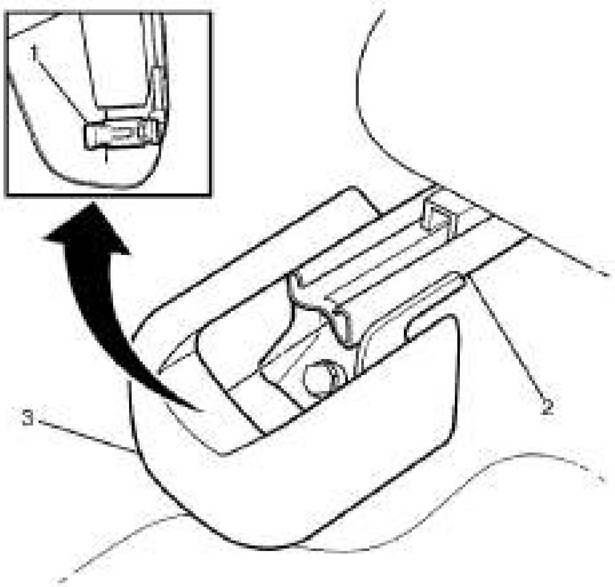
Removal Procedure



Important: Slide your hand under the outboard side of the front seat inner rear track cover (3) until you get to the rear edge, then lift upwards and rearwards to disengage the retaining clip (1) from the seat track.

Remove the front seat inner rear track cover from the seat track (2).

Installation Procedure



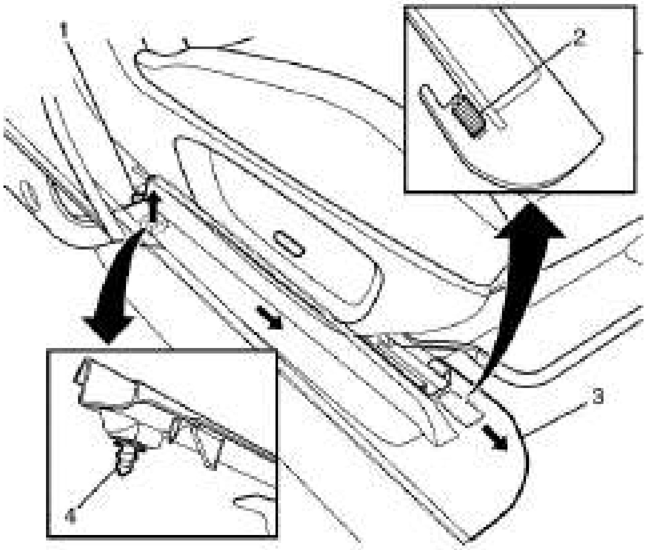
Important: Align the front seat inner rear track cover (3) with the seat track and engage the retaining clip (1).

Install the front seat rear inner rear track cover (1) to the seat track (2).

Driver or Passenger Seat Outer Adjuster Front Finish Cover Replacement

Removal Procedure

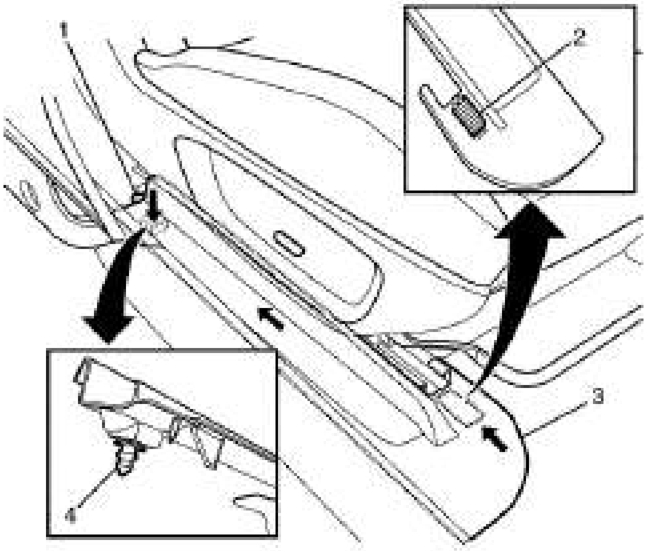
1. Remove the front seat outer rear track cover. Refer to Driver or Passenger Seat Outer Adjuster Rear Finish Cover Replacement.



Important: Grasp the rear edge of the front seat outer front track cover (1) and prise upwards to disengage the rear retainer (4).

2. Disengage the rear retainer (4) on the front seat outer front track cover (3).
3. Slide the front seat outer front track cover (3) forward to remove, making sure to disengage the front retainer (2).

Installation Procedure



1. Slide the front seat outer front track cover (3) towards to the rear of the seat, making sure to engage the front retainer (2).

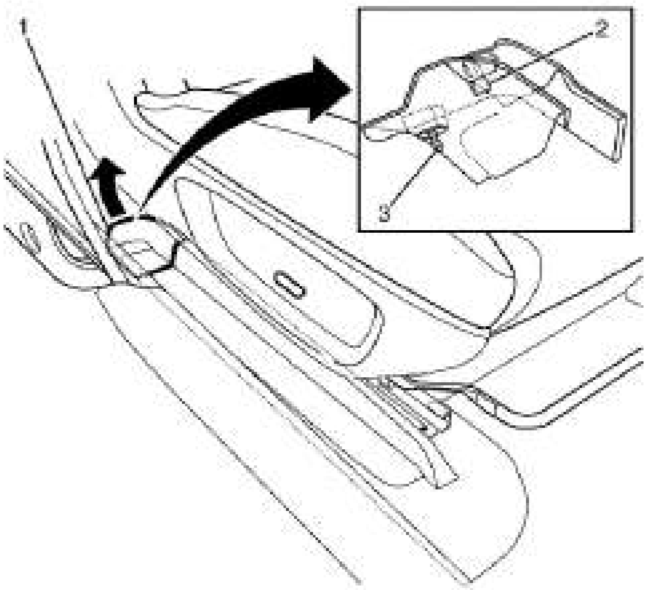
   Important: Grasp the rear edge of the front seat outer front track cover (1) and push downwards to engage the rear retainer (4).

2. Engage the rear retainer (4) on the front seat outer front track cover (3).
3. Install the front seat outer rear track cover. Refer to Driver or Passenger Seat Outer Adjuster Rear Finish Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | Document ID: 2049018

Driver or Passenger Seat Outer Adjuster Rear Finish Cover Replacement

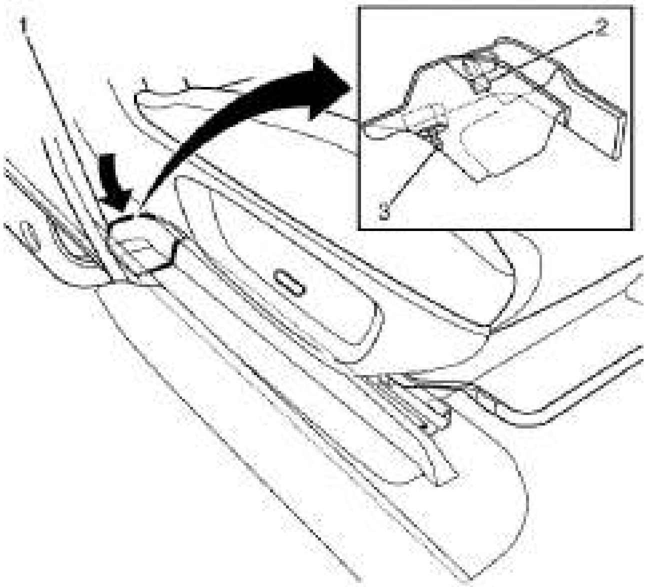
Removal Procedure



Important: Move the seat forward and grasp the rear edge of the front seat outer rear track cover (1), lift upwards to disengage the retaining clips (2 and 3).

Remove the front seat outer rear track cover (1) from the seat rail.

Installation Procedure



Important: Move the seat forward and grasp the rear edge of the front seat outer rear track cover (1), push downwards to engage the retaining clips (2 and 3).

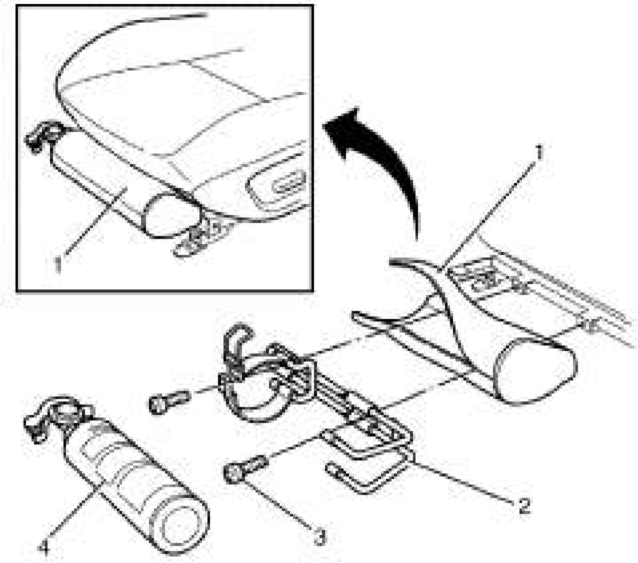
Install the front seat outer rear track cover (1) to the seat rail.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 2006440**

Fire Extinguisher Bracket and Cover Replacement

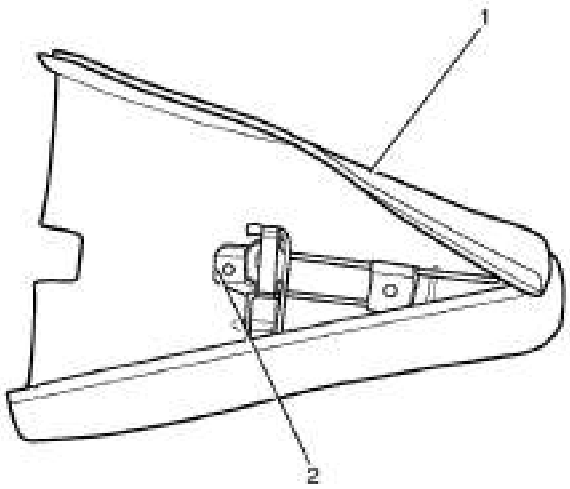
Removal Procedure

1. Adjust the passenger seat in order to obtain access to the fire extinguisher.



2. Raise the fire extinguisher cover (1) to reveal the fire extinguisher (4).
3. Unclip the fire extinguisher bracket (2) and remove the fire extinguisher (4).
4. Remove the fire extinguisher bracket to seat adjuster retaining bolts (3).
5. Remove the fire extinguisher bracket and cover.

Installation Procedure



1. Assembly the fire extinguisher cover and bracket out of the vehicle on a clean suitable work surface. As illustrated.
2. Install the fire extinguisher assembly to the seat adjuster.

   Tighten
   Tighten the retaining bolts to 18 N·m (13 lb ft).

3. Install and secure the fire extinguisher into the fire extinguisher bracket. Listen for an audible click to confirm fitting.
4. Lower the fire extinguisher cover.
5. Adjust the passenger seat back to it's original position.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 1995587**

Front Seat Adjuster Replacement

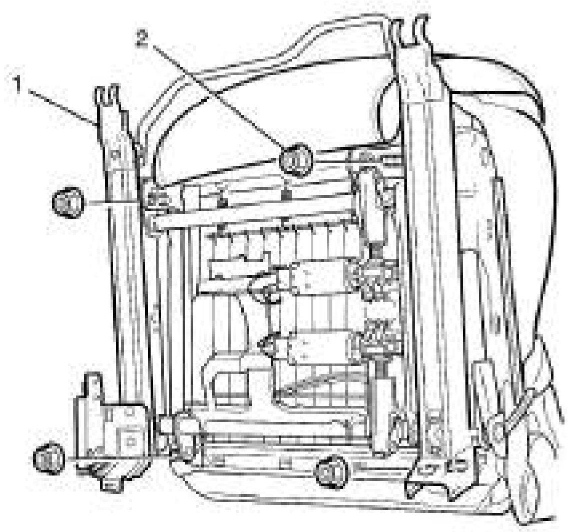
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

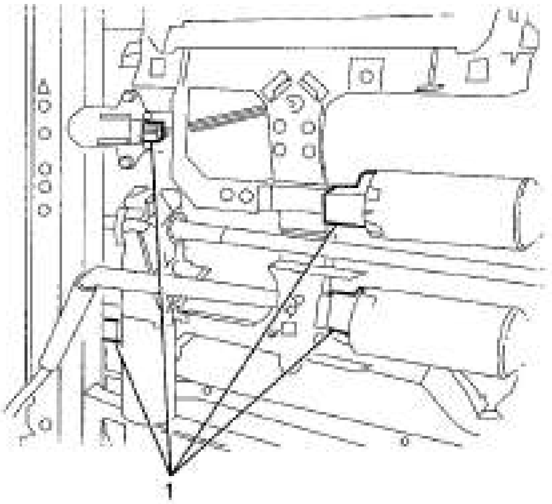
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement .
5. If required, remove the seat-belt buckle. Refer to Front Seat Belt Replacement .
6. As required, detach the seat-belt pretensioner wiring harness connector.



7. Remove the four seat adjuster retaining nuts (2) attaching the seat adjuster assembly (1) to the seat cushion frame.
8. Remove the seat adjuster assembly (1).

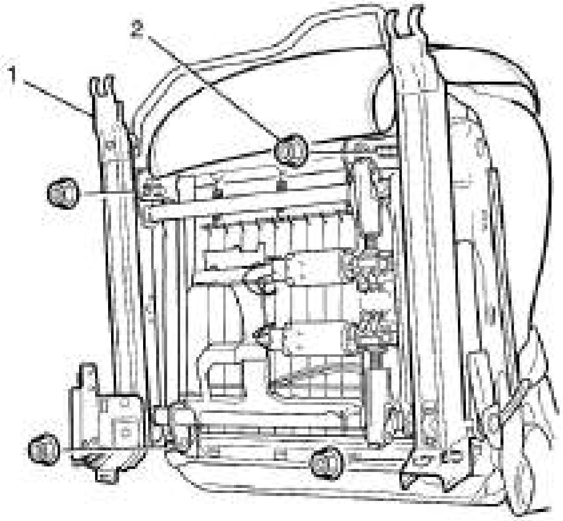


9. As required, detach the electrical wiring harness connectors (1).

Installation Procedure

1. Install the seat adjuster assembly onto the seat cushion frame.

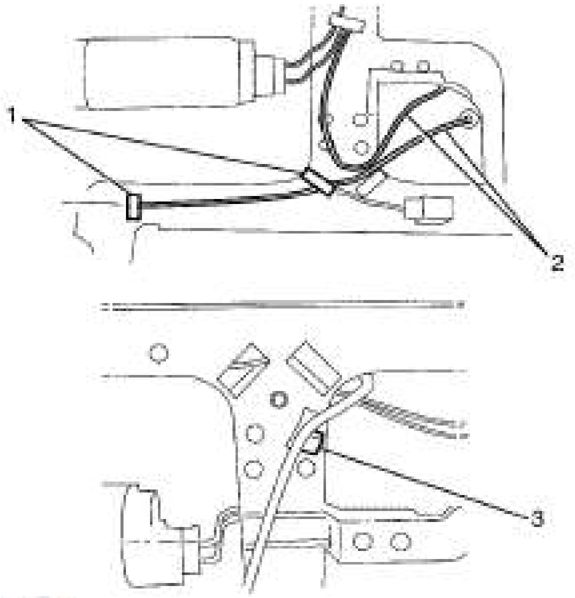
   Notice: Refer to Fastener Notice in the Preface section.



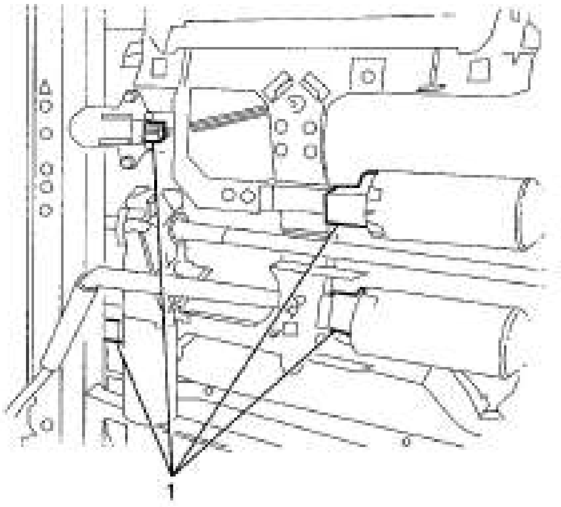
2. Install the four seat adjuster retaining nuts (2) attaching the seat adjuster assembly (1) to the seat cushion frame.

Tighten

Tighten the retaining nuts to 42 N·m (31 lb ft).



3. Ensure seat-belt pretensioner wiring harness is routed as follows:
   - Route pretensioner cable under cable tray tabs (1)
   - Direct pretensioner cable through cable tray gap (2)
   - Clip to under side of cable tray in the top hole (3)
4. As required, attach the seat-belt pretensioner wiring harness connector.



5. As required, attach the electrical wiring harness connectors (1).
6. If required, install the seat-belt buckle. Refer to Front Seat Belt Replacement .
7. Install the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement .

8. Install the front seat. Refer to Front Seat Replacement - Bucket .

   Caution: Refer to SIR Caution in the Preface section.

9. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
10. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
11. Test the seat for correct mechanical and electrical operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | Document ID: 2069439

Front Seat Back Replacement

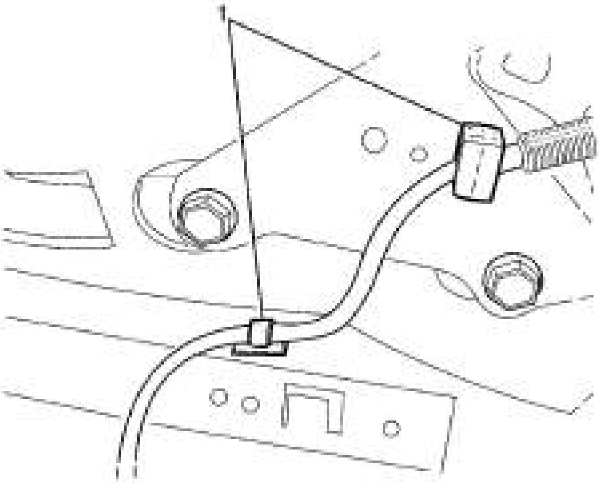
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

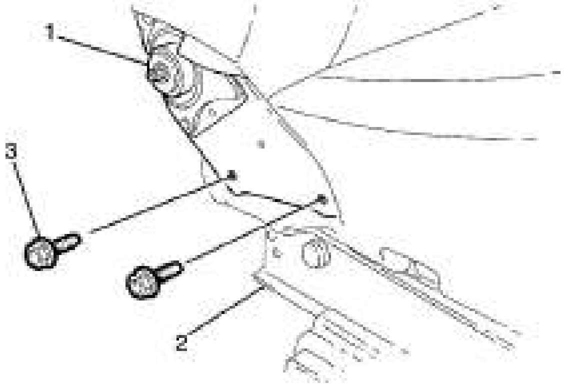
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket.
4. Remove the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement.
5. Remove the inner trim panel. Refer to Seat Cushion Inner Trim Panel Replacement.

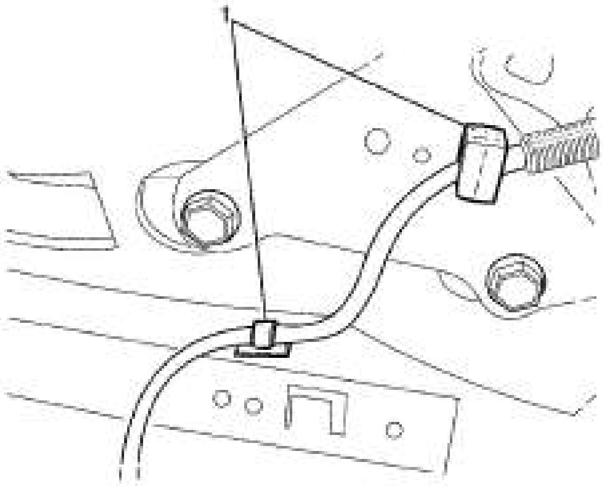


6. If required, disconnect and detach the front seat-back recline motor and side impact airbag wiring harness (1).



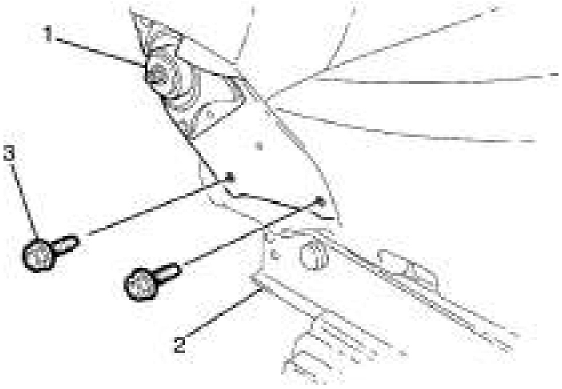
7. Remove the two seat back to seat base retaining bolts (3), each side, attaching the seat back assembly (1) to the front seat cushion frame assembly (2).
8. Remove the seat back assembly (1).

Installation Procedure



1. If removed, connect and attach the seat-back recline motor and airbag wiring harness (1).

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the two retaining bolts (3) each side, attaching the seat back assembly (1) to the front seat cushion frame assembly (2).

   Tighten
   Tighten the retaining bolts to 32 N·m (24 lb ft).

3. Install the inner trim panel. Refer to Seat Cushion Inner Trim Panel Replacement.
4. Install the outer trim panel. Refer to Seat Cushion Outer Trim Panel Replacement.
5. Install the front seat. Refer to Front Seat Replacement - Bucket.

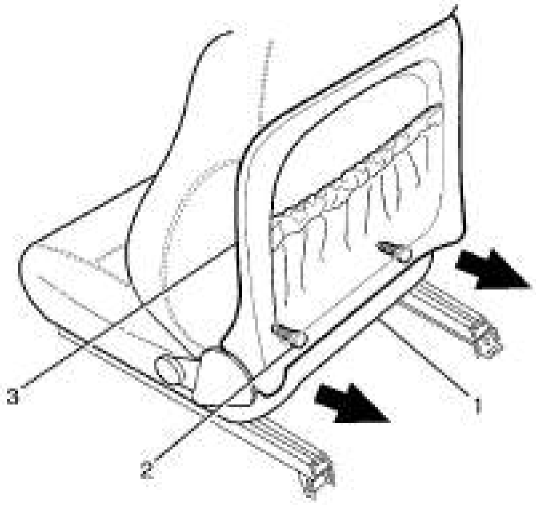
   Caution: Refer to SIR Caution in the Preface section.

6. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
7. Connect the battery ground cable to battery. Refer to Battery Negative Cable Disconnection and Connectionl.
8. Test seat for correct mechanical and electrical operation.

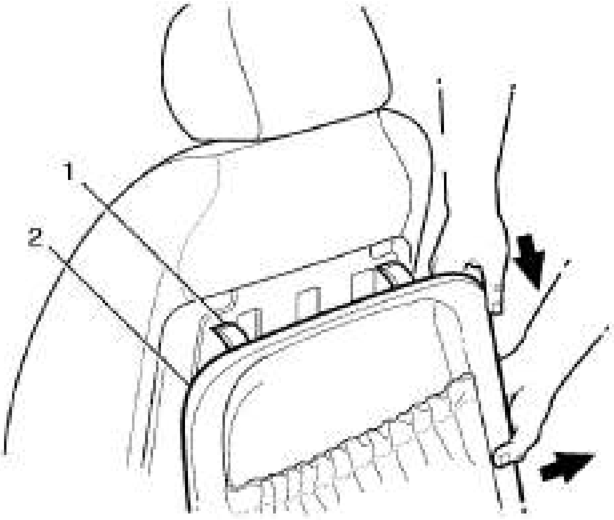
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 1995585**

Front Seat Back Trim Replacement

Removal Procedure



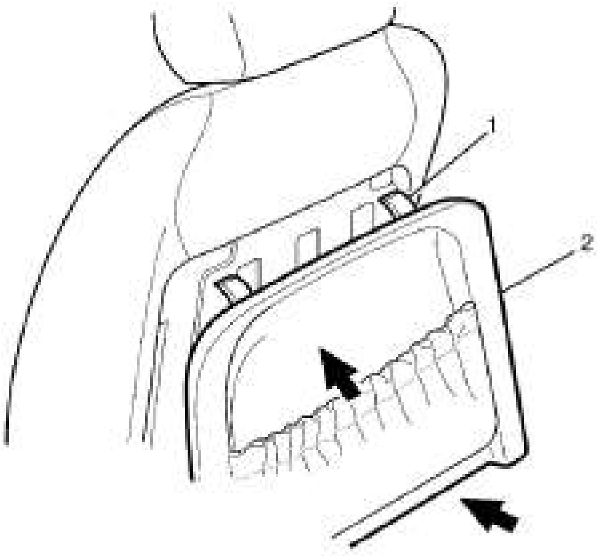
1. Pull the lower corners of the front seat-back trim (3) away from the seat (1) disengaging the two retaining clips (2).



2. While holding the lower section of the rear trim cover (2) out, pull the cover down to release the two upper retaining lugs (1).
3. Remove the rear trim cover (2).

Installation Procedure

Notice: Refer to General Repair Instructions in the Preface section.



1. Align the two upper retaining lugs (1) with the seat-back.
2. Push the front seat-back rear trim cover (2) up and in at the lower edge to engage the two lower retaining clips.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 1988911**

Front Seat Cushion Cover and Pad Replacement

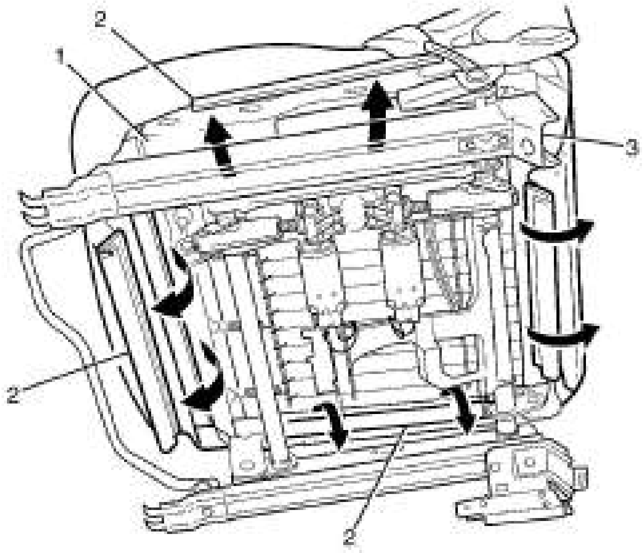
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

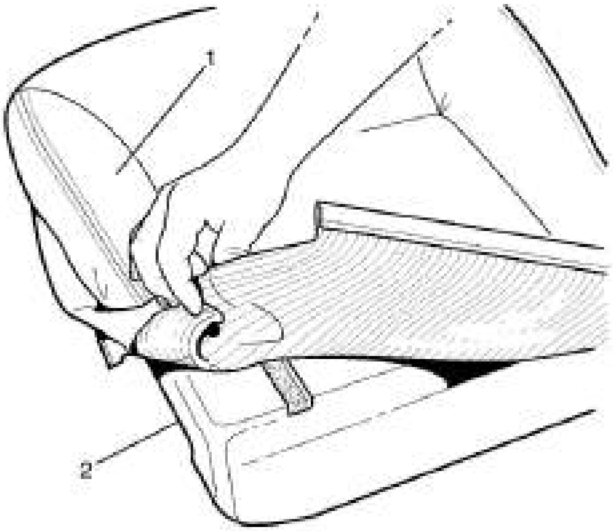
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to SIR Caution in the Preface section.

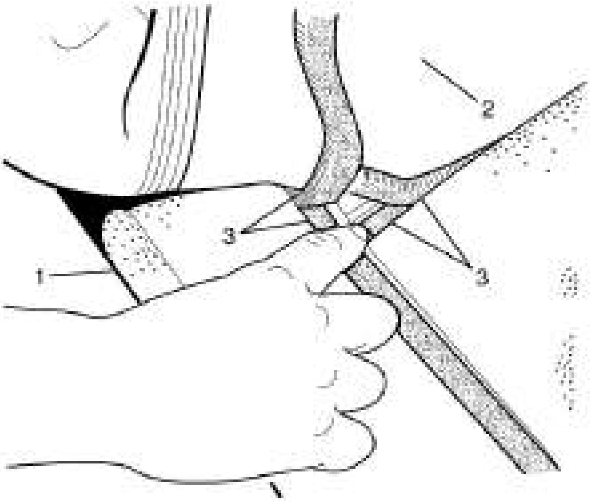
2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove seat-back frame assembly. Refer to Front Seat Back Frame Replacement .



5. Disengage the front and side J-strips (2) away from the seat adjuster (3).
6. Lift the cover and pad assembly away from the seat frame and then release the J-strip (2).
7. Remove the pad and cover assembly (1).
8. Place pad and cover assembly on a clean and suitable work surface.

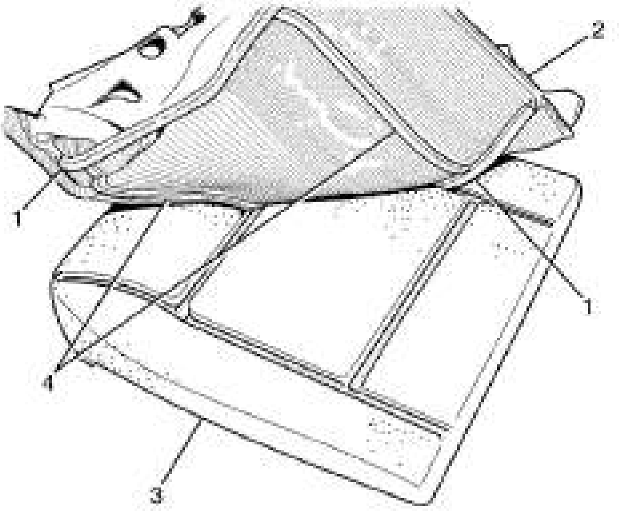


9. Fold the rear corners of the seat cushion cover (1) over the seat cushion pad (2).

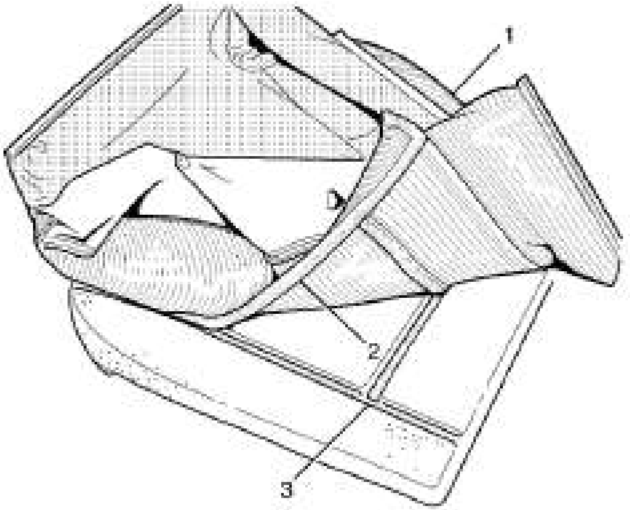


10. While holding the front seat cushion pad (1) pull the rear corners of the front seat cushion cover (2) forward and away from the pad to disengage the hook and loop strips (3).
11. Pull the cover up and over the forward edge of the pad.
12. Remove the seat cushion cover.

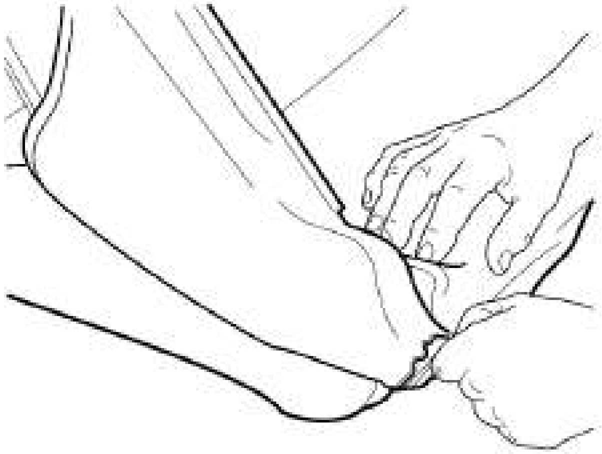
Installation Procedure



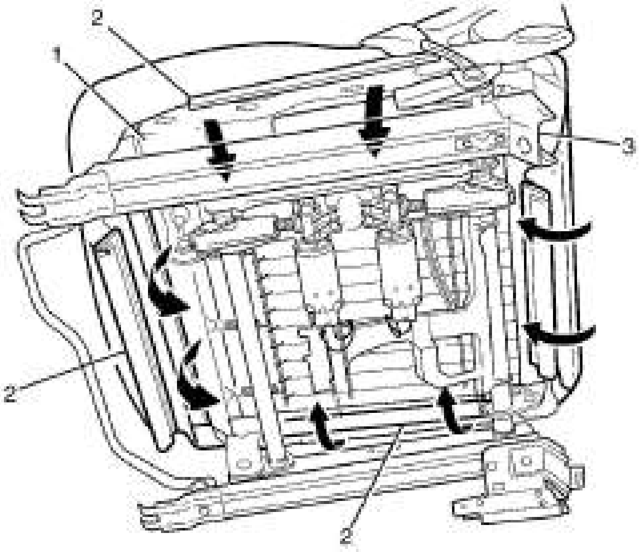
1. Align either the outer hook and loop strips (1) and the one or two cross hook and loop strips (2) on the front seat cushion cover (3) with the front seat cushion cover pad (4).
2. Press the folded edge of the seat cushion cover firmly into the corresponding groove in the pad to engage the hook and loop strip.



3. Align and press the outer hook and loop strip (1) on the cover (2) with the corresponding groove on the pad (3).



4. Roll the front corners of the seat cover over the pad.
5. Roll the sides of the seat cover over the pad.
6. Roll the rear corners of the seat cover over the pad.
7. Firmly run your finger in the seat cushion channels, to ensure a correct fitting.
8. Place seat the seat cover and pad onto the seat cushion frame.



9. Install the seat cushion (1) onto the seat adjuster assembly (3).
10. Engage the J-strips (2) onto the seat adjuster assembly (3)
11. Install the seat-back frame assembly. Refer to Front Seat Back Frame Replacement .
12. Install the front seat. Refer to Front Seat Replacement - Bucket .

Caution: Refer to SIR Caution in the Preface section.

13. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.

14. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
15. Test seat for correct mechanical and electrical operation.

Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 1988910**

Front Seat Cushion Replacement

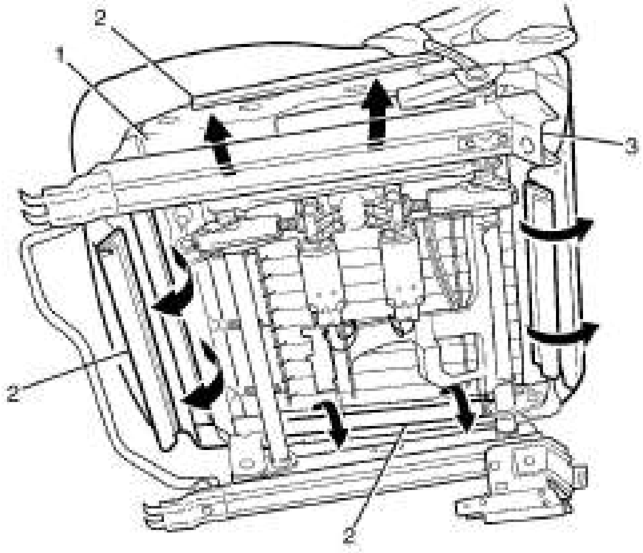
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

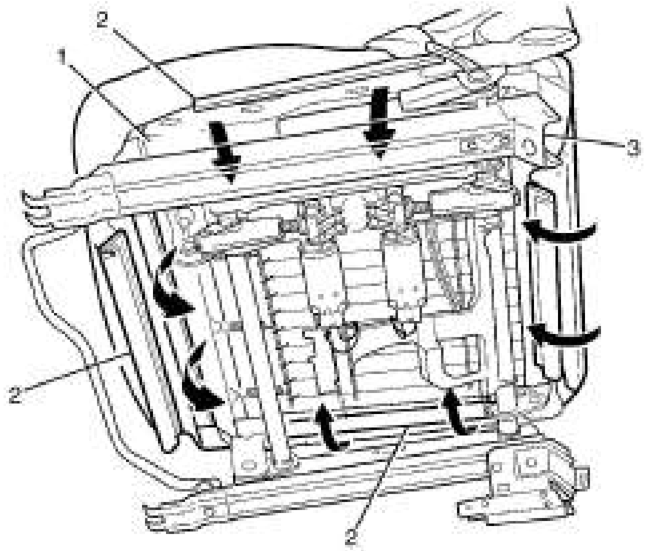
   Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove the front seat adjuster. Refer to Front Seat Adjuster Replacement .
5. Remove seat-back frame assembly. Refer to Front Seat Back Frame Replacement .



6. Disengage the front and side J-strips (2) away from the seat adjuster (3).
7. Remove the front seat cushion (1).

Installation Procedure



1. Install the front seat cushion (1) onto the front seat adjuster (3).
2. Engage the front and side J-strips (2) onto the seat adjuster (3).
3. Install seat-back frame assembly. Refer to Front Seat Back Frame Replacement .
4. Install the front seat. Refer to Front Seat Replacement - Bucket .

Caution: Refer to SIR Caution in the Preface section.

5. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
7. Test the seat for correct mechanical and electrical operation.

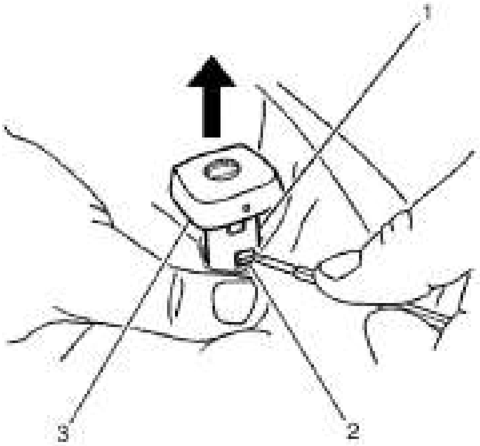
Front Seat Head Restraint Guide Replacement

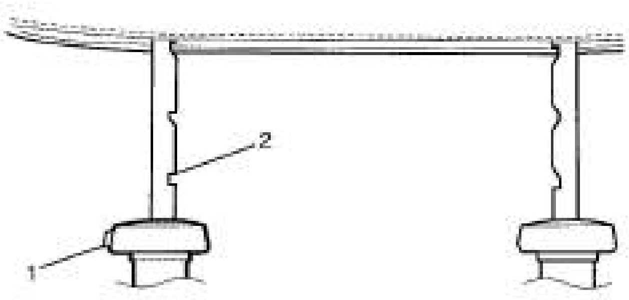
Removal Procedure

1. Remove the front seat head restraint. Refer to Front Seat Head Restraint Replacement .

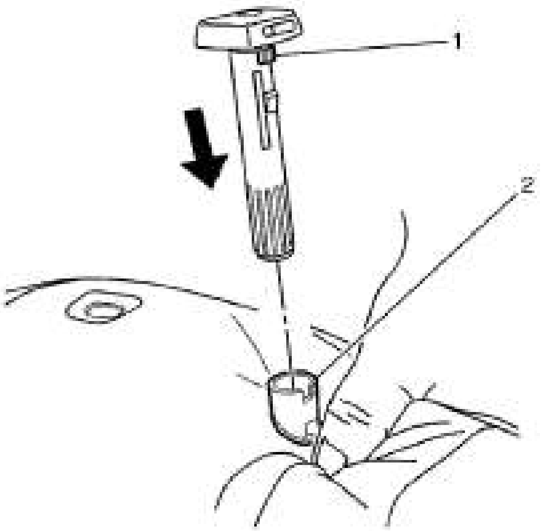


2. Push down on the seat cover to reveal the upper part of the head restraint guide (1).
3. Press the head restraint guide retaining lug (2), then remove the guide (3) from the frame.

Installation Procedure



1. Ensure the guide with the height adjuster lock (1), is installed on the left hand side of the seat and the side that corresponds the lower square notch (2) in the head restraint shaft.



2. Align the head restraint guide locating ribs (1) with the notch (2) in the seat back frame.
3. Insert the sleeve, listen for an audible click to confirm fitting.
4. Install the front seat head restraint. Refer to Front Seat Head Restraint Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 2006399**

Front Seat Horizontal Adjuster Position Sensor Replacement

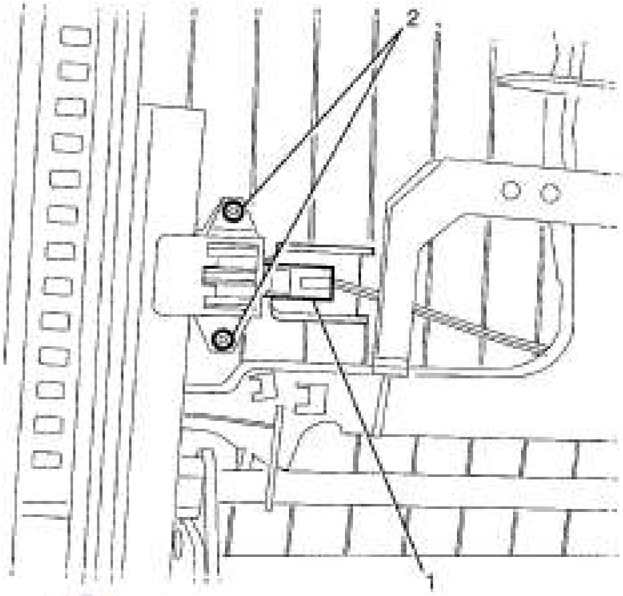
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

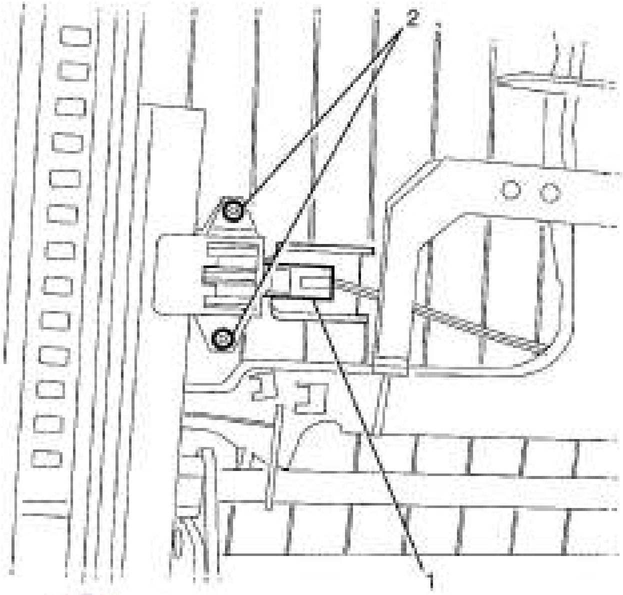
Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling .
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Place the front seat on a clean and suitable work surface.



5. Disconnect the track position sensor electrical connector (1).
6. Using a suitable drill bit and drill, remove the pop rivets (2) that secure the track position sensor to the track position sensor bracket.
7. Remove the track position sensor.

Installation Procedure



1. Align the track position sensor with the track position sensor bracket.
2. Using a universal pop rivet gun and pop rivets (2) secure the track position sensor to the track position bracket.
3. Connect the track position sensor electrical connector (1).
4. Install the front seat. Refer to Front Seat Replacement - Bucket .

Caution: Refer to SIR Caution in the Preface section.

5. Enable the SIR system. Refer to SIR Disabling and Enabling .
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
7. Test the front seat for correct mechanical and electrical operation.

Front Seat Replacement - Bucket

Removal Procedure

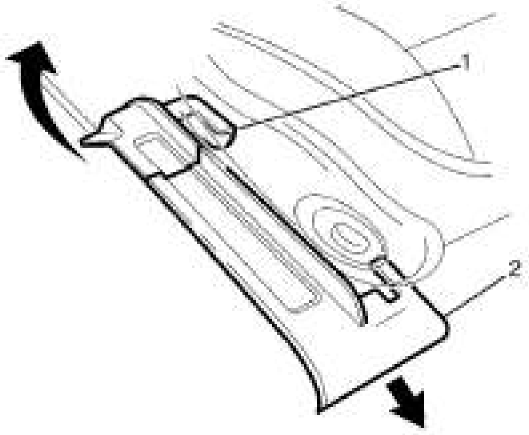
Caution: Refer to Battery Disconnect Caution in the Preface section.

Notice: Refer to General Repair Instructions in the Preface section.

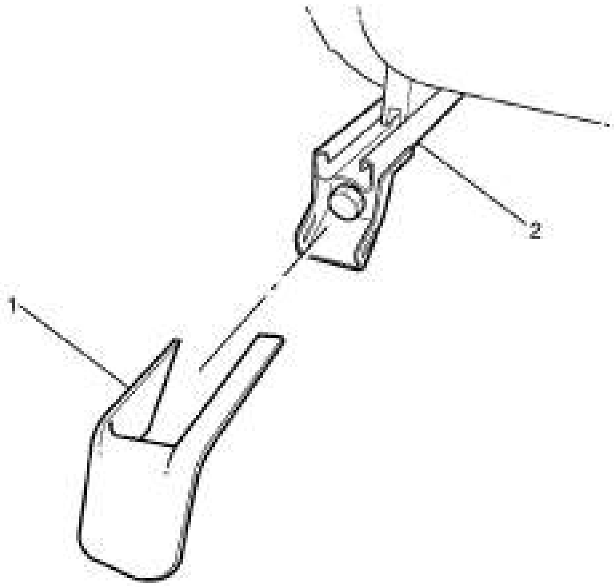
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection in Engine Electrical.

Caution: Refer to SIR Caution in the Preface section.

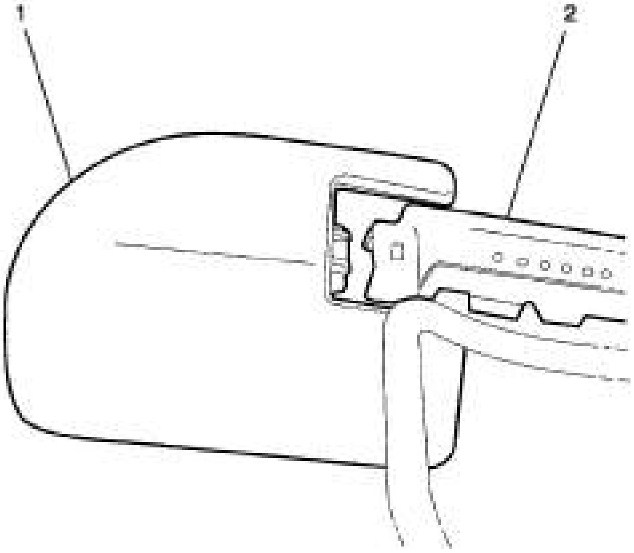
2. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.



3. Slide your hand around and under the inboard side of the rear outer cover (1) until you get to the rear edge, then lift upwards to disengage the retaining clip and remove cover.
4. Using a long flat head screwdriver, prise the rear edge of the front outboard cover (2) upwards, to disengage the clip.
5. Slide the front outboard cover (2) forward to remove.



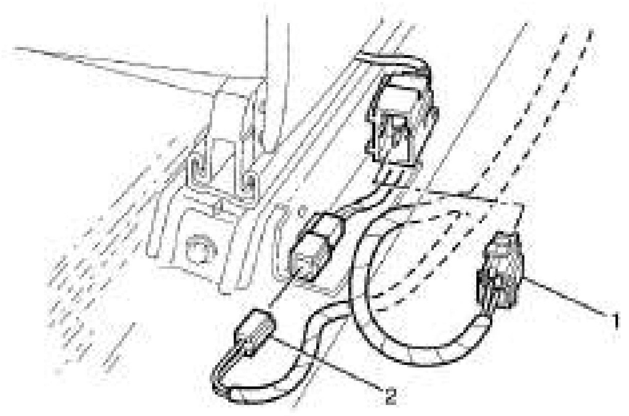
6. Remove the rear inner cover, by sliding your hand under the outboard side of the cover until you get to the rear edge, then lift upwards and rearwards to disengage the retaining clip.



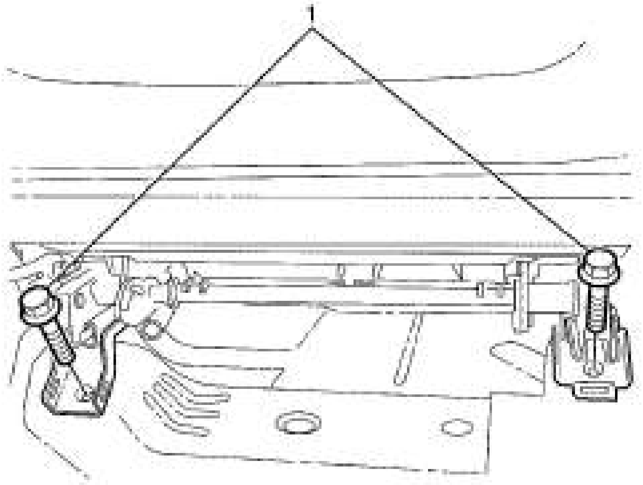
7. Remove the front seat track cover (1) by grasping the base of the cover and disengaging the retaining clip from the seat track (2).

Notice: Refer to General Repair Instructions in the Preface section.

Notice: Refer to Battery Negative Cable Disconnection and Connection in the Preface section.



8. Disconnect the front seat electrical connector (1), if fitted, and the seatbelt pretensioner electrical connector (2).



9. Remove the front seat rear retaining bolts (1).

Notice: Refer to General Repair Instructions in the Preface section.

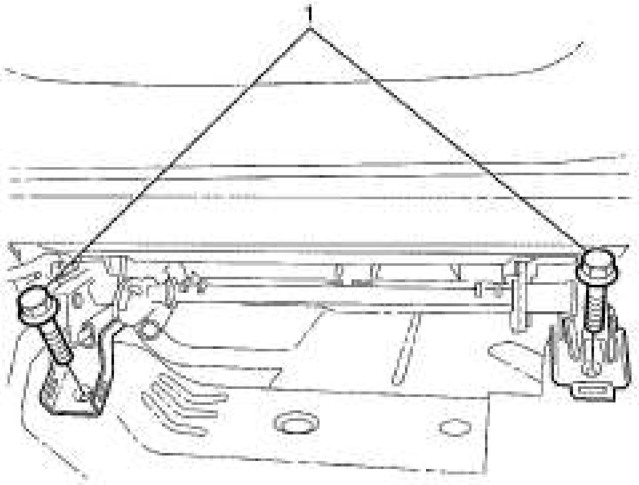
10. With the aid of an assistant remove the front seat, by lifting and tilting the seat forward, and then lifting and pulling the seat rearwards to disengage the front hooks.

Installation Procedure

Important: Physically inspect each hook to ensure it is correctly engage.

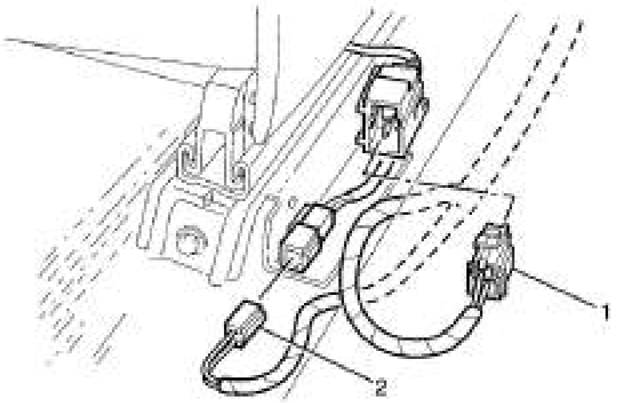
1. Engage the front seat retaining hooks into the slots in the body and slide the seat forward and down.

   Notice: Refer to Fastener Notice in the Preface section.



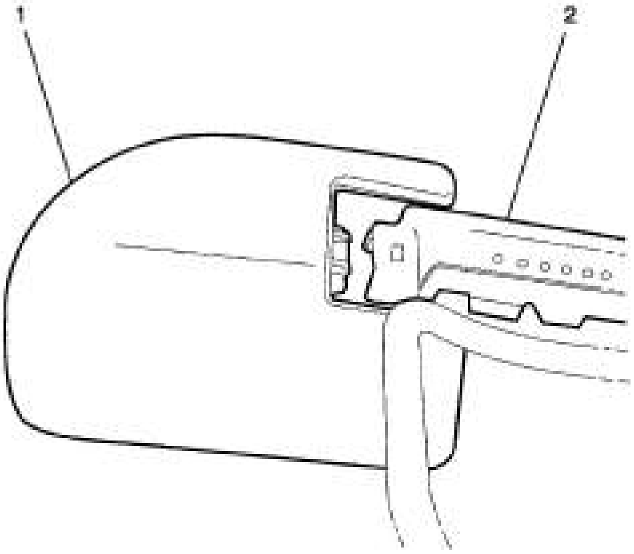
2. Install the front seat retaining bolts (1).

   Tighten
   Tighten the retaining bolts to 42 N·m (31 lb ft).

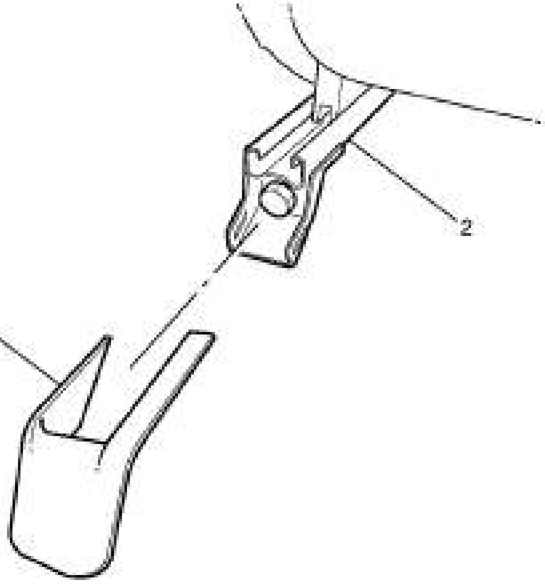


3. Connect the front seat electrical connector (1), if fitted, and the seatbelt pretensioner

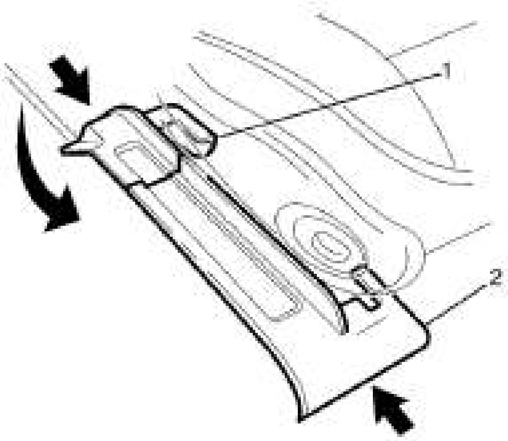
electrical connector (2) and the side air bag electrical connector, if fitted.



4. Install the front seat rail cover (1) by alining the cover with the seat track (2) and engaging the retaining clip.



5. Install the front seat rear inner retaining bolt cover (1) to the seat track (2).



6. Slide the lug on the front outer cover (2) into the outboard (1) seat rail.
7. Ensure the barb on the front outer cover (located 10cm rear of the front edge) engages with the carpet retainer trim.
8. Slide the cover fully rearwards, then push the cover down to engage the middle and rear most clip.
9. Line up the alignment tab on the rear outer cover with the slot on the front over cover.
10. Push downwards on the rear outer cover (1) to secure it to the seat rail and front outer cover. Listen for an audible click to confirm fitting.

    Caution: Refer to SIR Caution in the Preface section.

11. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
12. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
13. Test the front seat for correct mechanical and electrical operation.

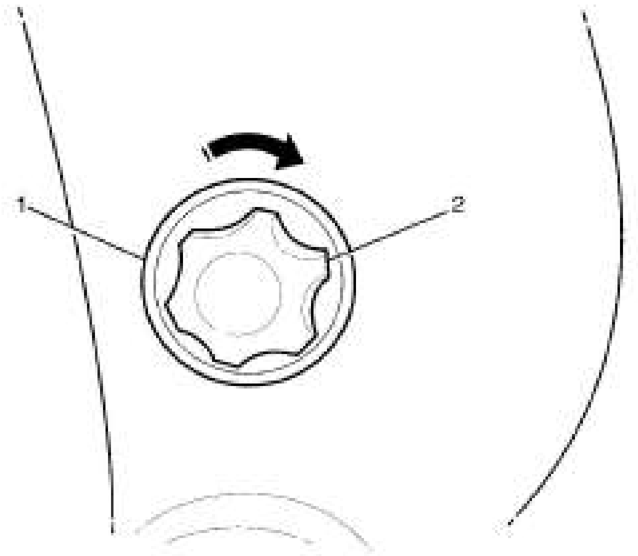
Lumbar Support Knob Replacement

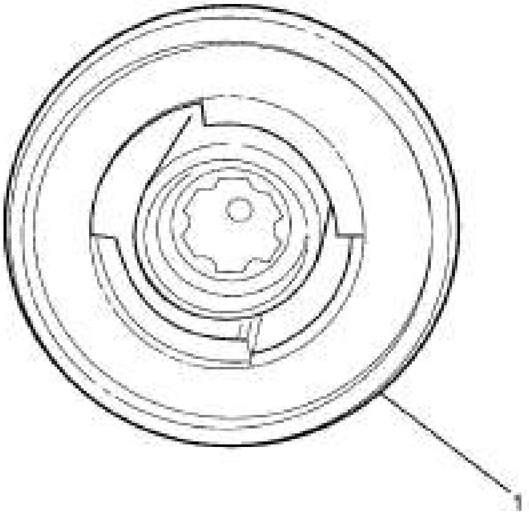
Removal Procedure



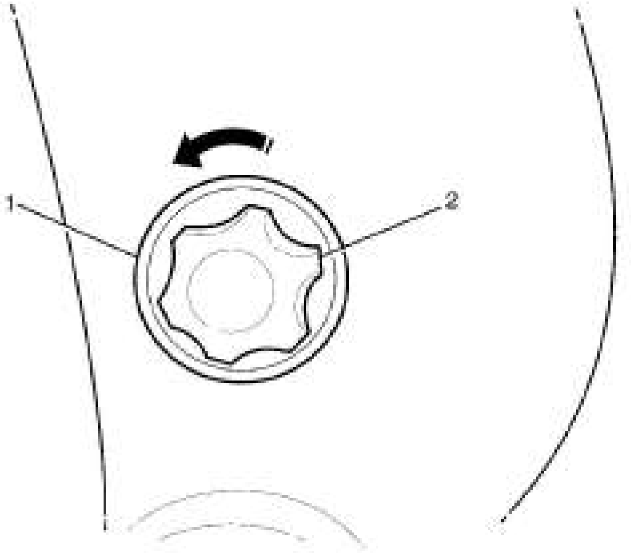
1. Turn the lumbar support adjuster deflector ring (1) clockwise until it is released from the adjuster shaft.
2. Remove the deflector ring (1) and knob assembly (2) by firmly pulling forward.

Installation Procedure

Notice: Refer to General Repair Instructions in the Preface section.



1. Install the deflector ring (1) onto the adjustment shaft.

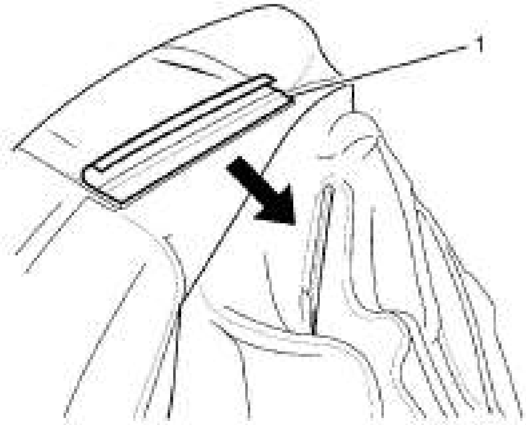


2. Twist the lumbar support deflector ring (1) anti-clockwise until it locks into place on the adjustment shaft, listen for an audible click to confirm fitting.
3. Install the lumbar support knob assembly (2) by firmly pushing it onto the adjuster shaft.
4. Test lumbar support assembly for correct operation.

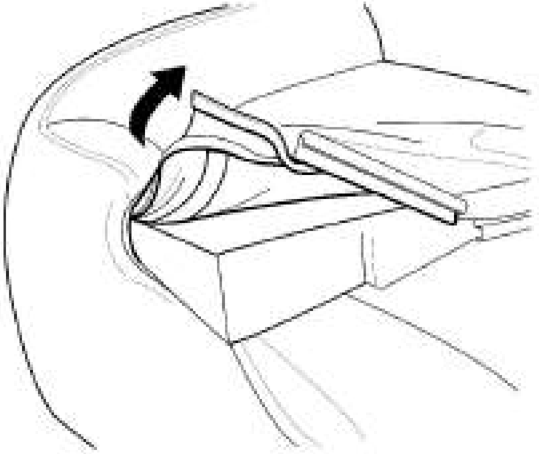
Rear Folding Seat Back Cover Replacement (Sedan)

Removal Procedure

1. Remove seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the rear seat back. Refer to Rear Seat Back Replacement in Seats.
3. If fitted, remove head restraints. Refer to Rear Seat Head Restraint Replacement.
4. Place seat on suitable work surface.
5. Turn seat over on its front.

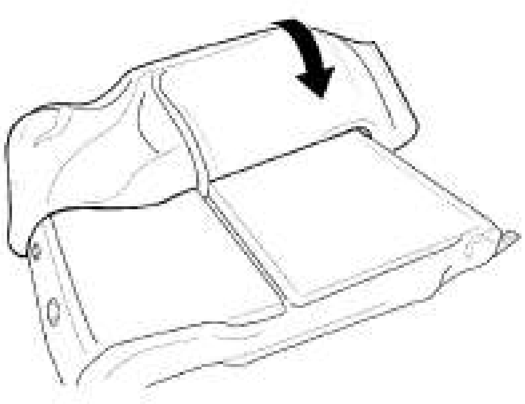


6. Detach the J-strips (1) retaining the back of the cover to the seat pad and frame.

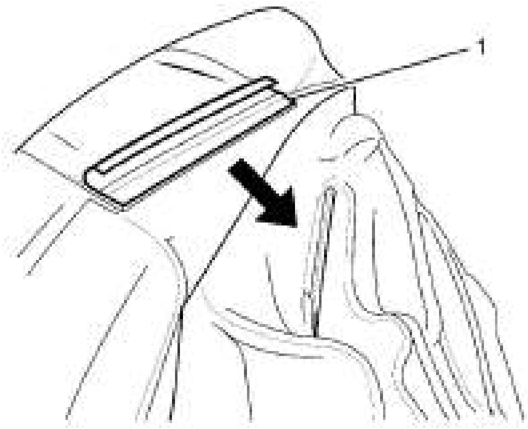


7. While holding the seat back pad, remove the seat back cover.

Installation Procedure



1. Align the aplix with the seat cover.
2. Install the seat cover.
3. Turn the seat back over on its front.



Important: When installing the seat cover, pull the cover tight in all corners to ensure no lumps will occur.

4. Attach the seat back cover J-strips to the seat back pad and frame.

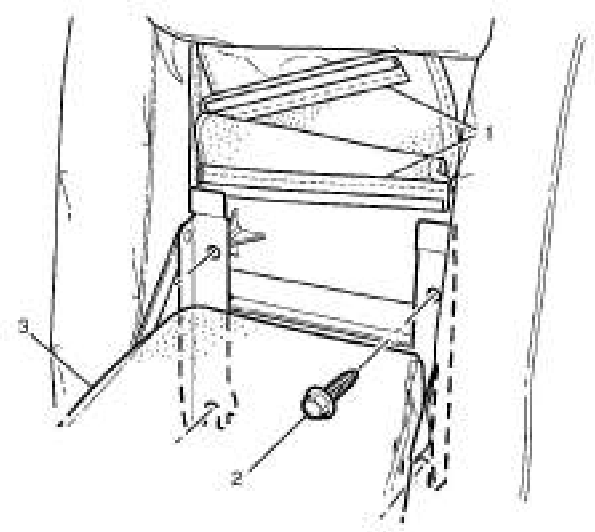
5. If fitted, install head restraints. Refer to Rear Seat Head Restraint Replacement.
6. Install the rear seat back. Refer to Rear Seat Back Replacement in Seats.
7. Install seat cushion. Refer to Rear Seat Cushion Cover and Pad Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 2133652**

Rear Seat Armrest Replacement (Sedan)

Removal Procedure

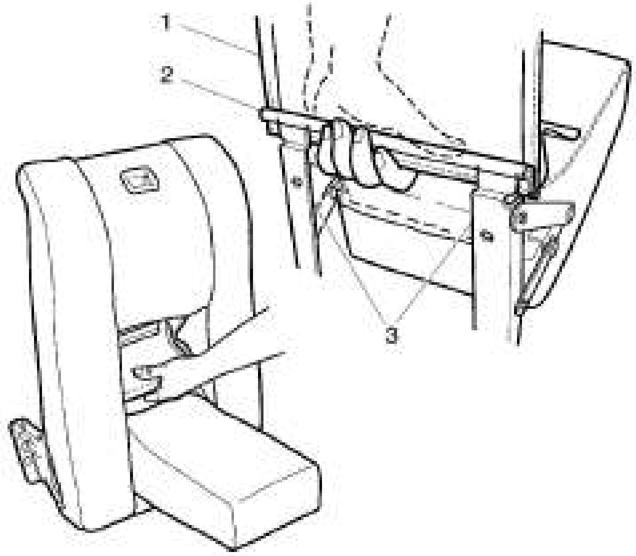
1. Remove the rear seat back. Refer to Rear Seat Back Replacement in Seats.
2. Remove the rear seat back folding. Refer to Rear Split Folding Seat Back Cushion Cover and Pad Replacement in Seats.
3. Place the centre seat on a suitable work surface.



4. Lower the arm rest assembly (3) and disengage the trim flap (1) from the armrest hinge to obtain access to the retaining bolts (2).
5. Remove the top two retaining bolts from the armrest hinge then loosen the two lower retaining bolts.
6. Remove the armrest assembly (3) by sliding it up and out.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the armrest assembly, to the seat back tray.
2. Install the four attaching screws.

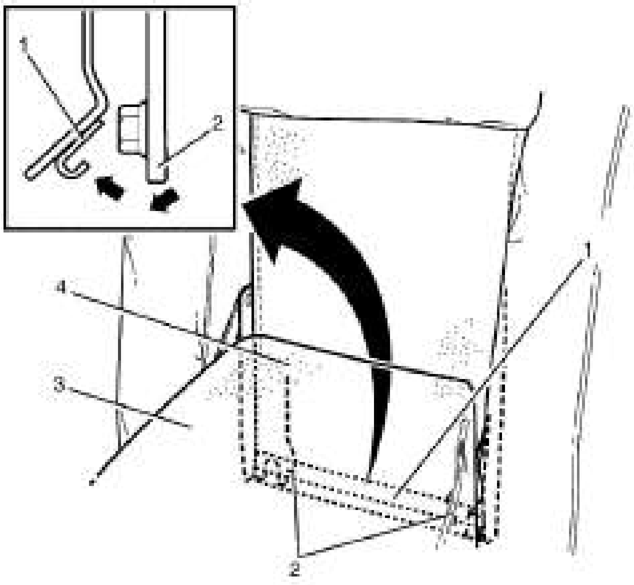
   Tighten
   Tighten the bolts to 4 N·m (35 lb in).

3. Install the armrest trim flap (1) upper J-strip (2), to the upper part of the hinge bracket (3).
4. Install the armrest trim flap (1) J-strip to the lower part of the hinge bracket (3).
5. Install the rear centre seat back. Refer to Rear Split Folding Seat Back Cushion Cover and Pad Replacement in Seats.
6. Install the rear seat back. Refer to Rear Seat Back Replacement in Seats.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | Document ID: 2133653

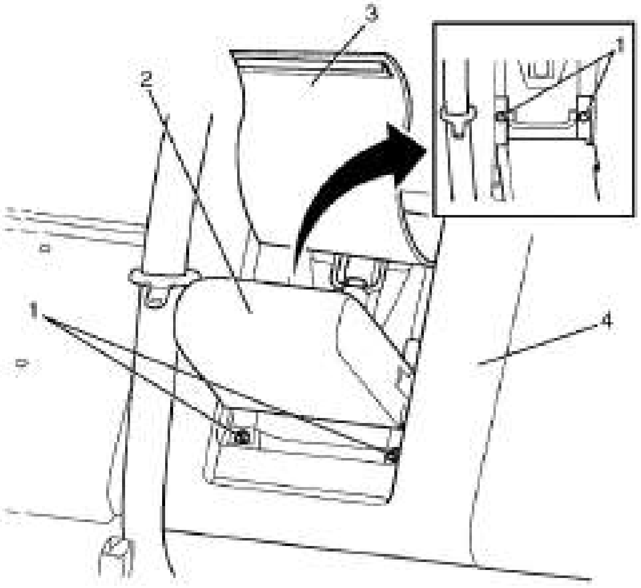
Rear Seat Armrest Replacement (Sportwagon)

Removal Procedure



Important: Adjust the armrest (3) to a suitable position to access the right rear seat back cover retainer (1).

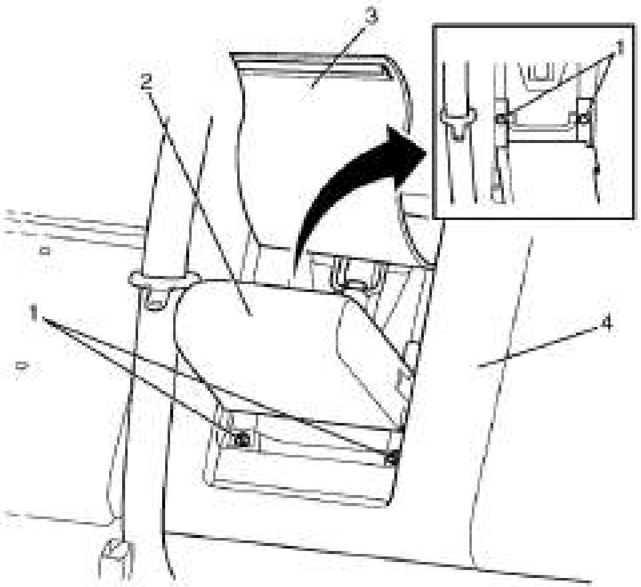
1. Carefully pull down on the right rear seat back cover retainer (1) and detach the trim flap (4) from the trim flap retainer (2).



Important: Lift the right rear seat back cover trim flap (3) to expose the armrest to right rear seat back frame retaining bolts (1).

2. Remove the right rear seat back armrest to the right rear seat back frame retaining bolts (1).
3. Remove the right rear seat back armrest assembly (2) from the right rear seat back assembly (4).

Installation Procedure

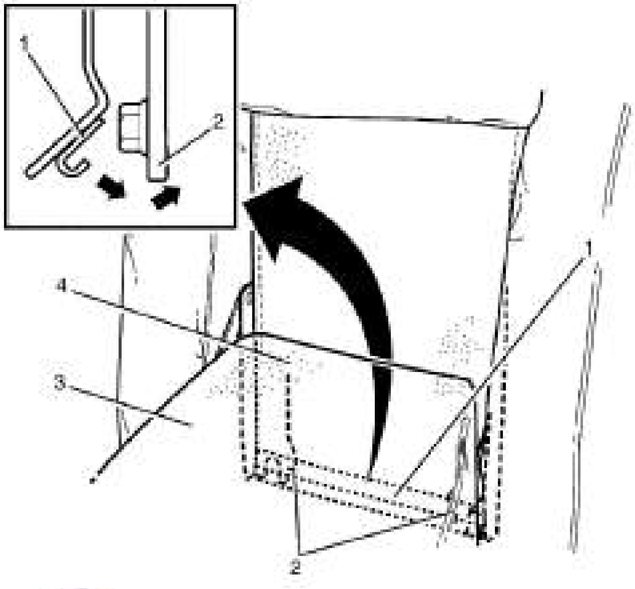


1. Install the right rear seat back armrest assembly (2) to the right rear seat back assembly (4).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the right rear seat back armrest to right rear seat back frame retaining bolts (1).

   Tighten
   Tighten the bolts to 8 N·m (31 lb in).



Important: Adjust the armrest (3) to a suitable position to access the right rear seat back cover retainer (1).

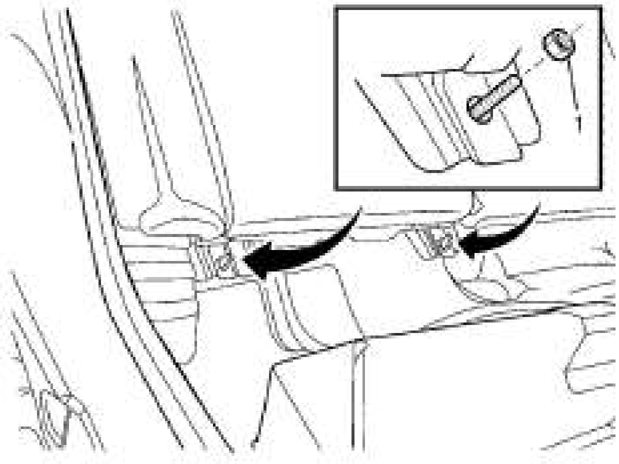
3. Carefully pull down on the right rear seat back cover retainer (1) and attach the trim flap (4) to the trim flap retainer (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | Document ID: 1985781

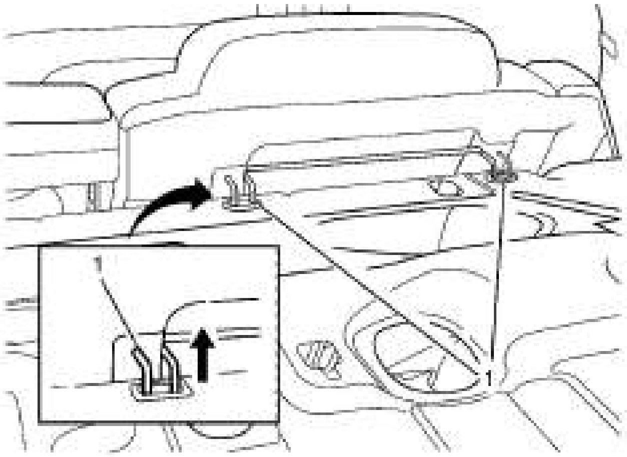
Rear Seat Back Cushion Replacement

Removal Procedure

1. Remove the seat cushion. Refer to Rear Seat Cushion Replacement.



2. Remove the two retaining bolts (1) attaching the seat back to body panel.

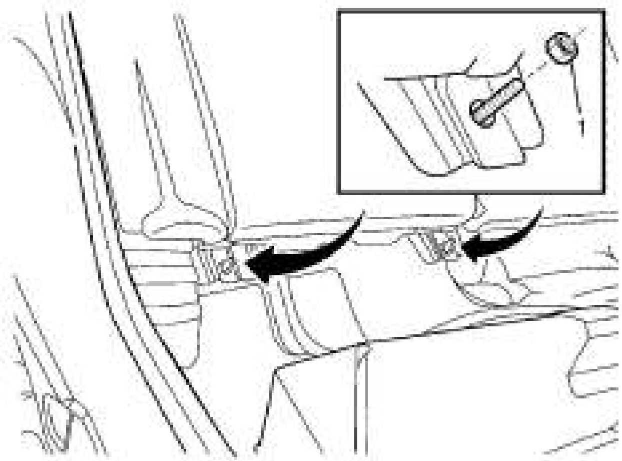


3. Remove the seat back out of the retaining slots (1).
4. Remove the seat back.

Installation Procedure

1. Install the seat back into the retaining slots.

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the two seat back retaining nuts (1).

   Tighten
   Tighten the nuts to 27 N·m (20 lb ft).

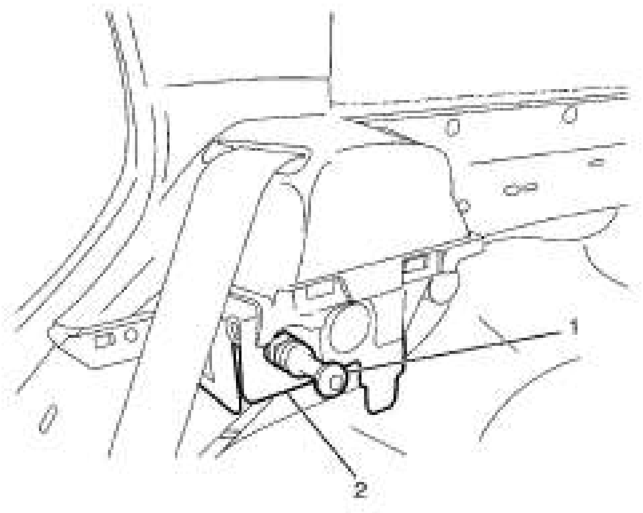
3. Install the seat cushion. Refer to Rear Seat Cushion Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 2158308**

Rear Seat Back Cushion Stop Striker Replacement

Removal Procedure

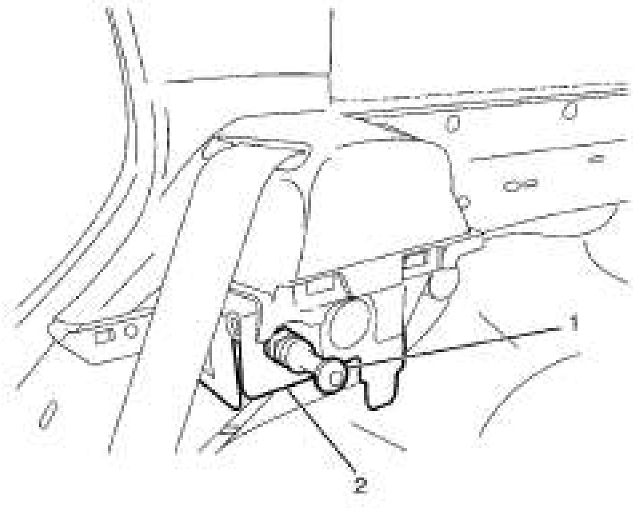
1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the rear seat back bolster. Refer to Rear Split Folding Seat Back Bolster Replacement.
3. Remove the luggage shade. Refer to Luggage Shade Replacement.
4. Remove the rear end trim finish panel. Refer to Rear End Trim Finish Panel Replacement.
5. Remove the rear compartment floor panel carpet. Refer to Rear Compartment Floor Panel Carpet Replacement.
6. Remove the load floor stationary panel carpet. Refer to Load Floor Stationary Panel Carpet Replacement.
7. Remove the load floor front panel carpet. Refer to Load Floor Front Panel Carpet Replacement.
8. Remove the quarter inner finish trim panel. Refer to Quarter Inner Trim Finish Panel Replacement.



9. Remove the rear seat back cushion stop striker (1) from the body lock pillar inner panel bracket (2).

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the rear seat back cushion stop striker (1) to the body lock pillar inner panel bracket (2).

   Tighten
   Tighten the striker to 70 N·m (52 lb ft).

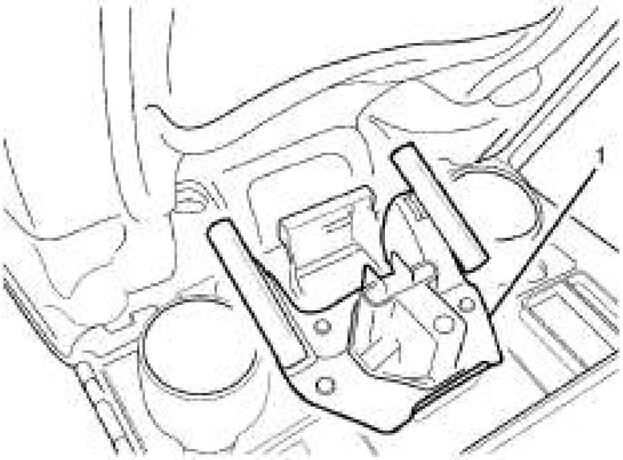
2. Install the quarter inner finish trim panel. Refer to Quarter Inner Trim Finish Panel Replacement.
3. Install the load floor front panel carpet. Refer to Load Floor Front Panel Carpet Replacement.
4. Install the load floor stationary panel carpet. Refer to Load Floor Stationary Panel Carpet Replacement.
5. Install the rear compartment floor panel carpet. Refer to Rear Compartment Floor Panel Carpet Replacement.
6. Install the rear end trim finish panel. Refer to Rear End Trim Finish Panel Replacement.
7. Install the luggage shade. Refer to Luggage Shade Replacement.
8. Install the seat back bolster. Refer to Rear Split Folding Seat Back Bolster Replacement.
9. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.
10. Check rear seat back latch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 1988930**

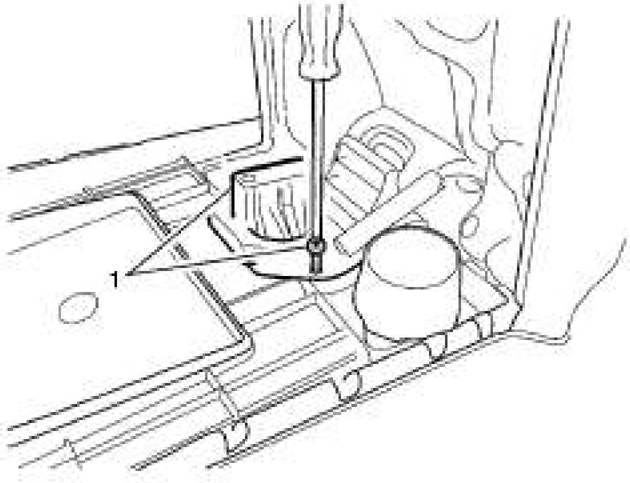
Rear Seat Back Latch Replacement (Sedan)

Removal Procedure

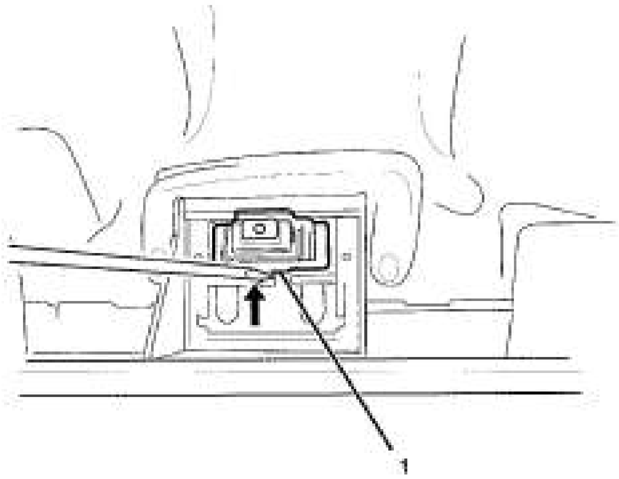
1. Remove the rear seat back. Refer to Rear Seat Back Replacement.
2. Remove the rear set back folding. Refer to Rear Split Folding Seat Back Replacement.



3. Detach seat back cover and lift to expose latch assembly (1).



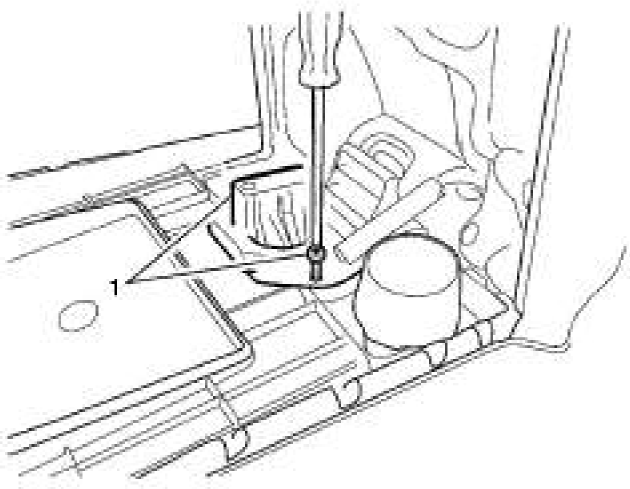
4. Remove the retaining screws (1) attaching the lock actuator to the seat back tray.
5. Remove the lock actuator from the seat back tray.



6. Using a suitable screwdriver, depress the tang (1) on the front of the release button.
7. Remove the release button from the rear centre seat back.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the lock actuator onto the seat back tray.

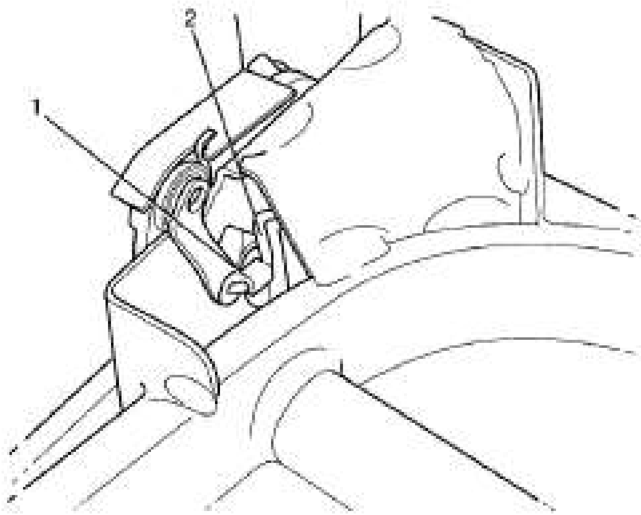
Tighten
Tighten the screws (1) to 2 N·m (18 lb in).

2. Install the rear centre seat back cover. Refer to Rear Split Folding Seat Back Cushion Cover and Pad Replacement in Seats.
3. Install the centre seat back release button, listen for an audible click to confirm fitting.
4. Remove the rear set back folding. Refer to Rear Split Folding Seat Back Replacement in Seats.
5. Install the rear seat back. Refer to Rear Seat Back Replacement in Seats.
6. Operate release button, to ensure correct operation.

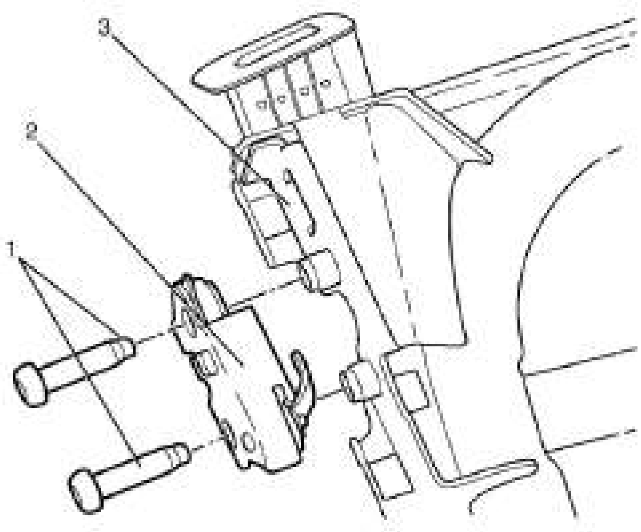
Rear Seat Back Latch Replacement (Sportwagon)

Removal Procedure

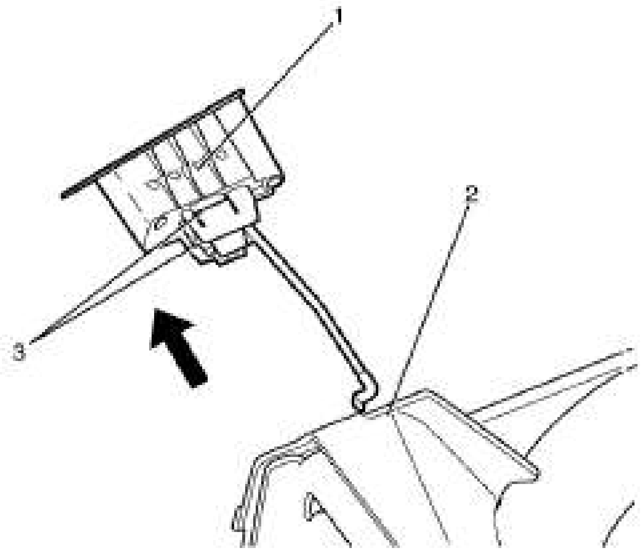
1. Remove the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.
2. Remove the appropriate rear seat back assembly. Refer to Rear Seat Back Cushion Replacement.
3. Remove the appropriate rear seat cover and pad. Refer to Rear Seat Cushion Cover and Pad Replacement.



4. Remove the seat lock linkage (2) from the linkage retainer clip (1).



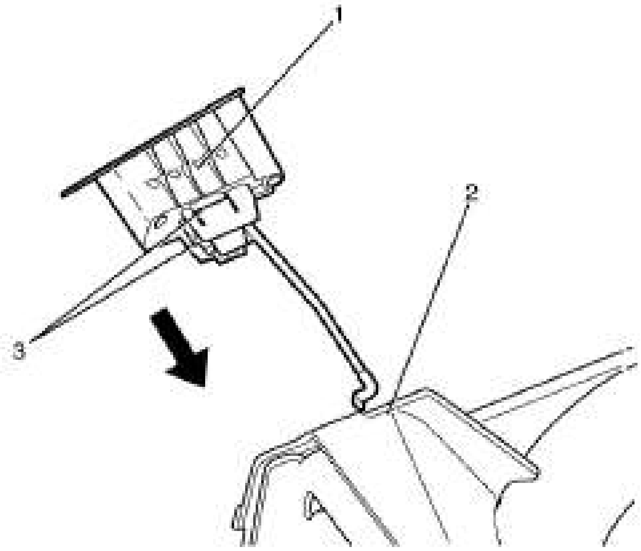
5. Remove the seat lock to seat frame retaining bolts (1).
6. Remove the seat lock (2) from the seat frame (3).



Important: Care must be taken not to damage the seat release handle assembly retainers (3).

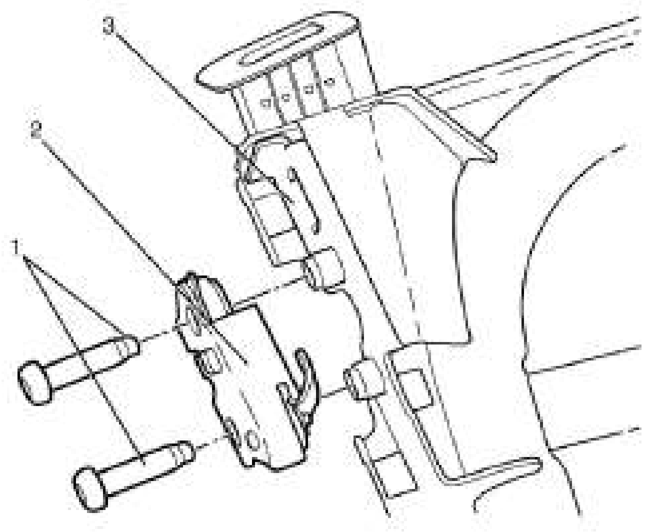
7. Using a suitable tool detach the seat release handle assembly retainers (3).
8. Remove the seat release handle assembly (1) from the seat frame (2).

Installation Procedure



Important: Listen for an audible click to confirm correct installation of the seat release handle assembly retainers (3).

1. Install the seat release handle assembly (1) to the seat frame (2).

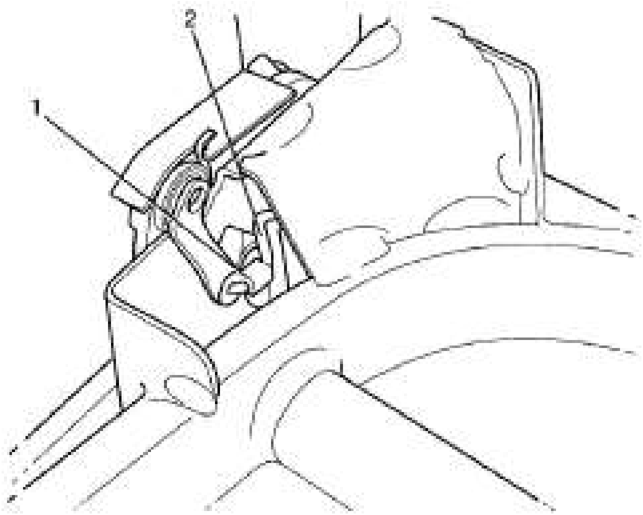


2. Install the seat lock (2) to the seat frame (3).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the seat lock to seat frame retaining bolts (1).

Tighten
Tighten the bolts to 43 N·m (31 lb ft).

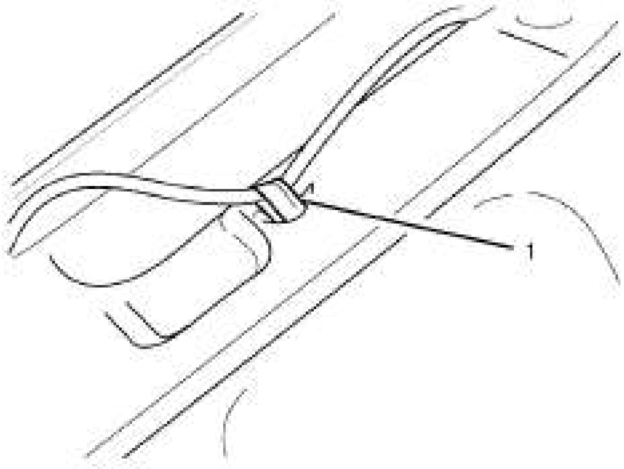


4. Install the seat lock linkage (2) to the retainer clip (1).
5. Attach the linkage retainer clip (1) to the seat lock linkage (2).
6. Install the appropriate rear seat cover and pad. Refer to Rear Seat Cushion Cover and Pad Replacement.
7. Install the appropriate rear seat back assembly. Refer to Rear Seat Back Cushion Replacement.
8. Install the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.

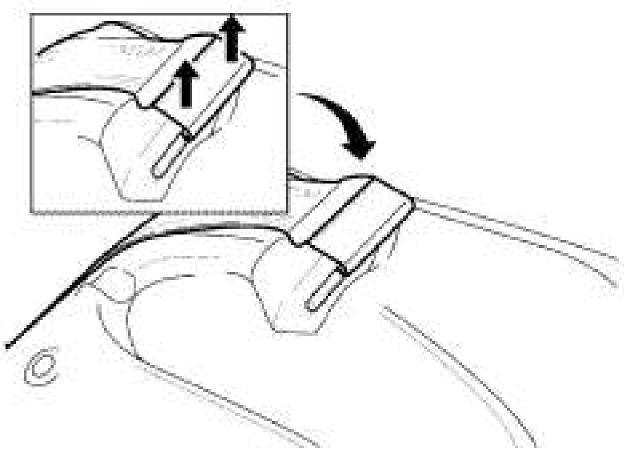
Rear Seat Cushion Cover and Pad Replacement

Removal Procedure

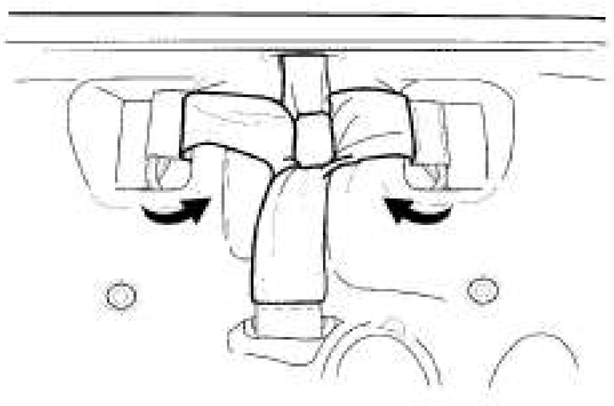
1. Remove the seat cushion. Refer to Rear Seat Cushion Replacement.
2. Place seat cushion on a suitable work surface.



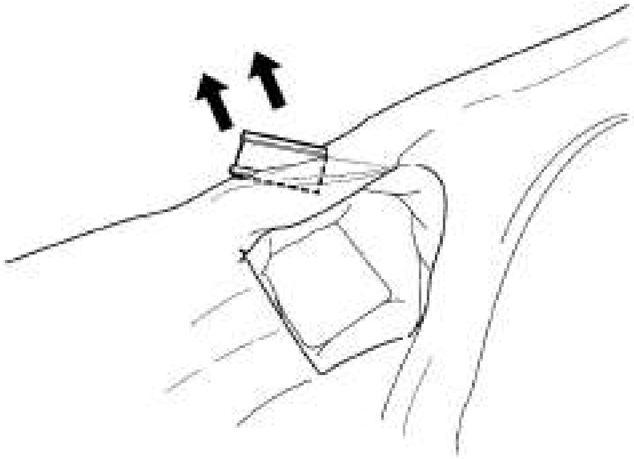
3. Detach the cushion cover from the base pad by uncliping the cushion cover retaining clip (1), carry this procedure until all the retaining clips are detach.



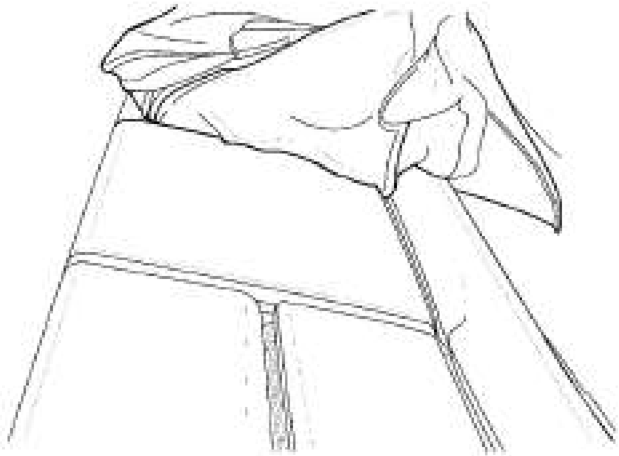
4. Detach the back of the seat cushion cover, by unhooking the J-strips from the base pad.



5. Detach the seat belt cross strap, by unhooking the J-strips from the base pad.

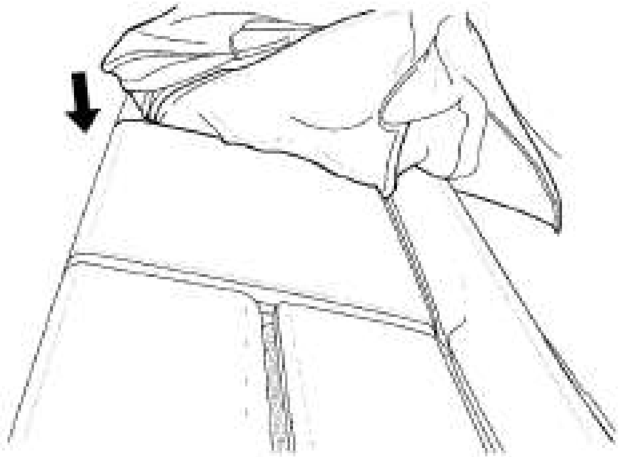


6. Detach the front of the seat cushion cover.
7. Turn seat cushion over.



8. Remove the seat cushion cover.

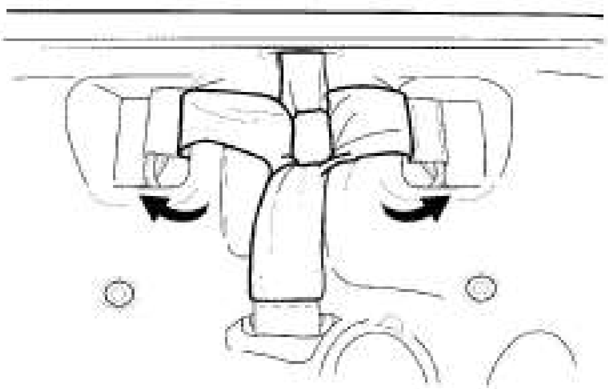
Installation Procedure



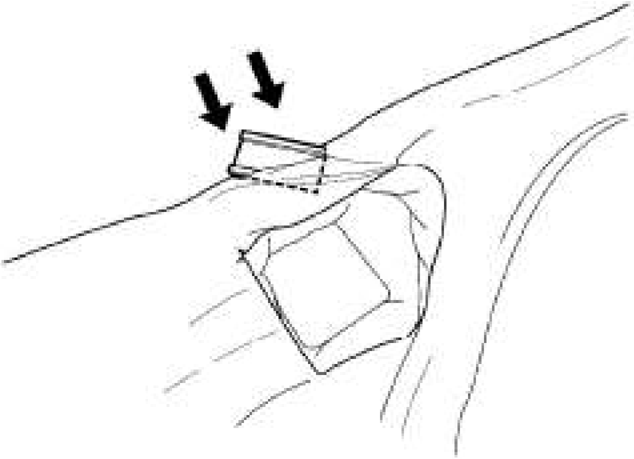
1. Install the seat cushion cover.
2. Turn the seat cushion over.

Important: When installing the front of the cover, ensure the corners are pulled tight.

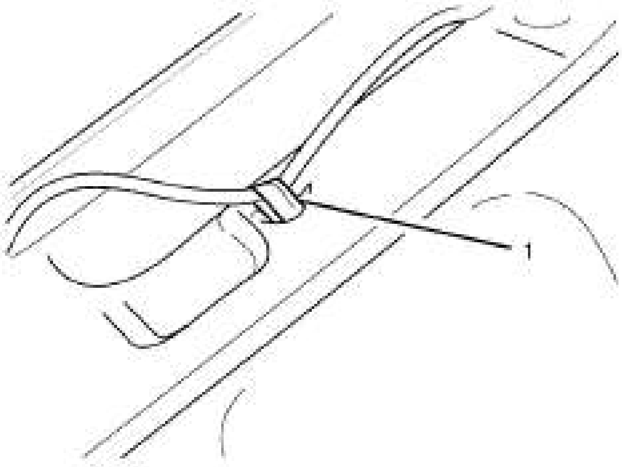
3. Install the front of the seat cushion cover.



4. Install the seat belt cross strap, by hooking the J-strips onto the base pad.



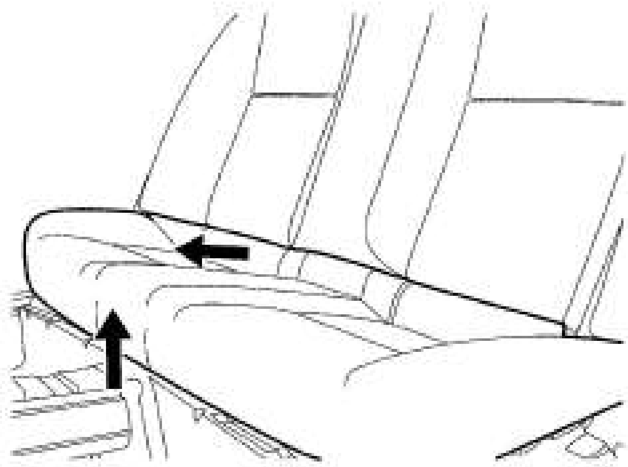
5. Install the back of the seat cushion cover.



6. Attach the cushion cover to the base pad by attaching the cushion cover retaining clip (1), listen for an audible click to confirm fitting.
7. Firmly run your finger in the seat cushion channels, to ensure a correct fitting.
8. Install the seat cushion. Refer to Rear Seat Cushion Replacement.

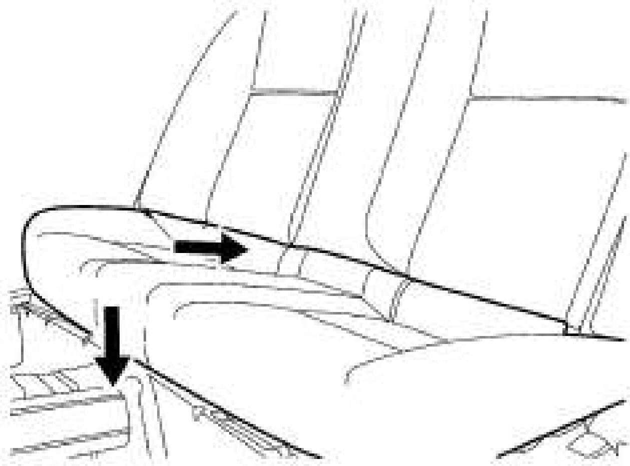
Rear Seat Cushion Replacement

Removal Procedure



1. Grasp base of seat and pull vertically upwards to avoid damage to clips, and pull outwards as shown.
2. Remove the seat cushion.

Installation Procedure



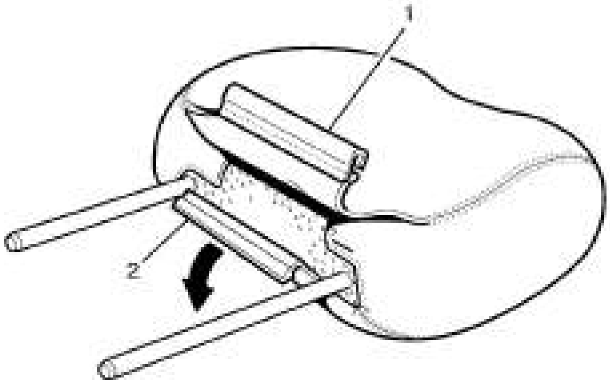
1. Install the seat back.
2. With downward pressure, install the seat cushion into the retaining grommets.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 1988931**

Rear Seat Head Restraint Cover Replacement

Removal Procedure

1. Remove the head restraint. Refer to Rear Seat Head Restraint Replacement.



2. Disengage the rear seat head restraint cover J-strip by pulling the flap (1) back out of the flap (2) in the direction shown.
3. Carefully remove the head restraint cover.

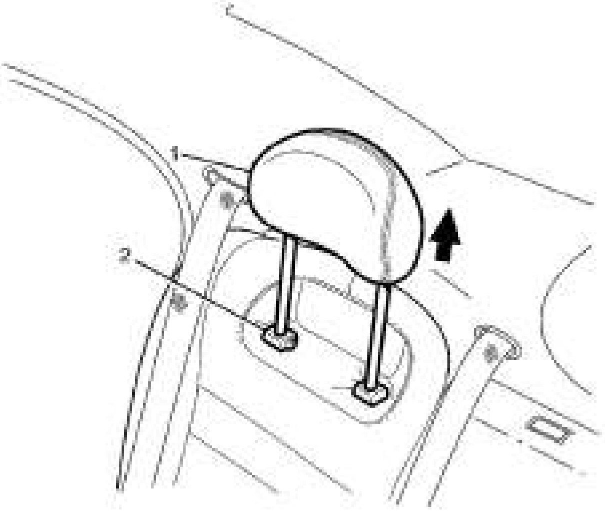
Installation Procedure

1. Carefully install the head restraint cover.
2. Engage the two J-strips, ensure the J-strips are fully engaged.
3. Install the head restraint. Refer to Rear Seat Head Restraint Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 1985783**

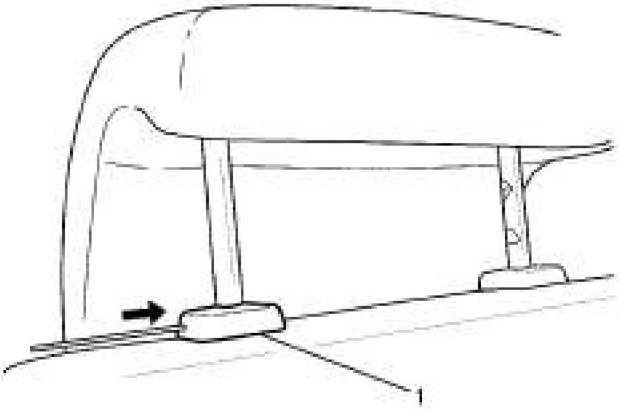
Rear Seat Head Restraint Replacement

Removal Procedure



Important: This procedure will require the aid of an assistant.

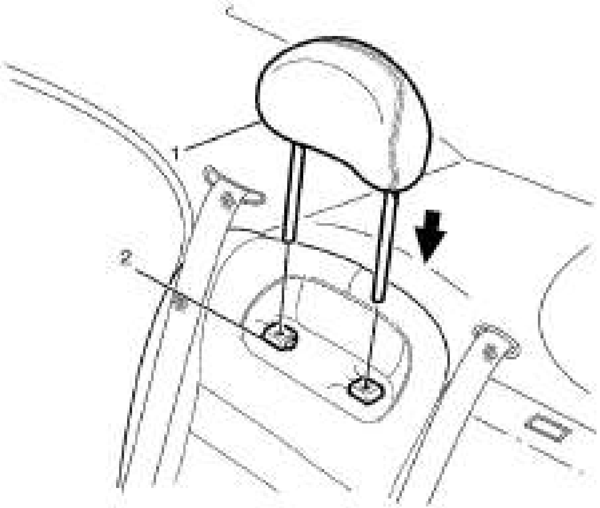
1. Fully extend the head restraint (1), out of the head restraint guides (2).



2. Insert a suitable size probe into the hole in the left hand restraint guide (1).

3. Depress the right-hand head restraint sleeve height adjuster lock and remove the head restraint
4. With the aid of the assistant remove the head restraint out of the guide.

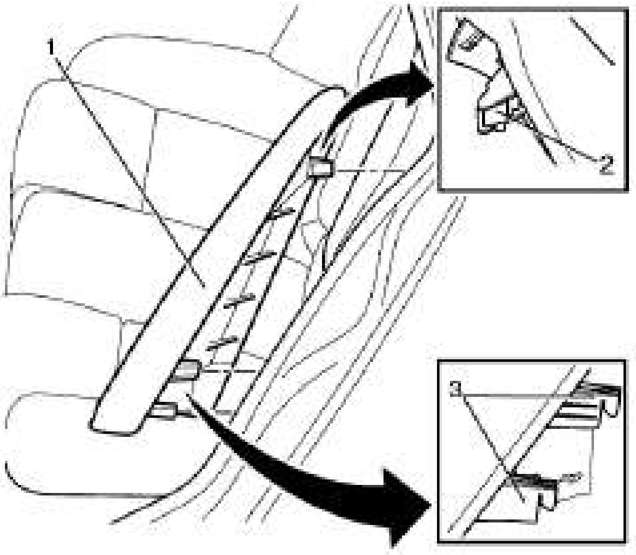
Installation Procedure



1. Locate the head restraint (1) in the head restraint guides (2).
2. Install the head restraint by pushing it into the head restraint guides, listen for an audible click to confirm fitting.

Rear Split Folding Seat Back Bolster Replacement (Sportwagon)

Removal Procedure

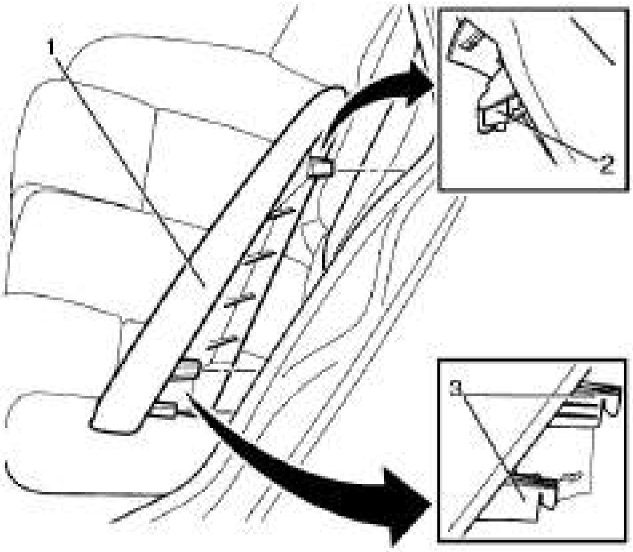


Important: The left hand side and right hand side seat back bolster are identical in removal and installation.

Important: Use a suitable tool to disengage the seat back bolster to body retainer (2).

1. Disengage the seat back bolster to body retainer (2).
2. Apply suitable upward pressure to the seat back bolster (1) to disengage the seat back bolster to body retaining hooks (3).
3. Remove the seat back bolster (1) from the vehicle.

Installation Procedure



1. Align the seat back bolster (1) to the vehicle and engage the seat back bolster to body retaining hooks (3).
2. Align the seat back bolster to body retainer (2) to the vehicle.

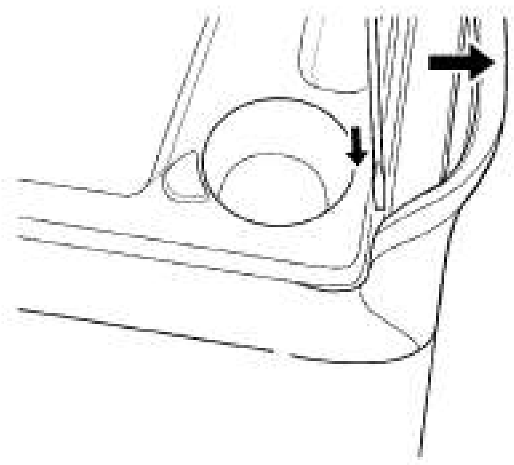
Important: Listen for an audible click to confirm correct installation of the seat back bolster to body retainer (2).

3. Apply suitable pressure to the seat back bolster (1) to engage the seat back bolster to body retainer (2).

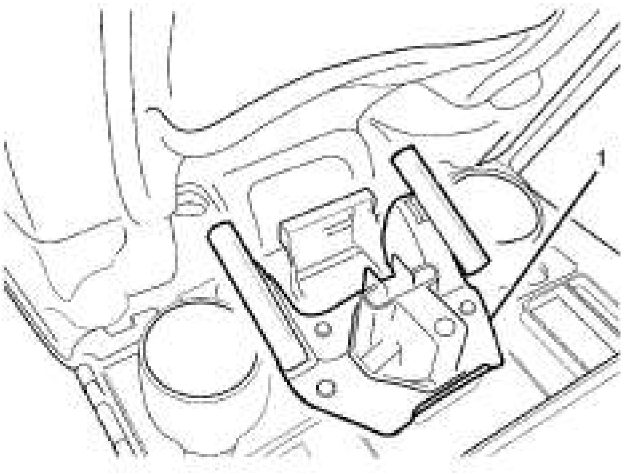
Rear Split Folding Seat Back Cushion Cover and Pad Replacement (Sedan)

Removal Procedure

1. Remove the seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the rear seat back. Refer to Rear Seat Back Replacement in Seats.
3. Remove the rear set back folding. Refer to Rear Split Folding Seat Back Replacement.
4. Place seat back face down on a suitable work surface.



5. Detach the seat back cover from the seat back base as shown in illustration.
6. Turn the seat back over on the base.



7. lift the seat cover and pad to expose the seat back latch assembly (1).
8. Remove the rear centre seat latch assembly. Refer to Rear Seat Back Latch Replacement.
9. Remove the seat back cover.

Installation Procedure

Important: Do not install the release button until the seat cover is fully installed.

1. Install the centre seat back latch assembly. Refer to Rear Seat Back Latch Replacement.
2. Turn the centre seat over.

Important: When installing the seat cover, pull the cover tight in all corners to ensure no lumps will occur.

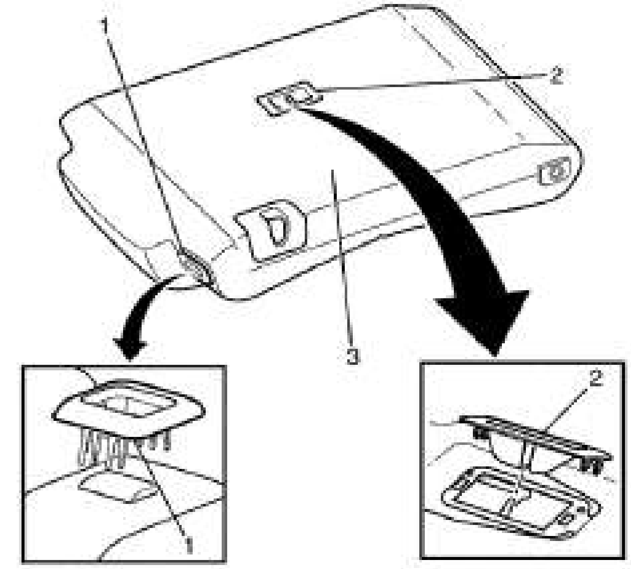
3. Install the centre seat cover to the seat pad and frame, listen for audible clicks to confirm fitting.
4. Turn the centre seat over.
5. Press down firmly on the seat pad channels to ensure a smooth finish to the cover.
6. Install the rear set back folding. Refer to Rear Split Folding Seat Back Replacement.
7. Install the rear seat back. Refer to Rear Seat Back Replacement in Seats.
8. Install the seat cushion. Refer to Rear Seat Cushion Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 2100392**

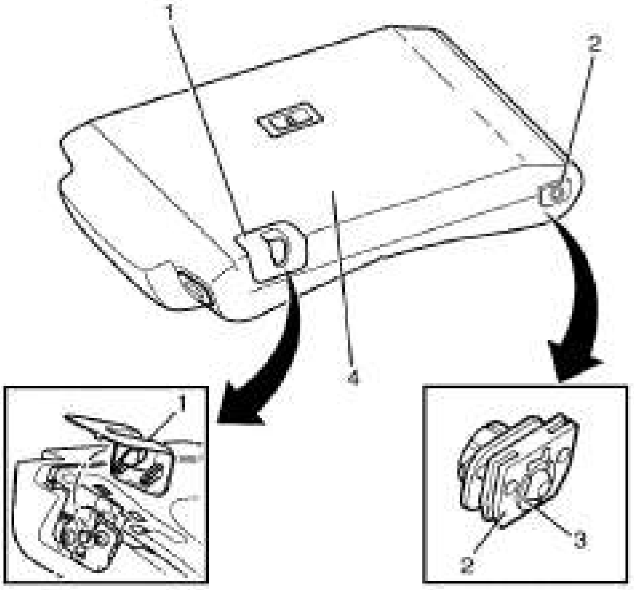
Rear Split Folding Seat Back Cushion Cover and Pad Replacement (Sportwagon)

Removal Procedure - Left Rear Seat Back Cover

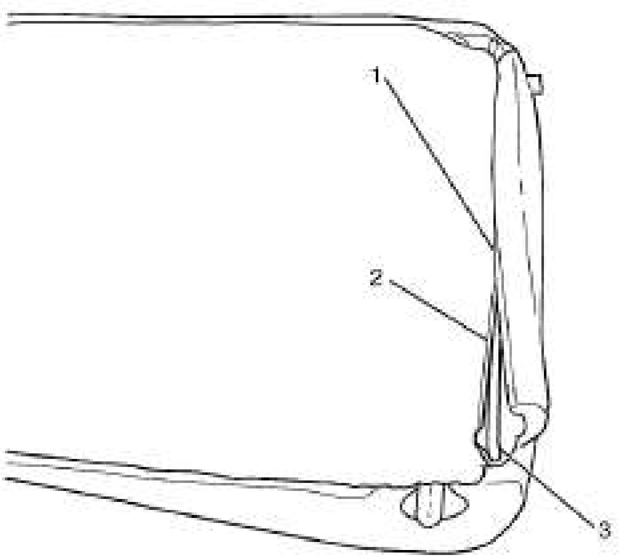
1. Remove the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.
2. Remove the left rear seat back assembly. Refer to Rear Seat Back Replacement.
3. Place the left rear seat back assembly on a suitable surface.



4. Remove the left rear seat back latch release button cover (1) from the left rear seat back assembly (3).
5. Remove the left rear seat back child restraint tether anchor cover (2) from the left rear seat back assembly (3).

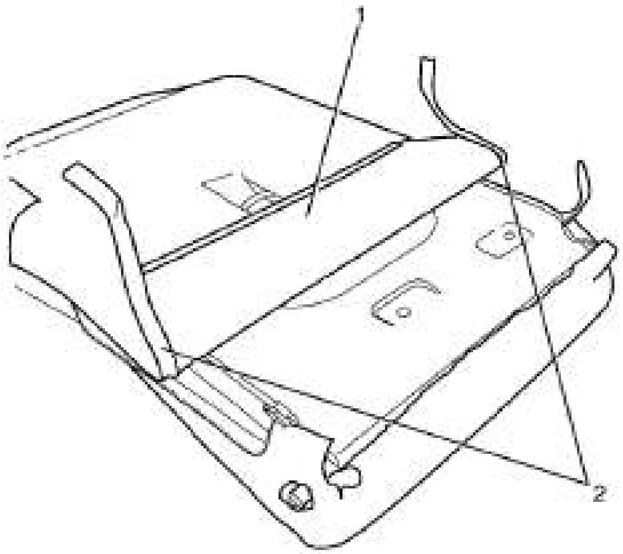


6. Remove the circlip (3) from the left rear seat back pivot retainer assembly (2).
7. Remove the left rear seat back pivot retainer assembly (2) from the left rear seat back assembly (4).
8. Remove the left rear seat back latch trim cover (1) from the left rear seat back assembly (4).

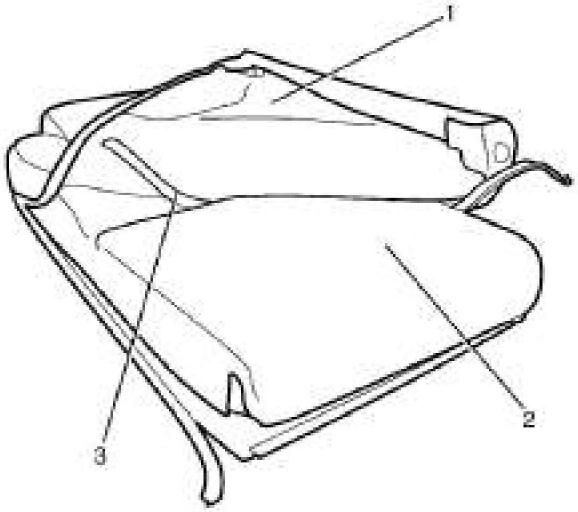


Important: Care must be taken not to damage the left rear seat back cover front retaining strip (1) and the left rear seat back cover rear retaining strip (2) when disengaging them from the left rear seat back cover retaining strip channel (3).

9. Using a suitable tool disengage the left rear seat back cover front retaining strip (1) from the left rear seat back retaining strip channel (3).
10. Using a suitable tool disengage the left rear seat back cover rear retaining strip (2) from the left rear seat back retaining strip channel (3).



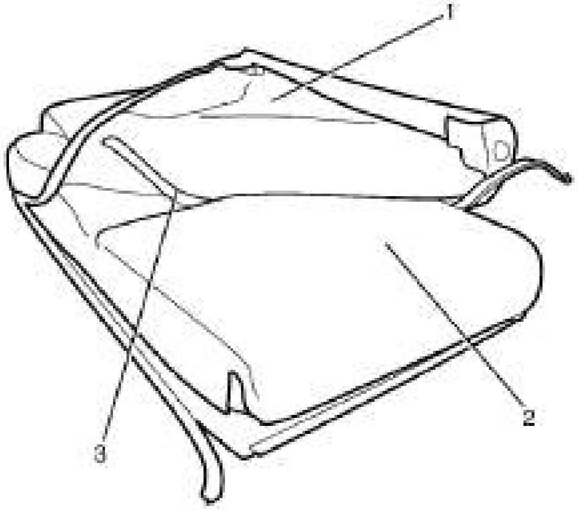
11. Unzip the left rear seat back cover zippers (2).
12. Fold back the left rear seat back cover (1).



Important: Take care not to tear the left rear seat back cover (1) when removing it from the left rear seat back assembly (2).

13. Detach the velcro strips (3) from the left rear seat back assembly (2) and remove the left rear seat back cover (1) from the left rear seat back assembly (2).

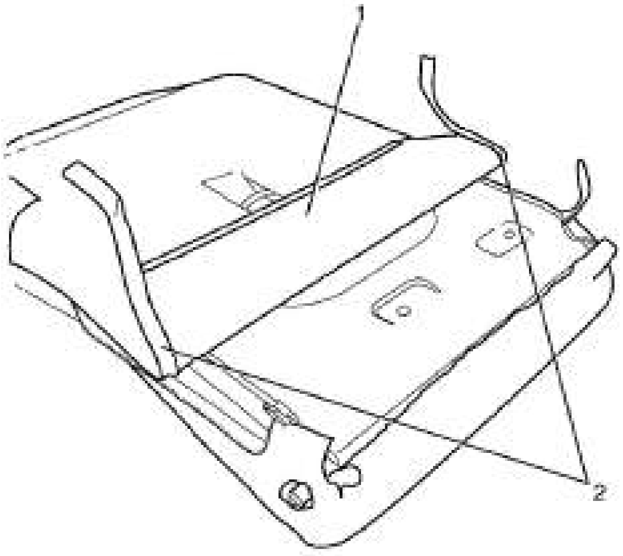
Installation Procedure - Left Rear Seat Back Cover



Important: Make sure that the velcro strips (3) are located correctly. Failure to comply may result in the incorrect installation of the left rear seat back cover (1).

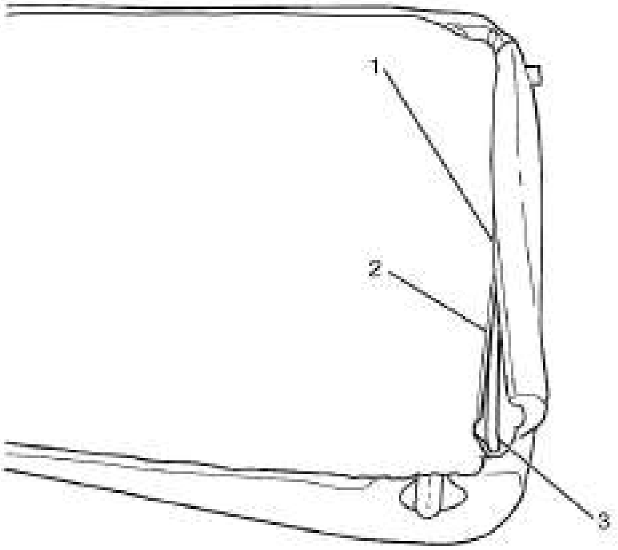
Important: Make sure that the left rear seat back cover (1) fits tightly without creasing, over the left rear seat back assembly (2).

1. Install the left rear seat back cover (1) to the left rear seat back assembly (2).
2. Attach the velcro strips (3) to the left rear seat back assembly (2).



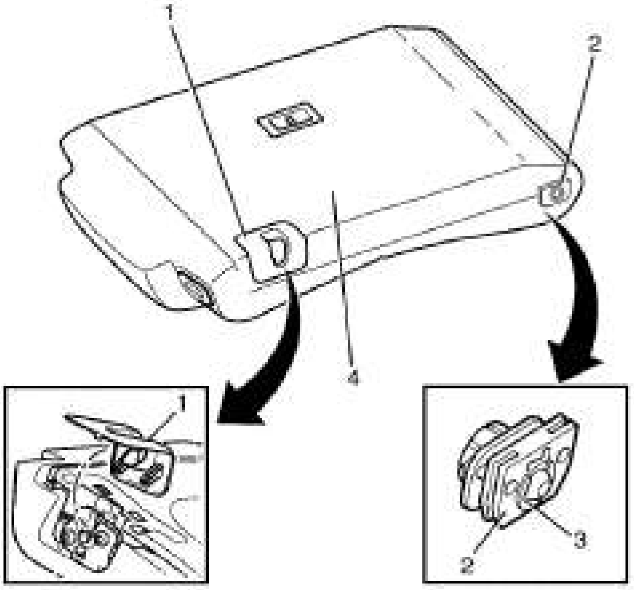
Important: Conceal the zipper ends behind the left rear seat back cover (1). Failure to comply may result in damage to the left rear seat back cover zippers (2).

3. Zip up the left rear seat back cover zippers (2).



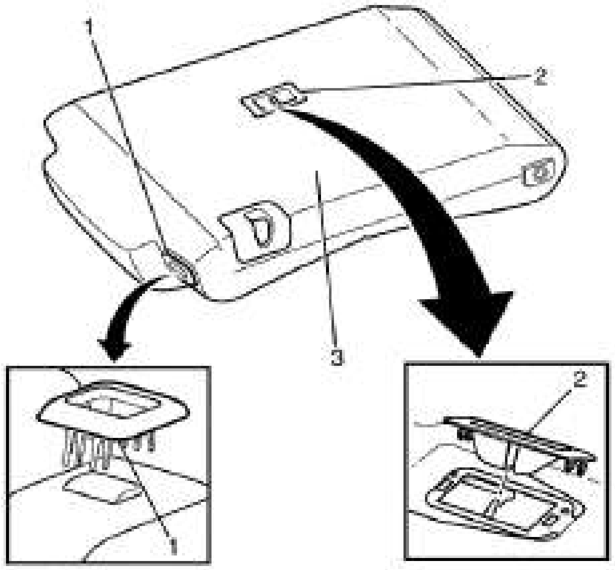
Important: Care must be taken not to damage the left rear seat back cover front retaining strip (1) and the left rear seat back cover rear retaining strip (2) when engaging them into the left rear seat back cover retaining strip channel (3).

4. Using a suitable tool engage the left rear seat back cover front retaining strip (1) into the left rear seat back retaining strip channel (3).
5. Using a suitable tool engage the left rear seat back cover rear retaining strip (2) into the left rear seat back retaining strip channel (3).



6. Install the left rear seat back latch trim cover (1) to the left rear seat back assembly (4)
7. Install the left rear seat back pivot retainer assembly (2) to the left rear seat back assembly (4).

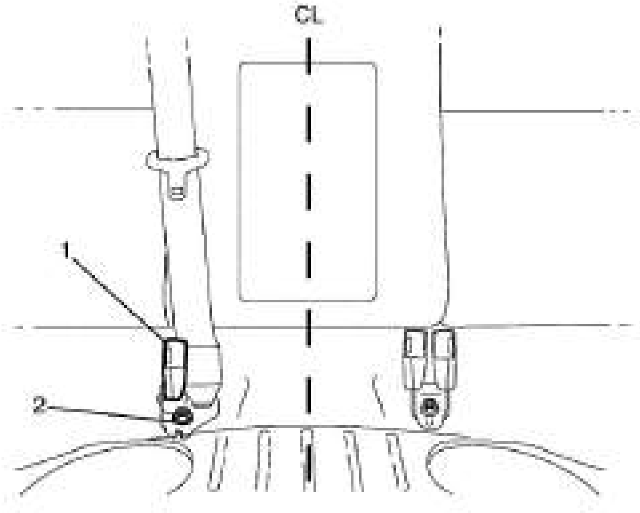
8. Install the circlip (3) to the left rear seat back pivot retainer assembly (2).



9. Install the left rear seat back child restraint tether anchor cover (2) to the left rear seat back assembly (3).
10. Install the left rear seat back latch release button cover (1) to the left rear seat back assembly (3).
11. Install the left rear seat back assembly. Refer to Rear Seat Back Replacement.
12. Install the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.

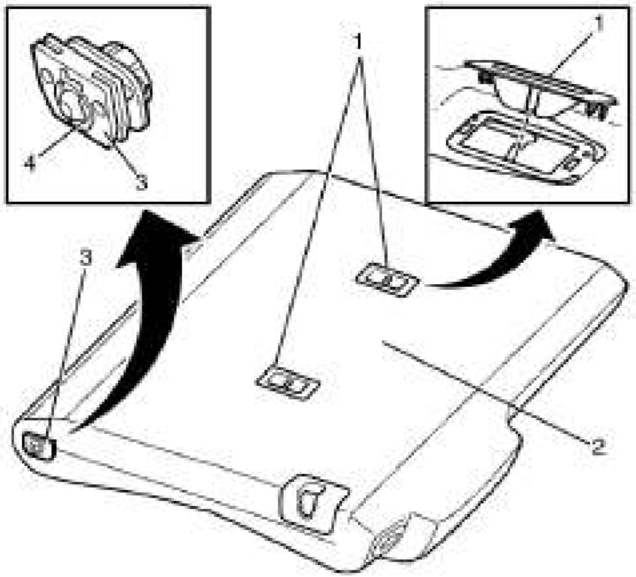
Removal Procedure - Right Rear Seat Back Cover

1. Remove the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.

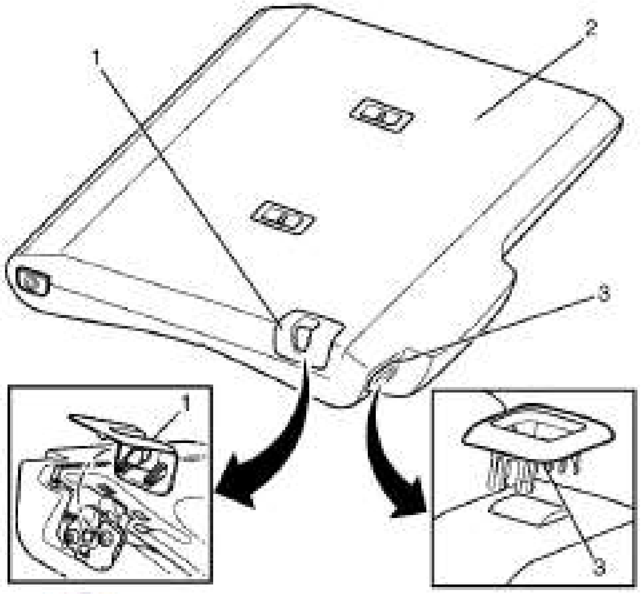


2. Remove the right rear seat belt buckle nut (2).
3. Remove the right rear seat belt buckle (1).

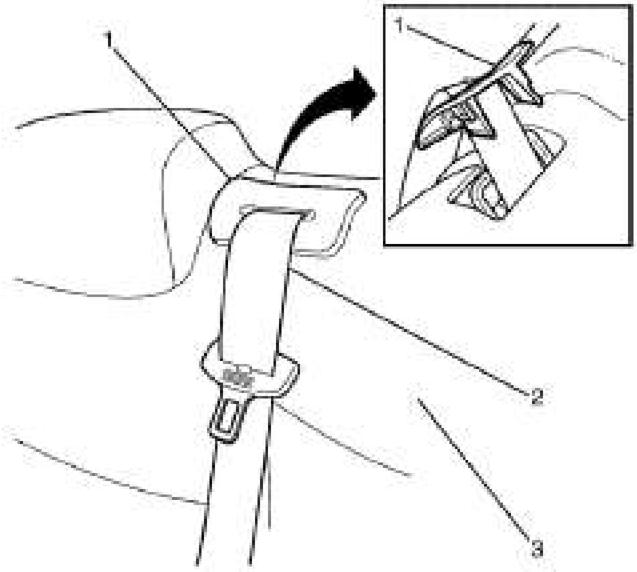
4. Remove the right rear seat back assembly. Refer to Rear Seat Back Replacement.
5. Place the right rear seat back assembly on a suitable surface.



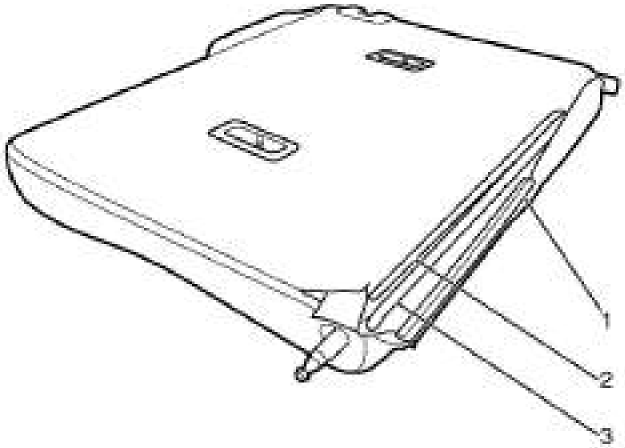
6. Remove the right rear seat back child restraint tether anchor covers (1) from the right rear seat back assembly (2).
7. Remove the circlip (4) from the pivot retainer assembly (3).
8. Remove the pivot retainer assembly (3) from the right rear seat back assembly (2).



9. Remove the right rear seat back latch trim cover (1) from the right rear seat back assembly (2).
10. Remove the right rear seat back latch release button cover (3) from the right rear seat back assembly (2).

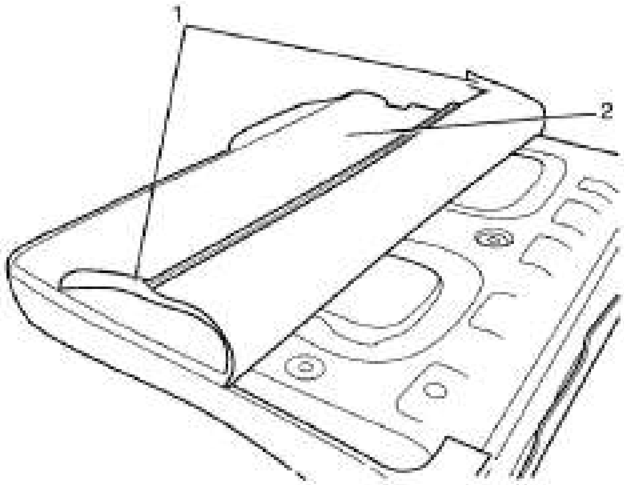


11. Remove the centre rear seatbelt guide trim (1) from the right rear seat back assembly (3).
12. Remove the centre rear seatbelt guide trim (1) from the centre rear seatbelt (2).

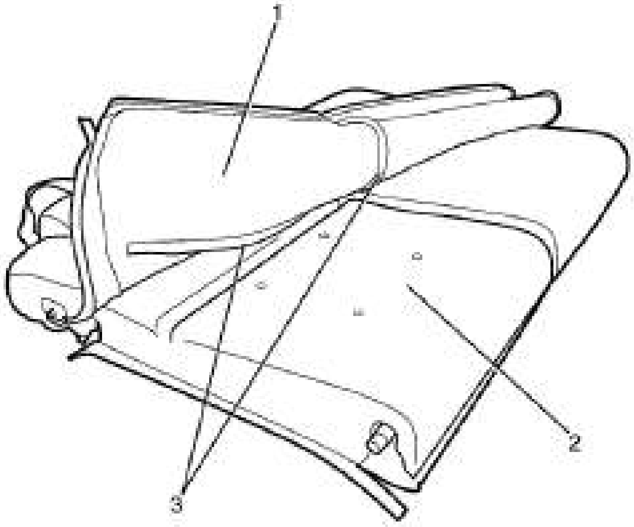


Important: Care must be taken not to damage the right rear seat back cover front retaining strip (1) and the right rear seat back cover rear retaining strip (2) when disengaging them from the right rear seat back cover retaining strip channel (3).

13. Using a suitable tool disengage the right rear seat back cover front retaining strip (1) from the right rear seat back retaining strip channel (3).
14. Using a suitable tool disengage the right rear seat back cover rear retaining strip (2) from the right rear seat back retaining strip channel (3).



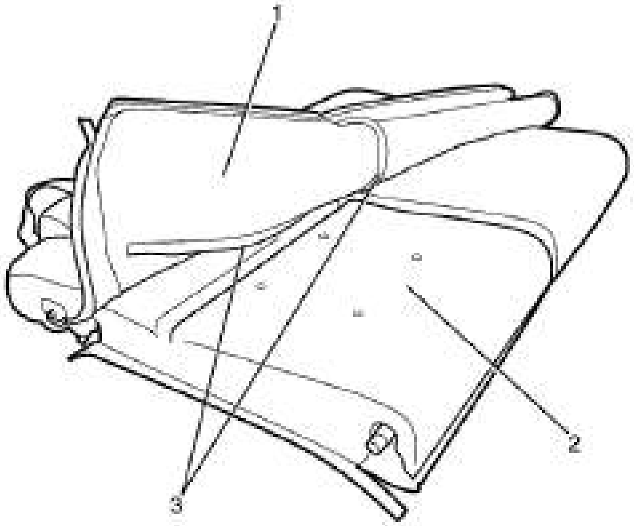
15. Unzip the right rear seat back cover zippers (1).
16. Fold back the right rear seat back cover (2).



Important: Take care not to tear the right rear seat back cover (1) when removing it from the right rear seat back assembly (2).

17. Detach the velcro strips (3) from the right rear seat back assembly (2) and remove the right rear seat back cover (1) from the right rear seat back assembly (2).

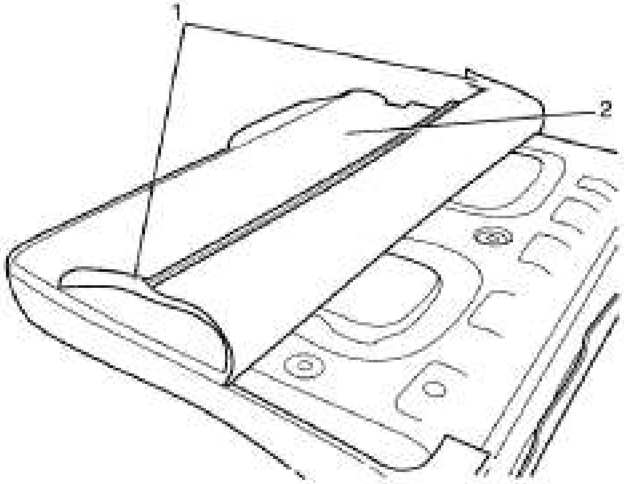
Installation Procedure - Right Rear Seat Back Cover



Important: Make sure that the velcro strips (3) are located correctly. Failure to comply may result in the incorrect installation of the right rear seat back cover (1).

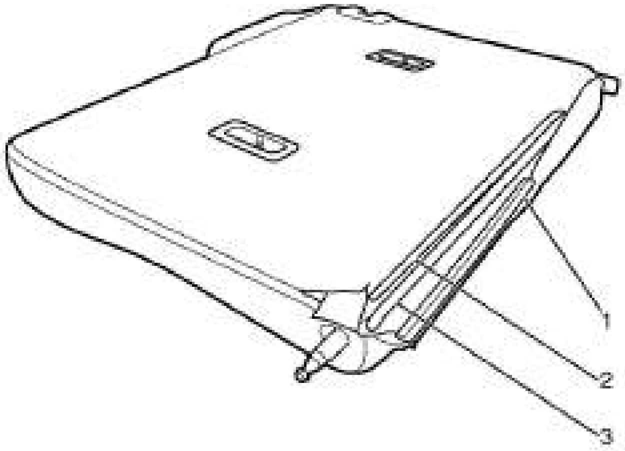
Important: Make sure that the right rear seat back cover (1) fits tightly without creasing, over the right rear seat back assembly (2).

1. Install the right rear seat back cover (1) to the right rear seat back assembly (2). Attach the velcro strips (3) to the right rear seat back assembly (2).



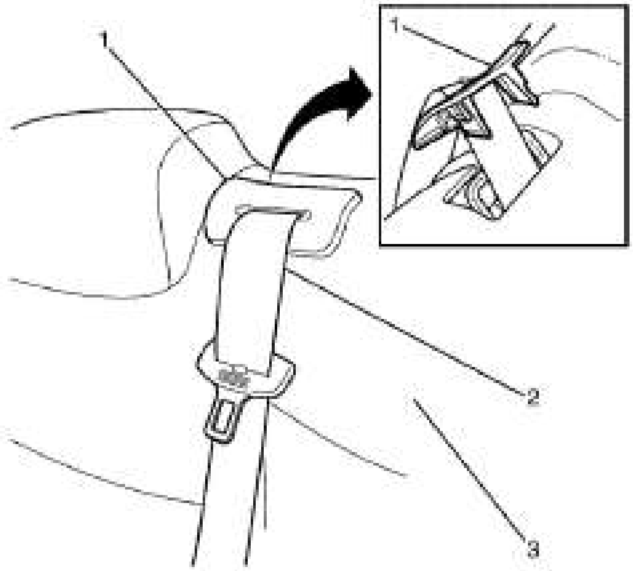
Important: Conceal the zipper ends behind the right rear seat back cover (1). Failure to comply may result in damage to the right rear seat back cover zippers (2).

2. Zip up the right rear seat back cover zippers (1).

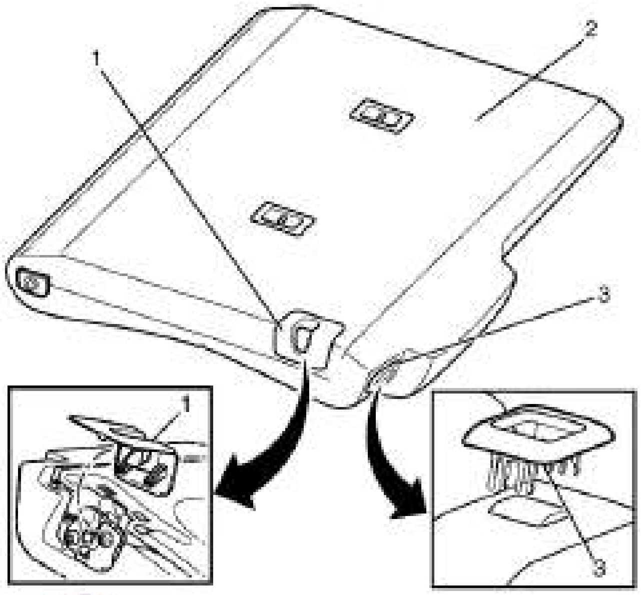


Important: Care must be taken not to damage the right rear seat back cover front retaining strip (1) and the right rear seat back cover rear retaining strip (2) when engaging them into the right rear seat back cover retaining strip channel (3).

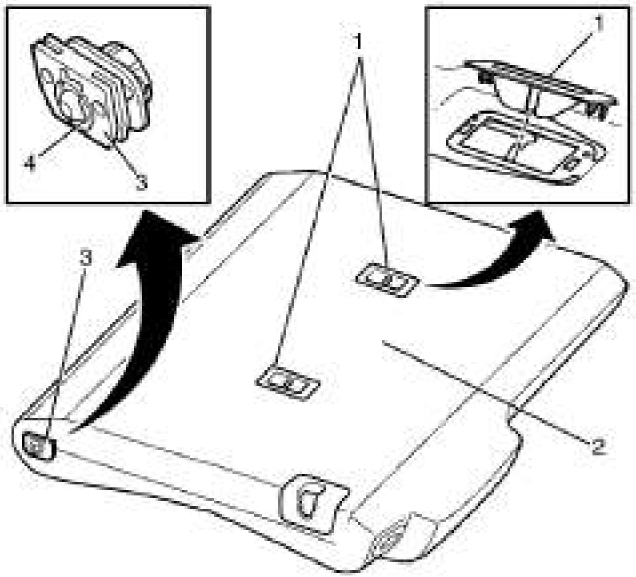
3. Using a suitable tool engage the right rear seat back cover front retaining strip (1) into the right rear seat back retaining strip channel (3).
4. Using a suitable tool engage the right rear seat back cover rear retaining strip (2) into the right rear seat back retaining strip channel (3).



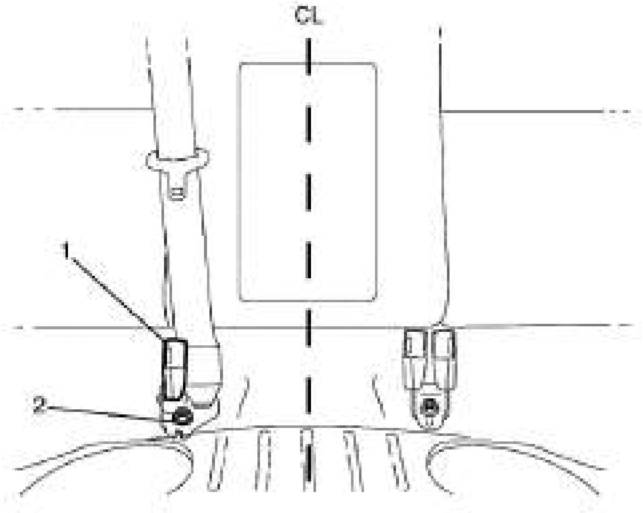
5. Install the centre rear seatbelt (2) to the centre rear seatbelt guide trim (1).
6. Install the centre rear seatbelt guide trim (1) to the rear seat back assembly (3).



7. Attach the right rear seat back latch release button cover (3) to the right rear seat back assembly (2).
8. Attach the right rear seat back latch trim cover (1) to the right rear seat back assembly (2).



9. Attach the pivot retainer assembly (3) to the right rear seat back assembly (2).
10. Attach the circlip (4) to the pivot retainer assembly (3).
11. Attach the right rear seat back child restraint tether anchor covers (1) to the right rear seat back assembly (2).
12. Install the right rear seat back assembly. Refer to Rear Split Folding Seat Back Replacement.



Important: Make sure the right rear seat belt buckle is parallel to vehicle centreline as shown.

13. Install the right rear seat belt buckle (1).

    Notice: Refer to Fastener Notice in the Preface section.

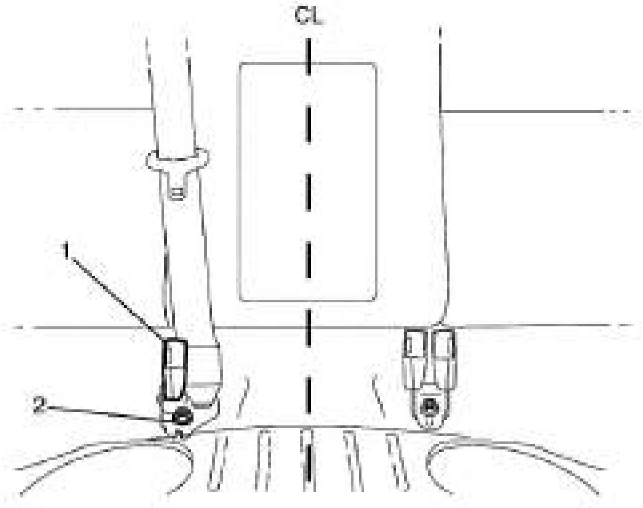
14. Install the right rear seat belt buckle nut (2).

    Tighten
    Tighten the nut to 43 N·m (31 lb ft).

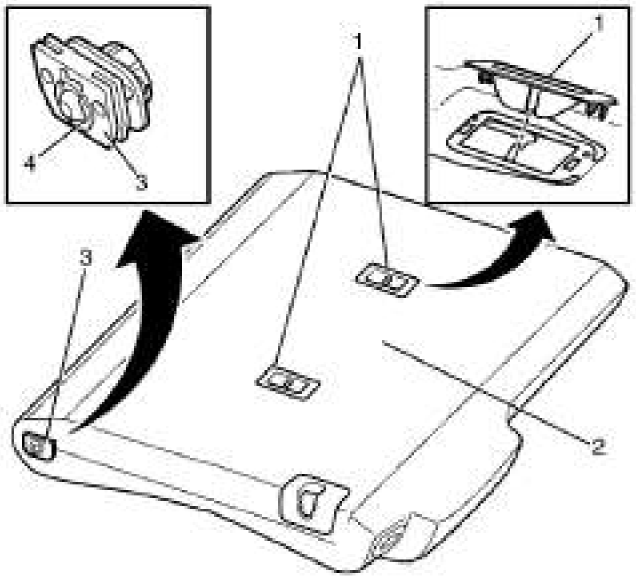
15. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.

Removal Procedure - Right Rear Seat Back Cover with Centre Armrest

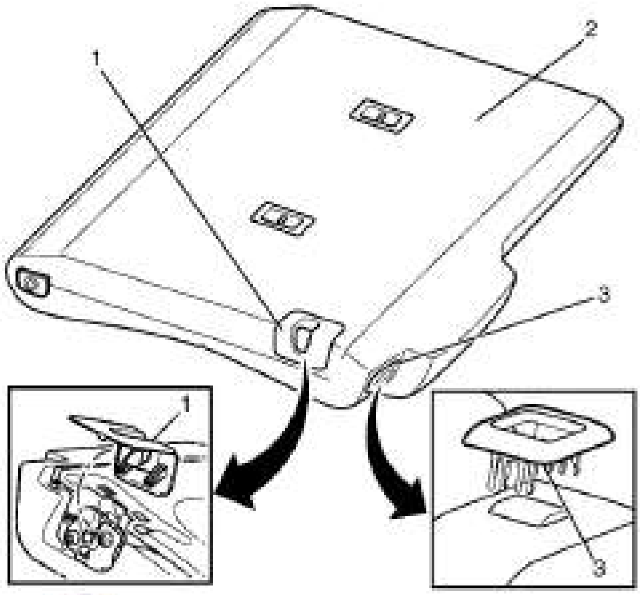
1. Remove the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.



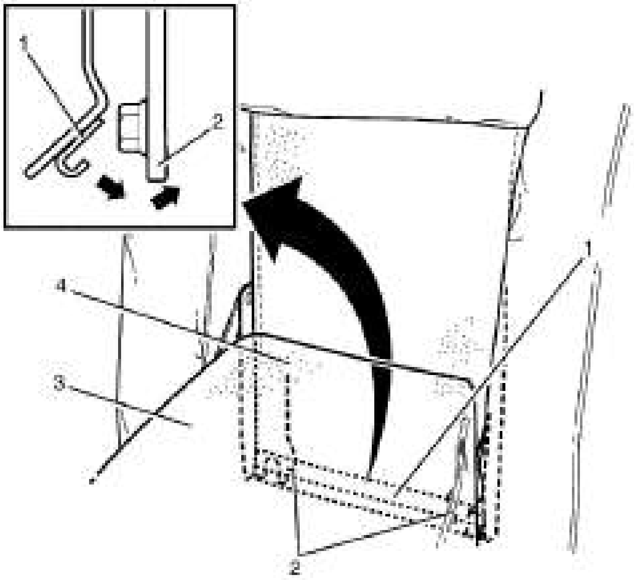
2. Remove the right rear seat belt buckle nut (2).
3. Remove the right rear seat belt buckle (1).
4. Remove the right rear seat back assembly. Refer to Rear Seat Back Replacement.
5. Place the right rear seat back assembly on a suitable surface.



6. Remove the right rear seat back child restraint tether anchor covers (1) from the right rear seat back assembly (2).
7. Remove the circlip (4) from the pivot retainer assembly (3).
8. Remove the pivot retainer assembly (3) from the right rear seat back assembly (2).

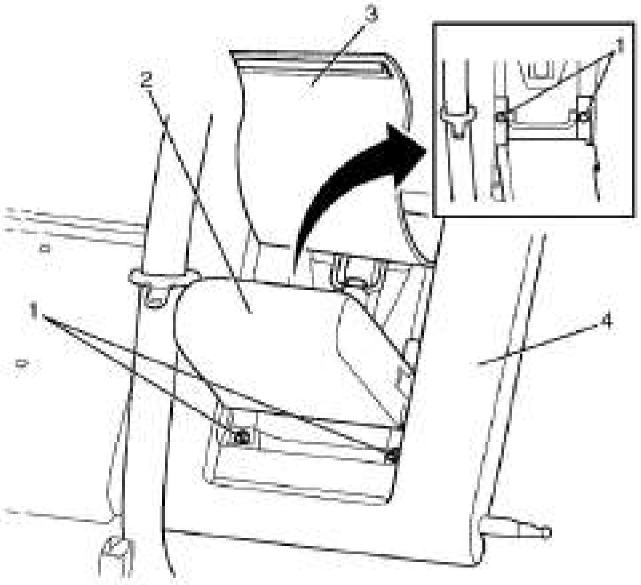


9. Remove the right rear seat back latch trim cover (1) from the right rear seat back assembly (2).
10. Remove the right rear seat back latch release button cover (3) from the right rear seat back assembly (2).



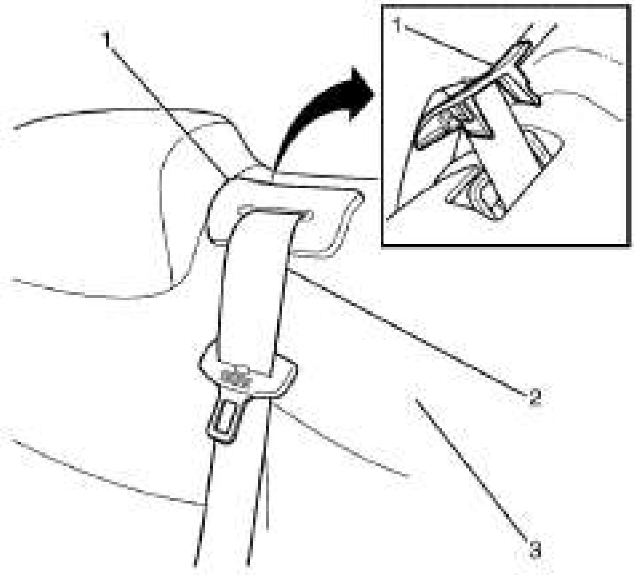
Important: Adjust the armrest (3) to a suitable position to access the right rear seat back cover retainer (1).

11. Carefully pull down on the right rear seat back cover retainer (1) and detach the trim flap (4) from the trim flap retainer (2).

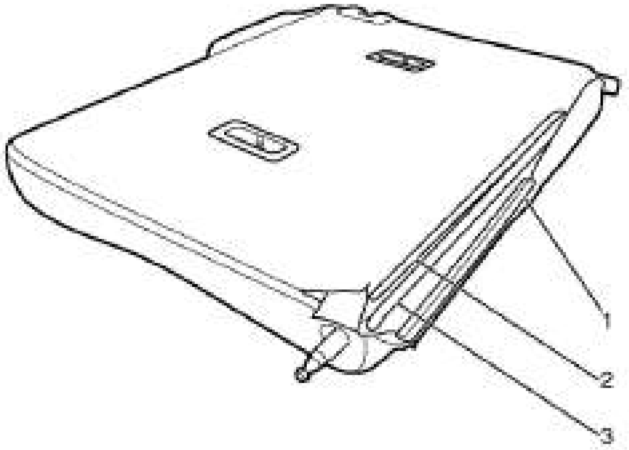


Important: Lift the right rear seat back cover trim flap (3) to expose the armrest to right rear seat back frame retaining bolts (1).

12. Remove the right rear seat back armrest to the right rear seat back frame retaining bolts (1).
13. Remove the right rear seat back armrest assembly (2) from the right rear seat back assembly (4).

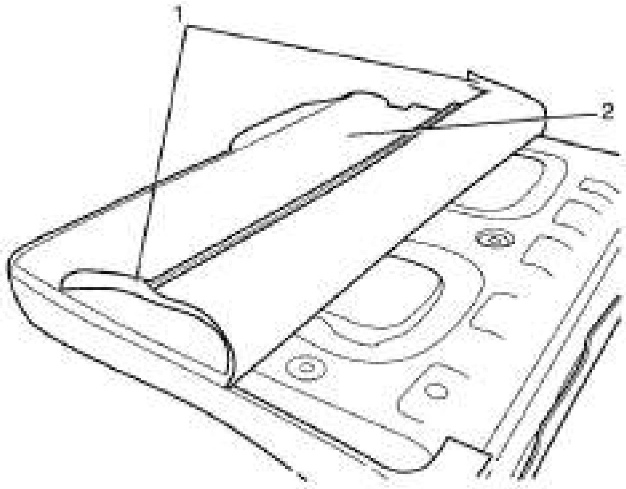


14. Remove the centre rear seatbelt guide trim (1) from the rear seat back assembly (3).
15. Remove the centre rear seatbelt guide trim (1) from the centre rear seatbelt (2).

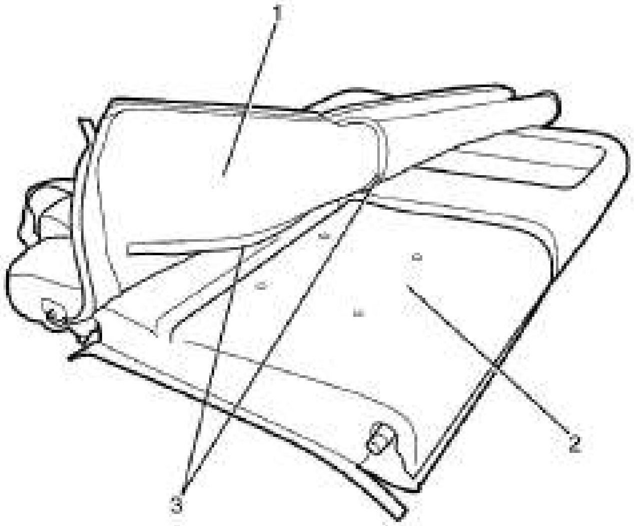


Important: Care must be taken not to damage the right rear seat back cover front retaining strip (1) and the right rear seat back cover rear retaining strip (2) when disengaging them from the right rear seat back cover retaining strip channel (3).

16. Using a suitable tool disengage the right rear seat back cover front retaining strip (1) from the right rear seat back retaining strip channel (3).
17. Using a suitable tool disengage the right rear seat back cover rear retaining strip (2) from the right rear seat back retaining strip channel (3).



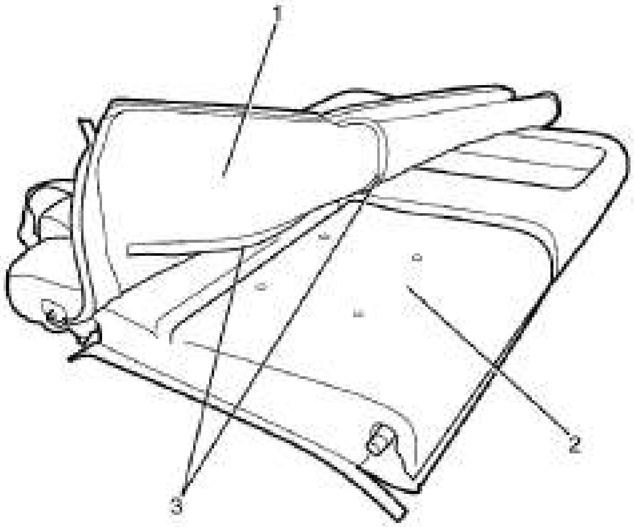
18. Unzip the right rear seat back cover zipper (1).
19. Fold back the right rear seat back cover (2).



Important: Take care not to tear the right rear seat back cover (1) when removing it from the right rear seat back assembly (2).

20. Detach the velcro strips (3) from the right rear seat back assembly (2) and remove the right rear seat back cover (1) from the right rear seat back assembly (2).

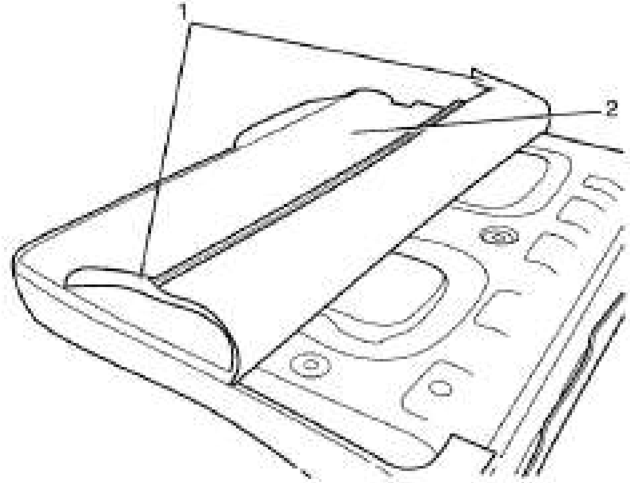
Installation Procedure - Right Rear Seat Back Cover with Centre Armrest



Important: Make sure that the velcro strips (3) are located correctly. Failure to comply may result in the incorrect installation of the right rear seat back cover (1).

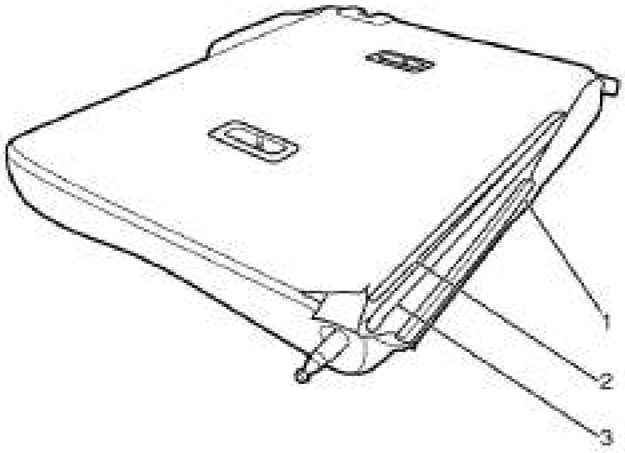
Important: Make sure that the right rear seat back cover (1) fits tightly without creasing, over the right rear seat back assembly (2).

1. Install the right rear seat back cover (1) to the right rear seat back assembly (2). Attach the velcro strips (3) to the right rear seat back assembly (2).



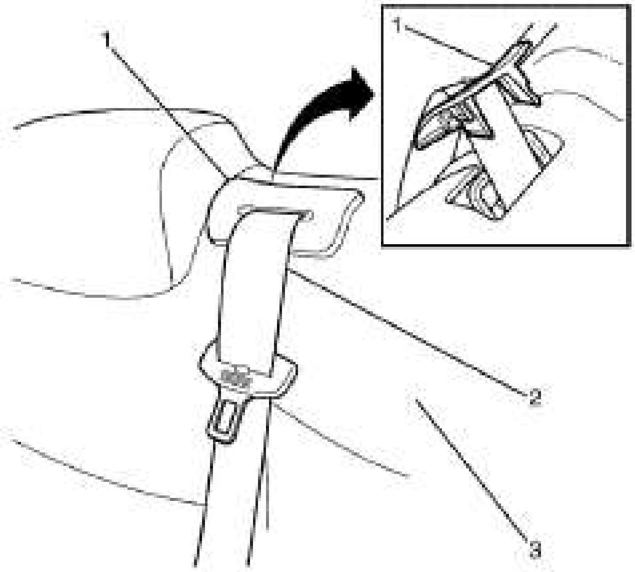
Important: Conceal the zipper ends behind the right rear seat back cover (1). Failure to comply may result in damage to the right rear seat back cover zippers (2).

2. Zip up the right rear seat back cover zipper (1).

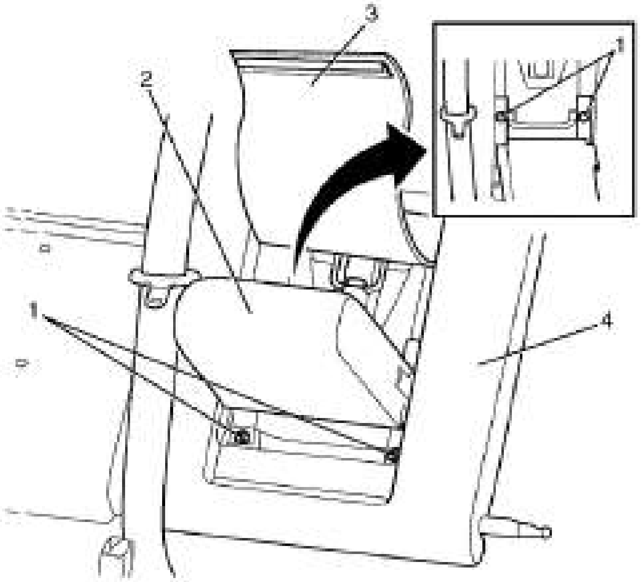


Important: Care must be taken not to damage the right rear seat back cover front retaining strip (1) and the right rear seat back cover rear retaining strip (2) when engaging them into the right rear seat back cover retaining strip channel (3).

3. Using a suitable tool engage the right rear seat back cover front retaining strip (1) into the right rear seat back retaining strip channel (3).
4. Using a suitable tool engage the right rear seat back cover rear retaining strip (2) into the right rear seat back retaining strip channel (3).



5. Install the centre rear seatbelt (2) to the centre rear seatbelt guide trim (1).
6. Install the centre rear seatbelt guide trim (1) to the rear seat back assembly (3).

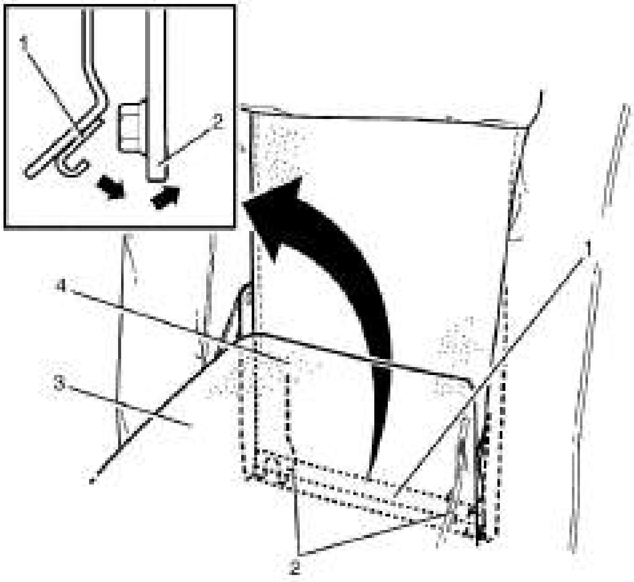


7. Install the right rear seat back armrest assembly (2) to the right rear seat back assembly (4).

Notice: Refer to Fastener Notice in the Preface section.

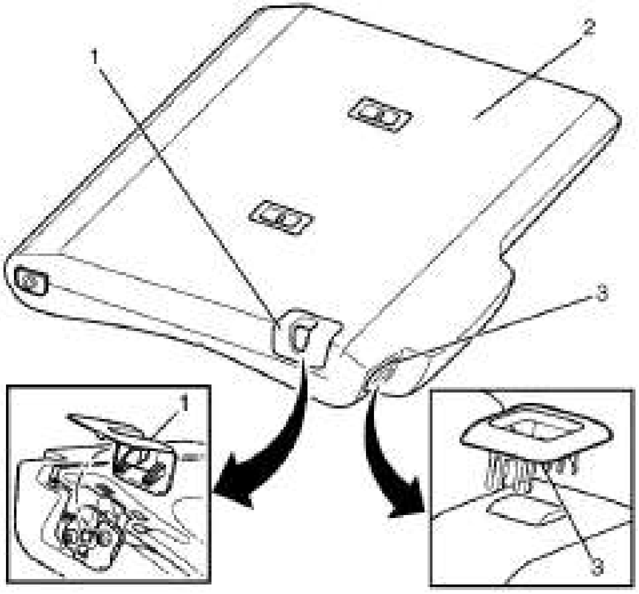
8. Install the right rear seat back armrest to right rear seat back frame retaining bolts (1).

Tighten
Tighten the bolts to 8 N·m (31 lb in).

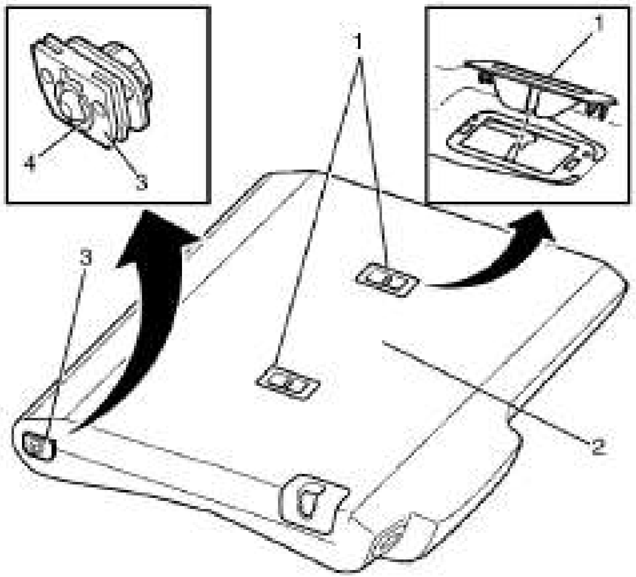


Important: Adjust the armrest (3) to a suitable position to access the right rear seat back cover retainer (1).

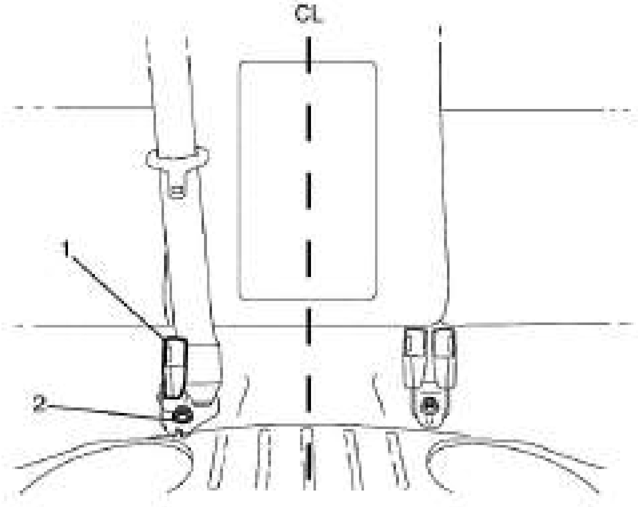
9. Carefully pull down on the right rear seat back cover retainer (1) and attach the trim flap (4) to the trim flap retainer (2).



10. Attach the right rear seat back latch release button cover (3) to the right rear seat back assembly (2).
11. Attach the right rear seat back latch trim cover (1) to the right rear seat back assembly (2).



12. Attach the pivot retainer assembly (3) to the right rear seat back assembly (2).
13. Attach the circlip (4) to the pivot retainer assembly (3).
14. Attach the right rear seat back child restraint tether anchor covers (1) to the right rear seat back assembly (2).
15. Install the right rear seat back assembly. Refer to Rear Split Folding Seat Back Replacement.



Important: Make sure the right rear seat belt buckle is parallel to vehicle centreline as shown.

16. Install the right rear seat belt buckle (1).

    Notice: Refer to Fastener Notice in the Preface section.

17. Install the right rear seat belt buckle nut (2).

    Tighten
    Tighten the nut to 43 N·m (31 lb ft).

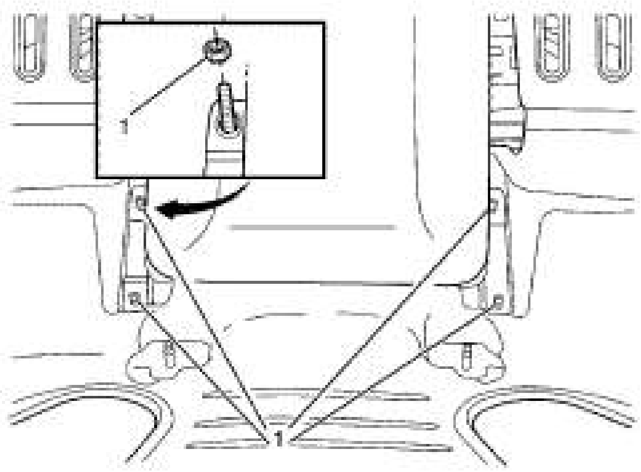
18. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 2100387**

Rear Split Folding Seat Back Replacement (Sedan)

Removal Procedure

1. Remove the seat cushion. Refer to Rear Seat Cushion Replacement.
2. Remove the rear seat back. Refer to Rear Seat Back Replacement.

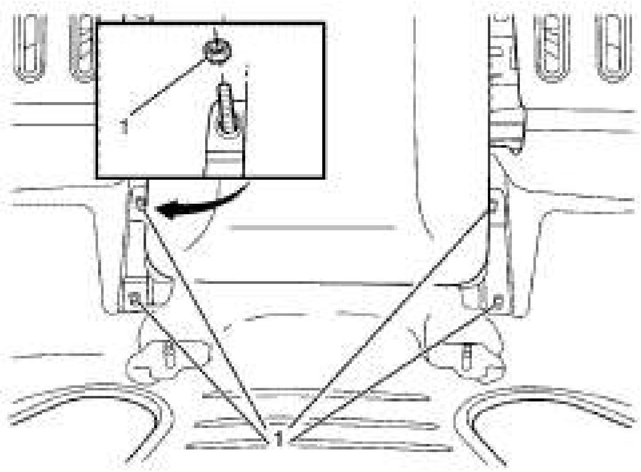


3. Remove the four seat back retaining nuts (1) attaching the seat back to the body panel.
4. Operate the seat back release button and remove the seat back.

Installation Procedure

1. Install the seat back onto the lock striker, listen for an audible click to confirm fitting.

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the four seat back retaining nuts (1).

   Tighten
   Tighten the nuts (1) to 23 N·m (17 lb ft).

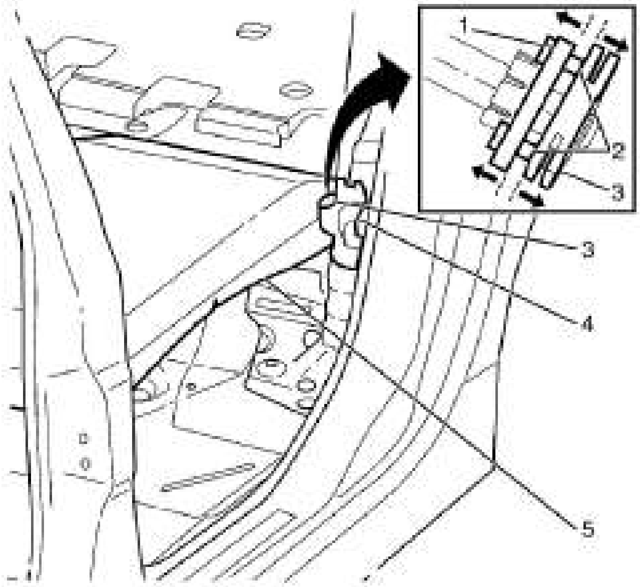
3. Install the rear seat back. Refer to Rear Seat Back Replacement in Seats.
4. Install the seat cushion. Refer to Rear Seat Cushion Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | **Document ID: 2100388**

Rear Split Folding Seat Back Replacement (Sportwagon)

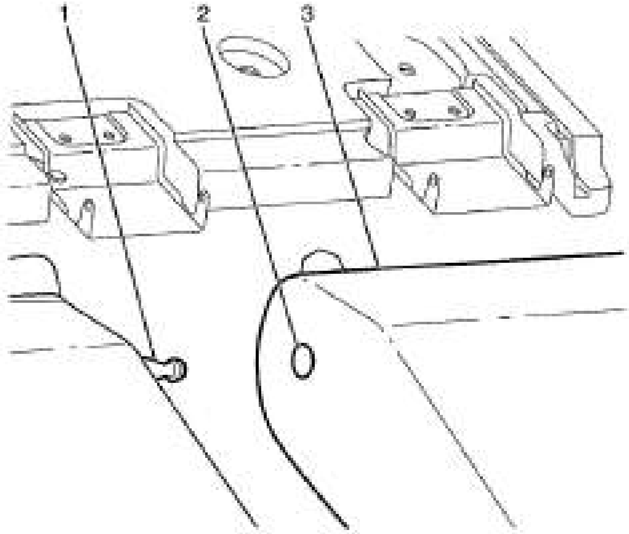
Removal Procedure - Left Rear Seat Back Assembly

1. Remove the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.
2. Remove the rear split folding seat back bolster. Refer to Rear Split Folding Seat Back Bolster Replacement.
3. Remove the rear compartment floor panel carpet. Refer to Rear Compartment Floor Panel Carpet Replacement
4. Adjust both front seats to the completely forward position.
5. Fold both rear seat backs down.

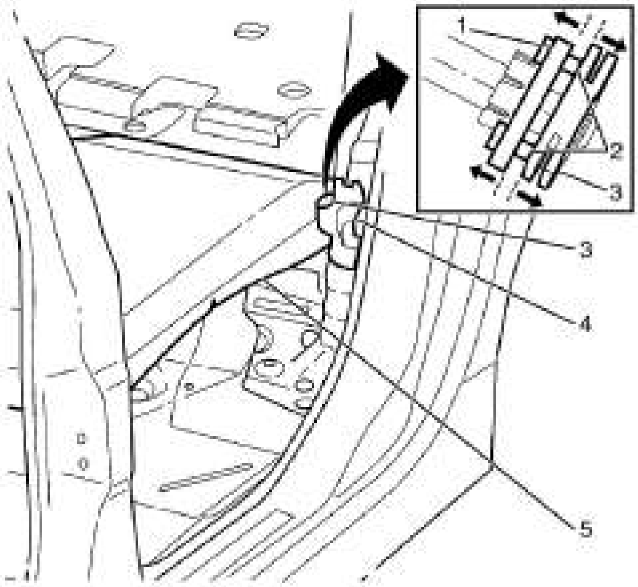


6. Using a suitable tool detach the pivot retainer plate (1) from the pivot retainer (3) in order to disengage the pivot retainer pins (2) from the pivot retainer mounting (4).
7. Lift the left rear seat back (5) to disengage the pivot retainer (3) from the pivot retainer mounting (4).
8. With the aid of an assistant pull the left rear seat back (5) towards the left rear door opening and remove from the vehicle.

Installation Procedure - Left Rear Seat Back Assembly



1. With the aid of an assistant install the left rear seat back (3) to the vehicle.
2. Align the left rear seat spindle cavity (2) with the right rear seat spindle (1).



Important: In order to engage the pivot retainer pins (2) to the pivot retainer mounting (4) the left rear seat back (5) must be folded into the upright position.

3. Attach the pivot retainer (3) to the pivot retainer mounting (4).

Important: Listen for an audible click to confirm correct installation of the pivot retainer (3) to the pivot retainer mounting (4).

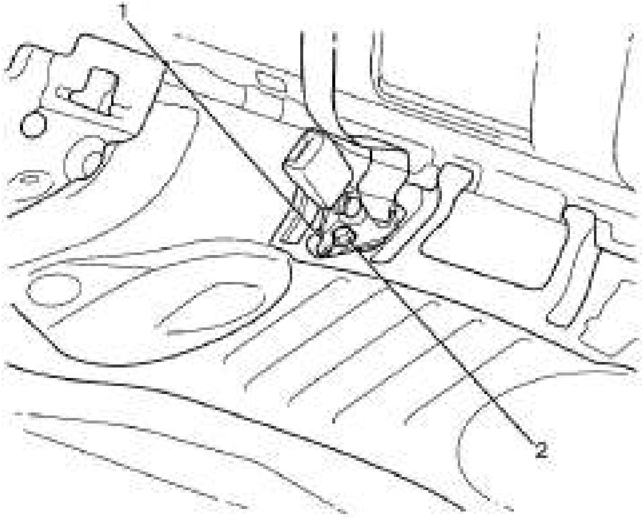
4. Fold the left rear seat back (5) into the upright position.
5. Install the rear split folding seat back bolster. Refer to Rear Split Folding Seat Back Bolster

Replacement.

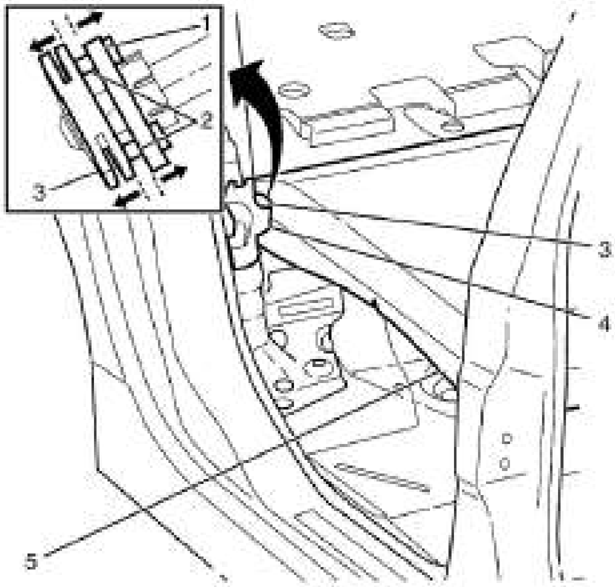
6. Install the rear seat cushion assembly. Refer to Rear Seat Cushion Replacement.

Removal Procedure - Right Rear Seat Back Assembly

1. Remove the left rear seat back.



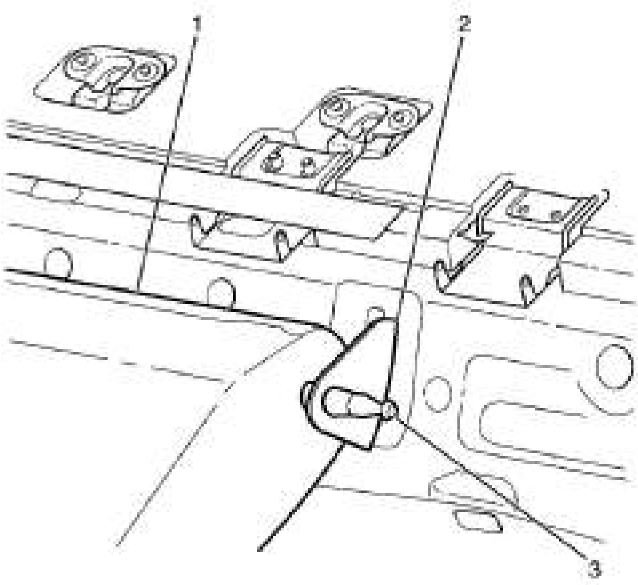
2. Remove the centre rear seatbelt anchor to body retaining nut (2) from the centre rear seatbelt anchor (1).



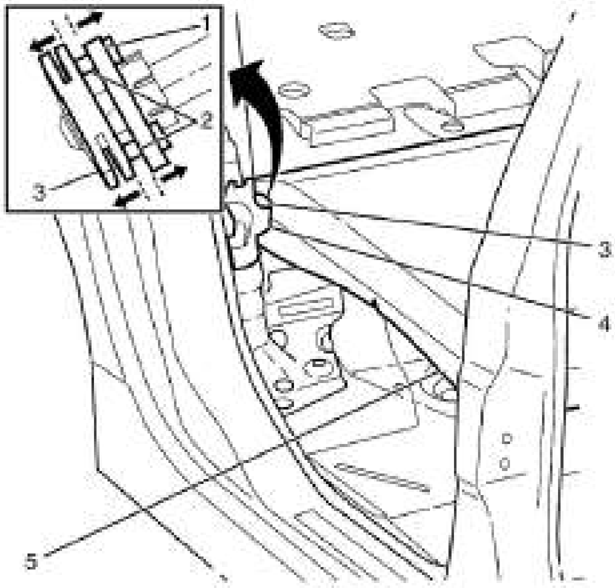
3. Using a suitable tool detach the pivot retainer plate (1) from the pivot retainer (3) in order to disengage the pivot retainer pins (2) from the pivot retainer mounting (4).
4. Lift the right rear seat back (5) to disengage the pivot retainer (3) from the pivot retainer mounting (4).
5. With the aid of an assistant pull the right rear seat back (5) towards the right rear door

opening and remove from the vehicle.

Installation Procedure - Right Rear Seat Back Assembly



1. With the aid of an assistant install the right rear seat back (1) to the vehicle.
2. Align the right rear seat spindle shaft (3) with the spindle shaft mounting (2).

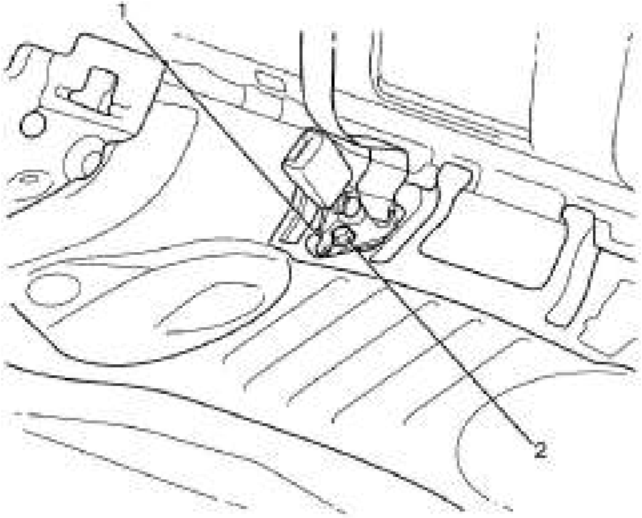


Important: In order to engage the pivot retainer pins (2) to the pivot retainer mounting (4) the right rear seat back (5) must be folded to the upright position.

3. Attach the pivot retainer (3) to the pivot retainer mounting (4).

Important: Listen for an audible click to confirm correct installation of the right rear seat.

4. Fold the right rear seat back (5) into the upright position.



5. Install the centre rear seatbelt anchor (1) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

6. Install the centre rear seatbelt anchor to body retaining nut (2) to the centre rear seatbelt anchor (1).

   Tighten
   Tighten the bolts to 43 N·m (31 lb ft).

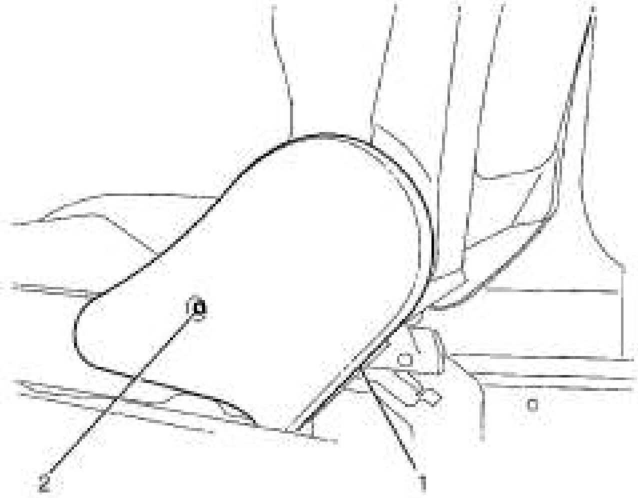
7. Install the left rear seat back.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | Document ID: 1985784

Seat Cushion Inner Trim Panel Replacement

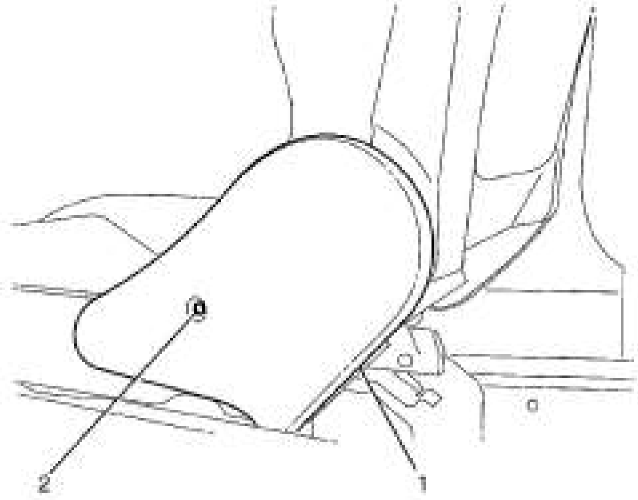
Removal Procedure

1. Remove the seat belt buckle. Refer to Seat Belt Buckle Pretensioner Replacement .



2. Remove the front seat inner trim (1) to hinge assembly retaining screw (2).
3. Firmly grasped the top of the front seat inner trim (1) and disengage the retaining clip.
4. Remove the front seat cushion inner trim (1).

Installation Procedure



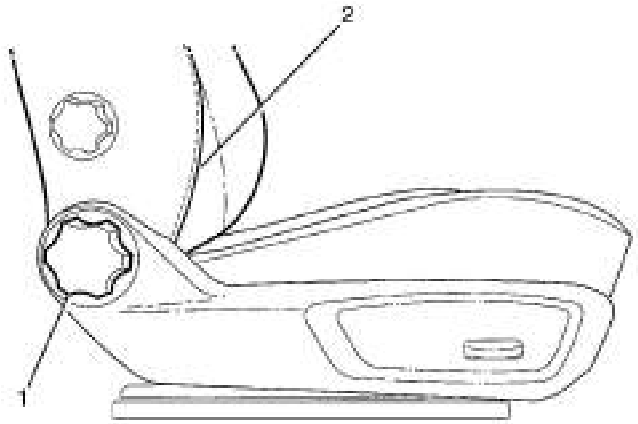
1. Install the front seat inner trim (1) to the hinge assembly.
2. Install the front seat inner trim (1) retaining screw (2).
3. Install the seat belt Buckle. Refer to Seat Belt Buckle Pretensioner Replacement .

Seat Cushion Outer Trim Panel Replacement (RHD)

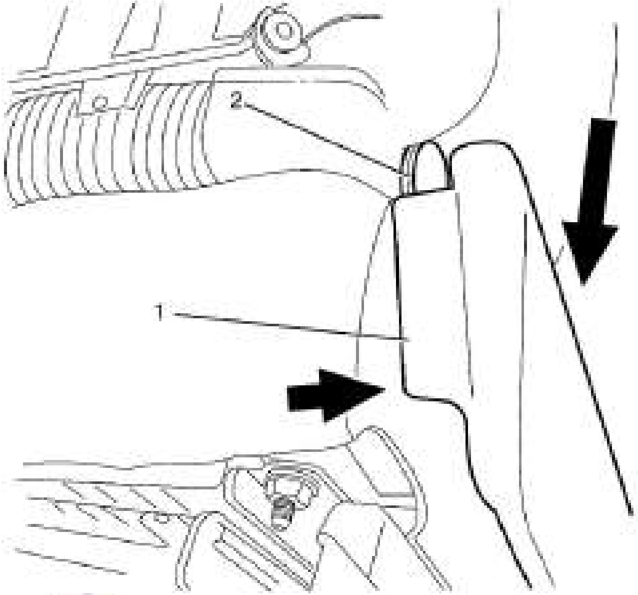
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

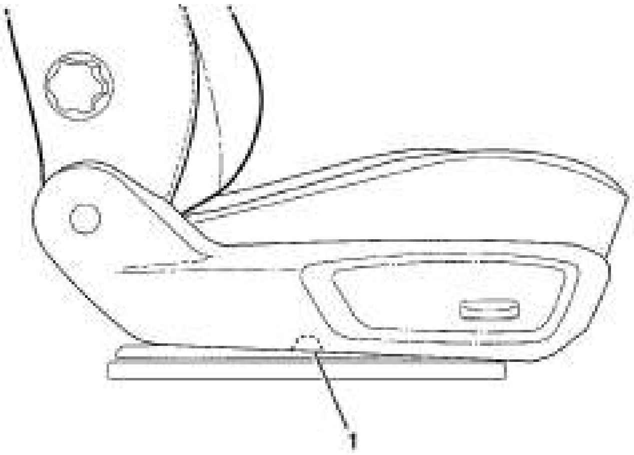
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the front seat. Refer to Front Seat Replacement - Bucket .



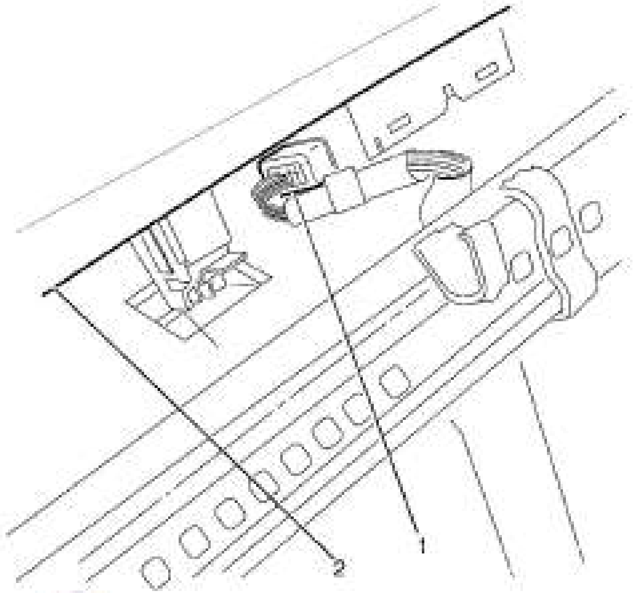
3. Using a suitable flat blade tool, gently pry off the adjusting knob (1) from the seat back (2).



4. Detach the rear of the outer trim panel (1) from the hinge assembly (2), by pushing the side cover down, and prying the bottom of the cover away from the hinge assembly.

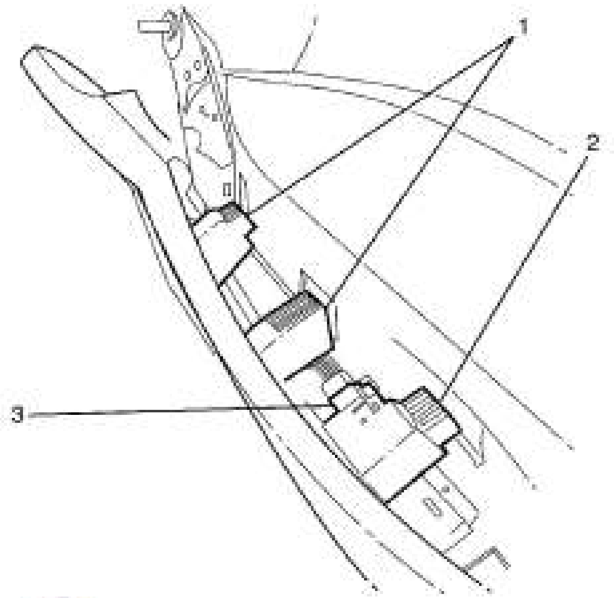


5. Using your finger press the trim panel retaining tang (1) down and slide the trim towards the front of the seat.

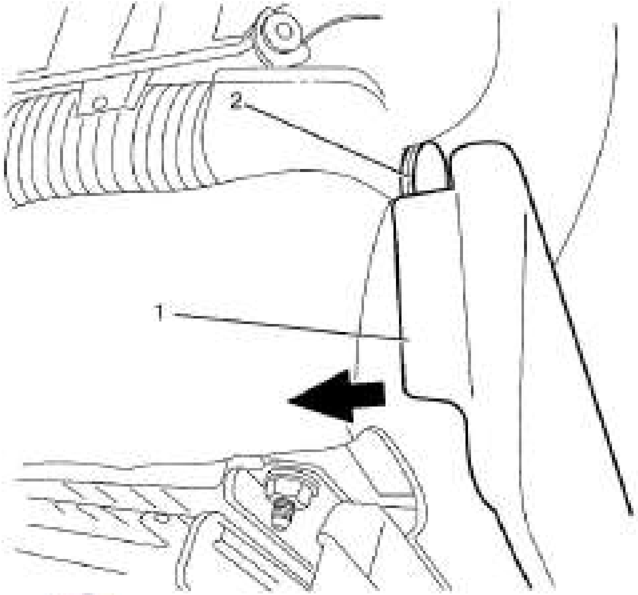


6. Disconnect the electrical connector (1).
7. Remove the outer trim panel (2).

Installation Procedure



1. Connect the electrical connector (3).
2. Locate front tab (2), then middle and rear (1).
3. Push outer trim panel towards cushion and slide towards rear of seat.



4. Attach the rear or the outer trim panel (1) to the hinge assembly (2).
5. Firmly push the adjusting knob on to the adjusting shaft.
6. Install the front seat. Refer to Front Seat Replacement - Bucket .
7. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
8. Test the seat for correct mechanical and electrical operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Seats | Seat Hardware, Trim, and Upholstery | Repair Instructions | Document ID: 2006457

Seat Lumbar Sub System Replacement

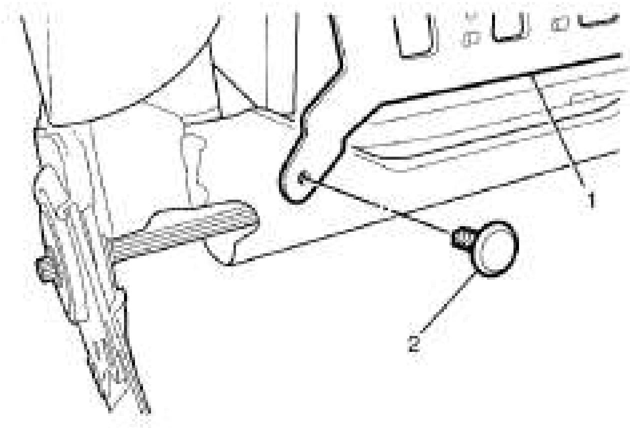
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

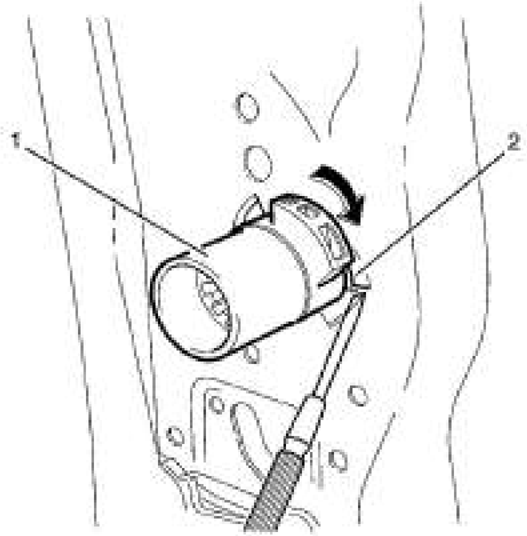
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to SIR Caution in the Preface section.

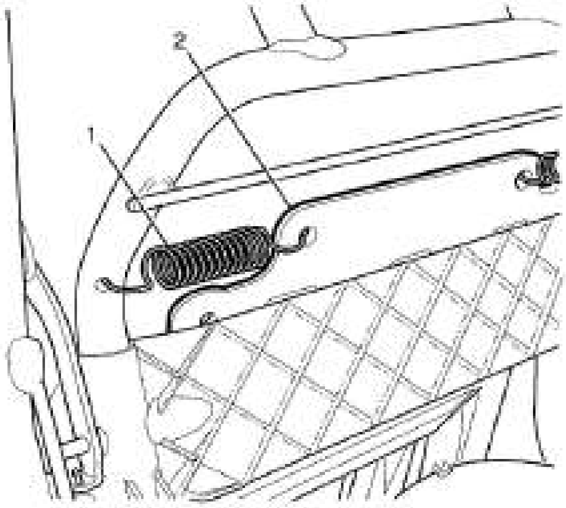
2. Disable the SIR system. Refer to SIR Disabling and Enabling .
3. Remove the front seat. Refer to Front Seat Replacement - Bucket .
4. Remove the front seat-back. Refer to Front Seat Back Replacement .
5. Remove the front seat cover and pad. Refer to Front Seat Back Cushion Cover and Cushion Pad Replacement .
6. Remove the front head restraints. Refer to Front Seat Head Restraint Replacement .
7. Remove the front head restraints guides. Refer to Front Seat Head Restraint Guide Replacement .



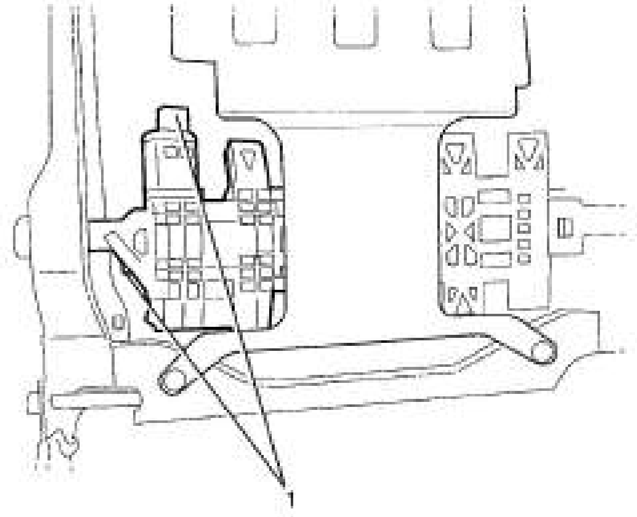
8. Remove the retainer (2) two places, attaching the lumbar support assembly (1) to the seat-back frame.



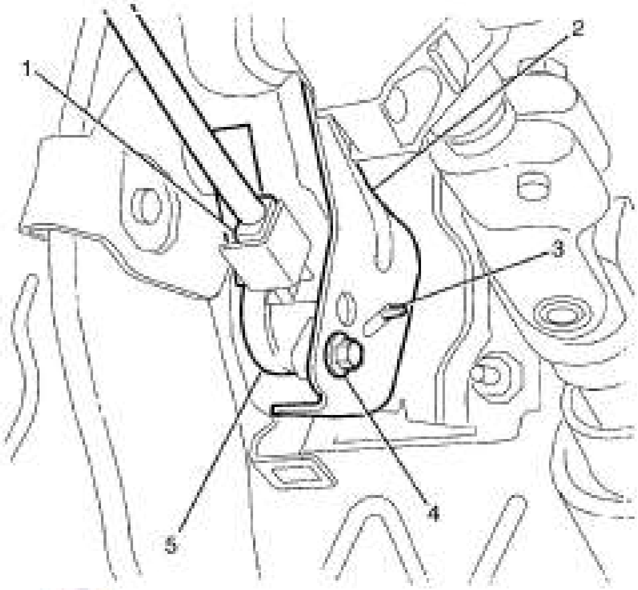
9. Depress the retaining tab (2) and from the inner side of the seat-back frame, rotate the lumbar support shaft (1) and withdraw from the seat-back frame.
10. Repeat this procedure for the opposite side.



11. Disconnect the spring (1), two places, attaching the lumbar support assembly (2) to the head restraint frame.

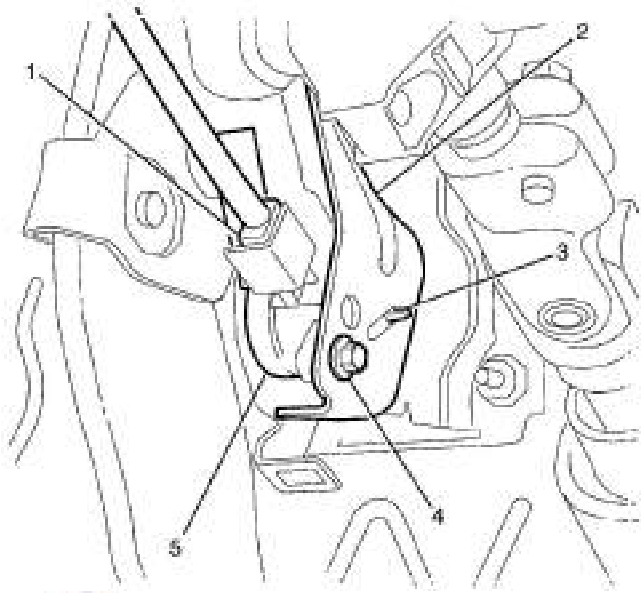


12. Disconnect the electrical connectors (1) attached to seat back harness for power & memory.

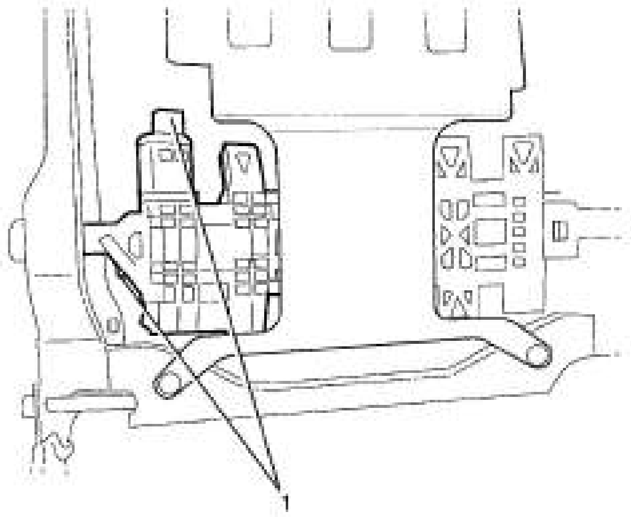


13. Remove the lumbar support assembly (1).

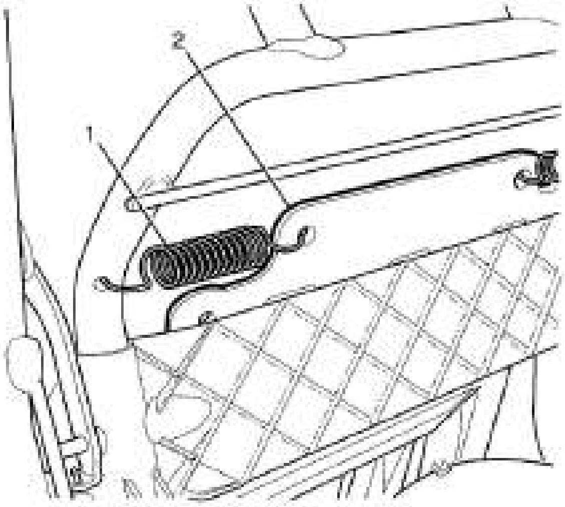
Installation Procedure



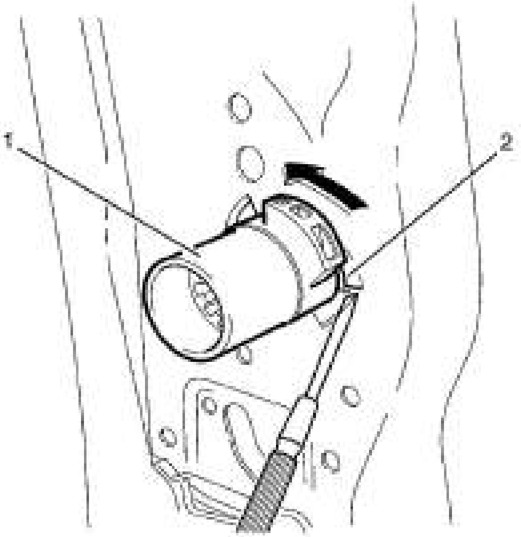
1. Install the lumbar support assembly (1) to the seat-back frame.



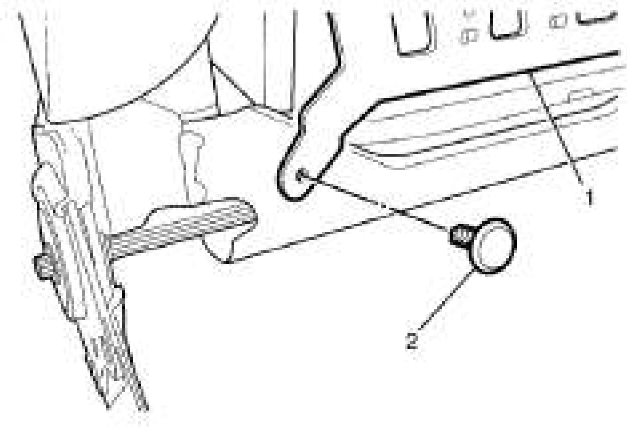
2. Connect the electrical connectors (1) attached to seat back harness for power & memory.



3. Connect the spring (1) two places, attaching the lumbar support assembly (2) to the head restraint frame.



4. Insert the lumbar support shaft (1) to the seat-back frame and rotate anti-clockwise until it locks in front of the retaining tab (2).



5. Install the lumbar support assembly (1) to seat-back frame retainers (2).
6. Install the front seat cover and pad. Refer to Front Seat Back Cushion Cover and Cushion Pad Replacement .
7. Install the front head restraints guides. Refer to Front Seat Head Restraint Guide Replacement .
8. Install the front head restraints. Refer to Front Seat Head Restraint Replacement .
9. Install the front seat. Refer to Front Seat Replacement - Bucket .

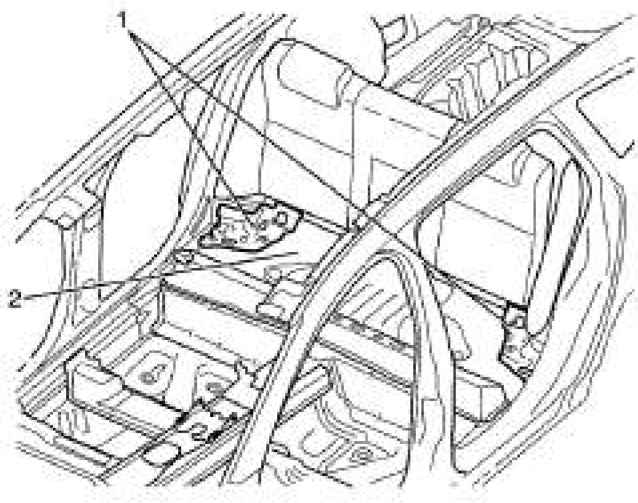
   Caution: Refer to SIR Caution in the Preface section.

10. Enable the SIR system. Refer to SIR Disabling and Enabling .
11. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
12. Test the seat for correct mechanical and electrical operation.

Sound Barrier Replacement - Rear Seat Cushion to Floorpan (Sportwagon)

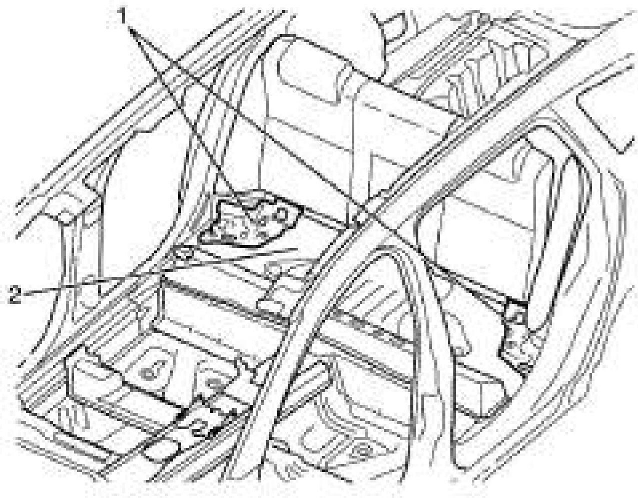
Removal Procedure

1. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.



2. Remove the rear floorpan sound barriers (1) from the floorpan (2).

Installation Procedure



Caution: All floor pan insulator material must meet Federal Vehicle Safety Standards for flammability. Failure to do so could result in personal injury and/or vehicle damage.

Important: When installing the floorpan sound barriers, aligned with the floorpan sound barriers with the respective contours on the floorpan (2).

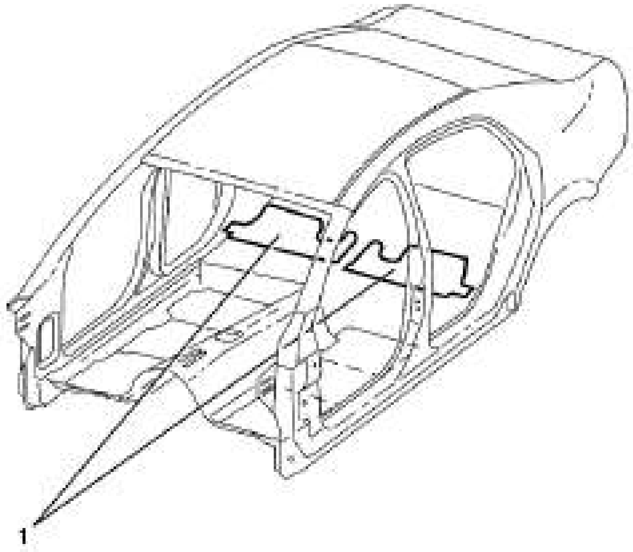
Important: Make sure that the floorpan sound barriers (1) bonds to the floorpan (2) adequately.

1. Clean the contact surface area with a suitable cleaning solution and a lint free cloth to remove any adhesive or grease.
2. Peel the backing from the floorpan sound barriers (1).
3. Install the floorpan sound barriers (1) to the floorpan (2).
4. Press the floorpan sound barriers (1) firmly in all areas in order to secure the sound barriers to the floorpan (2).
5. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.

Sound Barrier Replacement - Rear Seat Cushion to Floorpan (SWB)

Removal Procedure - Up to 24 Oct 06

1. Remove the rear seat back. Refer to Rear Seat Back Replacement .
2. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .



3. Lift the rear floor pan sound barriers (1) upward and pull outward in order to remove.

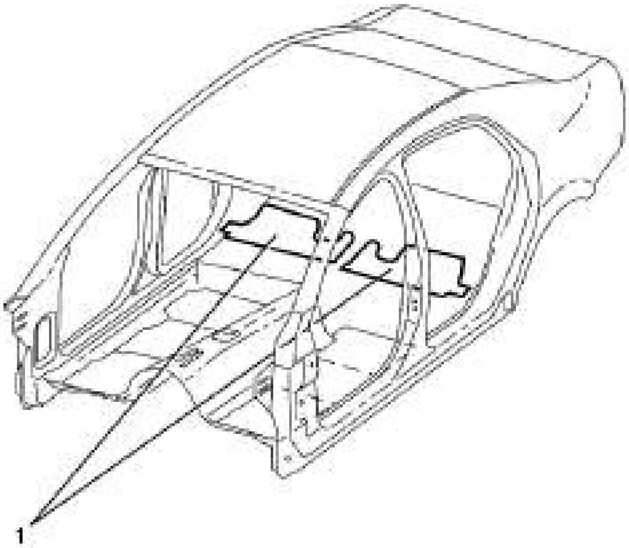
Installation Procedure - Up to 24 Oct 06

Caution: All floor pan insulator material must meet Federal Vehicle Safety Standards for flammability. Failure to do so could result in personal injury and/or vehicle damage.

Important: Align the sound barriers in order to keep the seat belt and seat attachment areas are clear.

Important: When installing the barriers, ensure they are aligned with the respective holes in the sheet metal.

1. Ensure the attachment areas are clear.
2. Remove the backing of the sound barriers.
3. Route the sound barriers around the electrical harness.



4. Press firmly in all areas in order to secure the sound barriers (1) to the floor pan.
5. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement .
6. Install the rear seat back. Refer to Rear Seat Back Replacement .

Lumbar Support Description and Operation

Lumbar Support Components

The driver seat lumbar support system with memory consists of the following components:

- Lumbar Switch
- Memory Seat Module (MSM)
- Lumbar Horizontal Motor
- Lumbar Horizontal Position Sensor
- SEATS Fuse 10 A

Lumbar Switch

Battery positive voltage is supplied at all times to the driver seat lumbar switch from the SEATS Fuse located in the left rear fuse block. When the lumbar switches are pressed they send a 12 volt signal to the MSM. The MSM then commands the lumbar motor to move in response to the switch signals.

Lumbar Motor

The lumbar support system consists of one motor that moves the lumbar support horizontally forward or rearward. The motor contains a electronic circuit breaker (PTC) that opens in the event of a circuit overload and will reset only after voltage has been removed from the circuit. The memory seat module provides the motor with a soft stop that will actually stop the motor just before its physical end-of-travel. This decreases the stress on the motor. If the motor reaches it's end-of-travel due a soft stop and the switch is released and pressed again, the lumbar support will move short distance farther to it's physical travel limit.

Lumbar Operation

When the lumbar switch is operated to move the lumbar support forward, battery positive voltage is applied through the switch contacts and the driver seat lumbar forward switch signal circuit to the MSM. In response to this signal, the MSM applies battery positive voltage through the lumbar motor forward control circuit and ground through the lumbar motor rearward control circuit to the motor. The motor runs to drive the lumbar support forward toward the occupant's back until the switch is released. Moving the lumbar support rearward works similarly to moving the lumbar support forward, except that battery positive voltage and ground are applied on the opposite circuits causing the motor to run in the opposite direction. The MSM also controls the lumbar horizontal motor during memory recall functions.

Position Sensors

The lumbar position sensor is a potentiometer which is attached directly to the lumbar motor. The MSM supplies a 5 volt reference voltage through the 5 volt reference circuit and ground through the low reference circuit to the lumbar position sensor. When the lumbar motor rotates, the resistance of the potentiometer varies changing the feedback voltage of the position sensor signal circuit. This voltage varies from 0.25-4.75 volts. The MSM monitors this voltage signal to determine the lumbar position.

When a memory set command is received, the MSM records the lumbar position by storing the feedback voltage from the position sensor. Then, when a memory recall command is received, the MSM moves the motor until the position sensor feedback voltage equals the feedback voltage stored in memory. The lumbar support is not involved in the easy exit function.

Memory Functions

Refer to Memory Seats Description and Operation.

Manual Seats Description (Rear - Sportwagon)

Manual Rear Seat Description and Operation

All vehicles have rear seat backs that folds forward. The vehicle is equipped with a 3 passenger bench seat with a split 60/40 seat back.

The seat back and seat cushions have formed foam pads, which fit the contours of the full panel seat back frame assembly and the designed contours of the seat cushion frame.

All vehicles have built in child seat tether anchors on the rear seat backs for securing child seats to the rear seat backs.

Some models are equipped with a rear seat armrest. Pull the rear seat armrest at the top to fold the rear seat armrest down. To fold the rear seat armrest away, lift the rear seat armrest and push into the rear seat armrest compartment in the rear seat back. Models with an armrest fitted also include a cupholder in the rear seat cushion. Pressing the front face of the cupholder releases it forward, it can then be retracted back into cushion by pushing it rearward until its latch engages.

The seat backs can operate independently from one another. Each seat back has a seat back release latch located at the top outer ends of the seat backs. The seat backs can only be operated in two positions, completely down or upright. Pressing the seat back release button enables the seat back to fold down. When the seat back is lifted to the upright position, the seat back is locked into place by the seat back locks.

The right rear seat back is equipped with a three point safety belt for the centre occupant. The retractor is located on the seat frame below the foam pad.

Diagnostic Starting Point - Power Steering System

Begin the system diagnosis by reviewing the system description and operation. Refer to Power Steering System Description and Operation. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is normal operation. To identify the correct procedure for diagnosing the system and where the procedure is located. Refer to Symptoms - Power Steering System.

Symptoms - Power Steering System

Important: Review the system description and operation in order to familiarise yourself with the system functions. Refer to Power Steering System Description and Operation.

Visual / Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power steering system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the power steering fluid reservoir for the correct power steering fluid level and condition.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Power Steering Fluid Leaks.
- Rattle, Clunk, or Shudder Noise from the Power Steering System.
- Whine or Growl Noise from the Power Steering System.
- Steering Effort Hard in One or Both Directions.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Diagnostic Information and Procedures | Document ID: 1995281

Power Steering System Test

Test Description

DEFINITION: The Power Steering System Testing Procedure will perform the following functions:

- Test the operation of the hydraulic power steering system.
- Test the operation of the power steering pump and power steering gear.
- Identify restrictions in the system.

The numbers below refer to the step numbers on the diagnostic table.

5. This step tests the system for restrictions.

7. This step tests the following components for the following conditions:

   - The pump for internal leakage
   - The power steering pipes for restrictions

8. This step tests the ability of the pump to regulate flow at minimum pressure.

10. This step tests the ability of the pump to regulate flow under normal operating conditions.

12. This step tests the internal components of the pump and the gear.

Test Procedure

Step	Action	Value (s)	Yes	No
1	Inspect the power steering fluid for the following indications of contamination: • Milky fluid - water • Brown fluid - burnt • Debris in fluid - plastic or dirt Is the fluid contaminated?	--	Go to Step 2	Go to Step 3
2	Flush the power steering system. Refer to Power Steering System Flushing. Did you complete the procedure?	--	Go to Step 3	--
3	**Important:** In order to accurately diagnose the system, the condition must be present during the test procedure. Attempt to duplicate the condition.	--	Go to	System

	Is the condition present?		Step 4	OK
4	1. Turn the ignition switch to the OFF position. 2. Place a drain pan under the vehicle in order to catch any power steering fluid. 3. Disconnect the power steering gear inlet pipe/hose from the power steering pump. 4. Install the J 44721 Power Steering System Analyser 5. Fill the power steering system to the correct level. Refer to Checking and Adding Power Steering Fluid. 6. Fully open the J 44721 valve. 7. Start the engine. **Notice:** Refer to Steering Wheel in the Full Turn Position Notice in the Preface section. 8. Turn the steering wheel from lock to lock three times, BRIEFLY holding the steering wheel against the steering stop each time in order to release any trapped air from the system. 9. Inspect and make sure that all of the power steering pipe/hose connections are not leaking. Did you complete the installation?	--	Go to Step 5	--
5	1. Start the engine. **Important:** The steering must not be against the steering stop. 2. Observe the pressure reading. Is the pressure reading greater than the specified value?	1379 kPa (200 psi)	Go to Step 6	Go to Step 7
6	**Important:** A restriction may be present in the power steering system. Turn off the engine immediately. Locate and repair the restriction. Did you complete the repair?	--	Go to Step 15	--
7	1. Allow the engine to run until the engine reaches normal operating temperature. 2. Record the pressure and flow readings. 3. Partially close the J 44721 valve to adjust the system pressure to the specified value. Record the flow reading. 4. Subtract second flow reading from the first flow reading. Is the decrease in flow greater than 3.8 L (1 gal) per minute?	4827 kPa (700 psi)	Go to Step 11	Go to Step 8
	Important: Do not leave the valve closed for more than 5 seconds, or internal pump damage could occur. Fully close then open the J 44721 valve 3 times. Record all			

8	of the high pressure readings. Refer to Power Steering Pump Specifications, for power steering system pressure relief specifications. Are the three high pressure readings within specifications?	--	Go to Step 9	Go to Step 13
9	Are the three high pressure readings within 245 kPa (50 psi) of each other?	--	Go to Step 10	Go to Step 13
10	1. Increase the engine speed to approximately 1500 RPM. 2. Record the flow reading. Refer to Power Steering Pump Specifications, for power steering system pressure specifications. Is the flow reading within specifications?	--	Go to Step 11	Go to Step 13
11	Is the difference between the flow reading recorded in step 7.2 and the minimum flow specification more than 3.8 L (1 gal) per minute?	--	Go to Step 13	Go to Step 12
12	**Notice:** Refer to Steering Wheel in the Full Turn Position Notice in the Preface section. Turn the steering wheel from steering stop to steering stop and record the flow readings at each stop. Is the flow lower than 3.8 L (1 gal) per minute?	--	Go to Step 15	Go to Step 14
13	Replace the power steering pump. Refer to Power Steering Pump Replacement. Did you complete the replacement?	--	Go to Step 15	--
14	The power steering gear is leaking across the piston or bypassing the valve circuit. Replace the power steering gear. Refer to Steering Gear Replacement in Power Steering System. Refer to Steering Gear Replacement in Power Steering System. Did you complete the replacement?	--	Go to Step 15	--
15	Test the power steering system for the original condition. Does the original condition still exist?	--	Go to Step 5	Go to Step 16
16	1. Disconnect and remove the J 44721 from the vehicle. 2. Connect the power steering gear inlet pipe/hose to the power steering pump. 3. Fill the power steering system to the correct level. Refer to Checking and Adding Power Steering Fluid. Did you complete the procedure?	--	System OK	--

Power Steering Fluid Leaks

Step	Action	Yes	No
1	Did you review the Power Steering System General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System .
2	Verify that power steering fluid leaks are present. Is the power steering system leaking?	Go to Step 3	System OK
3	Inspect the power steering system fittings. Are the fittings leaking?	Go to Step 8	Go to Step 4
4	Inspect the power steering hoses. Are the hoses leaking?	Go to Step 9	Go to Step 5
5	Inspect the power steering pump and the fluid reservoir for leaks. Is the power steering pump or fluid reservoir leaking?	Go to Step 10	Go to Step 6
6	Inspect the power steering gear for leaks. Is the power steering gear leaking?	Go to Step 11	Go to Step 7
7	Inspect the power steering cooler for leaks. Is the power steering cooler leaking?	Go to Step 12	Go to Step 2
8	**Notice:** Refer to Fastener Notice in the Preface section. Tighten the fittings. Refer to Fastener Tightening Specifications . Did you complete the repair?	Go to Step 13	--
9	Replace the power steering hoses. Refer to the appropriate procedures: • Power Steering Fluid Reservoir Outlet Hose Replacement . • Power Steering Gear Inlet Pipe/Hose Replacement . • Power Steering Gear Outlet Pipe/Hose Replacement . • Power Steering Fluid Reservoir Inlet Hose Replacement . Did you complete the repair?	Go to Step 13	--
	Replace the power steering pump or reservoir. Refer to		

10	Power Steering Pump Replacement . Refer to Power Steering Fluid Reservoir Replacement . Did you complete the repair?	Go to Step 13	--
11	Replace the power steering gear. Refer to Power Steering Fluid Reservoir Outlet Hose Replacement . Did you complete the repair?	Go to Step 13	--
12	Replace the power steering cooler. Refer to Power Steering Fluid Cooler Replacement . Did you complete the repair?	Go to Step 13	--
13	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Whine or Growl Noise from the Power Steering System

Step	Action	Yes	No
1	Did you review the Power Steering System Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System .
2	Verify that a whine or growl noise is present. Is a whine or growl noise present?	Go to Step 3	System OK
3	Perform the power steering test procedure in order to diagnose a hydraulic condition and repair or replace a component. Refer to Power Steering System Test . Did you repair or replace a power steering system component?	Go to Step 10	Go to Step 4
4	Using the J 39570 Chassis Ear, inspect the power steering gear for a whine or growl noise. Is the noise present at the power steering gear?	Go to Step 7	Go to Step 5
5	Using the J 39570 , inspect the power steering pump for a whine or growl noise. Is the noise present at the power steering pump?	Go to Step 8	Go to Step 6
6	Using the J 39570 , inspect the power steering hoses for a whine or growl noise. Is the noise present at the power steering hoses?	Go to Step 9	Go to Step 2
7	Replace the power steering gear. Refer to Steering Gear Replacement . Did you complete the repair?	Go to Step 10	--
8	Replace the power steering pump. Refer to Power Steering Pump Replacement . Did you complete the repair?	Go to Step 10	--
9	Adjust the routing of the power steering hoses. Did you complete the repair?	Go to Step 10	--
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Diagnostic Information and Procedures | **Document ID: 1978628**

Steering Effort Hard in One or Both Directions

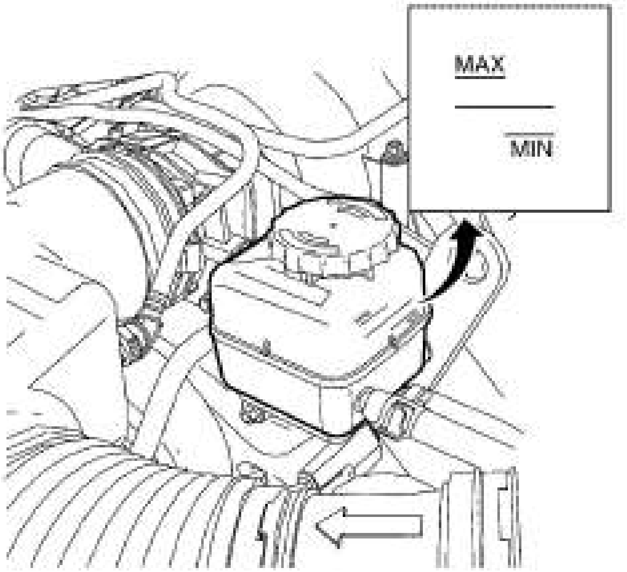
Step	Action	Yes	No
1	Did you review the Power Steering System General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System.
2	Verify that the steering effort is hard in one or both directions. Does the system operate normally?	System OK	Go to Step 3
3	Perform the power steering test procedure. Refer to Power Steering System Test. Did you complete the procedure?	Go to Step 4	--
4	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Checking and Adding Power Steering Fluid

Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

Important: When checking the fluid level after servicing the steering system, bleed the air from the system. Refer to Power Steering System Bleeding .

1. Remove the engine dress cover. Refer to Engine Cover Replacement for 3.6L engine, or Engine Cover Replacement for 6.0L engine.
2. Clean the area surrounding the power steering fluid reservoir cap and level indicators.



3. Make sure that the fluid level is at the correct level mark on the power steering fluid reservoir.
   - If fluid is hot, the fluid level should be at the MAX level mark on the reservoir.
   - If fluid is cold, the fluid level should be at the MIN level mark on the reservoir.
4. Remove the power steering fluid reservoir cap.

Important: Use approved new power steering fluid from a sealed container. For fluid specifications refer to Fluid and Lubricant Recommendations .

5. Add power steering fluid as required, until the correct fluid level is obtained.
6. Install the power steering fluid reservoir cap.

Power Steering Fluid Cooler Replacement

The power steering cooler is an integral part of the air conditioning condenser and must be replaced as an assembly. Refer to Air Conditioning Condenser Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | Document ID: 1976243

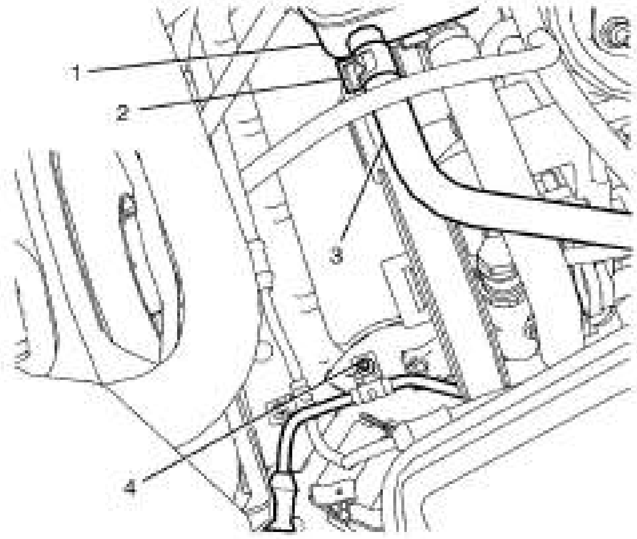
Power Steering Fluid Reservoir Inlet Hose Replacement (3.6L Engine)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

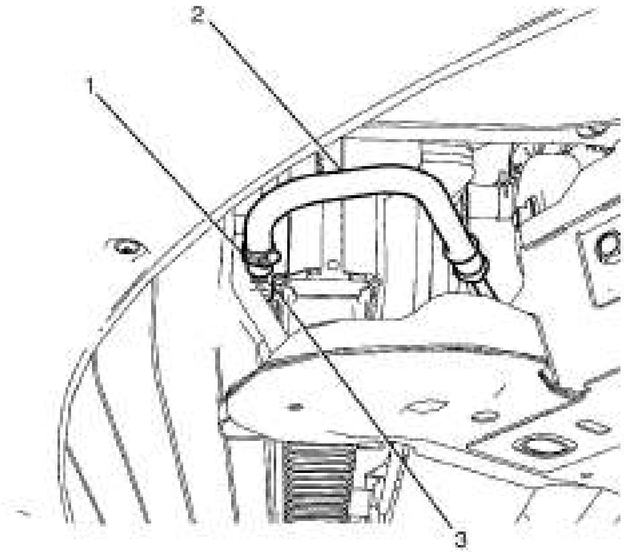
1. Remove the engine dress cover. Refer to Engine Cover Replacement.
2. Remove the upper section of the air box. Refer to Air Cleaner Assembly Replacement.
3. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
4. Place a large suitable container under the vehicle in order to collect draining power steering fluid.



5. Remove the power steering fluid reservoir inlet pipe/hose bracket to subframe retaining bolt (4).

Important: The power steering fluid reservoir (1) must be plugged to prevent the entry of foreign particles into the power steering system.

6. Release the power steering fluid reservoir inlet pipe/hose spring clamp (2) and disconnect the power steering fluid reservoir inlet pipe/hose (3) from the power steering fluid reservoir (1).
7. Plug the power steering fluid reservoir (1).
8. Remove the front air deflector. Refer to Front Air Deflector Replacement.

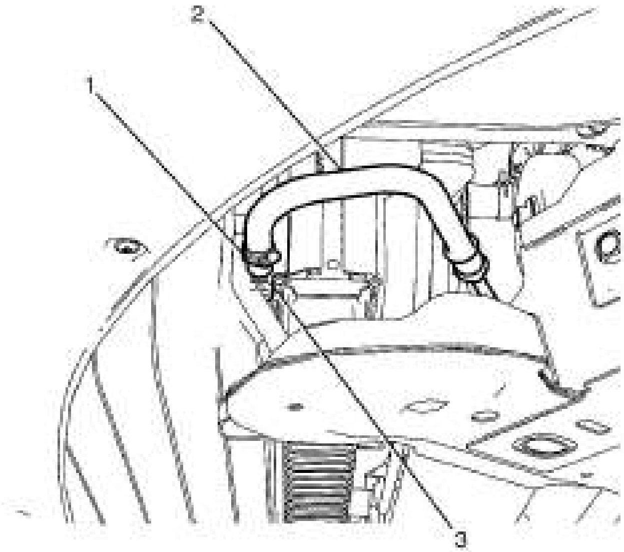


Important: The power steering cooler (3) must be plugged to prevent the entry of foreign particles into the power steering system.

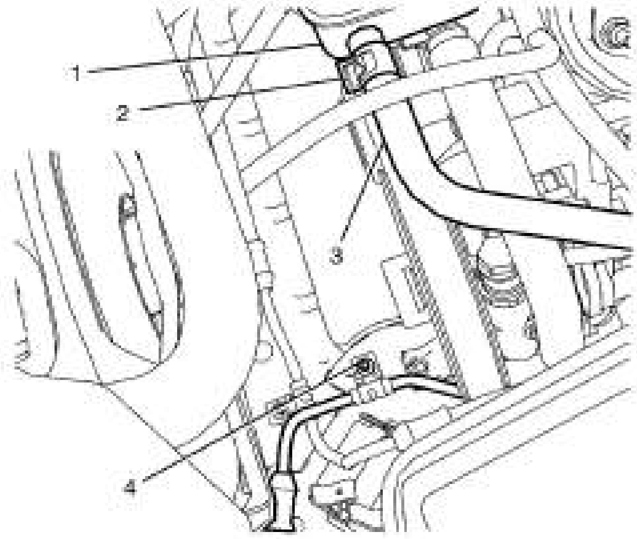
9. Release the power steering fluid reservoir inlet pipe/hose spring clamp (1) and disconnect the power steering fluid reservoir inlet hose (2) from the power steering cooler (3).
10. Plug the power steering cooler (3).
11. Plug the power steering fluid reservoir (1).
12. Remove the fluid reservoir inlet pipe/hose (2).

Installation Procedure

1. Install the power steering fluid reservoir inlet pipe/hose spring clamps to the power steering fluid reservoir inlet pipe/hose.



2. Position the power steering fluid reservoir inlet pipe/hose (2).
3. Remove the plug from the power steering cooler (3).
4. Release the power steering fluid reservoir inlet pipe/hose spring clamp (1) and connect the power steering fluid reservoir inlet pipe/hose (2) to the power steering cooler (3).
5. Install the front air deflector. Refer to Front Air Deflector Replacement.
6. Remove the safety stands.
7. Lower the vehicle to the ground.



8. Remove the plug from the power steering fluid reservoir (1).
9. Release the power steering fluid reservoir inlet pipe/hose spring clamp (2) and connect the power steering fluid reservoir inlet hose (3) to the power steering fluid reservoir (1).

   Notice: Refer to Fastener Notice in the Preface section.

10. Install the power steering fluid reservoir inlet pipe/hose bracket to subframe retaining bolt (4).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

11. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
12. Install the upper section of the air box. Refer to Air Cleaner Assembly Replacement.

    Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

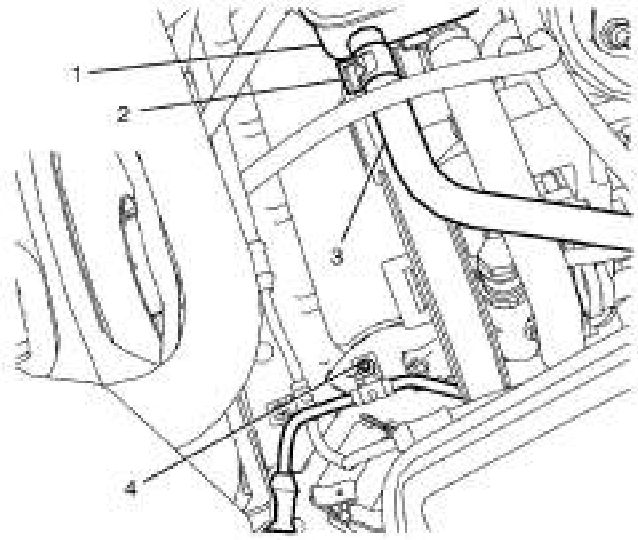
13. Fill power steering fluid reservoir with fluid to FULL level mark on the fluid reservoir.
14. Bleed the power steering system. Refer to Power Steering System Bleeding.
15. Check for power steering fluid leaks.
16. Remove the container from under the vehicle.
17. Install the engine dress cover. Refer to Engine Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2038106**

Power Steering Fluid Reservoir Inlet Hose Replacement (6.0L Engine)

Removal Procedure

1. Remove the engine dress cover. Refer to Engine Cover Replacement.
2. Remove the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement.
3. Remove the upper section of the air box. Refer to Air Cleaner Assembly Replacement.
4. Place a large suitable container under the vehicle in order to collect draining fluid.



5. Remove the power steering fluid reservoir inlet pipe/hose bracket to subframe retaining bolt (4).

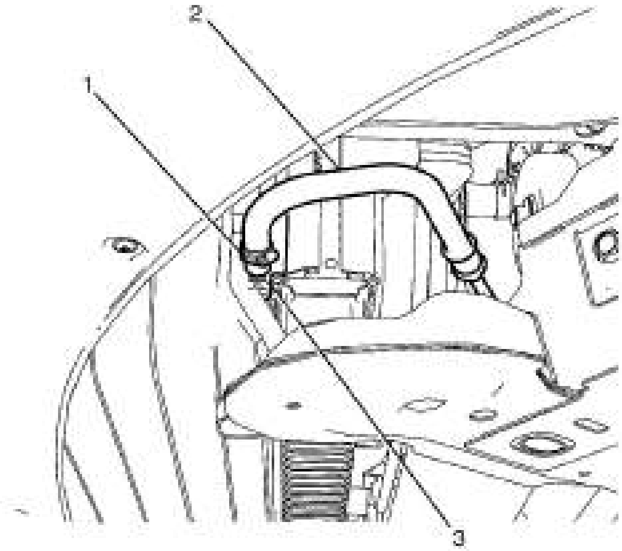
   Important: The power steering fluid reservoir (1) must be plugged to prevent the entry of foreign particles into the power steering system.

6. Release the power steering fluid reservoir inlet pipe/hose spring clamp (2) and disconnect the power steering fluid reservoir inlet pipe/hose (3) from the power steering fluid reservoir (1).
7. Plug the power steering fluid reservoir (1).

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

8. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
9. Remove the front air deflector. Refer to Front Air Deflector Replacement.

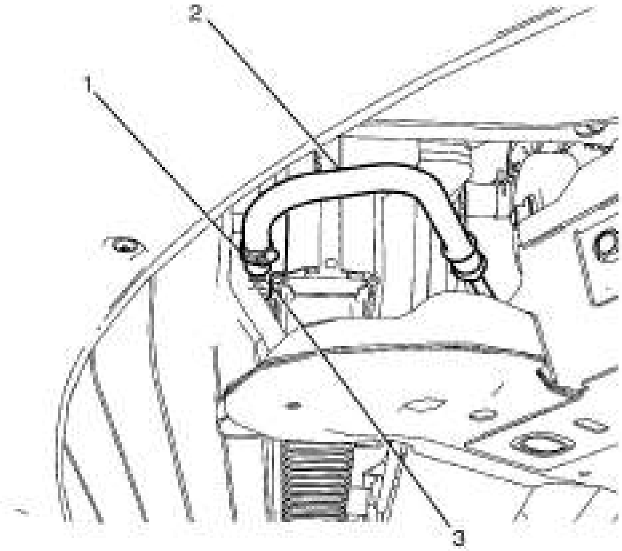


Important: The power steering cooler (3) must be plugged to prevent the entry of foreign particles into the power steering system.

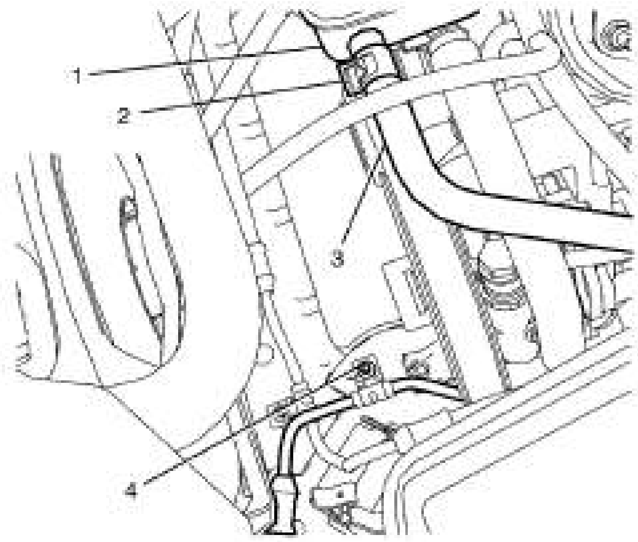
10. Release the power steering fluid reservoir inlet pipe/hose spring clamp (1) and disconnect the power steering fluid reservoir inlet pipe/hose (2) from the power steering cooler (3).
11. Plug the power steering cooler (3).
12. Remove the fluid reservoir inlet pipe/hose (2).

Installation Procedure

1. Install the power steering fluid reservoir inlet pipe/hose spring clamps to the power steering fluid reservoir inlet pipe/hose.



2. Install the power steering fluid reservoir inlet pipe/hose (2).
3. Remove the plug from the power steering cooler (3).
4. Release the power steering fluid reservoir inlet pipe/hose spring clamp (1) and connect the power steering fluid reservoir inlet pipe/hose (2) to the power steering cooler (3).
5. Install the front air deflector. Refer to Front Air Deflector Replacement.
6. Remove the safety stands.
7. Lower the vehicle to the ground.



8. Remove the plug from the power steering fluid reservoir (1).
9. Release the power steering fluid reservoir inlet pipe/hose spring clamp (2) and connect the power steering fluid reservoir inlet pipe/hose (3) to the power steering fluid reservoir (1).

   Notice: Refer to Fastener Notice in the Preface section.

10. Install the power steering fluid reservoir inlet pipe/hose bracket to subframe retaining bolt (4).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

11. Install the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement.
12. Install the upper section of the air box. Refer to Air Cleaner Assembly Replacement.

    Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

13. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
14. Bleed the power steering system. Refer to Power Steering System Bleeding.
15. Check for power steering fluid leaks.
16. Remove the container from under the vehicle.
17. Install the engine dress cover. Refer to Engine Cover Replacement.

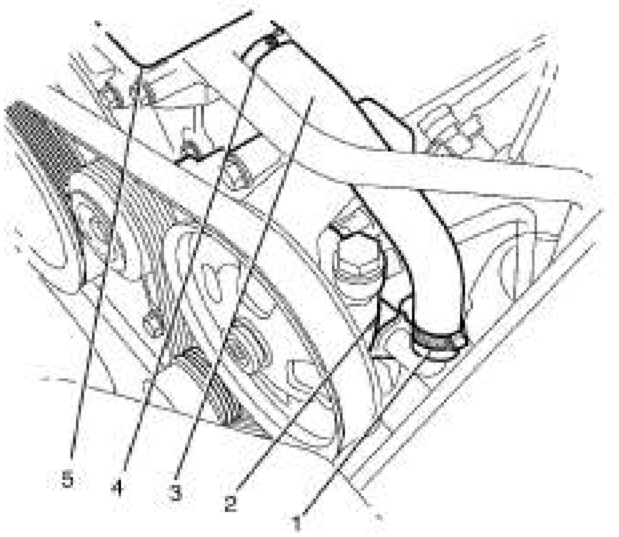
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 1976241**

Power Steering Fluid Reservoir Outlet Hose Replacement (3.6L Engine)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover Replacement.
2. Place a large suitable container under the vehicle in order to collect draining fluid.



3. Release the power steering fluid reservoir outlet hose worm drive clamp (4).

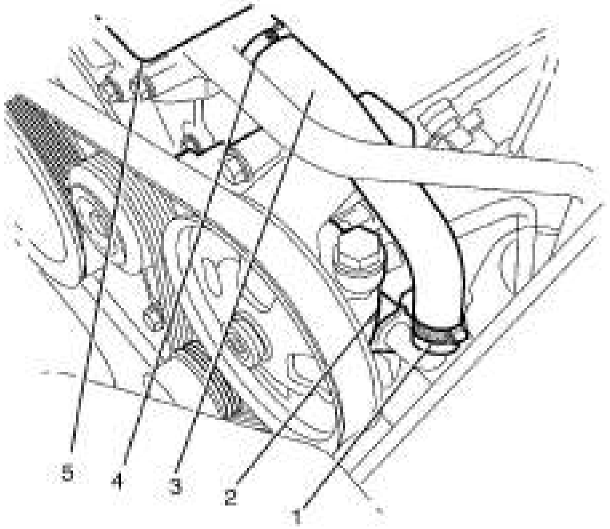
Important: The power steering fluid reservoir (5) must be plugged to prevent the entry of foreign particles into the power steering system.

4. Disconnect the power steering fluid reservoir outlet hose (3) from the power steering fluid reservoir (5).
5. Plug the power steering fluid reservoir (5).
6. Release the power steering fluid reservoir outlet hose worm drive clamp (1).

Important: The power steering pump (2) must be plugged to prevent the entry of foreign particles into the power steering system.

7. Remove the power steering fluid reservoir outlet hose (3) from the power steering pump (2).
8. Plug the power steering pump (2).
9. Inspect all parts for wear and damage.

Installation Procedure



1. Install the power steering fluid reservoir outlet hose worm drive clamps (1) and (4) to power steering fluid reservoir outlet pipe/hose (3).
2. Remove the plug from the power steering pump (2).
3. Install the fluid reservoir outlet hose (3) to the power steering pump (2).

Notice: Refer to Fastener Notice in the Preface section.

4. Tighten the power steering fluid reservoir outlet hose worm drive clamp (1).

Tighten
Tighten the worm drive clamp.

5. Remove the plug from the power steering fluid reservoir (5).
6. Connect the fluid reservoir outlet hose (3) to the power steering fluid reservoir (5).
7. Tighten the power steering fluid reservoir outlet hose worm drive clamp (4).

Tighten
Tighten the worm drive clamp.

Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

8. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
9. Bleed the power steering system. Refer to Power Steering System Bleeding.
10. Check for power steering fluid leaks.
11. Remove the container from under the vehicle.
12. Install the engine dress cover. Refer to Engine Cover Replacement.

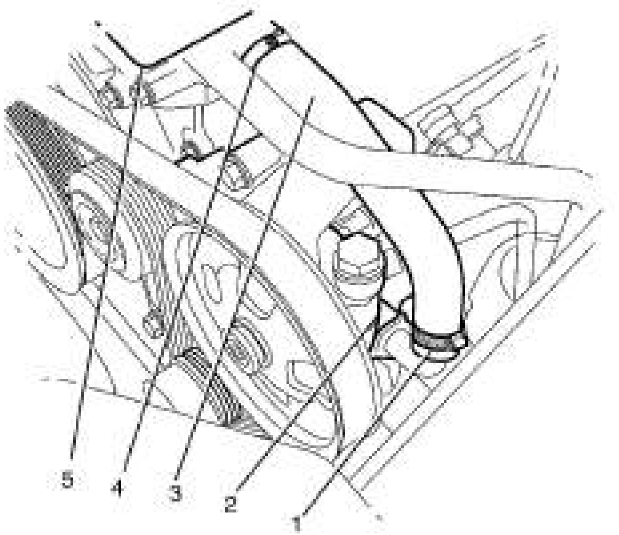
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2038103**

Power Steering Fluid Reservoir Outlet Hose Replacement (6.0L Engine)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover Replacement.
2. Place a large suitable container under the vehicle in order to collect draining fluid.



3. Release the power steering fluid reservoir outlet hose worm drive clamp (4).

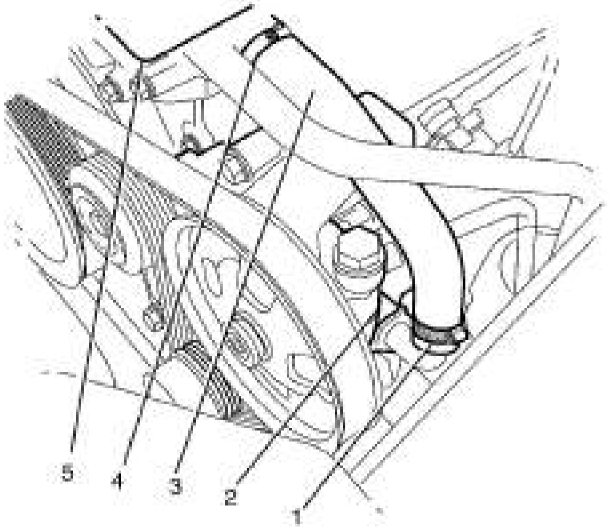
Important: The power steering fluid reservoir (5) must be plugged to prevent the entry of foreign particles into the power steering system.

4. Disconnect the power steering fluid reservoir outlet hose (3) from the power steering fluid reservoir (5).
5. Plug the power steering fluid reservoir (5).
6. Release the power steering fluid reservoir outlet hose worm drive clamp (1).

Important: The power steering pump (2) must be plugged to prevent the entry of foreign particles into the power steering system.

7. Remove the power steering fluid reservoir outlet hose (3) from the power steering pump (2).
8. Plug the power steering pump (2).
9. Inspect all parts for wear and damage.

Installation Procedure



1. Install the power steering fluid reservoir outlet hose worm drive clamps (1) and (4) to power steering fluid reservoir outlet pipe/hose (3).
2. Remove the plug from the power steering pump (2).
3. Install the fluid reservoir outlet hose (3) to the power steering pump (2).

   Notice: Refer to Fastener Notice in the Preface section.

4. Tighten the power steering fluid reservoir outlet hose worm drive clamp (1).

   Tighten
   Tighten the worm drive clamp.

5. Remove the plug from the power steering fluid reservoir (5).
6. Connect the fluid reservoir outlet hose (3) to the power steering fluid reservoir (5).
7. Tighten the power steering fluid reservoir outlet hose worm drive clamp (4).

   Tighten
   Tighten the worm drive clamp.

   Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

8. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
9. Bleed the power steering system. Refer to Power Steering System Bleeding.
10. Check for power steering fluid leaks.
11. Remove the container from under the vehicle.
12. Install the engine dress cover. Refer to Engine Cover Replacement.

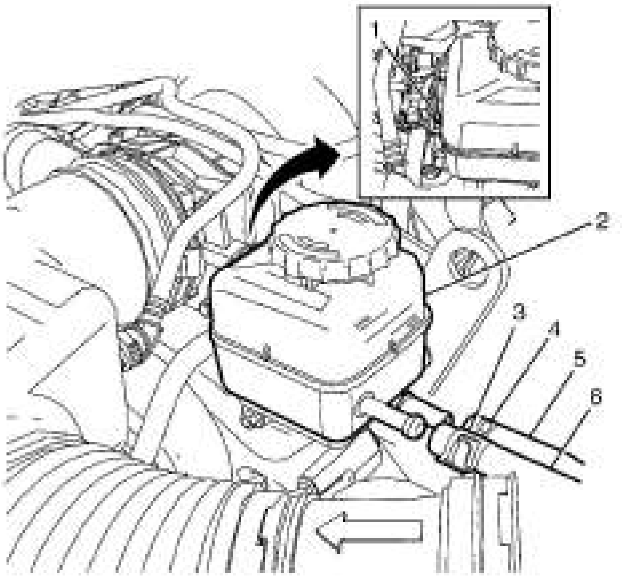
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | Document ID: 1976248

Power Steering Fluid Reservoir Replacement (3.6L Engine)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover Replacement .
2. Place a large suitable container under the power steering fluid reservoir Inlet and outlet in order to collect draining fluid.



Important: The power steering fluid reservoir inlet pipe/hose (5) must be plugged to prevent the entry of foreign particles into the power steering system.

3. Release the power steering fluid reservoir inlet pipe/hose worm drive clamp (4) and disconnect the power steering fluid reservoir inlet pipe/hose (5) from the power steering fluid reservoir (2).
4. Plug the power steering fluid reservoir inlet pipe/hose (5).
5. Release the power steering fluid reservoir outlet pipe/hose spring clamp (3).

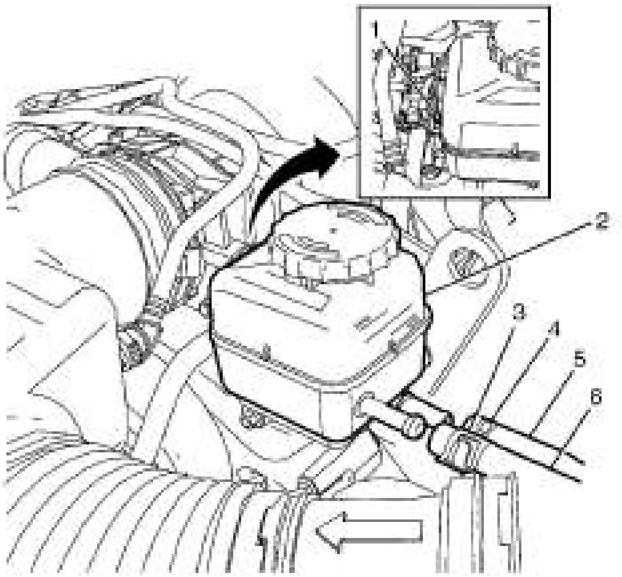
Important: The power steering fluid reservoir outlet pipe/hose (6) must be plugged to prevent the entry of foreign particles into the power steering system.

6. Disconnect the power steering fluid reservoir outlet pipe/hose (6) from the power steering fluid reservoir (2).
7. Plug the power steering fluid reservoir outlet pipe/hose (6).

Important: The power steering fluid reservoir bracket locking tang (1) must be released before removing the power steering fluid reservoir (2).

8. Remove the power steering fluid reservoir (2).

Installation Procedure



Important: The power steering fluid reservoir bracket locking tang (1) must be located correctly.

1. Install the power steering fluid reservoir (2).
2. Remove the plug from the power steering fluid reservoir outlet pipe/hose (6).
3. Connect the power steering fluid reservoir outlet pipe/hose (6) to the power steering fluid reservoir (2).
4. Tighten the power steering fluid reservoir outlet pipe/hose spring clamp (3).
5. Remove the plug from the power steering fluid reservoir inlet pipe/hose (5).
6. Release the power steering fluid reservoir inlet pipe/hose worm drive clamp (4) and connect the power steering fluid reservoir inlet pipe/hose (5) to the power steering fluid reservoir (2).

Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

7. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
8. Bleed the power steering system. Refer to Power Steering System Bleeding .
9. Check for power steering fluid leaks.
10. Install the engine dress cover. Refer to Engine Cover Replacement .

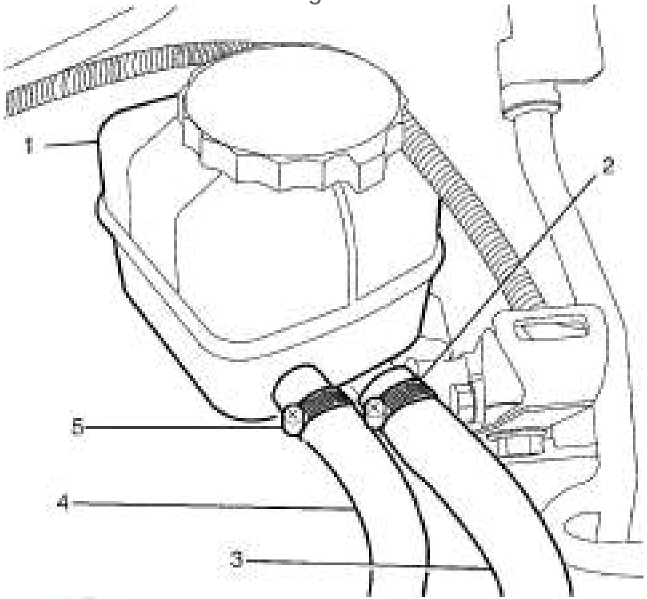
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2038109**

Power Steering Fluid Reservoir Replacement (6.0L Engine)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover Replacement
2. Place a large suitable container under the power steering fluid reservoir Inlet and outlet in order to collect draining fluid.



Important: The hose must be plugged to prevent the entry of foreign particles into the power steering system.

3. Release the power steering fluid reservoir inlet pipe/hose spring clamp (5) and disconnect the power steering fluid reservoir inlet pipe/hose (4) from the power steering reservoir (1). Plug the hose.
4. Release the power steering fluid reservoir outlet pipe/hose worm drive clamp (2).

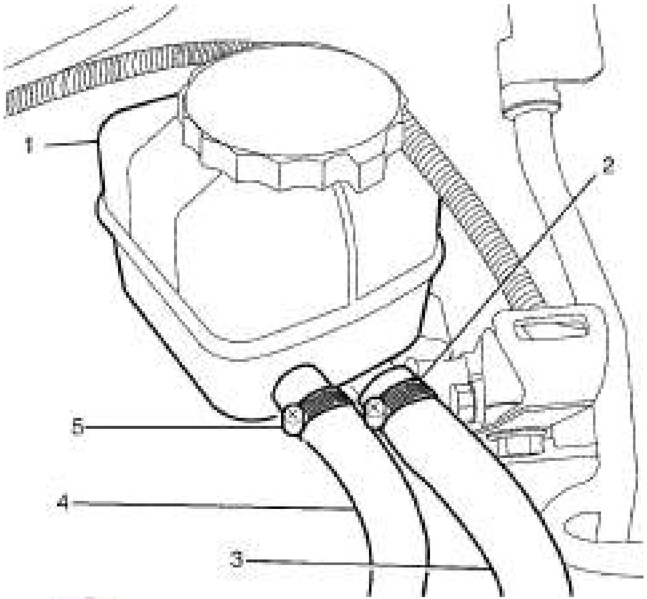
Important: The hose must be plugged to prevent the entry of foreign particles into the power steering system.

5. Disconnect the power steering fluid reservoir outlet pipe/hose (3) from the power steering reservoir.
6. Plug the hose.

Important: The power steering fluid reservoir bracket locking tang must be released before removing the power steering reservoir.

7. Remove the power steering fluid reservoir (1) from the engine bracket.

Installation Procedure



1. Install the power steering fluid reservoir (1) to the engine bracket.
2. Remove the plug from the power steering fluid reservoir outlet pipe/hose (4).
3. Connect the power steering fluid reservoir outlet pipe/hose (4) to the power steering reservoir (1).

   Notice: Refer to Fastener Notice in the Preface section.

4. Tighten the power steering fluid reservoir outlet pipe/hose worm drive clamp (2).
5. Remove the plug from the power steering fluid reservoir inlet pipe/hose (3).
6. Release the power steering fluid reservoir inlet pipe/hose spring clamp (5) and connect the power steering fluid reservoir inlet pipe/hose (3) to the power steering reservoir (1).

   Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

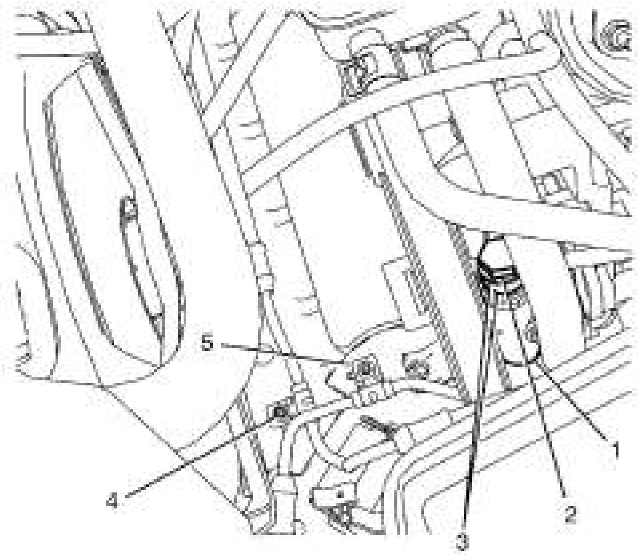
7. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
8. Bleed the power steering system. Refer to Power Steering System Bleeding .
9. Check for power steering fluid leaks.
10. Install the engine dress cover. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2194801**

Power Steering Gear Inlet Pipe/Hose Replacement (3.6L Engine)

Removal Procedure

1. Remove the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
2. Remove the upper section of the air box. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.
3. Remove the air inlet duct. Refer to Air Cleaner Inlet Duct ReplacementAir Cleaner Inlet Duct Replacement.
4. Place a large suitable container under the vehicle in order to collect draining fluid.



5. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (4).

   Important: Remove the power steering fluid reservoir inlet hose to subframe retaining bolt (5) to aid in removing the power steering gear inlet pipe/hose.

6. Remove the power steering fluid reservoir inlet hose to subframe retaining bolt (5).

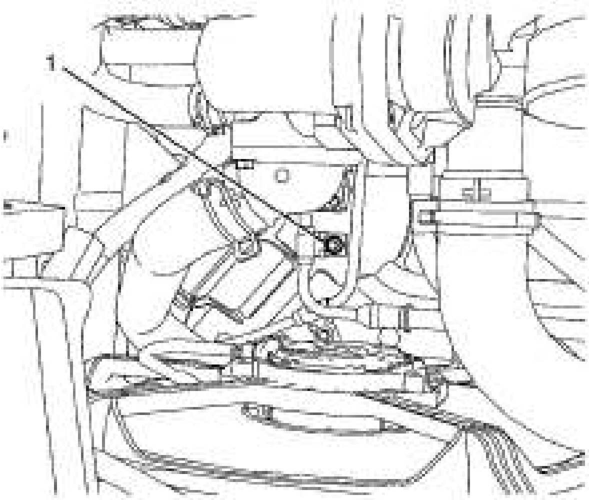
   Important: The power steering pump (1) must be plugged to prevent the entry of foreign particles into the power steering system.

   Important: The copper sealing washers (3) must be discarded after removal.

7. Remove the power steering gear inlet pipe/hose to power steering pump retaining banjo bolt (2) and copper sealing washers (3).

   Discard the washers.

8. Plug the power steering pump (1).

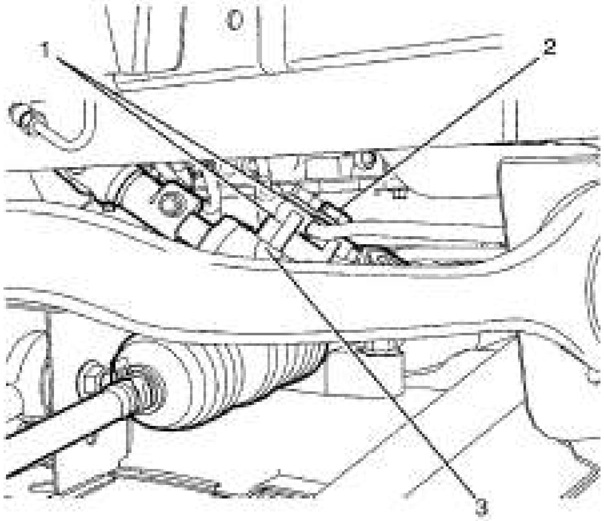


9. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

10. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
11. Remove the front air deflector. Refer to Front Air Deflector ReplacementFront Air Deflector Replacement.



Important: The power steering gear (3) must be plugged to prevent the entry of foreign particles into the power steering system.

Important: The copper sealing washers (1) must be discarded after removal.

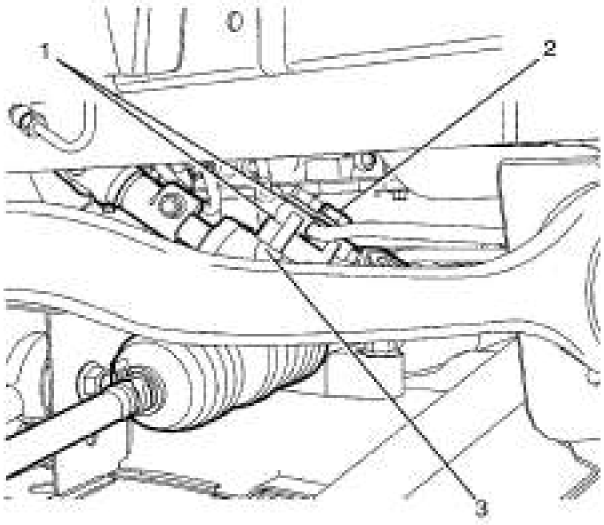
12. Remove the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (2) and copper sealing washers (1).

    Discard the washers.

13. Plug the power steering gear (3).
14. Remove the power steering gear inlet pipe/hose.

Installation Procedure

1. Position the power steering gear inlet pipe/hose.



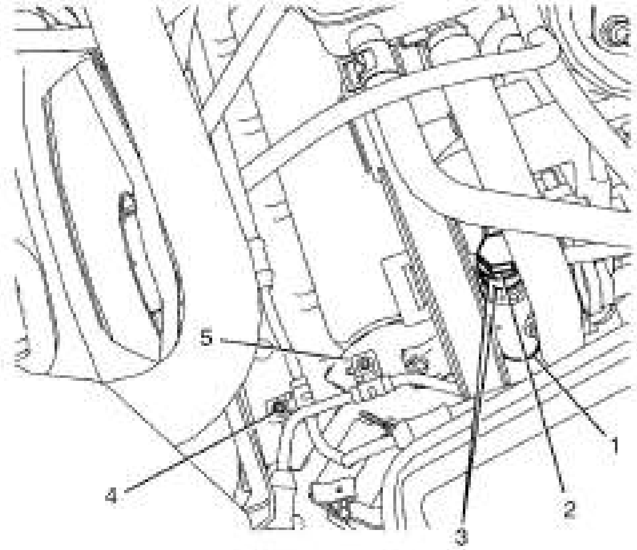
2. Remove the plug from the power steering gear (3).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (2) and NEW copper sealing washers (1).

   Tighten
   Tighten the banjo bolt to 58 N·m (43 lb ft).

4. Install the front air deflector. Refer to Front Air Deflector ReplacementFront Air Deflector Replacement.
5. Remove the safety stands.
6. Lower the vehicle to the ground.



7. Remove the plug from the power steering pump (1).
8. Install the power steering gear inlet pipe/hose to power steering pump retaining banjo bolt (2) and NEW copper sealing washers (3).

   Tighten
   Tighten the banjo bolt to 58 N·m (43 lb ft).

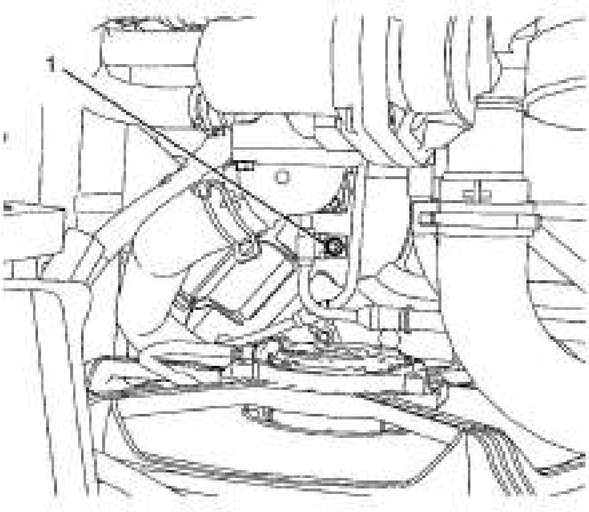
9. Install the power steering gear inlet pipe/hose bracket to subframe retaining bolt (4).

   Tighten
   Tighten the bolt to 9 N·m (80 lb in).

10. Install the power steering fluid reservoir inlet pipe/hose bracket to subframe retaining bolt (5).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

11. Remove the container from under the vehicle.



12. Install the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

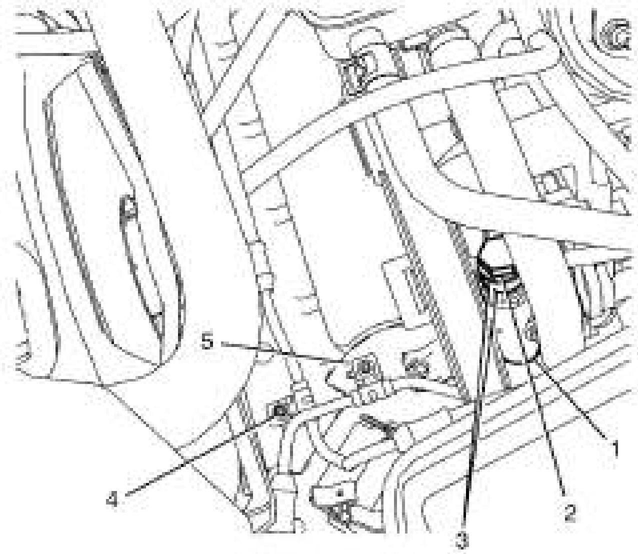
13. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
14. Bleed the power steering system. Refer to Power Steering System BleedingPower Steering System Bleeding.
15. Check for power steering fluid leaks.
16. Install the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
17. Install the air inlet duct. Refer to Air Cleaner Inlet Duct ReplacementAir Cleaner Inlet Duct Replacement.
18. Install the upper section of the air box. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2194802**

Power Steering Gear Inlet Pipe / Hose Replacement (6.0L Engine)

Removal Procedure

1. Remove the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
2. Remove the air intake duct. Refer to Air Cleaner Inlet Duct ReplacementAir Cleaner Inlet Duct Replacement.
3. Remove the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor with Intake Air Temperature Sensor ReplacementMass Airflow Sensor with Intake Air Temperature Sensor Replacement.
4. Remove the upper section of the air box. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.
5. Place a large suitable container under the vehicle in order to collect draining fluid.



6. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (4).

   Important: Remove the power steering fluid reservoir inlet hose to subframe retaining bolt (5) to aid in removing the power steering gear inlet pipe/hose.

7. Remove the power steering fluid reservoir inlet hose to subframe retaining bolt (5).

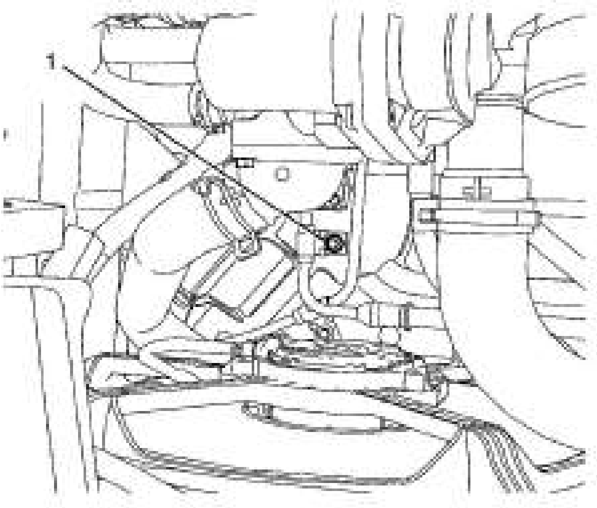
   Important: The power steering pump (1) must be plugged to prevent the entry of foreign particles into the power steering system.

   Important: The copper sealing washers (3) must be discarded after removal.

8. Remove the power steering gear inlet pipe/hose to power steering pump retaining banjo bolt (2) and copper sealing washers (3).

Plug the power steering pump (1).

Discard the washers.

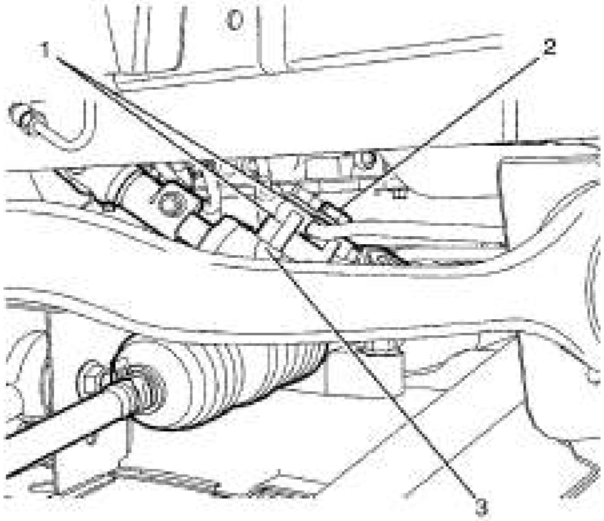


9. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

10. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
11. Remove the splash shield. Refer to Engine Splash Shield ReplacementEngine Splash Shield Replacement.



Important: The power steering gear (3) must be plugged to prevent the entry of foreign particles into the power steering system.

Important: The copper sealing washers (1) must be discarded after removal.

12. Remove the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (2) and copper sealing washers (1).

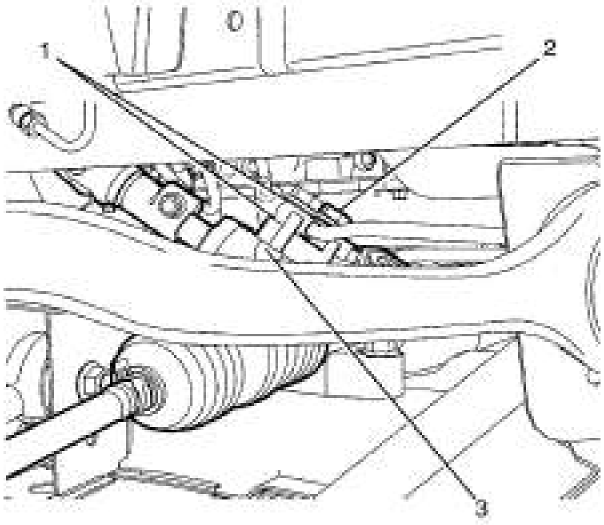
    Plug the power steering gear (3).

    Discard the washers.

13. Remove the power steering gear inlet pipe/hose.

Installation Procedure

1. Install the power steering gear inlet pipe/hose.



2. Remove the plug from the power steering gear (3).

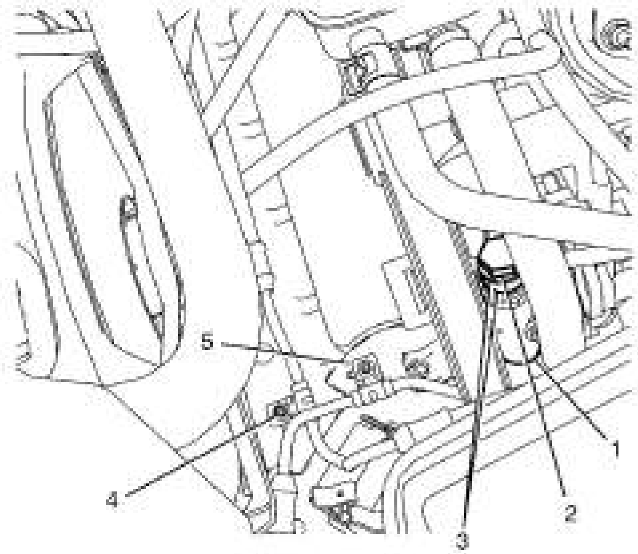
   Notice: Refer to Fastener Notice in the Preface section.

3. Install the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (2) and NEW copper sealing washers (1).

   Tighten
   Tighten the banjo bolt to 58 N·m (43 lb ft).

4. Install the splash shield. Refer to Engine Splash Shield ReplacementEngine Splash Shield Replacement.

5. Remove the safety stands.
6. Lower the vehicle to the ground.



7. Remove the plug from the power steering pump (1).
8. Install the power steering gear inlet pipe/hose to power steering pump retaining banjo bolt (2) and NEW copper sealing washers (3).

   Tighten
   Tighten the banjo bolt to 58 N·m (43 lb ft).

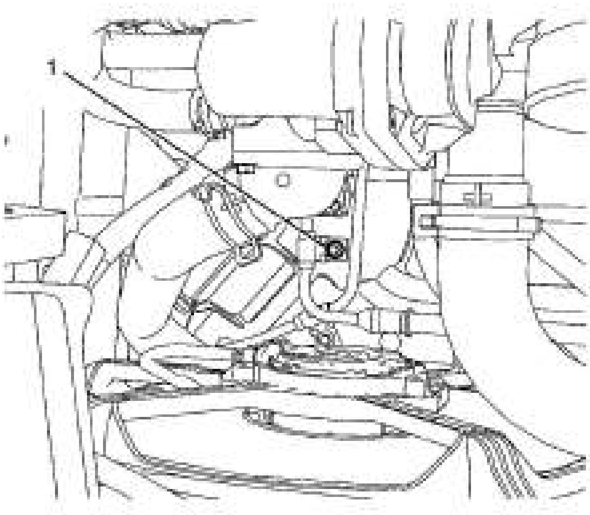
9. Install the power steering gear inlet pipe/hose bracket to subframe retaining bolt (4).

   Tighten
   Tighten the bolt to 9 N·m (80 lb in).

10. Install the power steering fluid reservoir inlet pipe/hose to subframe retaining bolt (5).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

11. Remove the container from under the vehicle.



12. Install the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

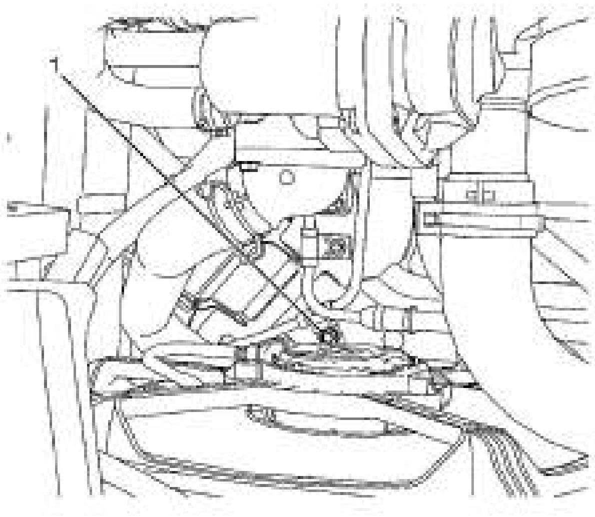
13. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
14. Bleed the power steering system. Refer to Power Steering System BleedingPower Steering System Bleeding.
15. Check for power steering fluid leaks.
16. Install the upper section of the air box. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.
17. Install the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor with Intake Air Temperature Sensor ReplacementMass Airflow Sensor with Intake Air Temperature Sensor Replacement.
18. Install the air intake duct. Refer to Air Cleaner Inlet Duct ReplacementAir Cleaner Inlet Duct Replacement.
19. Install the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2005023**

Power Steering Gear Outlet Pipe / Hose Replacement (3.6L Engine)

Removal Procedure -- Up to 12 Sep 07

1. Remove the engine dress cover. Refer to Engine Cover Replacement.
2. Remove the air inlet duct. Refer to Air Cleaner Inlet Duct Replacement.

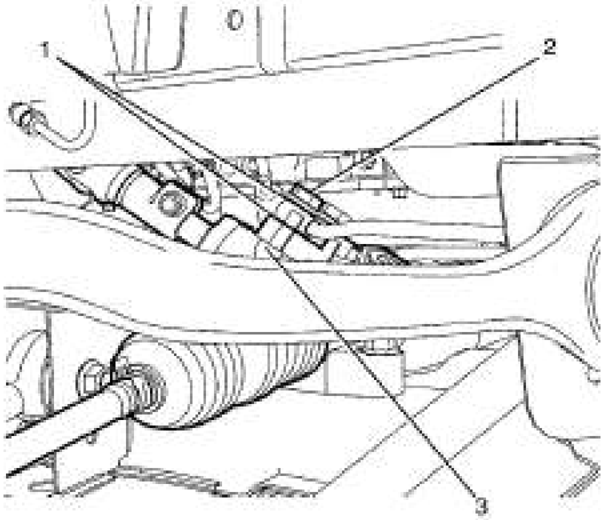


3. Remove the power steering gear outlet pipe/hose bracket to subframe retaining bolt (1).

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
5. Remove the front air deflector. Refer to Front Air Deflector Replacement.
6. Remove the engine splash shield. Refer to Engine Splash Shield Replacement.
7. Place a large suitable container under the vehicle.



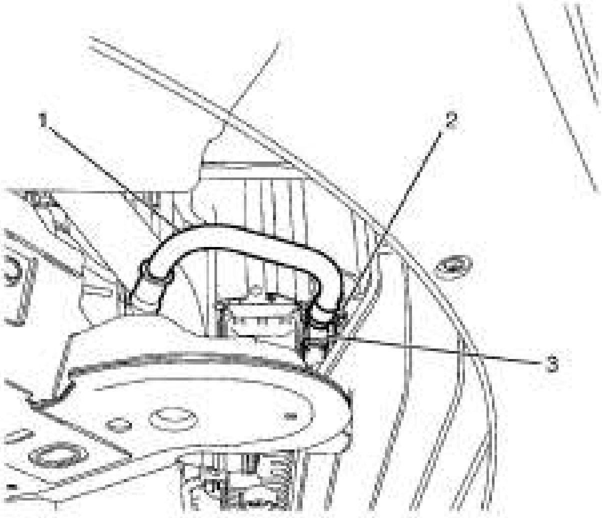
Important: The power steering gear (3) must be plugged to prevent the entry of foreign particles into the power steering system.

Important: Copper sealing washers (1) must be discarded after removal.

8. Remove the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (2) and copper sealing washers (1).

   Discard the washers.

9. Plug the power steering gear (3).



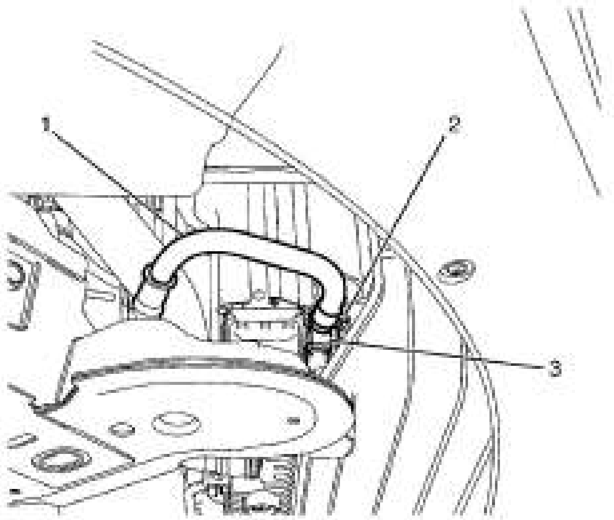
Important: The power steering cooler (3) must be plugged to prevent the entry of foreign particles into the power steering system.

10. Release the power steering gear outlet pipe/hose spring clamp (2) and disconnect the power steering gear outlet pipe/hose (1) from the power steering cooler (3).
11. Plug the power steering cooler (3).

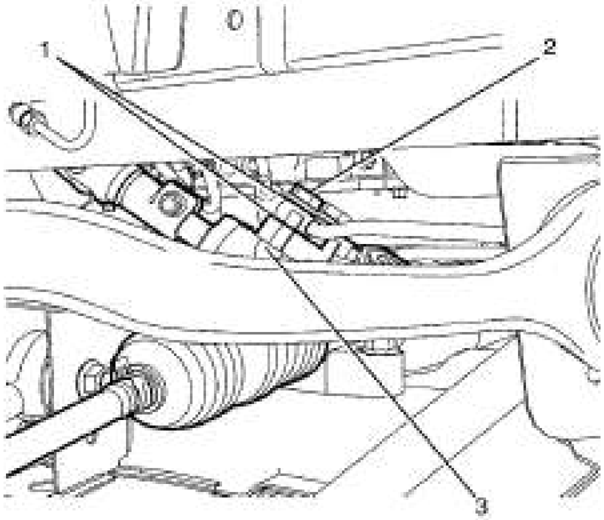
Important: If fitting the later type steering high pressure hose and secondary hose to a pre 12th September 2007 vehicle, they must be replaced as a pair.

12. Remove the power steering gear outlet pipe/hose (1).

Installation Procedure -- Up to 12 Sep 07



1. Install the power steering gear outlet pipe/hose (1).
2. Remove the plug from the power steering cooler (3).
3. Release the power steering gear outlet pipe/hose spring clamp (2) and connect the power steering gear outlet pipe/hose (1) to the power steering cooler (3).



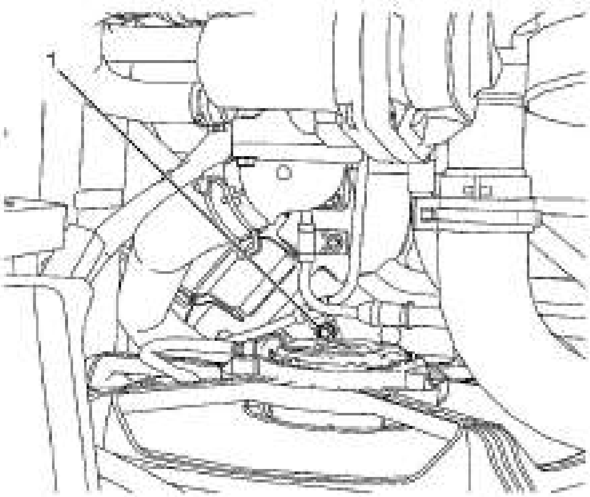
4. Remove the plug from the power steering gear (3).

   Notice: Refer to Fastener Notice in the Preface section.

5. Install the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (1) and NEW copper sealing washers (2).

   Tighten
   Tighten the banjo bolt to 58 N·m (43 lb ft).

6. Remove the container from under the vehicle.
7. Install the engine splash shield. Refer to Engine Splash Shield Replacement.
8. Install the front air deflector. Refer to Front Air Deflector Replacement.
9. Remove the safety stands.
10. Lower the vehicle to the ground.



11. Install the power steering gear outlet pipe/hose bracket to subframe retaining bolt (1).

Tighten
Tighten the bolt to 9 N·m (80 lb in).

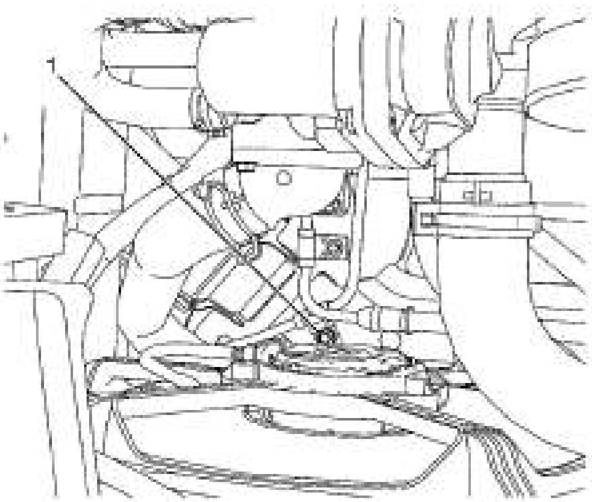
12. Install the engine dress cover. Refer to Engine Cover Replacement.
13. Remove the air inlet duct. Refer to Air Cleaner Inlet Duct Replacement.

Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

14. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
15. Bleed the power steering system. Refer to Power Steering System Bleeding.
16. Check for power steering fluid leaks.

Removal Procedure -- As of 12 Sep 07

1. Remove the engine dress cover. Refer to Engine Cover Replacement.
2. Remove the air inlet duct. Refer to Air Cleaner Inlet Duct Replacement.

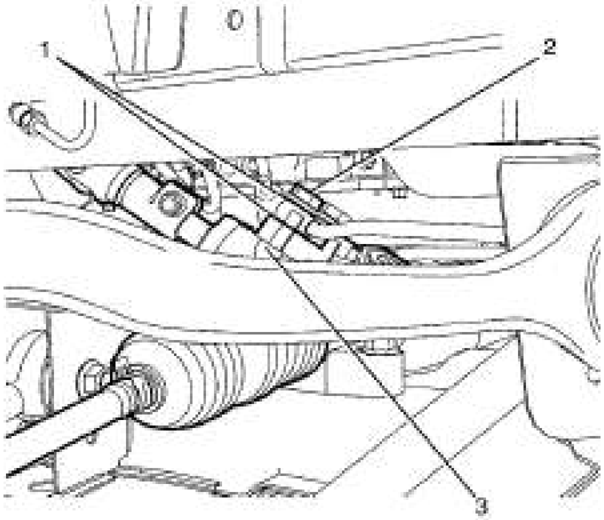


3. Remove the power steering gear outlet pipe/hose bracket to subframe retaining bolt (1).

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
5. Remove the front air deflector. Refer to Front Air Deflector Replacement.
6. Remove the engine splash shield. Refer to Engine Splash Shield Replacement.
7. Place a large suitable container under the vehicle.



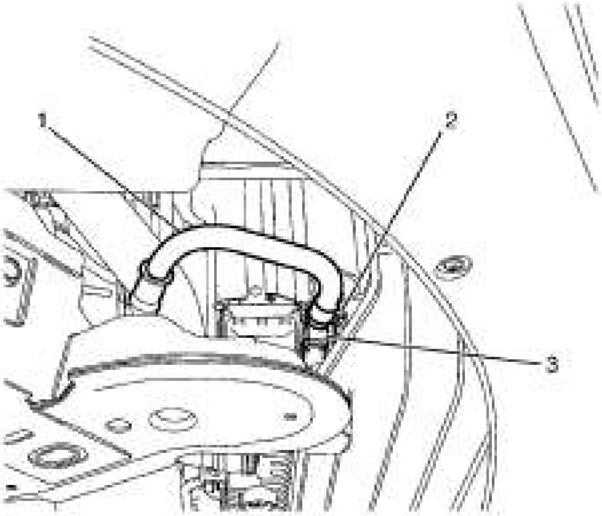
Important: The power steering gear (3) must be plugged to prevent the entry of foreign particles into the power steering system.

Important: Copper sealing washers (1) must be discarded after removal.

8. Remove the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (2) and copper sealing washers (1).

   Discard the washers.

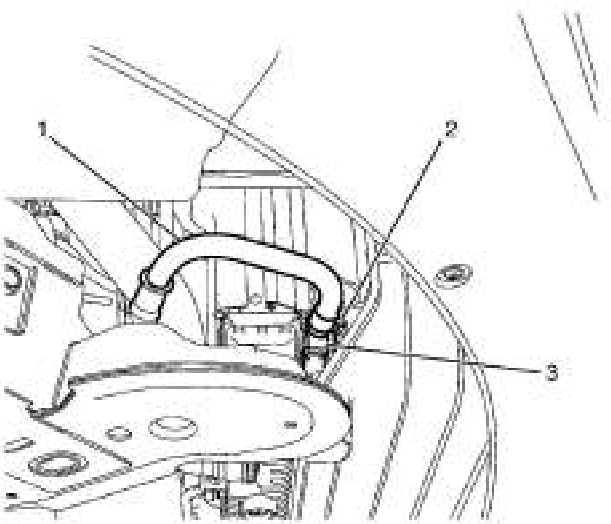
9. Plug the power steering gear (3).



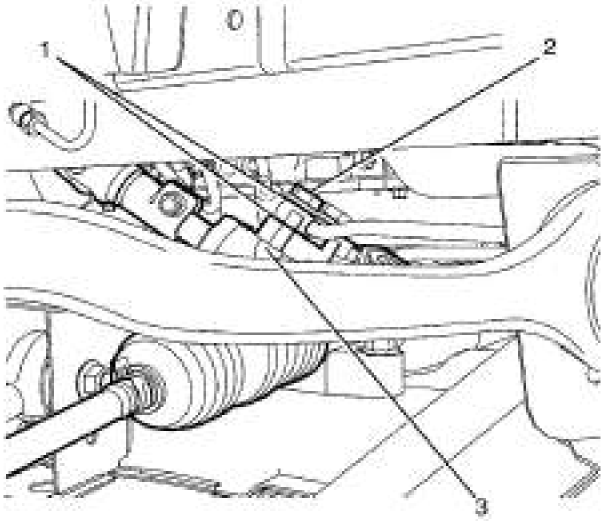
Important: The power steering cooler (3) must be plugged to prevent the entry of foreign particles into the power steering system.

10. Release the power steering gear outlet pipe/hose spring clamp (2) and disconnect the power steering gear outlet pipe/hose (1) from the power steering cooler (3).
11. Plug the power steering cooler (3).
12. Remove the power steering gear outlet pipe/hose (1).

Installation Procedure -- As of 12 Sep 07



1. Install the power steering gear outlet pipe/hose (1).
2. Remove the plug from the power steering cooler (3).
3. Release the power steering gear outlet pipe/hose spring clamp (2) and connect the power steering gear outlet pipe/hose (1) to the power steering cooler (3).



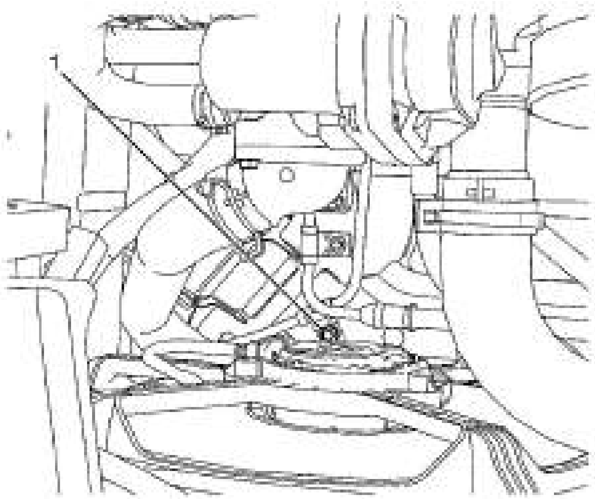
4. Remove the plug from the power steering gear (3).

   Notice: Refer to Fastener Notice in the Preface section.

5. Install the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (1) and NEW copper sealing washers (2).

   Tighten
   Tighten the banjo bolt to 58 N·m (43 lb ft).

6. Remove the container from under the vehicle.
7. Install the engine splash shield. Refer to Engine Splash Shield Replacement.
8. Install the front air deflector. Refer to Front Air Deflector Replacement.
9. Remove the safety stands.
10. Lower the vehicle to the ground.



11. Install the power steering gear outlet pipe/hose bracket to subframe retaining bolt (1).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

12. Install the engine dress cover. Refer to Engine Cover Replacement.
13. Remove the air inlet duct. Refer to Air Cleaner Inlet Duct Replacement.

    Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

14. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
15. Bleed the power steering system. Refer to Power Steering System Bleeding.
16. Check for power steering fluid leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 1976218**

Power Steering Pump Pulley Replacement

Tools Required

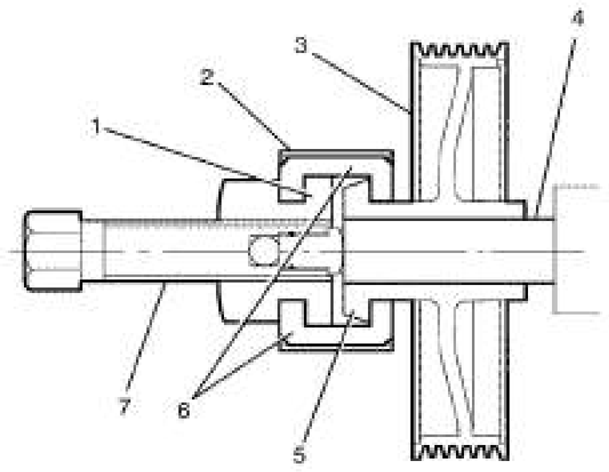
- 7185 Power Steering Pump Pulley Remover
- 7005 Power Steering Pump Pulley Installer

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the power steering pump. Refer to Power Steering Pump Replacement .
2. Suitably support the power steering pump in a vice.



3. Lubricate the forcing screw (7) of 7185 .
4. Position the forcing screw (7) against the pulley shaft (4).

Important: The half jaws (6) must be fully engaged with the pulley flange (5) and the 7185 flange (1), the larger open end diameter (has chamfer and relief profile) engages with the pulley flange (5).

5. Install the half jaws (6) over the pulley flange (5) and the 7185 flange (1).

Important: The forcing screw (7) must be aligned with the pump axis.

6. Slide the retainer sleeve (2) over the half jaws, and hand tighten the forcing screw (7).

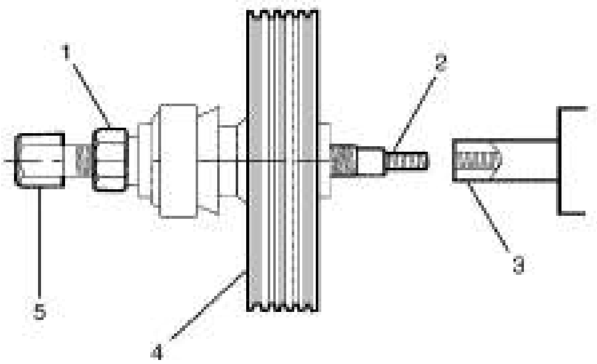
Important: Observe the orientation and the depth of the pulley (3) with reference to the original position, this will minimise the potential of incorrect pulley installation.

Important: Do not use power tools or exceed a torque of 90.0 N·m. If the pulley cannot be removed within this torque, remove the pulley using 7185 . If still unsuccessful, replace the complete power steering pump assembly.

7. Remove the pulley (3) from the pulley shaft (4) by progressively tightening the forcing screw (7).

Installation Procedure

1. Lubricate the thread of the 7005 forcing nut (1).



Important: Before installing the pulley (4) it must be properly aligned and orientated in relation to the pump shaft (3).

2. Slide the power steering pump pulley (4) over the 7005 forcing screw (2).
3. Install the 7005 forcing screw (2) into the pump shaft (3).

Important: The depth to which the pulley (4) is going to travel must be observed and maintained.

Important: Hold the forcing screw hex (5) while tightening the forcing nut (1).

4. Install the pulley (4) to the pump shaft (3) by progressively tightening the forcing nut (1).
5. Remove the 7005 from the pump shaft (3).
6. Remove the power steering pump from the vice.
7. Install the power steering pump. Refer to Power Steering Pump Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2194799**

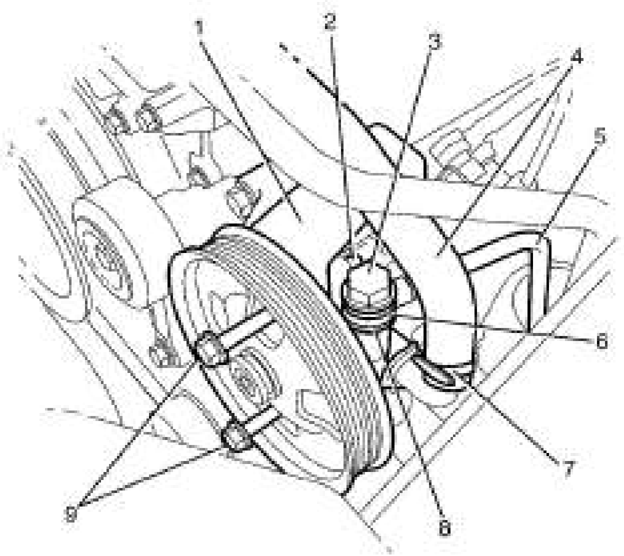
Power Steering Pump Replacement (3.6L Engine)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
2. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct ReplacementAir Cleaner Outlet Duct Replacement.
3. Remove the upper section of the air box. Refer to Air Cleaner Outlet Duct ReplacementAir Cleaner Outlet Duct Replacement.
4. Remove the power steering drive belt. Refer to Drive Belt ReplacementDrive Belt Replacement.
5. Place a large suitable container under the vehicle in order to collect draining power steering fluid.



Important: The copper sealing washers (6 and 8) must be discarded after removal.

6. Remove the power steering gear inlet pipe to power steering pump retaining banjo bolt (3) and copper sealing washers (6 and 8).

   Discard the washers.

7. Disconnect the power steering gear inlet pipe (5) from the power steering pump (2).

Important: The power steering gear inlet pipe/hose (5) must be plugged to prevent the entry of foreign particles into the power steering system.

8. Plug the power steering gear inlet pipe/hose (5).
9. Release the power steering fluid reservoir outlet pipe/hose spring clamp (7).

   Important: The power steering power steering fluid reservoir outlet pipe/hose (4) must be plugged to prevent the entry of foreign particles into the power steering system.

10. Disconnect the power steering fluid reservoir outlet pipe/hose (4) from the power steering pump (2).
11. Plug the power steering fluid reservoir outlet pipe/hose (4).

    Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

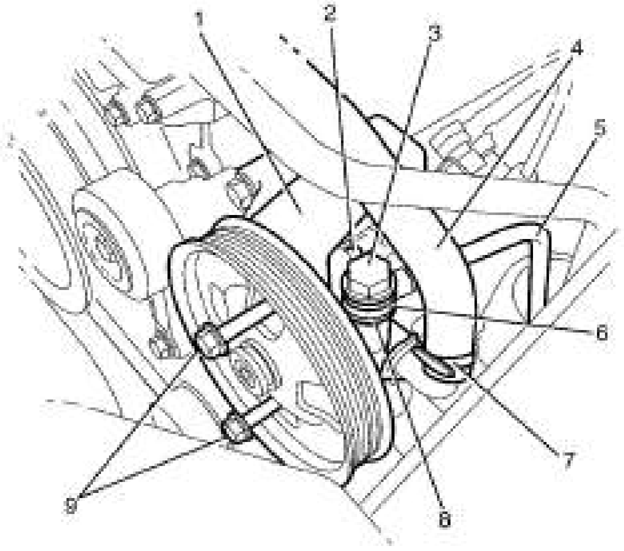
12. Remove the power steering pump to power steering pump bracket retaining bolts (9).

    Discard the bolts.

13. Remove the power steering pump (2) from the power steering pump bracket (1).
14. Remove the power steering pulley from the power steering pump. Refer to Power Steering Pump Pulley ReplacementPower Steering Pump Pulley Replacement.

Installation Procedure

1. Install the power steering pulley to the power steering pump. Refer to Power Steering Pump Pulley ReplacementPower Steering Pump Pulley Replacement.



2. Position the power steering pump (2) to the power steering pump bracket (1).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the NEW power steering pump to power steering pump bracket retaining bolts (9).

   Tighten
   Tighten the bolts to 27 N·m (20 lb ft).

4. Remove the plug from the power steering gear inlet pipe/hose (5).
5. Connect the power steering gear inlet pipe/hose (5) to the power steering pump (2).
6. Install the power steering gear inlet pipe to power steering pump retaining banjo bolt (3) and NEW copper sealing washers (6 and 8).

   Tighten
   Tighten the banjo bolt to 58 N·m (43 lb ft).

7. Remove the plug from the power steering fluid reservoir outlet pipe/hose (4).
8. Connect the power steering fluid reservoir outlet pipe/hose (4) to the power steering pump (2).
9. Tighten the power steering fluid reservoir outlet hose spring clamp (7).
10. Install the power steering drive belt. Refer to Drive Belt ReplacementDrive Belt Replacement.
11. Install the upper section of the air box. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.
12. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct ReplacementAir Cleaner Outlet Duct Replacement.
13. Fill power steering fluid reservoir with fluid to FULL level mark on the fluid reservoir.
14. Bleed the power steering system. Refer to Power Steering System BleedingPower Steering System Bleeding.
15. Check for power steering fluid leaks.
16. Remove the container from under the vehicle.
17. Install the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2194800**

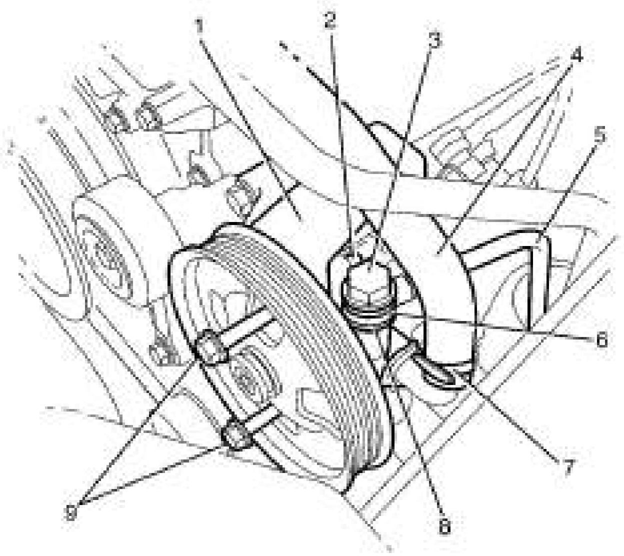
Power Steering Pump Replacement (6.0L Engine)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
2. Remove the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor with Intake Air Temperature Sensor ReplacementMass Airflow Sensor with Intake Air Temperature Sensor Replacement.
3. Remove the upper section of the air box. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.
4. Remove the power steering drive belt. Refer to Drive Belt Replacement - AccessoryDrive Belt Replacement - Accessory.
5. Place a large suitable container under the vehicle in order to collect draining power steering fluid.



Important: The power steering gear inlet pipe (5) must be plugged to prevent the entry of foreign particles into the power steering system.

Important: The copper sealing washers (6 and 8) must be discarded after removal.

6. Remove the power steering gear inlet pipe to power steering pump retaining banjo bolt (3) and copper sealing washers (6 and 8).

Plug the power steering gear inlet pipe (5).

Discard the washers.

7. Disconnect the power steering gear inlet pipe (5) from the power steering pump (2).
8. Release the power steering fluid reservoir outlet hose spring clamp (7).

Important: The power steering power steering fluid reservoir outlet hose (4) must be plugged to prevent the entry of foreign particles into the power steering system.

9. Disconnect the power steering fluid reservoir outlet hose (4) from the power steering pump (2).

Plug the power steering fluid reservoir outlet hose (4).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

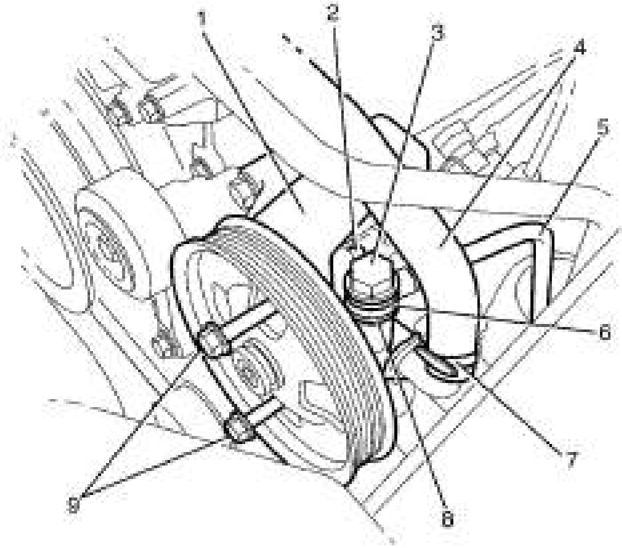
10. Remove the power steering pump to power steering pump bracket retaining bolts (9).

Discard the bolts.

11. Remove the power steering pump (2) from the power steering pump bracket (1).
12. Remove the power steering pulley from the power steering pump. Refer to Power Steering Pump Pulley ReplacementPower Steering Pump Pulley Replacement.

Installation Procedure

1. Install the power steering pulley to the power steering pump. Refer to Power Steering Pump Pulley ReplacementPower Steering Pump Pulley Replacement.



2. Install the power steering pump (2) to the power steering pump bracket (1).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the NEW power steering pump to power steering pump bracket retaining bolts (9).

Tighten
Tighten the bolts to 27 N·m (22 lb ft).

4. Remove the plug from the power steering gear inlet pipe (5).
5. Connect the power steering gear inlet pipe/hose (5) to the power steering pump (2).
6. Install the power steering gear inlet pipe to power steering pump retaining banjo bolt (3) and NEW copper sealing washers (6 and 8).

Tighten
Tighten the banjo bolt to 58 N·m (43 lb ft).

7. Remove the plug from the power steering fluid reservoir outlet hose (4).
8. Connect the power steering fluid reservoir outlet hose (4) to the power steering pump (2).
9. Tighten the power steering fluid reservoir outlet hose spring clamp (7).
10. Install the power steering drive belt. Refer to Drive Belt Replacement - AccessoryDrive Belt Replacement - Accessory.
11. Install the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor with Intake Air Temperature Sensor ReplacementMass Airflow Sensor with Intake Air Temperature Sensor Replacement.
12. Install the upper section of the air box. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.
13. Fill power steering fluid reservoir with fluid to FULL level mark on the fluid reservoir.
14. Bleed the power steering system. Refer to Power Steering System BleedingPower Steering System Bleeding.
15. Check for power steering fluid leaks.
16. Remove the container from under the vehicle.
17. Install the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.

Power Steering System Bleeding

Important:

- Use approved new power steering fluid from a sealed container. For fluid specifications refer to Fluid and Lubricant Recommendations.
- Hoses touching the frame, body or engine may cause power steering system noise. Verify that the hoses do not touch any other part of the vehicle.
- Loose connections may not leak, but may allow air into the steering system. Verify that all hose connections are tight. Refer to Fastener Tightening Specifications.

Notice: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

Important: Power steering fluid level must be maintained throughout bleed procedure.

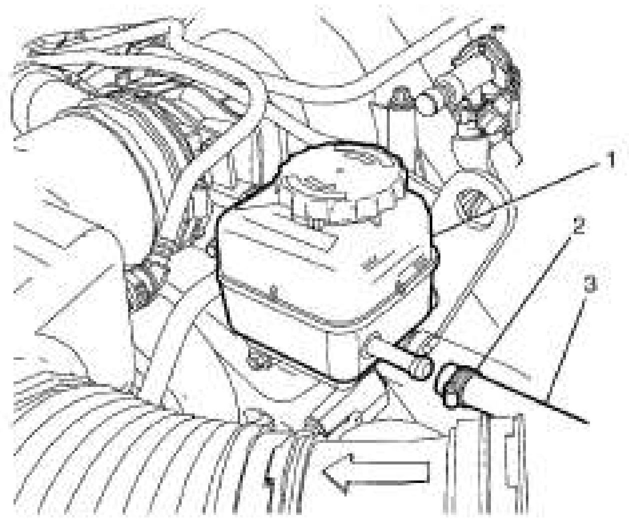
1. Fill power steering fluid reservoir with fluid to the COLD MAX level mark on the reservoir.
2. Raise the vehicle until the front wheels are off the ground. Refer to Lifting and Jacking the Vehicle.
3. With the engine OFF, turn the steering wheel from stop to stop 12 times.
4. Verify power steering fluid level per operating specification. Refer to Checking and Adding Power Steering Fluid.
5. Start the engine and allow to run at idle for three seconds, turn the engine OFF.
6. Repeat steps 4 and 5 until the power steering level remains constant.
7. Start the engine and allow to run at idle.
8. Rotate steering wheel from left to right 8 times. Check for sign of cavitation or fluid aeration (pump noise/whining).
9. Turn the engine OFF. Verify the fluid level. Refer to Checking and Adding Power Steering Fluid.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | Document ID: 1976249

Power Steering System Flushing

Important: Do not reuse drained power steering fluid regardless of appearance or condition.

1. Raise and support the front of the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Place a large suitable container under the power steering fluid reservoir inlet connection in order to collect draining fluid.
3. Clean the area surrounding the fluid reservoir cap.

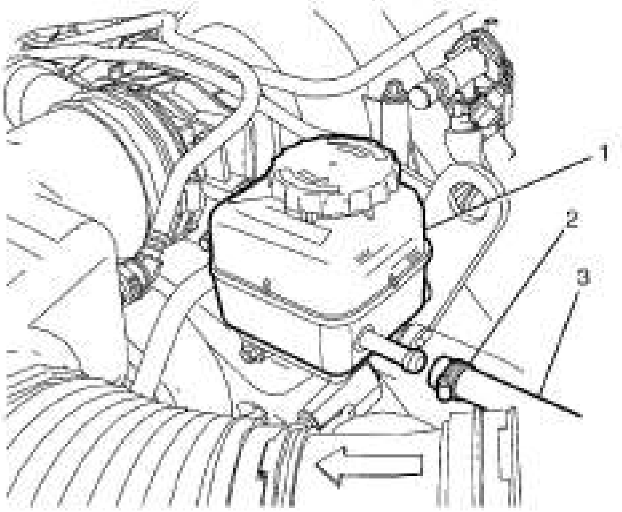


4. Release the power steering fluid reservoir inlet pipe/hose spring clamp (2) and disconnect the power steering fluid reservoir inlet pipe/hose (3) from the power steering fluid reservoir (1).
5. Plug the power steering fluid reservoir (1).

Important:

- This step may require 4 L (3.5 qt) of power steering fluid until the draining fluid appears clear.
- Do not allow the power steering fluid level in the fluid reservoir to drop below MAX while the engine is running.
- Use approved new power steering fluid from a sealed container. For fluid specifications refer to Fluid and Lubricant Recommendations.

6. Run the engine at idle while maintaining the fluid level at MAX in the reservoir, until the fluid draining from the power steering fluid reservoir Inlet hose is clean and free from debris.
7. Turn the engine OFF.



8. Remove the plug from power steering fluid reservoir.
9. Release the power steering fluid reservoir inlet pipe/hose spring clamp (2) and connect the power steering fluid reservoir inlet pipe/hose (3) to the power steering fluid reservoir (1).
10. Remove the container.
11. Check the power steering fluid. Refer to Checking and Adding Power Steering Fluid.
12. Run the engine at idle for approximately 15 minutes.
13. Inspect the power steering fluid for the following indications of contamination:
    - Milky fluid - water
    - Brown fluid - burnt
    - Plastic debris or dirt chunks
14. If the fluid is contaminated, repeat steps 3 - 12.
15. Clean any spilt fluid.
16. Bleed the power steering system. Refer to Power Steering System Bleeding.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2194795**

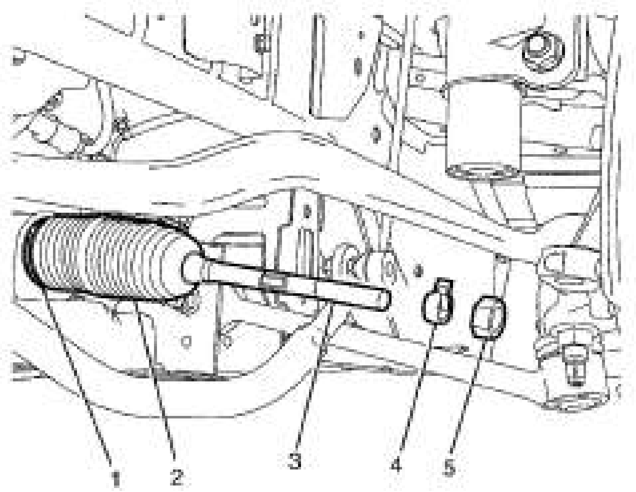
Steering Gear Boot Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
3. Remove the tie rod end. Refer to Steering Linkage Outer Tie Rod ReplacementSteering Linkage Outer Tie Rod Replacement.



Important: Note the number of turns required to remove the tie rod end lock nut (5).

4. Remove the tie rod end lock nut (5) from the tie rod (3).

Important: The tie rod boot to tie rod retaining clamp (4) is a single use part and must be discarded after removal.

5. Remove the tie rod boot to tie rod retaining clamp (4).

Discard the clamp.

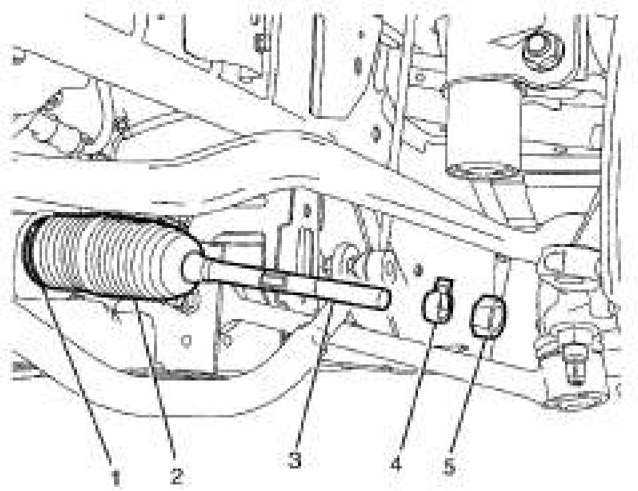
Important: The tie rod boot to steering gear housing clamp (1) is a single use part and must be discarded after removal.

6. Remove the tie rod boot to steering gear housing clamp (1).

Discard the clamp.

7. Remove the tie rod boot (2) from the tie rod (3).

Installation Procedure



1. Install the tie rod boot (2) to the tie rod (3).
2. Install the NEW tie rod boot to steering gear housing clamp (1).
3. Install the NEW tie rod boot to tie rod retaining clamp (4).

Important: The tie rod end lock nut (5) must be installed rotating the same number of turns as recorded during removal and aligned with the mark previously made on the tie rod (3).

4. Install the tie rod end lock nut (5) to the tie rod (3).
5. Install the tie rod end. Refer to Steering Linkage Outer Tie Rod ReplacementSteering Linkage Outer Tie Rod Replacement.
6. Install the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
7. Remove the safety stands.
8. Lower the vehicle to the ground.
9. Bounce the vehicle several times to settle the suspension.
10. Check and adjust the wheel alignment. Refer to Wheel Alignment MeasurementWheel Alignment Measurement.

Notice: Refer to Fastener Notice in the Preface section.

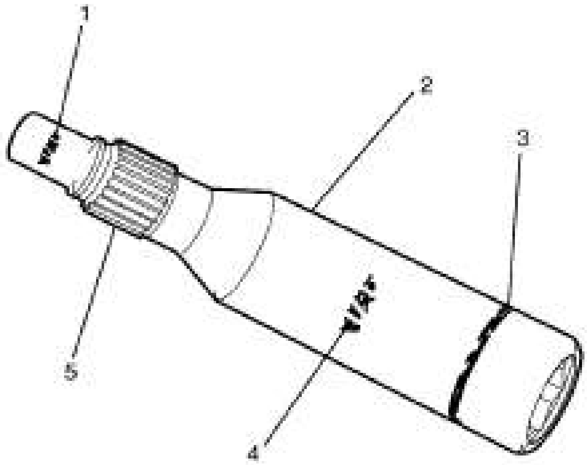
11. Tighten the tie rod end lock nut (5).

Tighten
Tighten the nut to 170 N·m (125 lb ft).

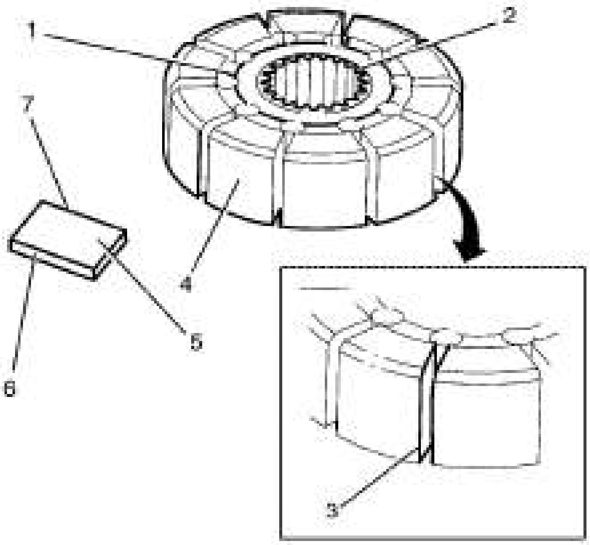
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | Document ID: 1995310

Steering Gear Component Inspection

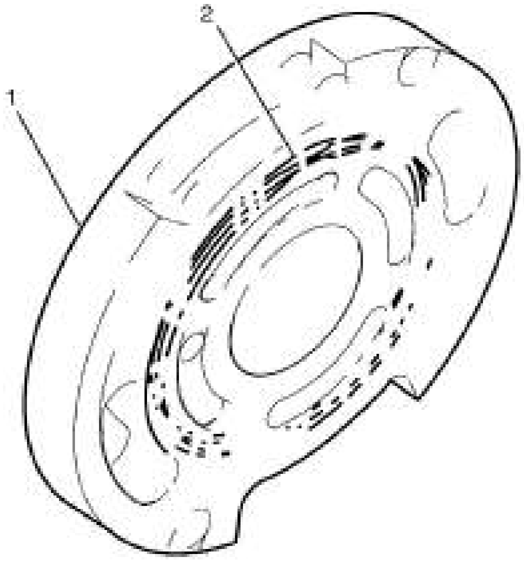
Caution: Refer to General Repair Instructions in the Preface section.



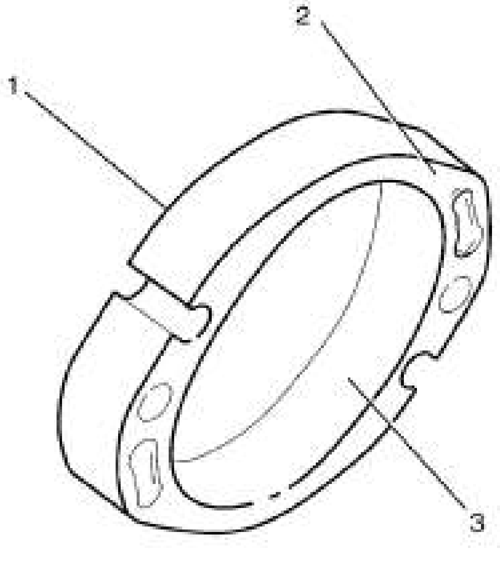
1. Clean all parts in a suitable cleaning fluid and dry.
2. Inspect the power steering pump drive shaft (2) for:
   - Scoring, pitting or bush pick-up on the pump housing bush surface (1).
   - Worn or damaged splines (5).
   - Scoring, pitting or bush pick-up on the rear end plate bush surface (4).
   - Excessive wear on the seal track (3).



3. Inspect the pump rotor (4) for:
    - Scoring on the thrust surfaces (1).
    - Worn or damaged splines (2).
    - Damage to the vane channels (3) that may cause the vanes to stick.
4. Inspect the vanes (5) for:
    - Excessive wear on the contact surface (7).
    - Wear on the thrust faces of the vane (6).
    - Make sure the vanes move freely in the vane channels (3).

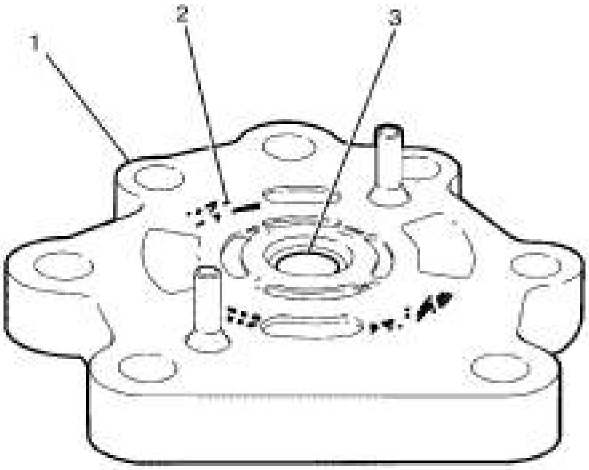


5. Inspect the thrust plate (1) for wear and any scoring marks (2).

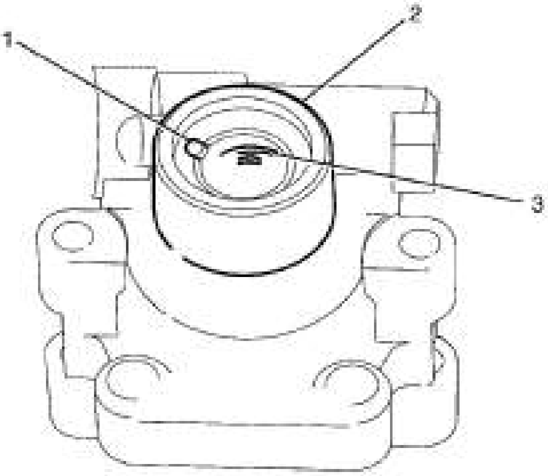


Important: A high polish is always present on the surface of the power steering pump ring as a result of normal wear. Do not confuse this with abnormal wear.

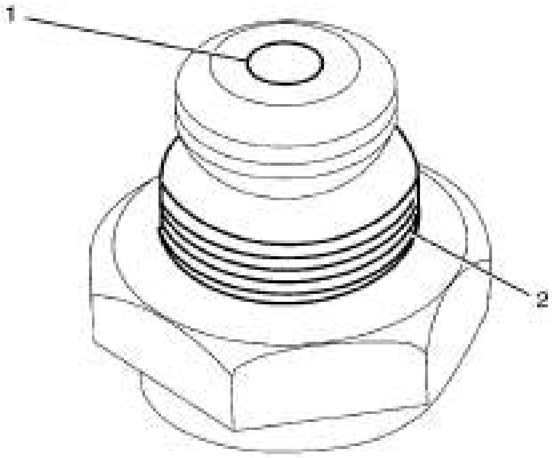
6. Inspect the power steering pump ring (1) for excessive wear and scouring on the inner surface (3) and the side faces (3).



7. Inspect the rear end plate (1) for:
   - Excessive wear, signs of bush material pick-up or pitting of the rear end plate bush (3).
   - Scouring and excessive wear on the thrust face (2).



8. Inspect the power steering pump housing (3) for:
   - Excessive wear, signs of bush material pick-up or pitting of the power steering pump housing bush (1).
   - Blockages in the power steering pump housing bush lubrication passage (2).



9. Inspect the high pressure outlet fitting for:
   - Damage to the threads (2).
   - Restrictions in the outlet orifice (1).
10. Inspect the droop flow control valve for:
    - Burrs and foreign material on the shaft and piston plunger.
    - Blocked filer screen, which is located in the base of the valve assembly.
    - Insert the valve assembly into the pump housing and make sure the valve is free to move in the housing bore. If sticking is observed, check for foreign material and burrs on the inside the housing.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Power Steering | Repair Instructions | **Document ID: 2194797**

Steering Gear Replacement (3.6L Engine RHD)

Tools Required

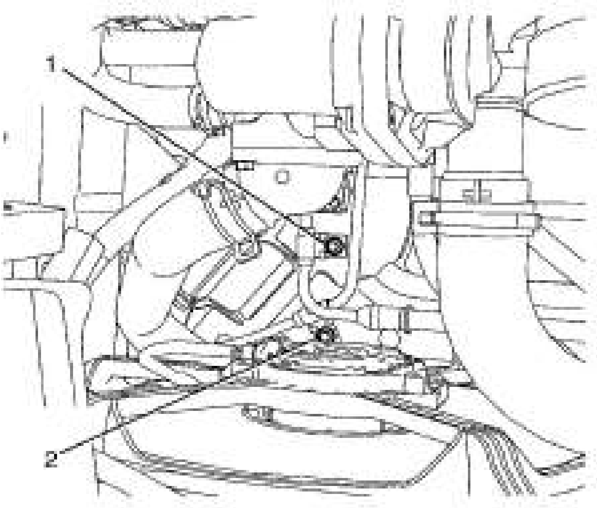
CH-49405 CH-49405 Ball Joint Release Too.l

Removal Procedure

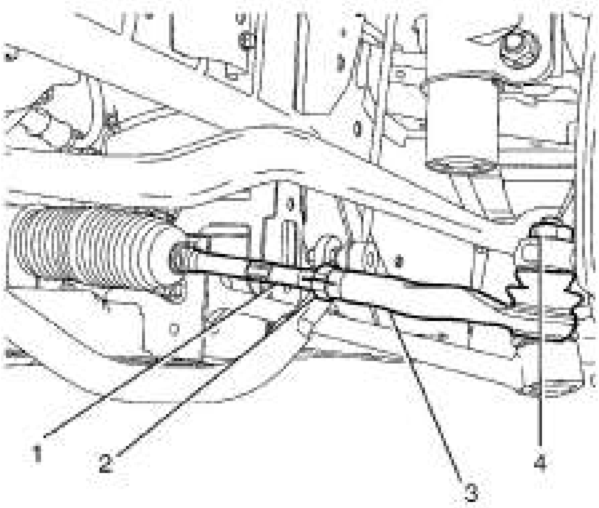
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
2. Remove the air inlet duct. Refer to Air Cleaner Inlet Duct ReplacementAir Cleaner Inlet Duct Replacement.



3. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).
4. Remove the power steering gear outlet pipe/hose bracket to subframe retaining bolt (2).
5. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
6. Remove the front wheels. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.



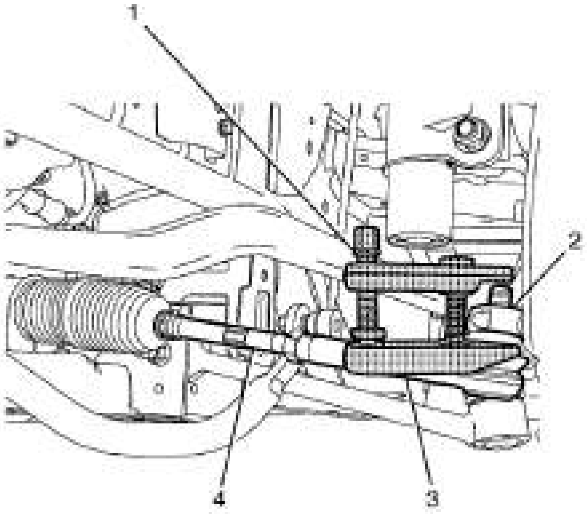
Important: Mark the tie rod end (3) and tie rod end lock nut (2) in relation to the tie rod (1).

7. Loosen the tie rod end lock nut (2) half a turn.

   Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

8. Remove the tie rod end to steering knuckle retaining nut (4).

   Discard the nut.

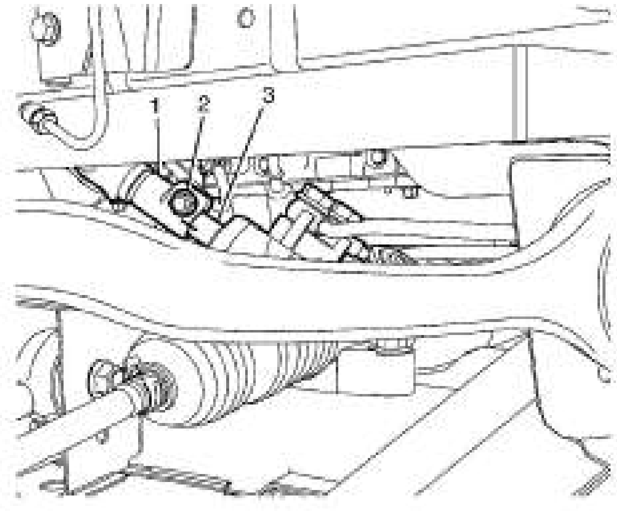


Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

9. Separate the tie rod end (3) from the steering knuckle (2) using the CH-49405 CH-49405 (1).
10. Remove the CH-49405 CH-49405 (1).
11. Disconnect the tie rod end (3) from the steering knuckle (1).

Important: Note the number of turns required to remove.

12. Remove the tie rod end (3) from the tie rod (4).
13. Repeat steps 6 to 11 on the other side of the vehicle.
14. Remove the engine undertray. Refer to.



Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

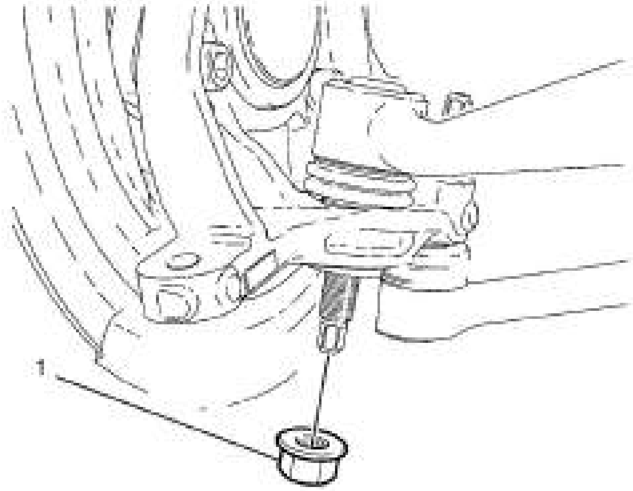
15. Mark the intermediate steering shaft (1) in relation to the pinion shaft (3).
16. Remove the intermediate steering shaft to pinion shaft retaining bolt (2).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

17. Disconnect the intermediate shaft (2) from the pinion shaft (3).

    Discard the bolt.

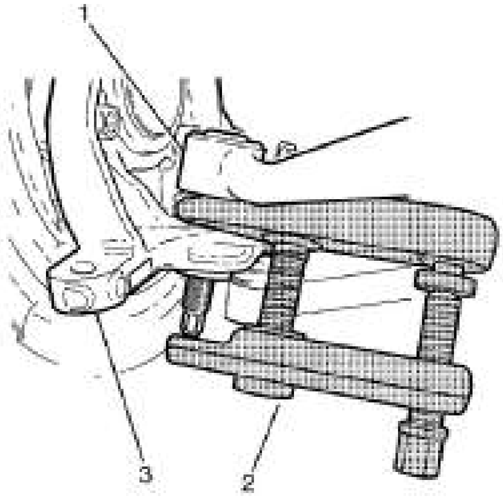
18. Lower the vehicle.



Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

19. Remove the driver side front castor arm to steering knuckle retaining nut (1).

    Discard the nut.

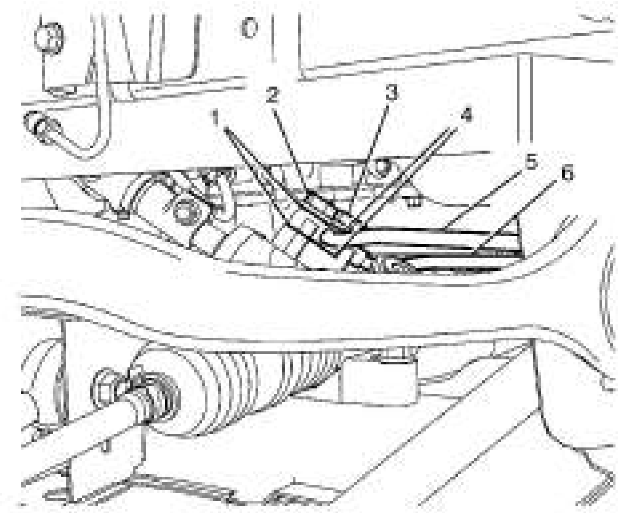


Important: Once a load is applied by the release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

20. Separate the driver side front castor arm (3) from the steering knuckle (1) using the CH-

49405 CH-49405 (2).

21. Disconnect the driver side front castor arm (3) from the steering knuckle (1).
22. Place a large suitable container under the vehicle in order to collect draining fluid.



Important: The power steering inlet pipe/hose (5) must be plugged to prevent the entry of foreign particles into the power steering system.

Important: The copper sealing washers (1) must be discarded after removal.

23. Remove the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (2) and copper sealing washers (1).

    Plug the steering gear inlet pipe/hose (5).

    Discard the washers.

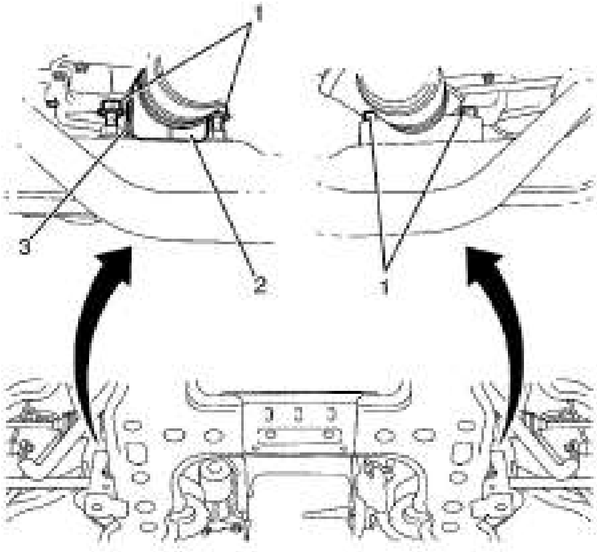
    Important: The power steering outlet pipe/hose (6) must be plugged to prevent the entry of foreign particles into the power steering system.

    Important: The copper sealing washers (4) must be discarded after removal.

24. Remove the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (3) and copper sealing washers (4).

    Plug the steering gear outlet pipe/hose (6).

    Discard the washers.

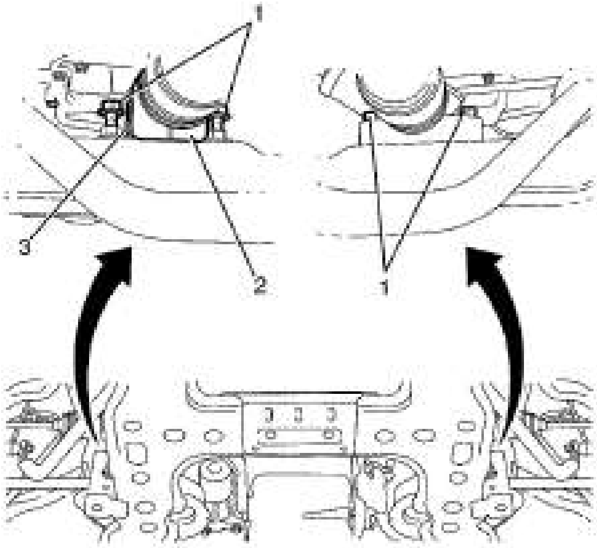


25. Remove the steering gear to subframe retaining bolts (1).
26. Remove the steering gear insulator retaining bracket (2) from the steering gear insulator (3).
27. Remove the steering gear insulator (3) from the steering gear.

Important: The steering gear must be removed from the driver side of the vehicle.

28. Remove the steering gear from the vehicle.

Installation Procedure



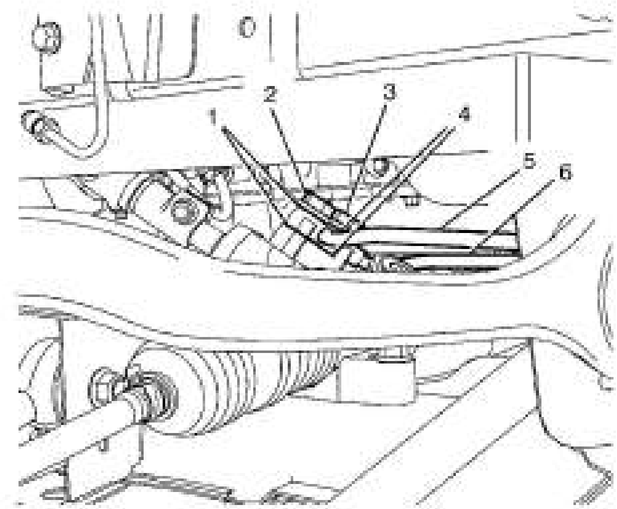
Important: The steering gear must be installed from the driver side of the vehicle.

1. Install the steering gear to the vehicle.
2. Install the steering gear insulator (3) to the steering gear.
3. Install the steering gear insulator retaining bracket (2) to the steering gear insulator (3).

Notice: Refer to Fastener Notice in the Preface section.

4. Install the steering gear to subframe retaining bolts (1).

Tighten
Tighten the Bolts to 65 N·m (48 lb ft).



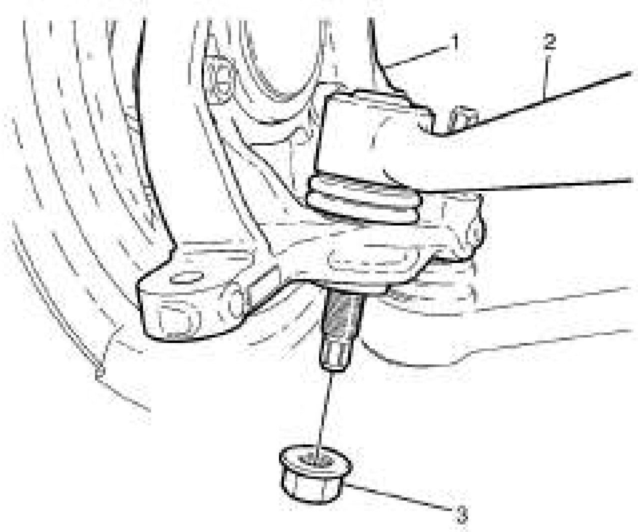
5. Remove the plug from the steering gear inlet pipe/hose (5).
6. Install the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (1) and NEW copper sealing washers (2).

Tighten
Tighten the banjo bolt to 58 N·m (43 lb ft).

7. Remove the plug from the steering gear outlet pipe/hose (6).
8. Install the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (3) and NEW copper sealing washers (4).

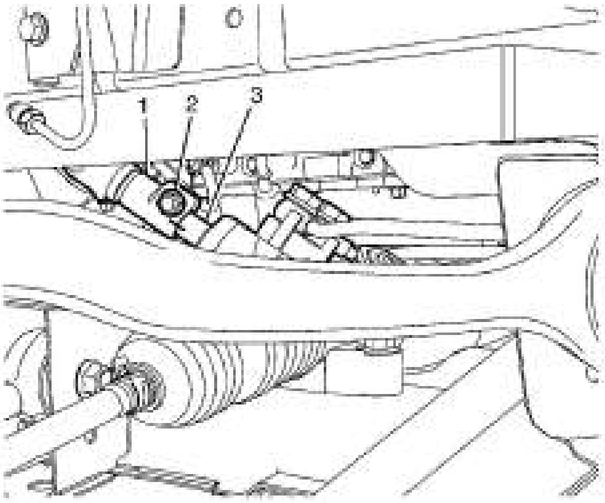
Tighten
Tighten the banjo bolt to 58 N·m (43 lb ft).

9. Remove the container from under the vehicle.



10. Connect the driver side front castor arm (2) to the steering knuckle (1).
11. Install the driver side front castor arm ball joint to steering knuckle NEW retaining nut (3).

Tighten
Tighten nut to 70 N·m (52 lb ft).

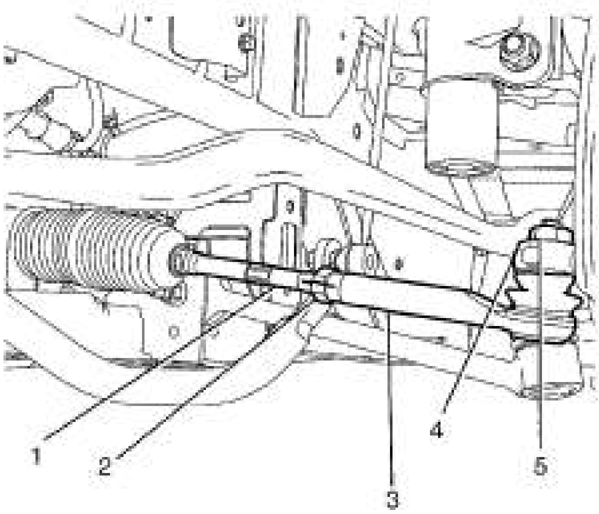


Important: The intermediate steering shaft and pinion shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

12. Connect the intermediate steering shaft (1) to the pinion shaft (3).
13. Install the intermediate steering shaft to pinion shaft NEW retaining bolt (2).

Tighten

Tighten the bolt to 25 N·m (18 lb ft).



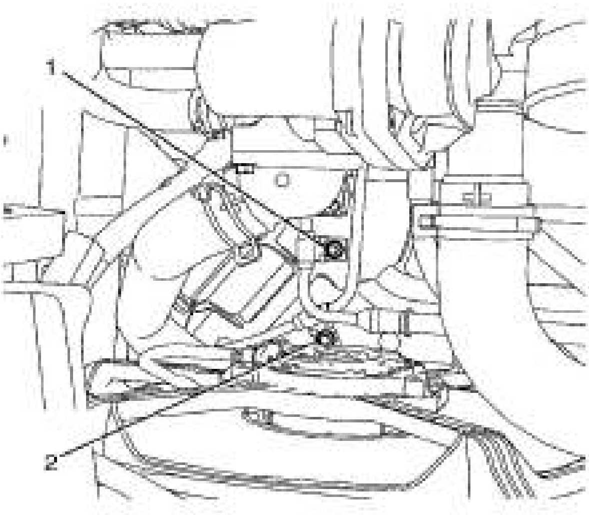
Important: The tie rod end (3) must be installed rotating the same number of turns as recorded during removal and aligned with the mark previously made on the tie rod (1) and tie rod end lock nut (2).

14. Install the tie rod end (3) to the tie rod (1).
15. Connect the tie rod end (3) to the steering knuckle (4).
16. Install the tie rod end to steering knuckle retaining NEW nut (5).

Tighten

Tighten the nut to 25 N·m+ 120 degrees (18 lb ft + 120 degrees).

17. Repeat steps 14 to 16 on the other side of the vehicle.
18. Install the engine undertray. Refer to Engine Splash Shield ReplacementEngine Splash Shield Replacement.
19. Install the front wheels. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
20. Remove the safety stands.
21. Lower the vehicle to the ground.



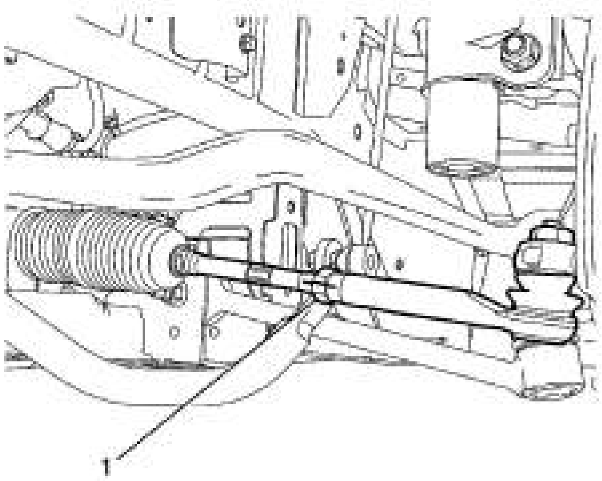
22. Install the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

23. Install the power steering gear outlet pipe/hose bracket to subframe retaining bolt (2).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

24. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
25. Bleed the power steering system. Refer to Power Steering System BleedingPower Steering System Bleeding.
26. Check for power steering fluid leaks.
27. Install the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
28. Install the air inlet duct. Refer to Air Cleaner Inlet Duct ReplacementAir Cleaner Inlet Duct Replacement.
29. Bounce the vehicle several times to settle the suspension.
30. Check and adjust the wheel alignment. Refer to Wheel Alignment MeasurementWheel Alignment Measurement.



31. Tighten the tie rod end lock nut (1).

    Tighten
    Tighten the nut to 170 N·m (125 lb ft).

Steering Gear Replacement (6.0L Engine RHD)

Tools Required

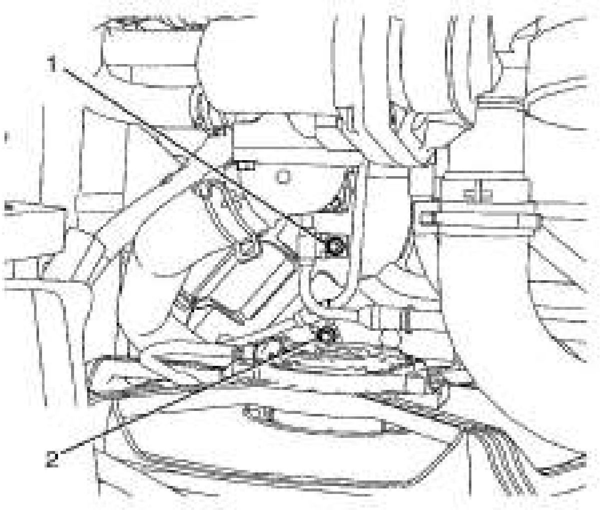
6297 6297 Ball Joint Release Too.l

Removal Procedure

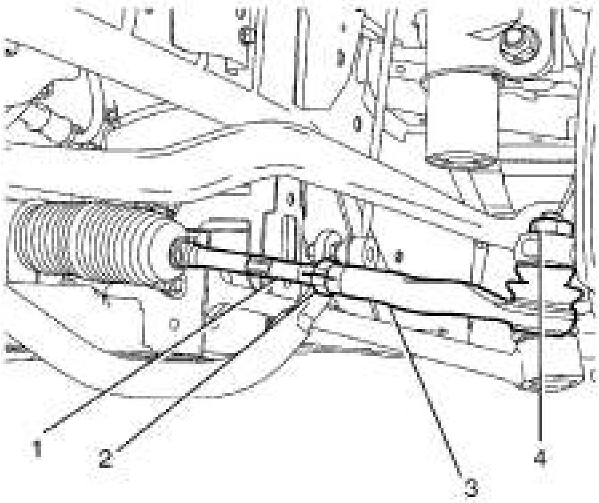
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
2. Remove the air inlet duct. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement.



3. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).
4. Remove the power steering gear outlet pipe/hose bracket to subframe retaining bolt (2).
5. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
6. Remove the front wheels. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.



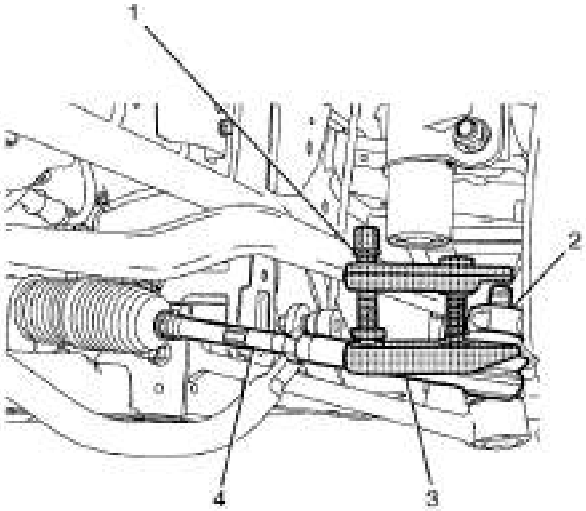
Important: Mark the tie rod end (3) and tie rod end lock nut (2) in relation to the tie rod (1).

7. Loosen the tie rod end lock nut (2) half a turn.

   Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

8. Remove the tie rod end to steering knuckle retaining nut (4).

   Discard the nut.

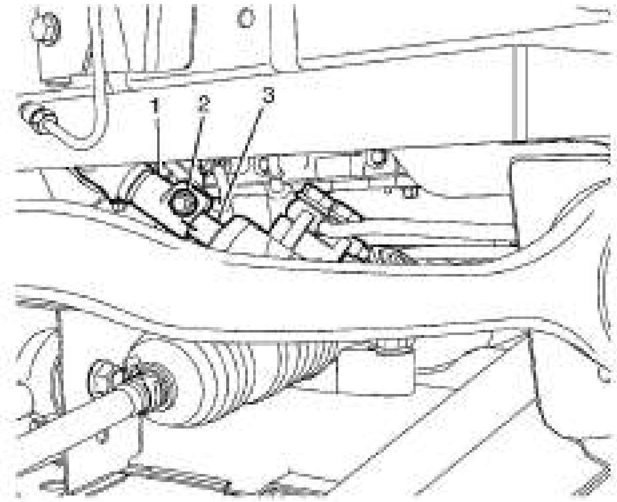


Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

9. Separate the tie rod end (3) from the steering knuckle (2) using the 6297 6297 (1).
10. Remove the 6297 6297 (1).
11. Disconnect the tie rod end (3) from the steering knuckle (1).

Important: Note the number of turns required to remove.

12. Remove the tie rod end (3) from the tie rod (4).
13. Repeat steps 6 to 11 on the other side of the vehicle.
14. Remove the engine undertray. Refer to Engine Splash Shield ReplacementEngine Splash Shield Replacement.



Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

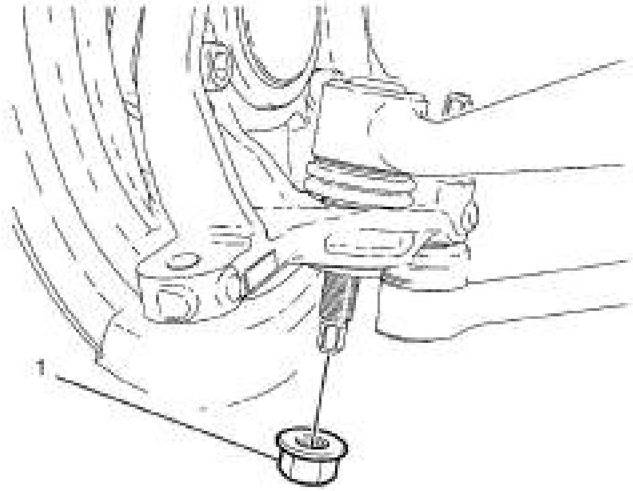
15. Mark the intermediate steering shaft (1) in relation to the pinion shaft (3).
16. Remove the intermediate steering shaft to pinion shaft retaining bolt (2).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

17. Disconnect the intermediate shaft (2) from the pinion shaft (3).

    Discard the bolt.

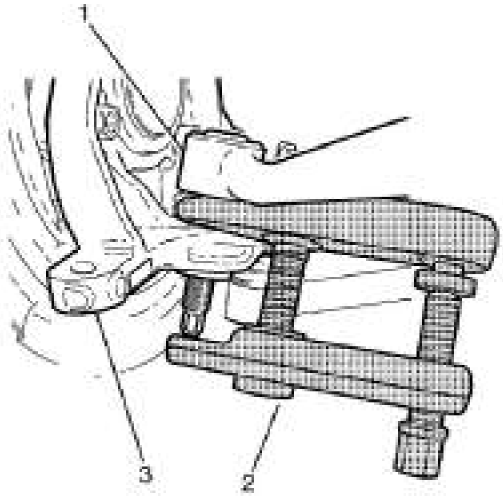
18. Lower the vehicle.



Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

19. Remove the driver side front castor arm to steering knuckle retaining nut (1).

    Discard the nut.

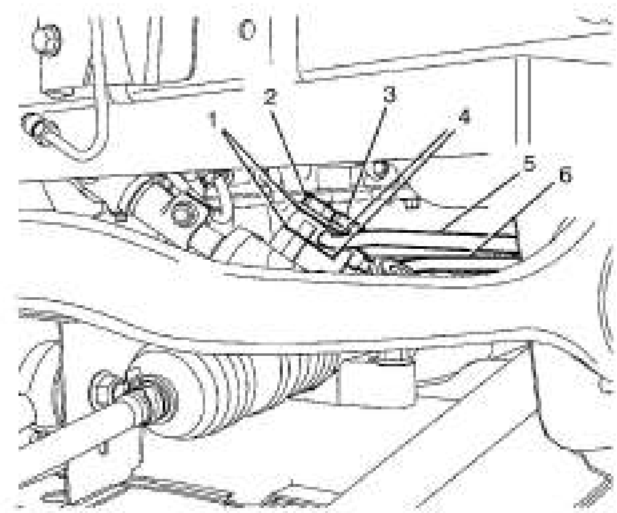


Important: Once a load is applied by the release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

20. Separate the driver side front castor arm (3) from the steering knuckle (1) using the 6297

6297 (2).

21. Disconnect the driver side front castor arm (3) from the steering knuckle (1).
22. Place a large suitable container under the vehicle in order to collect draining fluid.



Important: The power steering inlet pipe/hose (5) must be plugged to prevent the entry of foreign particles into the power steering system.

Important: The copper sealing washers (1) must be discarded after removal.

23. Remove the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (2) and copper sealing washers (1).

    Plug the steering gear inlet pipe/hose (5).

    Discard the washers.

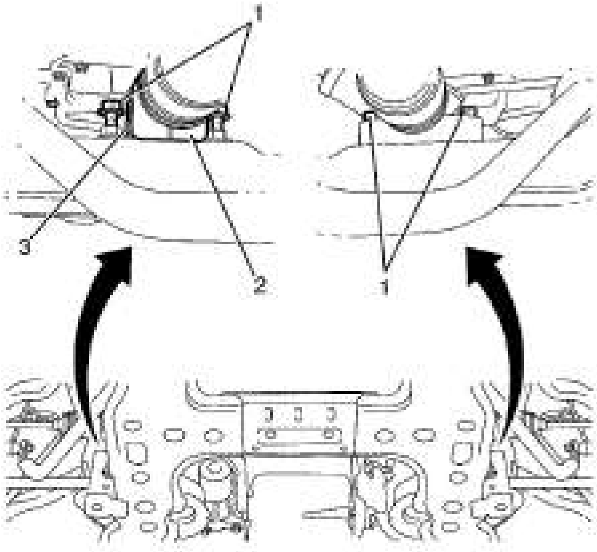
    Important: The power steering outlet pipe/hose (6) must be plugged to prevent the entry of foreign particles into the power steering system.

    Important: The copper sealing washers (4) must be discarded after removal.

24. Remove the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (3) and copper sealing washers (4).

    Plug the steering gear outlet pipe/hose (6).

    Discard the washers.

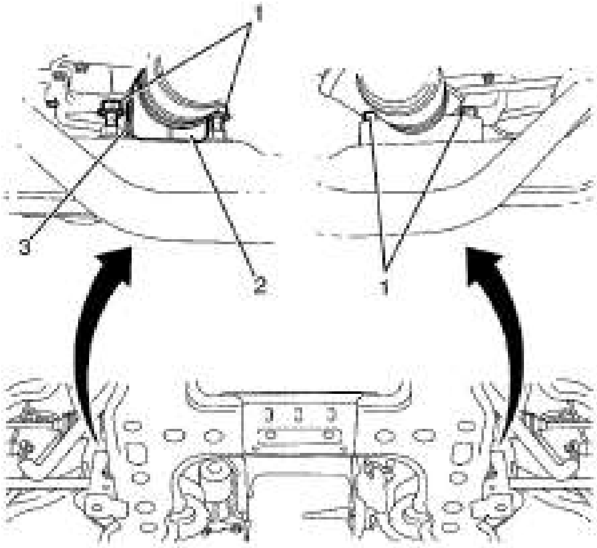


25. Remove the steering gear to subframe retaining bolts (1).
26. Remove the steering gear insulator retaining bracket (2) from the steering gear insulator (3).
27. Remove the steering gear insulator (3) from the steering gear.

Important: The steering gear must be removed from the driver side of the vehicle.

28. Remove the steering gear from the vehicle.

Installation Procedure



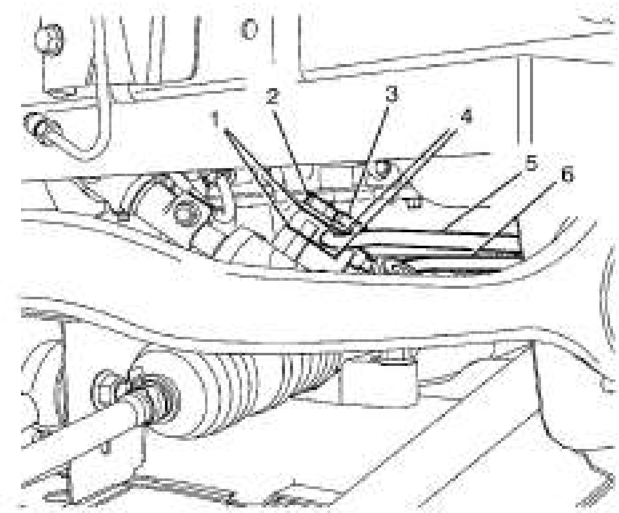
Important: The steering gear must be installed from the driver side of the vehicle.

1. Install the steering gear to the vehicle.
2. Install the steering gear insulator (3) to the steering gear.
3. Install the steering gear insulator retaining bracket (2) to the steering gear insulator (3).

Notice: Refer to Fastener Notice in the Preface section.

4. Install the steering gear to subframe retaining bolts (1).

Tighten
Tighten the Bolts to 65 N·m (48 lb ft).



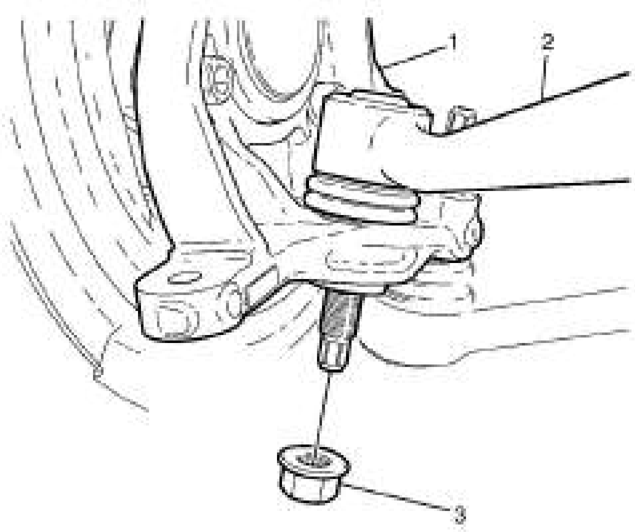
5. Remove the plug from the steering gear inlet pipe/hose (5).
6. Install the power steering gear inlet pipe/hose to power steering gear retaining banjo bolt (1) and NEW copper sealing washers (2).

Tighten
Tighten the banjo bolt to 58 N·m (43 lb ft).

7. Remove the plug from the steering gear outlet pipe/hose (6).
8. Install the power steering gear outlet pipe/hose to power steering gear retaining banjo bolt (3) and NEW copper sealing washers (4).

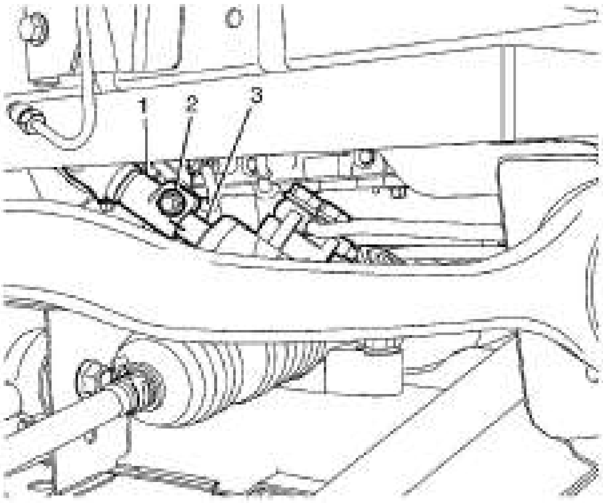
Tighten
Tighten the banjo bolt to 58 N·m (43 lb ft).

9. Remove the container from under the vehicle.



10. Install the driver side front control arm (2) to the steering knuckle (1).
11. Install the driver side front castor arm ball joint to steering knuckle NEW retaining nut (3).

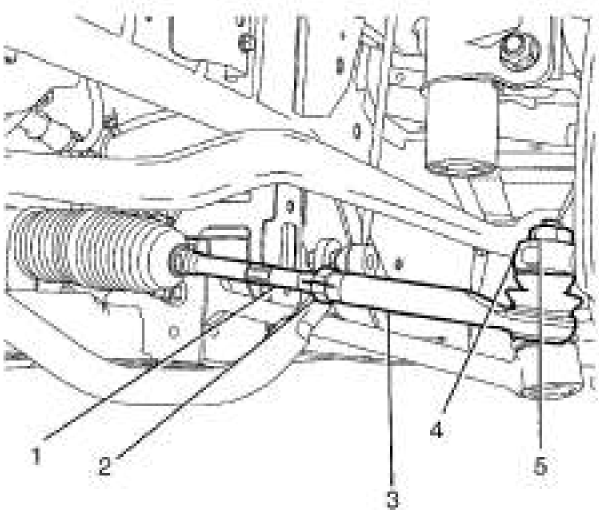
    Tighten
    Tighten nut to 70 N·m (52 lb ft).



Important: The intermediate steering shaft and pinion shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

12. Connect the intermediate steering shaft (1) to the pinion shaft (3).
13. Install the intermediate steering shaft to pinion shaft NEW retaining bolt (2).

Tighten
Tighten the bolt to 25 N·m (18 lb ft).

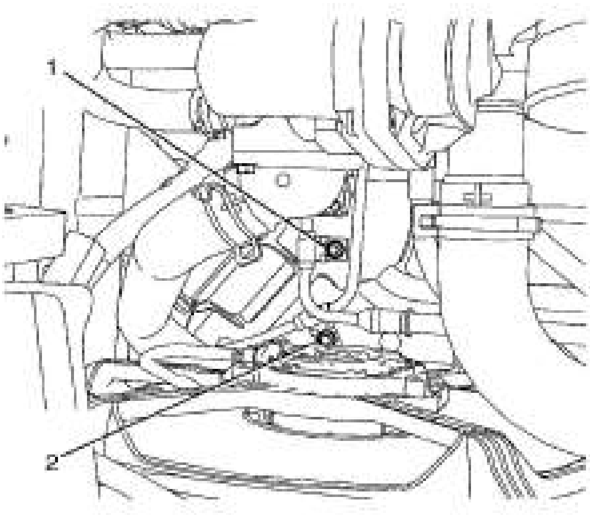


Important: The tie rod end (3) must be installed rotating the same number of turns as recorded during removal and aligned with the mark previously made on the tie rod (1) and tie rod end lock nut (2).

14. Install the tie rod end (3) to the tie rod (1).
15. Connect the tie rod end (3) to the steering knuckle (4).
16. Install the tie rod end to steering knuckle retaining NEW nut (5).

Tighten
Tighten the nut to 25 N·m+ 120 degrees (18 lb ft + 120 degrees).

17. Repeat steps 14 to 16 on the other side of the vehicle.
18. Install the engine undertray. Refer to Engine Splash Shield ReplacementEngine Splash Shield Replacement.
19. Install the front wheels. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
20. Remove the safety stands.
21. Lower the vehicle to the ground.



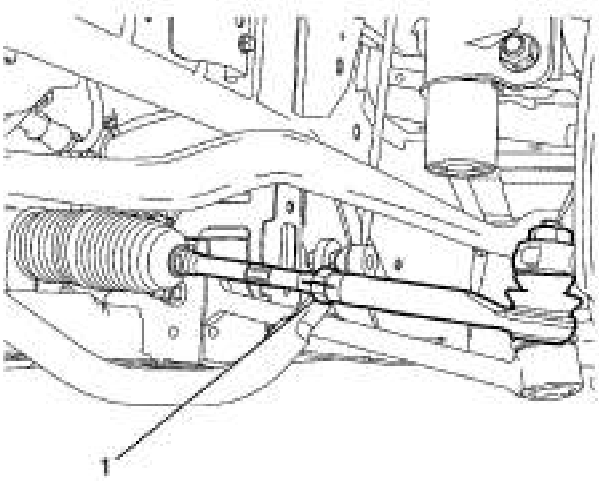
22. Install the power steering gear inlet pipe/hose bracket to subframe retaining bolt (1).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

23. Install the power steering gear outlet pipe/hose bracket to subframe retaining bolt (2).

    Tighten
    Tighten the bolt to 9 N·m (80 lb in).

24. Fill power steering fluid reservoir with fluid to the MAX level mark on the reservoir.
25. Bleed the power steering system. Refer to Power Steering System BleedingPower Steering System Bleeding.
26. Check for power steering fluid leaks.
27. Install the engine dress cover. Refer to Engine Cover ReplacementEngine Cover Replacement.
28. Install the air inlet duct. Refer to Air Cleaner Assembly ReplacementAir Cleaner Assembly Replacement 3.
29. Bounce the vehicle several times to settle the suspension.
30. Check and adjust the wheel alignment. Refer to Wheel Alignment MeasurementWheel Alignment Measurement.



31. Tighten the tie rod end lock nut (1).

Tighten
Tighten the nut to 170 N·m (125 lb ft).

Steering Linkage Outer Tie Rod Replacement

Tools Required

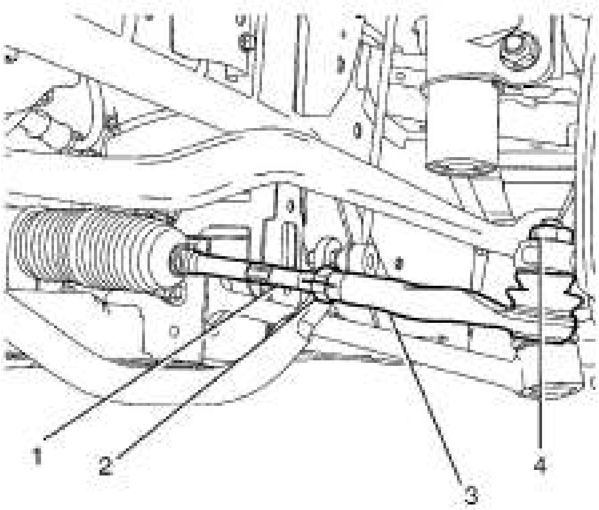
6297 6297 Ball Joint Release Tool.

Removal Procedure After

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.



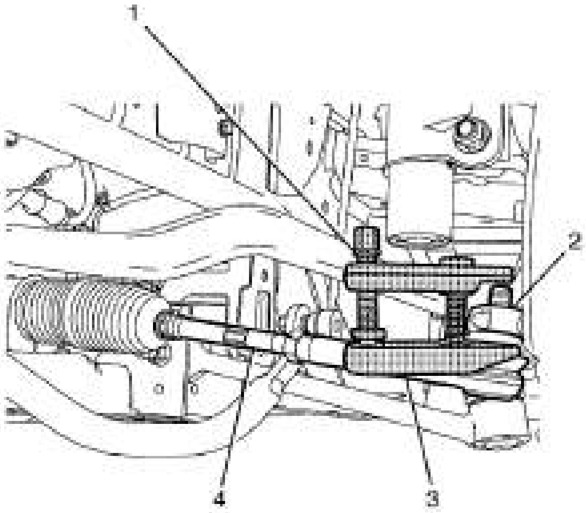
Important: Mark the tie rod end (3) and tie rod end lock nut (2) in relation to the tie rod (1).

3. Loosen the tie rod end lock nut (2) half a turn.

Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

4. Remove the tie rod end to steering knuckle retaining nut (4).

Discard the nut.



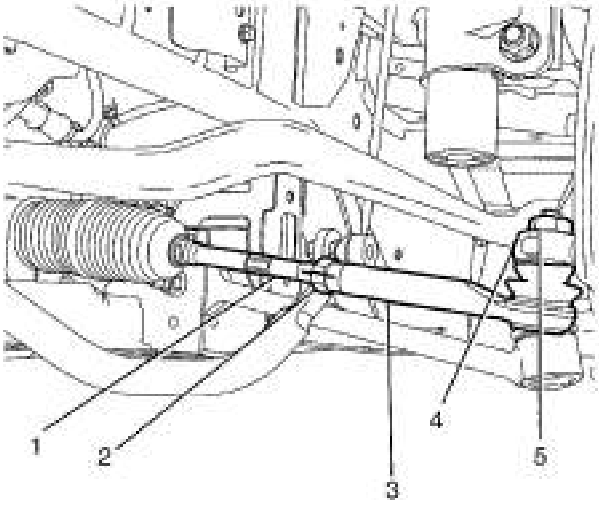
Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

5. Separate the tie rod end (3) from the steering knuckle (2) using the 6297 6297 (1).
6. Remove the 6297 6297 (1).
7. Disconnect the tie rod end (3) from the steering knuckle (2).

Important: Note the number of turns required to remove.

8. Remove the tie rod end (3) from the tie rod (4).

Installation Procedure



Important: The tie rod end (3) must be installed rotating the same number of turns as recorded during removal and aligned with the mark previously made on the tie rod (1).

1. Install the tie rod end (3) to the tie rod (1).
2. Connect the tie rod end (3) to the steering knuckle (4).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the tie rod end to steering knuckle retaining NEW nut (5).

Tighten
Tighten the nut to 25 N·m+ 120 degrees (18 lb ft + 120 degrees).

4. Install the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
5. Remove the safety stands.
6. Lower the vehicle to the ground.
7. Bounce the vehicle several times to settle the suspension.
8. Check and adjust the wheel alignment. Refer to Wheel Alignment MeasurementWheel Alignment Measurement.
9. Tighten the tie rod end lock nut (2).

Tighten
Tighten the nut to 170 N·m (125 lb ft).

Power Steering System Description and Operation

Power Steering System Description

The power steering fluid reservoir holds the power steering fluid. It is mounted to a bracket on the engine remotely located from the power steering pump. The power steering fluid reservoir outlet hose allows low pressure fluid to flow from the power steering fluid reservoir to the power steering pump. The power steering pump is a constant displacement vane-type pump that provides hydraulic pressure and flow for the power steering gear. The power steering pump is belt-driven. The power steering gear inlet pipe/hose connects the power steering pump to the power steering gear allowing pressurised power steering fluid to flow from the power steering pump to the power steering gear. The power steering gear is a rack and pinion type assembly. The power steering gear converts steering wheel rotation to lateral movement. The power steering gear outlet pipe/hose allows fluid to flow from the power steering gear to the power steering fluid cooler. The power steering fluid cooler transfers the heat generated by power steering pump and power steering gear from the fluid to the atmosphere. The power steering fluid reservoir inlet hose allows fluid to flow from the power steering fluid cooler back to the power steering fluid reservoir.

Power Steering Pump Description

Hydraulic pressure for the power steering system is provided by a Kayaba vane type constant flow pump.

Fluid from the power steering fluid reservoir outlet pipe/hose flows through a passage in the power steering pump housing to the rear end plate which will then supply the vanes with under-vane pressure and to fill the cavity between the rotor and the pump ring as well as filling the high pressure chamber.

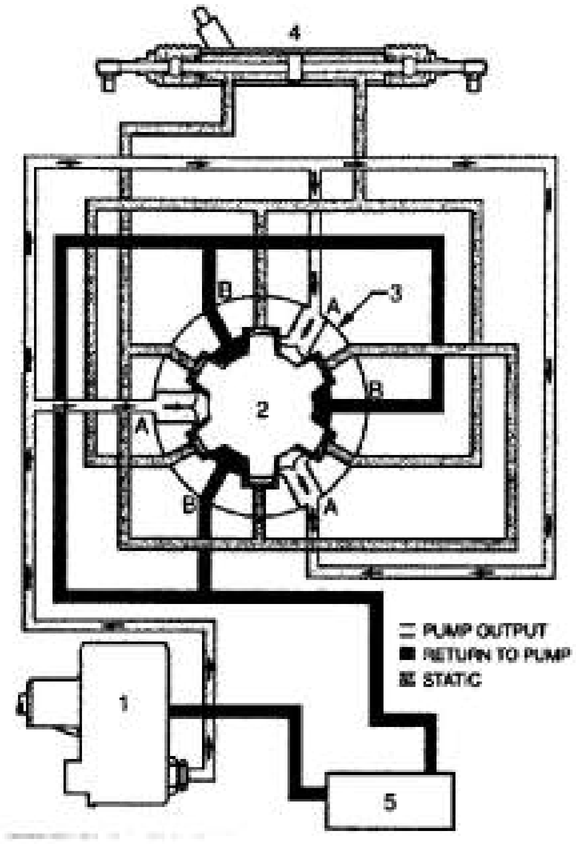
The power steering pump drive shaft is fitted with a pulley, which is driven by the serpentine belt from the engine crankshaft. The power steering pump drive shaft turns the rotor and vane assembly. The vane tips follow the inner cam surface of the power steering pump ring, moving outward and inward twice during each revolution. This results in a complete pumping cycle every 180% of rotation. Power steering fluid is moved in the spaces between the vanes. As the vane tips move inwards, the pressure of the power steering fluid is raised and the power steering fluid is discharged from the power steering pump ring through the thrust plate to the cavity in the front of the power steering pump housing. A portion of this pressurised power steering fluid is circulated through the central port system in the rear plate forcing the vanes against the cam surface of the power steering pump ring.

Power Steering Gear Description

The power steering gear is a rack and pinion type system, the rack and the pinion are the two components that convert steering wheel rotation to lateral movement. The steering shaft is attached to the pinion in the steering gear. The pinion rotates with the steering wheel. Gear teeth on the pinion mesh with gear teeth on the rack. The rotating pinion moves the rack from side to side. The steering gear contains a valve assembly that regulates the incoming fluid to the right and left chambers in order to assist in right and left turns. Turning the steering wheel partially rotates the valve assembly, which applies greater fluid pressure and flow to one side of the rack piston, and lower pressure and flow to the other side of the rack piston. The pressure assists the lateral movement of the rack. The lateral action of the rack pushes and pulls the tie rods in order to change the direction of the vehicle's front wheels.

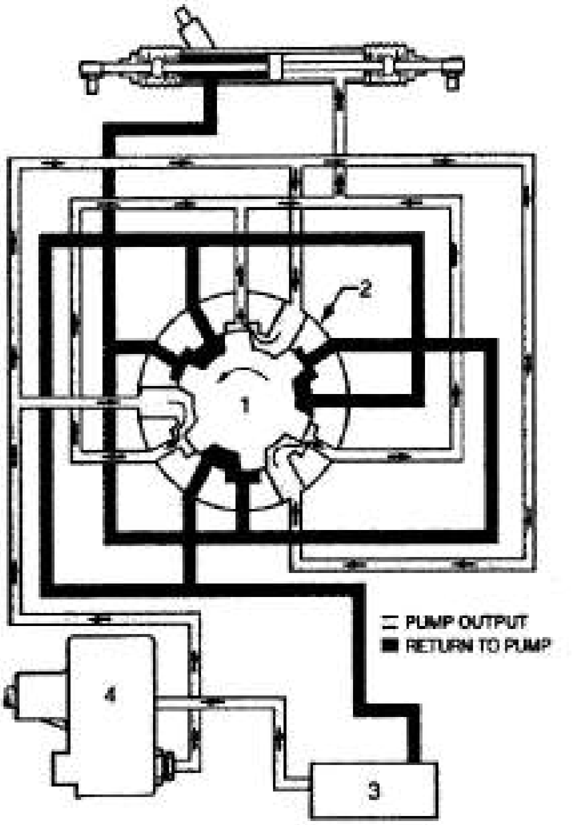
Power Steering Fluid Flow

Neutral Position -- Straight Ahead



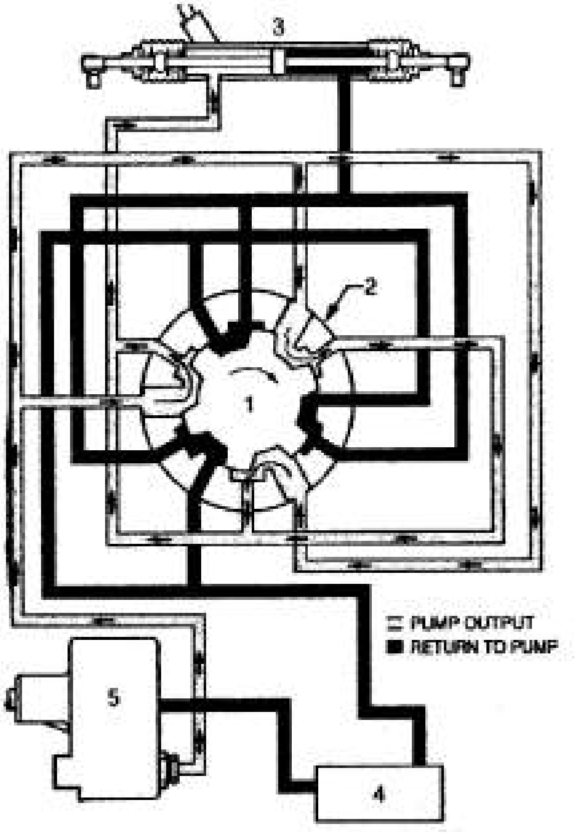
In the straight ahead position, power steering fluid flow from the pump (1) is directed into the cavity (A) of the inner valve assembly (2) and out through a number of drilled holes (B) in the outer sleeve (3). In this steering position, the inner valve allows power steering fluid to pass equally to both sides of the rack (4) piston (shown as static because no power steering fluid actually flows to and from the steering gear). The bypassed power steering fluid returns to the power steering fluid reservoir (5) through holes drilled in the longitudinal grooves of the inner valve. With an equal pressure applied to both sides of the rack piston, no power assistance is provided.

Turning Left



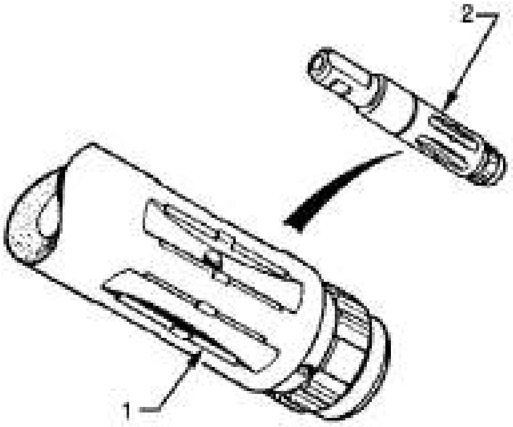
When turning to the left, relative motion between the inner rotating valve (1) and the outer sleeve (2) occurs, this blocks the fluid return cricuit and redirects the fliud to the right-hand side of the rack piston (3), at the same time the power steering fluid on the opposite side of the piston is directed to the return circuit, leading to the reservoir (3) and the pump (4). This action is slight at first, providing only a small amount of driver assistance, but becomes progressively greater with higher steering loads as the torsion bar in the rotary valve assembly allows the valve to rotate further.

Turning Right



When turning to the right, relative motion between the inner rotating valve (1) and the outer sleeve (2) occurs, this blocks the fluid return cricuit and redirects the fliud to the left-hand side of the rack piston (3), at the same time the power steering fluid on the opposite side of the piston is directed to the return circuit, leading to the reservoir (3) and the pump (4). This action is slight at first, providing only a small amount of driver assistance, but becomes progressively greater with higher steering loads as the torsion bar in the rotary valve assembly allows the valve to rotate further.

Inner Rotating Valve



When parking the vehicle more than 90% of the work is done by the power steering fluid. In order to achieve a balance between this graduated increase of assistance and maintain a realistic feel with good response as the road speed increases, the grooves (1) of the inner rotating valve (2) are precisely shaped to meter the flow of power steering fluid.

Under extreme load conditions or for any reason the hydraulic system becomes inoperative, the torsion bar will deflect to a pre-determined point, then allow the input shaft to drive the steering pinion directly. This is achieved by having a loose fitting spline between the lower end of the input shaft and the surrounding upper end of the pinion.

Under these operating conditions, steering loads will be high and a noticeable amount of slack will develop because of the torsion bar flexing. Therefore while the steering gear remains entirely operable, the vehicle should only be operated in this manner for the minimum distance needed to reach a point where the system can be serviced.

Diagnostic Starting Point - Steering Column

Begin the system diagnosis by reviewing the system Description and Operation. Refer to Steering Wheel and Column Description and Operation . Reviewing the Description and Operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the Description and Operation information will also help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Steering Wheel and Column in order to identify the correct procedure for diagnosing the system and where the procedure is located.

Symptoms - Steering Wheel and Column

Review the system description and operation in order to familiarize yourself with the system functions. Refer to Steering Wheel and Column Description and Operation in Steering Wheel and Column.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel and column.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Lock System Does Not Unlock.
- Lock System Does Not Lock.
- Steering Column Tilt Function Inoperative.
- Lock System Sticks in Start.
- Ignition Key Cannot Be Removed from the Ignition Lock Cylinder.
- Noise in Steering Column.
- Looseness in Steering Column.

Lock System Does Not Lock

Step	Action	Yes	No
DEFINITION: The lock system does not allow the key to rotate out of the OFF position.			
1	Did you review the Steering Wheel and Column Description and Operation?	Go to Step 2	Go to Steering Wheel and Column Description and Operation in Steering Wheel and Column.
2	Verify that the ignition lock system does not unlock. Does the ignition lock system operate normally?	System OK	Go to Step 3
3	Inspect for an incorrect, worn, or damaged key. Is the key incorrect, worn, or damaged?	Go to Step 7	Go to Step 4
4	Inspect for a faulty ignition lock cylinder. Is the ignition lock cylinder damaged?	Go to Step 8	Go to Step 5
5	Inspect the ignition lock cylinder housing for damage. Is the ignition lock cylinder housing damaged?	Go to Step 9	Go to Step 6
6	Inspect the ignition switch assembly for damage. Is the ignition switch assembly damaged?	Go to Step 10	Verify customer concern, go to Strategy Based Diagnosis in General information.
7	Replace the key. Refer to Replacing Keys in Theft Deterrent. Did you complete the repair?	Go to Step 11	--
8	Replace the ignition lock cylinder. Refer to Ignition Lock Cylinder Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 11	--
9	Replace the steering column assembly. Refer to Steering Column Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 11	--
10	Replace the ignition switch. Refer to Ignition and Start Switch Replacement in Steering Wheel and Column.		

	Did you complete the repair?	Go to Step 11	--
11	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Steering Wheel and Column | Diagnostic Information and Procedures | **Document ID: 1973412**

Lock System Does Not Unlock

Step	Action	Yes	No
DEFINITION: The lock system does not allow the key to rotate out of the OFF position.			
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Steering Wheel and Column Description and Operation in Steering Wheel and Column.
2	Verify that the lock system does not unlock. Does the lock system operate normally?	System OK	Go to Step 3
3	Inspect for an incorrect, worn, or damaged key. Is the key incorrect, worn, or damaged?	Go to Step 7	Go to Step 4
4	Inspect for a faulty lock cylinder. Is the lock cylinder damaged?	Go to Step 8	Go to Step 5
5	Inspect the ignition switch assembly for damage. Is the ignition switch assembly damaged?	Go to Step 10	Go to Step 6
6	Inspect the lock module assembly for looseness or binding. Is the lock module assembly loose or binding?	Go to Step 9	Go to Step 11
7	Replace the key. Refer to Replacing Keys in Theft Deterrent. Did you complete the repair?	Go to Step 11	--
8	Replace the lock cylinder. Refer to Ignition Lock Cylinder Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 11	--
9	Tighten or replace the ignition switch to steering column assembly retaining screws. Refer to Fastener Tightening Specifications . Did you complete the repair?	Go to Step 11	--
10	Replace the ignition switch. Refer to Ignition and Start Switch Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 11	--

11	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Lock System Sticks in Start

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation?	Go to Step 2	Go to Steering Wheel and Column Description and Operation in Steering Wheel and Column.
2	Verify that the lock system sticks in the START position. Does the lock system operate normally?	System OK	Go to Step 3
3	Inspect the ignition lock cylinder housing for damage. Is the ignition lock cylinder case assembly damaged?	Go to Step 6	Go to Step 4
4	Inspect the ignition lock cylinder for damage. Is the ignition lock cylinder damaged?	Go to Step 7	Go to Step 5
5	Inspect the ignition switch for damage. Is the ignition switch damaged?	Go to Step 8	Verify customer concern, go to Strategy Based Diagnosis in General information.
6	Replace the steering column assembly. Refer to Steering Column Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 9	--
7	Replace the ignition lock cylinder. Refer to Ignition Lock Cylinder Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 9	--
8	Replace the ignition switch. Refer to Ignition and Start Switch Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 9	--
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Looseness in Steering Column

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Steering Wheel and Column in Steering Wheel and Column.
2	Verify that the steering column is loose. Is the steering column loose?	Go to Step 3	System OK
3	Inspect the steering column mounting bolts for looseness. Are the steering column mounting bolts loose?	Go to Step 8	Go to Step 4
4	Verify that the steering column mounting bracket capsule is not sheared. Is the steering column bracket mounting capsule sheared?	Go to Step 9	Go to Step 5
5	Inspect the upper and lower tilt head pivots for wear or damage. Are the upper or lower tilt head pivots worn or damaged?	Go to Step 9	Go to Step 6
6	Inspect the intermediate shaft universal joints for wear or damage Are the intermediate joints worn or damaged?	Go to Step 10	Go to Step 7
7	Inspect the steering shaft bearings for wear or damage. Are the steering shaft bearings worn or damaged?	Go to Step 9	Verify customer concern, go to Strategy Based Diagnosis in General information.
8	Tighten the brackets to specifications. Refer to Fastener Tightening Specifications in Steering Wheel and Column. Did you complete the repair?	Go to Step 11	--
9	Replace the steering column assembly. Refer to Steering Column Replacement in Steering Wheel and Column. Did you complete the replacement?	Go to Step 11	--
10	Replace the intermediate steering shaft. Refer to Intermediate Steering Shaft Replacement.		

	Did you complete the repair?	Go to Step 11	--
11	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Noise in Steering Column

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Steering Wheel and Column in Steering Wheel and Column.
2	Verify that noise is present in the steering column during operation. Is noise present in the steering column during operation?	Go to Step 3	System OK
3	Inspect the steering column components for looseness. Are any of the steering column components loose?	Go to Step 9	Go to Step 4
4	Inspect the SIR coil for noise. Is the SIR coil noisy?	Go to Step 10	Go to Step 5
5	Inspect the steering column tilt mechanism assembly for wear or damage. Is the tilt mechanism assembly worn or damaged?	Go to Step 11	Go to Step 6
6	Inspect the steering shaft bearings for wear or damage. Are the steering shaft bearings worn or damaged?	Go to Step 11	Go to Step 7
7	Inspect the intermediate shaft upper universal joint for wear or damage. Is the intermediate shaft upper universal joint worn or damaged?	Go to Step 12	Go to Step 8
8	Inspect the intermediate shaft lower universal joint for wear or damage. Is the intermediate shaft lower universal joint worn or damaged?	Go to Step 12	Verify customer concern, go to Strategy Based Diagnosis in General information.
9	**Notice:** Refer to Fastener Notice in the Preface section. Tighten the steering column components to the required specifications. Refer to Fastener Tightening Specifications. Did you complete the repair?	Go to Step 13	--

10	Replace the SIR coil. Refer to Inflatable Restraint Steering Wheel Module Coil Replacement in SIR. Did you complete the repair?	Go to Step 13	--
11	Replace the steering column assembly. Refer to Steering Column Replacement in Steering Wheel and Column. Did you complete the repair?	Go to Step 13	--
12	Replace the intermediate steering shaft. Refer to Intermediate Steering Shaft Replacement Did you complete the repair?	Go to Step 13	--
13	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Steering Column Tilt Function Inoperative

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Steering Wheel and Column.
2	Verify that the steering column tilt function is inoperative. Does the steering column tilt function operate normally?	System OK	Go to Step 3
3	Verify that the shoe is not seized on the pivot pin. Is the shoe seized on the pivot pin?	Go to Step 9	Go to Step 4
4	Inspect the shoe grooves for dirt, burrs, or rust. Are the shoe grooves free of dirt, burrs, and rust?	Go to Step 9	Go to Step 5
5	Inspect weak or broken shoe lock spring. Is the shoe lock spring weak or broken?	Go to Step 9	Go to Step 6
6	Inspect the pivot pins for binding. Are the pivot pins binding?	Go to Step 9	Go to Step 7
7	Inspect for a weak or broken wheel tilt spring. Is the wheel tilt spring weak or broken?	Go to Step 9	Go to Step 8
8	Inspect the steering column wiring harness for tightness. Is the steering column wiring harness too tight?	Go to Step 10	Verify customer concern, go to Strategy Based Diagnosis.
9	Replace the steering column. Refer to Steering Column Replacement. Is the repair complete?	Go to Step 13	--
10	Reposition the steering column wiring harness to the correct location. Is the steering column wiring harness routed correctly?	Go to Step 13	--
11	Operate the steering column tilt function in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Steering Wheel and Column | Repair Instructions | **Document ID: 1993851**

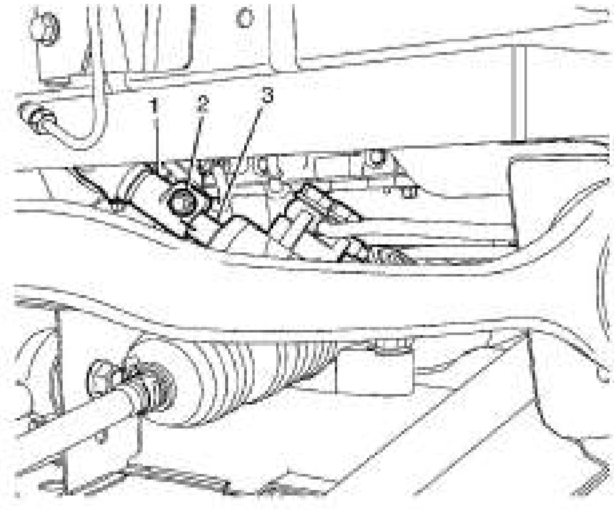
Intermediate Steering Shaft Replacement (RHD)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

2. Mark the intermediate steering shaft (1) in relation to the pinion shaft (3).
3. Remove the intermediate steering shaft to pinion shaft retaining bolt (2).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

4. Disconnect the intermediate shaft (2) from the pinion shaft (3).

   Discard the bolt.

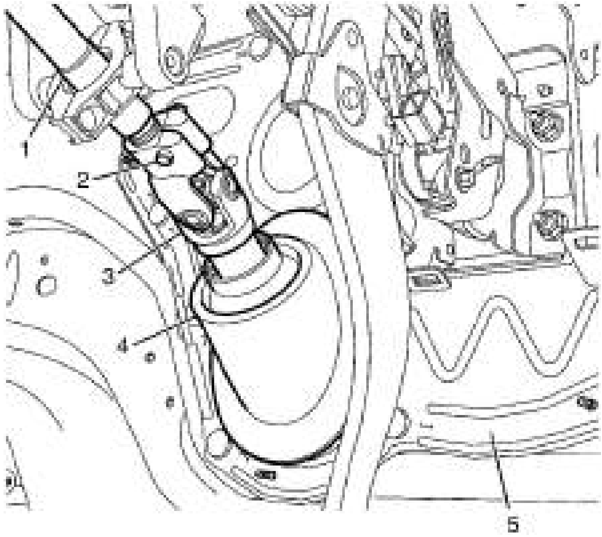
5. Lower the vehicle.

Caution: Refer to SIR Caution in the Preface section.

6. Disable the SIR system. Refer to SIR Disabling and Enabling .
7. Remove the driver side instrument panel lower trim panel assembly. Refer to Knee Bolster

Replacement .

8. Remove the driver side instrument panel lower right trim plate assembly. Refer to Instrument Panel Outer Trim Cover Replacement .
9. Remove the driver side instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
10. Remove the driver side air outlet duct - floor, RH Instrument Panel Outer Air Outlet Deflector Replacement - Right Side .



Important: Observing the orientation of the steering column shaft (1) with reference to the intermediate steering shaft (3) will minimise the potential of incorrect steering column assembly alignment.

11. Mark the steering column shaft (1) in relation to the intermediate shaft (3).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

12. Remove the steering column shaft to intermediate steering shaft retaining bolt (2).

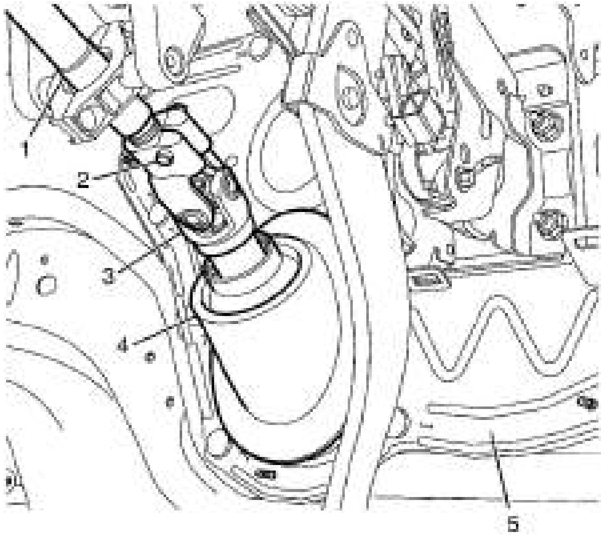
Discard the bolt.

13. Disconnect the steering column shaft (1) from the intermediate steering shaft (3).

Important: Pull the intermediate steering shaft grommet (1) from the cabin side of the mod plate (5) to detach.

14. Detach the intermediate steering shaft grommet (1).
15. Remove the intermediate shaft (2).

Installation procedure



1. Install the intermediate steering shaft (3).

   Important: Push the intermediate shaft grommet (4) from the cabin side of the mod plate (5).

2. Mount the intermediate shaft grommet (4).

   Important: The steering column shaft and intermediate steering shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

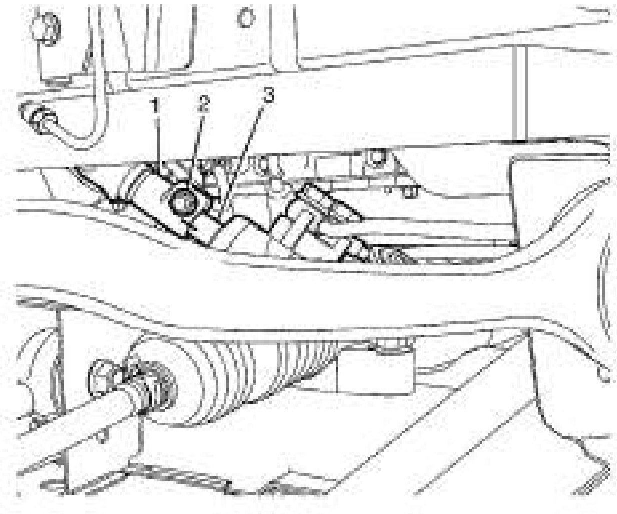
3. Connect the steering column shaft (1) to the intermediate steering shaft (3).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the NEW steering column shaft to intermediate steering shaft retaining bolt (2).

   Tighten
   Tighten the bolt to 28 N·m (21 lb ft).

5. Install the driver side air outlet duct - floor, RH Instrument Panel Outer Air Outlet Deflector Replacement - Right Side .
6. Install the driver side instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
7. Install the driver side instrument panel lower right trim plate assembly. Refer to Instrument Panel Outer Trim Cover Replacement .
8. Install the driver side instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement .
9. Enable the SIR system. Refer to SIR Disabling and Enabling .
10. Raise vehicle.



Important: The intermediate steering shaft and pinion shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

11. Connect the intermediate steering shaft (1) to the pinion shaft (3).
12. Install NEW the intermediate steering shaft to pinion shaft retaining bolt (2).

    Tighten
    Tighten the bolt to 28 N·m (21 lb ft).

13. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Steering Wheel and Column | Repair Instructions | Document ID: 1992046

Steering Angle Sensor Replacement (RHD)

Removal Procedure

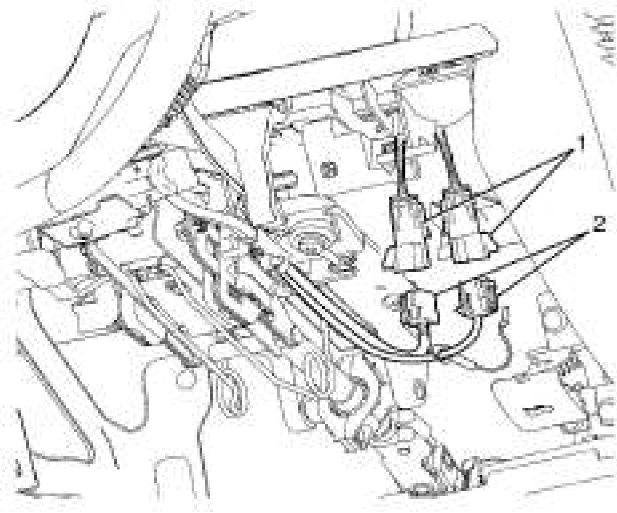
1. Turn the key to the ignition OFF position.

   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to SIR Caution in the Preface section.

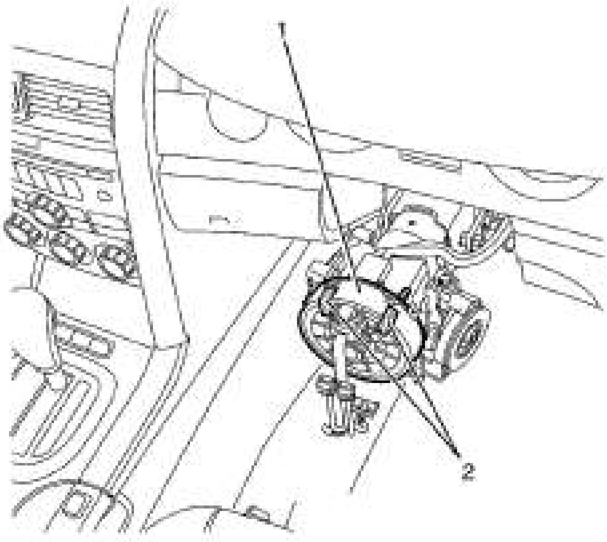
3. Disable the SIR system. Refer to SIR Disabling and Enabling .
4. Remove the inflatable restraint steering wheel module. Refer to Inflatable Restraint Steering Wheel Module Replacement .
5. Remove the steering wheel. Refer to Steering Wheel Replacement .
6. Remove the steering column trim covers. Refer to Steering Column Trim Covers Replacement .
7. Remove the cruise control switch. Refer to Turn Signal Switch Replacement .
8. Remove the wipers/washer switch. Refer to Windshield Wiper and Washer Switch Replacement .



Important: The clock spring is referred to as the SIR coil.

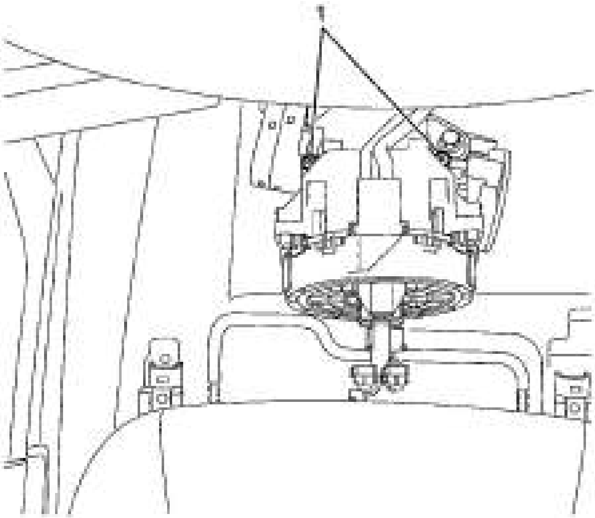
Important: The steering angle sensor, SIR coil and turn signal cancel cam assembly is referred to as the SIR coil assembly.

9. Disconnect the SIR coil assembly connectors, (1) from (2).



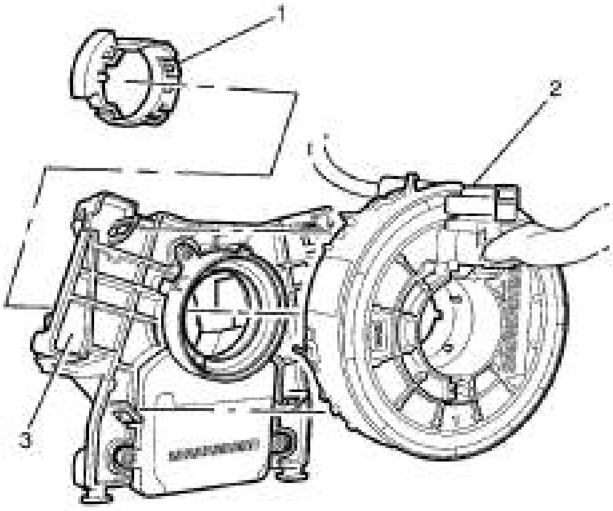
Important: Secure the SIR coil assembly so it does not rotate whilst disassembling.

10. Secure the SIR coil assembly (1) using suitable tape (2) to prevent rotation during disassembly.



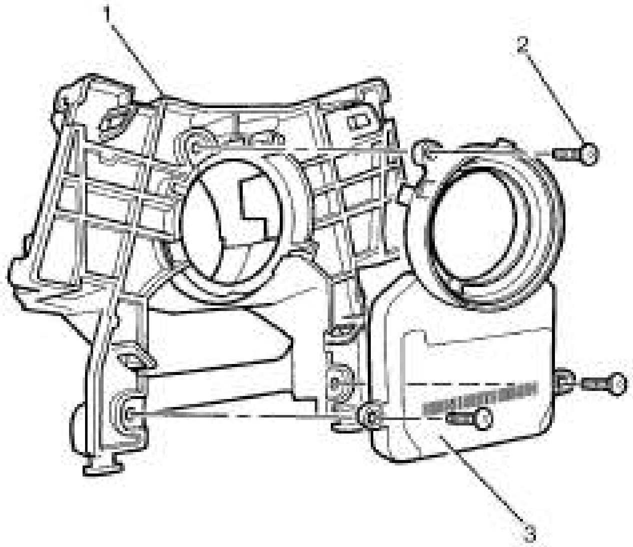
11. Remove the SIR coil assembly to steering column retaining screws (1).

Disassembly Procedure



Important: Discard the turn signal cancel cam after removal.

1. Remove turn signal cancel cam (1) from back of the SIR coil assembly using a suitable tool and discard the turn signal cancel cam .

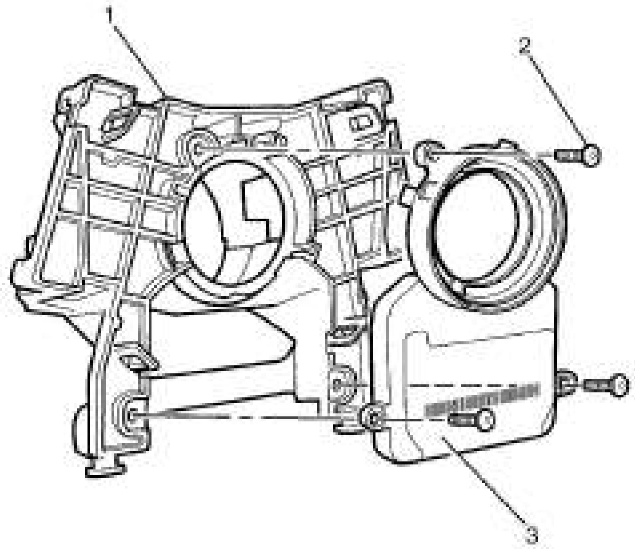


2. Remove the steering angle sensor to multifunction switch (MFS) holder retaining screws (2).

   Important: The MFS must be discarded if steering angle sensor is replaced

3. Remove the steering angle sensor (3) from the MFS holder (1) and discard the holder.

Assembly Procedure



1. Install the steering angle sensor (3) to the NEW MFS holder (1).

   Important: Install the steering angle sensor to MFS holder retaining screws (2) until there is no movement of the sensor to MFS holder, DO NOT overtighten the screws as damage to the steering angle sensor may occur.

2. Install the steering angle sensor to MFS holder retaining screws (2).

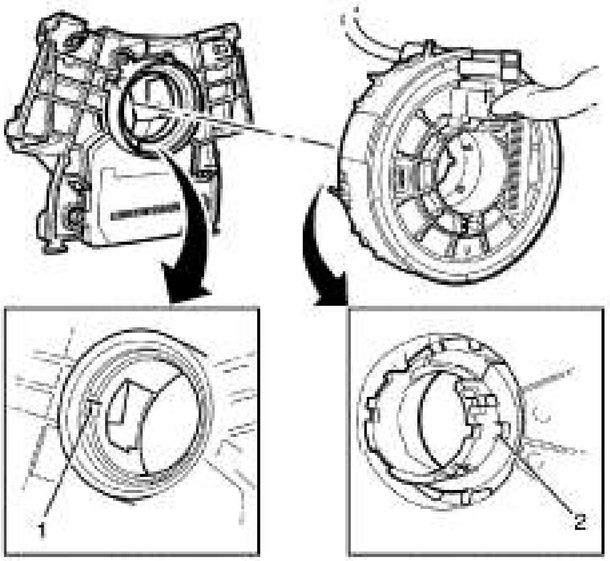
   Tighten
   Tighten the screws to 0.3 Nm (0.22 lb in).

   Notice: The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.

   Important: If an existing SIR coil assembly is to being installed, the SIR coil assembly must be centred.

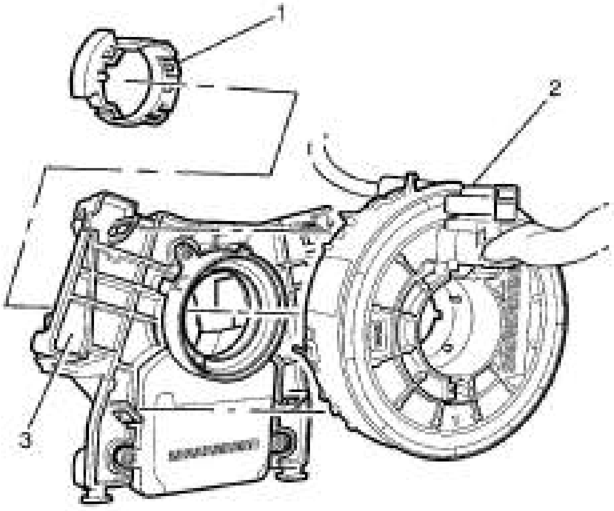
   Important: To centre the SIR coil rotate the coil in one direction until resistance can be felt, then rotate the coil in the opposite direction counting the amount of rotations (there should be approximately 6 complete rotations). Position the wiring harness on the front of the SIR coil to the 12 O'clock position (if not already there) then rotate the coil 3 full turns in the opposite direction and lock the coil in this position, this is the centre position.

3. Centre the SIR coil assembly if required.

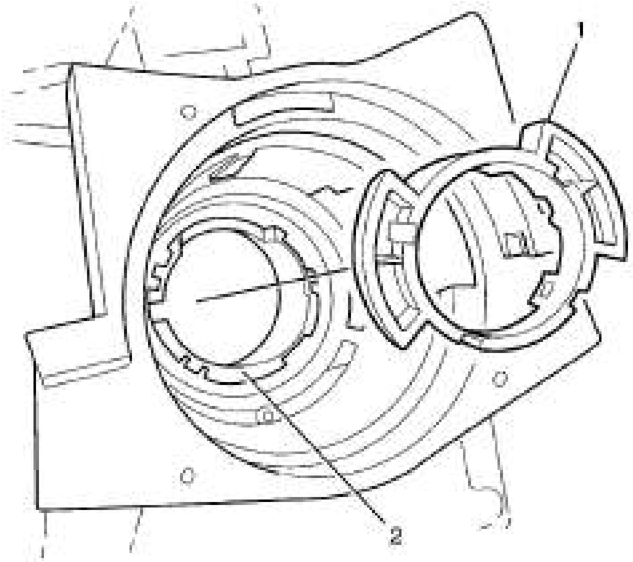


Important: Make sure that the locating cutout on the steering angle sensor (1) aligns with the SIR coil (2), mark the cutout on the steering angle sensor (1) to assist in correct locating of the SIR coil (2).

4. Align SIR coil assembly locating block (2) to the steering angle sensor (1) cutout

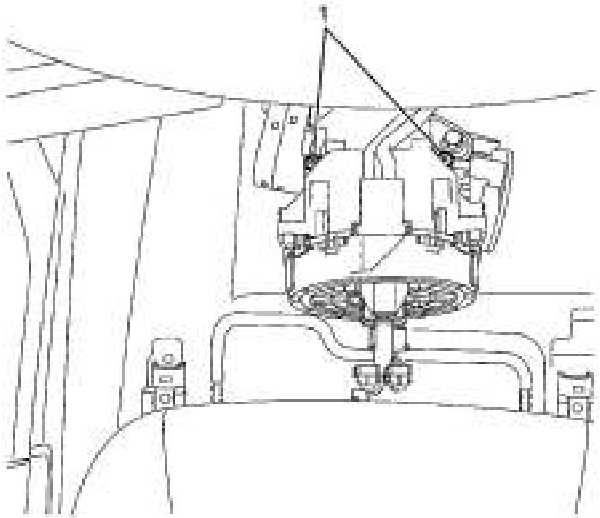


5. Install the SIR coil assembly (2) to the MFS holder (3).



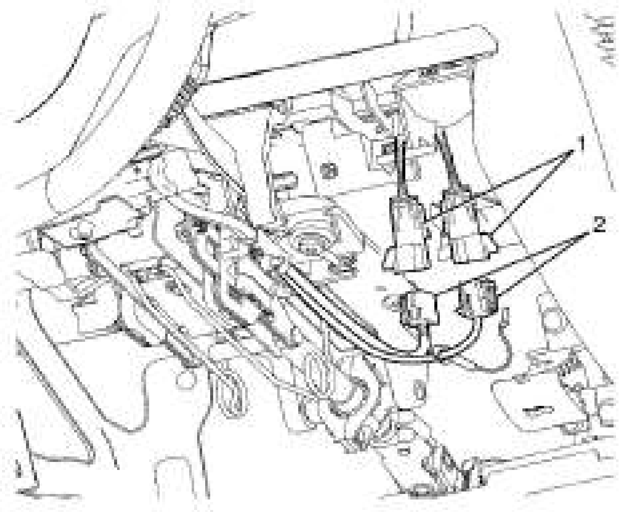
6. Install the NEW turn signal cancel cam (1) to the back of the SIR coil assembly (2).

Installation Procedure



1. Install the SIR coil assembly to steering column retaining screws (1).

   Tighten
   Tighten the screws to 1 Nm (9 lb in).



2. Connect the SIR coil assembly connectors, (1) to (2).
3. Install the wipers/washer switch. Refer to Windshield Wiper and Washer Switch Replacement .
4. Install the cruise control switch. Refer to Turn Signal Switch Replacement .
5. Remove the SIR coil assembly securing tape.
6. Install the steering column trim covers. Refer to Steering Column Trim Covers Replacement .
7. Install the steering wheel. Refer to Steering Wheel Replacement .
8. Install the inflatable restraint steering wheel module to the steering wheel. Refer to Inflatable Restraint Steering Wheel Module Replacement .
9. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .
10. Enable the SIR system. Refer to SIR Disabling and Enabling .
11. Calibrate the steering angle sensor. Refer to Steering Angle Sensor Centering .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Steering Wheel and Column | Repair Instructions | Document ID: 1993845

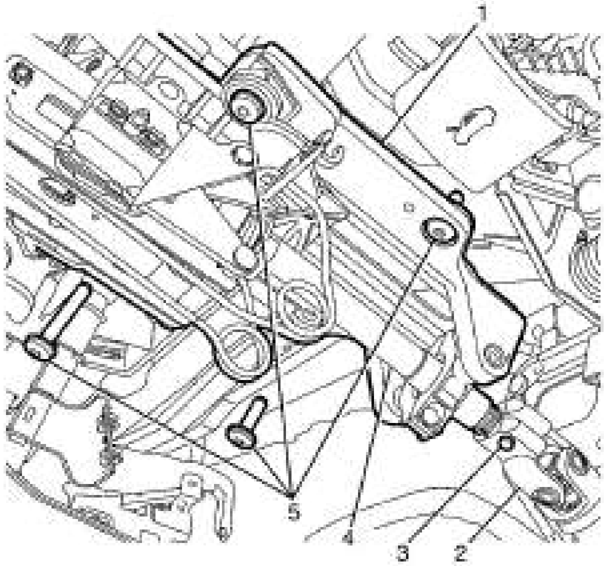
Steering Column Replacement (RHD)

Removal Procedure

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling .
3. Remove the inflatable restraint steering wheel module. Refer to Inflatable Restraint Steering Wheel Module Replacement .
4. Remove the steering wheel. Refer to Steering Wheel Replacement .
5. Remove the steering column trim covers. Refer to Steering Column Trim Covers Replacement .
6. Remove the theft deterrent exciter module. Refer to Theft Deterrent Module Replacement .
7. Remove the turn signal switch. Refer to Turn Signal Switch Replacement .
8. Remove the wipers/washer switch. Refer to Windshield Wiper and Washer Switch Replacement .
9. Remove the inflatable restraint steering wheel module coil. Refer to Inflatable Restraint Steering Wheel Module Coil Replacement .
10. Remove the ignition switch. Refer to Ignition and Start Switch Replacement .
11. Remove the driver side instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement .
12. Remove the driver side instrument panel lower right trim plate assembly. Refer to Instrument Panel Outer Trim Cover Replacement .
13. Remove the driver side instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
14. Remove the driver side floor air outlet duct. Refer to Instrument Panel Outer Air Outlet Deflector Replacement - Right Side .



Important: Observing the orientation of the steering column shaft (4) with reference to the intermediate steering shaft (2) will minimise the potential of incorrect steering column assembly alignment.

15. Mark the steering column shaft (4) in relation to the intermediate steering shaft (2).

    Important: Secure the steering wheel to prevent rotation otherwise damage to the SIR coil will occur.

    Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

16. Remove the steering column shaft to intermediate steering shaft retaining bolt (3).

    Discard the bolt.

17. Disconnect the steering column shaft (4) from the intermediate steering shaft (2).

    Important: The steering column assembly (1) must be supported before removing the steering column assembly to body retaining bolts (5).

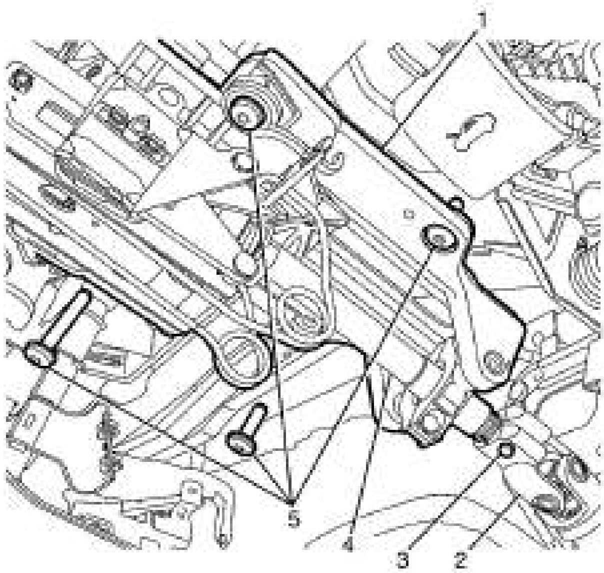
    Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

18. Remove the steering column assembly to body retaining bolts (5).

    Discard the bolts.

19. Remove the steering column assembly (1).

Installation Procedure



Important: The steering column shaft (4) and intermediate shaft (2) splines must be installed in the position recorded during removal and aligned with the marks previously made.

1. Connect the steering column shaft (4) to the intermediate shaft (2).
2. Install the steering column assembly (1) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the NEW steering column assembly to body retaining bolts (5).

   Tighten
   Tighten the bolts to 22 N·m (16 lb ft).

4. Install the NEW steering column shaft to intermediate steering shaft retaining bolt (3).

   Tighten
   Tighten the bolt to 28 N·m (21 lb ft).

5. Install the driver side floor air outlet duct Instrument Panel Outer Air Outlet Deflector Replacement - Right Side .
6. Install the driver side instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
7. Install the driver side instrument panel lower right trim plate assembly. Refer to Instrument Panel Outer Trim Cover Replacement .
8. Install the driver side instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement .
9. Install the ignition switch. Refer to Ignition and Start Switch Replacement .
10. Install the inflatable restraint steering wheel module coil. Refer to Inflatable Restraint Steering Wheel Module Coil Replacement .
11. Install the wipers/washer switch. Refer to Windshield Wiper and Washer Switch Replacement .
12. Install the turn signal switch replacement. Refer to Turn Signal Switch Replacement .
13. Install the theft deterrent exciter module. Refer to Theft Deterrent Module Replacement .
14. Install the steering column trim covers. Refer to Steering Column Trim Covers Replacement .
15. Install the steering wheel. Refer to Steering Wheel Replacement .
16. Install the inflatable restraint steering wheel module. Refer to Inflatable Restraint Steering Wheel Module Replacement .
17. Enable the SIR system. Refer to SIR Disabling and Enabling .

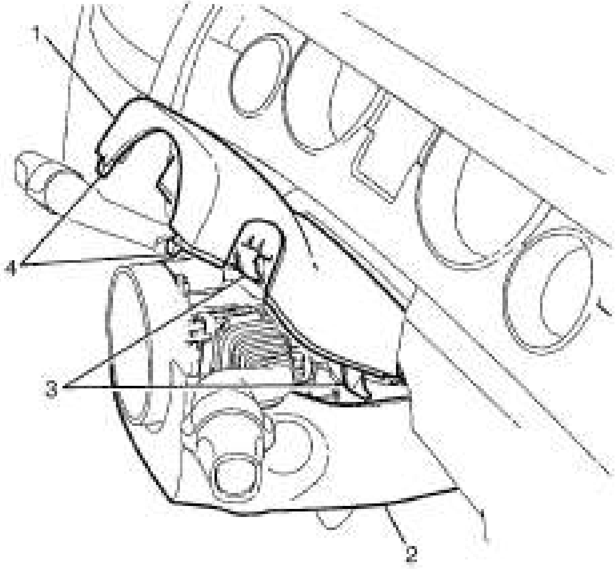
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Steering Wheel and Column | Repair Instructions | **Document ID: 1993789**

Steering Column Trim Cover Replacement (RHD)

Removal Procedure

Caution: Refer to SIR Caution in the Preface section.

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Remove the steering wheel. Refer to Steering Wheel Replacement .



Important: Note original position of the steering wheel and column assembly with regards to steering wheel height and reach.

3. Release the steering column tilt lever.

   Fully lower the steering wheel and column assembly.

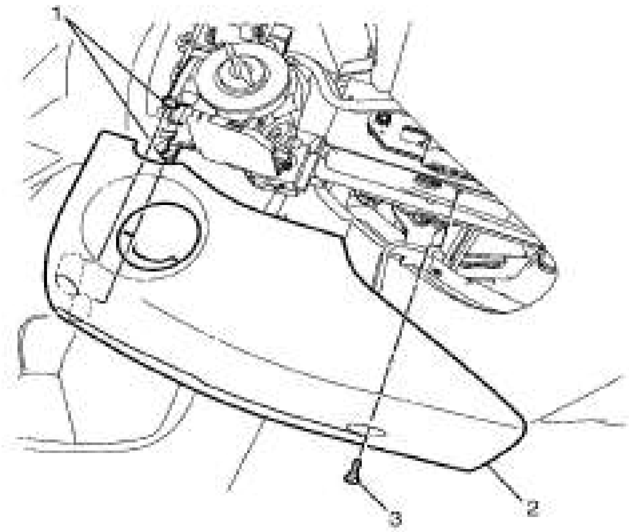
   Important: Do not use excessive force to separate the steering column trim covers.

   Important: Press the steering column upper trim cover lower edge towards the front of the vehicle and lift in order to disengage the front locking tabs (4).

4. Unclip the face of the steering column upper trim cover (1) from the steering column lower trim cover (2).

   Important: Lift the steering column upper trim cover face and pull towards the rear of the vehicle in order to disengage the rear locking tabs (3).

5. Remove the steering column upper trim cover (1).



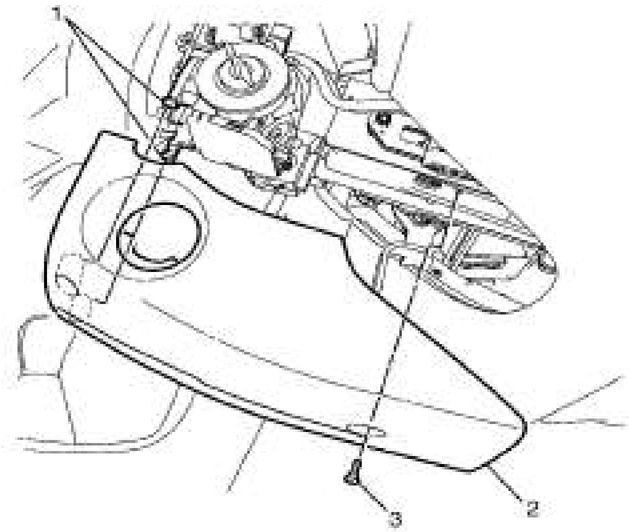
6. Remove the steering column lower trim cover to steering column assembly retaining screw (3).

   Important: Do not use excessive force to separate the steering column lower trim cover from the mounting tabs (1).

   Important: Pull the steering column lower trim cover (2) towards the rear of the vehicle in order to disengage the mounting tabs (1).

7. Remove the steering column lower trim cover (2).

Installation Procedure



Important: Do not use excessive force to mount the steering column lower trim cover (2) to the mounting tabs (1).

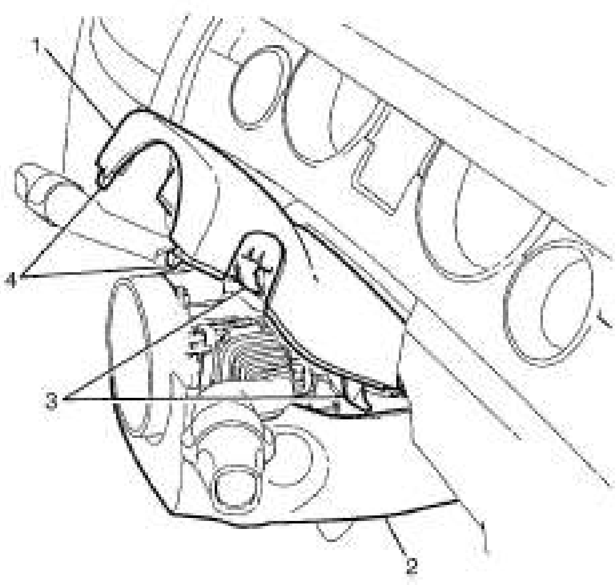
Important: Lift the column lower trim cover and press towards the front of the vehicle in order to engage the mounting tabs (1).

1. Install the steering column lower trim cover (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the steering column lower trim cover to steering column assembly retaining screw (3).

   Tighten
   Tighten the screw to 2 N·m (18 lb in).



Important: Do not use excessive force to secure the steering column upper trim cover (1).

Important: Lower the steering column upper trim cover (1) and push towards the front of the vehicle in order to engage the rear locking tabs (3).

3. Install the steering column upper trim cover (1).

   Important: Press down on the steering column upper trim cover front face in order to clip the front locking tabs (4) to the steering column lower trim cover (2).

4. Clip the face of the steering column upper trim cover (1) to the steering column lower trim cover (2).

5. Install the steering wheel. Refer to Steering Wheel Replacement .
6. Set the steering wheel and column assembly to the original position and lock the steering column tilt lever.
7. Enable the SIR system. Refer to SIR Disabling and Enabling .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Steering | Steering Wheel and Column | Repair Instructions | **Document ID: 1993828**

Steering Wheel Replacement (RHD)

Tools Required

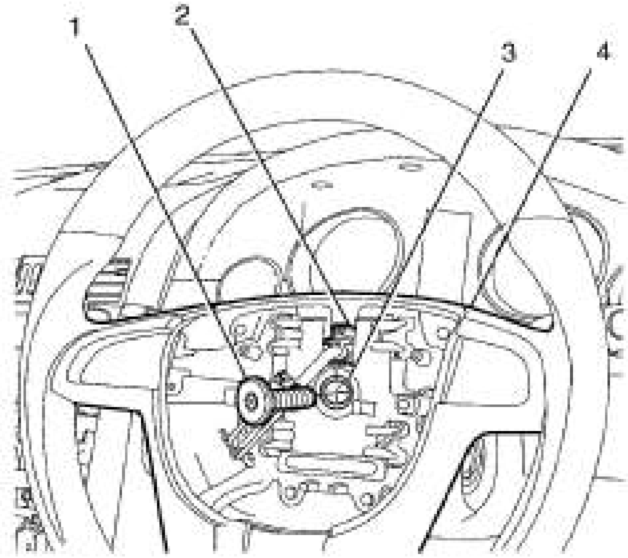
7245 Steering Wheel Puller.

Removal procedure

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to SIR Caution in the Preface section.

2. Disable the SIR system. Refer to SIR Disabling and Enabling.
3. Remove the inflatable restraint steering wheel module. Refer to Steering Wheel Inflatable Restraint Module Replacement.



4. Disconnect the steering wheel electrical connector (2).

   Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

5. Remove the steering wheel to steering column retaining bolt (1).
6. Discard the bolt.

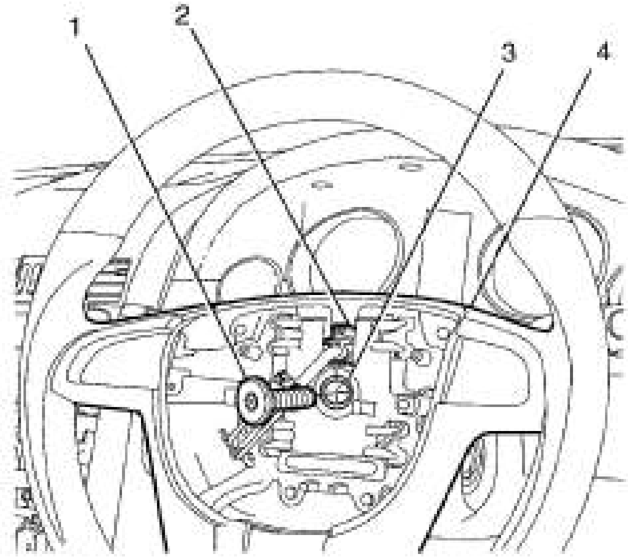
   Important: Observing the orientation of the steering wheel with reference to the steering column will minimise the potential of incorrect steering wheel alignment.

7. Mark the steering wheel (4) in relation to the steering column shaft (3).

   Important: The front wheels and steering wheel (4) must be in the straight ahead position before removing the steering wheel (4) from the steering column shaft (3).

8. Remove the steering wheel (4) from the steering column shaft (3). If necessary use the 7245 Steering Wheel Puller.

Installation Procedure



Important: The steering wheel and steering column shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

1. Install the steering wheel (4) to the steering column shaft (3).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the NEW steering wheel to steering column shaft retaining bolt (1).

   Tighten
   Tighten the bolt to 45 N·m (33 lb ft).

3. Connect the steering wheel electrical connector (2).
4. Install the inflatable restraint steering wheel module to the steering wheel. Refer to Steering Wheel Inflatable Restraint Module Replacement.
5. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
6. Enable the SIR system. Refer to SIR Disabling and Enabling.

Tilt Lever Replacement

The tilt lever is an integral part of the steering column and must only be replaced as a complete assembly. Refer to Steering Column Replacement.

Steering Wheel and Column Description and Operation

The steering wheel and column has 4 primary functions:

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

Vehicle Steering

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

Vehicle Security (If Equipped)

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch--location varies
- The steering column lock--content varies
- The ignition cylinder--location varies
- The theft deterrent module--location varies

Driver Convenience

The steering wheel and column also features driver controls attached for convenience and comfort. The following controls are mounted on or near the steering wheel or column.

- The turn signal switch
- The wiper/washer switch
- The horn pad/cruise control switch
- The redundant radio/entertainment system controls
- The manual/power tilt or tilt/telescoping functions
- The navigation

Driver Safety

The steering wheel and column has safety features to protect the driver. The following components may be mounted on or near the steering column:

Energy-Absorbing Steering Column: The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The energy-absorbing feature, collapsible steering shaft, and break away mounting features help reduce the injury in the event of an accident. In addition to these features, the following driver safety features may be on the steering column.

Electronic Park Lock (EPL) / Ignition Lock Cylinder Control Actuator (If Equipped): If the vehicle is equipped with automatic transmission and a floor mounted console gear shift, it has an ignition lock cylinder control actuator system in the steering column. The ignition lock cylinder control actuator purpose is to prevent the ignition key from being turned to the OFF position when the transmission is in any position other than PARK and the vehicle may still be moving. The column ignition lock system consists of an ignition lock cylinder control actuator, and a park position switch that is located in the automatic transmission shift lock control switch. The ignition lock cylinder control actuator contains a pin that is spring loaded to mechanically prevent the ignition key cylinder from being turned to the lock position when the vehicle transmission is not in the PARK position. If vehicle power is lost, and/or the transmission is not in the PARK position the operator will not be able to turn the ignition key to the lock position and will not be able to remove the ignition key from the column.

SIR Coil and Module: For additional information on the operation of the SIR coil and module, refer to SIR System Description and Operation.

Steering Wheel Angle Sensor or Steering Wheel Position Sensor : The steering wheel position sensor is located somewhere along the steering shaft assembly. The sensor measures the position of the steering wheel and the speed at which it is rotated. A signal representing this measurement is provided to the vehicle stability enhancement system (VSES) module. The VSES module uses this signal, along with several others representing different vehicle conditions, to monitor the driving behavior of the vehicle and ensure that it stays in control. If the VSES module determines that the vehicle is out of control it provides signals to the powertrain control module (PCM) and the ABS module. These output signals are used to modulate the transmission torque and brake pressure of each of the vehicles wheels in order to regain control of the vehicle.

Diagnostic Starting Point - Roof

Begin the system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check will provide the following information:

- The identification of the control module(s) which command the system.
- The ability of the control module(s) to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

Symptoms - Roof

Important: Review the system operation in order to familiarize yourself with the system functions. Refer to Sunroof Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Power Sunroof system. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for mechanical binding.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Power Sunroof Malfunction

Power Sunroof Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	1	1	--	--
Ignition	1	1	2	--
Signal Terminal 5	1	1	1*	--
Signal Terminal 4	1	1	1*	--
Signal Terminal 3	1	1	1*	--
Signal Terminal 2	1	1	1*	--
Sunroof Switch Ground	--	1	--	--
Sunroof Control Module Ground	--	1	--	--
* Internal damage to the sunroof switch may occur if shorted to B+ 1. Power sunroof malfunction 2. Power sunroof operates with ignition OFF				

Circuit/System Description

The sunroof control module determines the sunroof motor direction based on the inputs received from the sunroof switch. The sunroof switch is a rotary dial type switch with four outputs, the sunroof switch data 1 through 4 signal circuits. The coded inputs to the sunroof control module will initiate a request to slide the sunroof window to a specific position. The sunroof control module supplies the corresponding switch data signal circuits with a 12-volt reference. When the ignition switch is in the ON position, voltage is applied to the sunroof control module via the electronic control unit and the S/ROOF 20A fuse located in the instrument panel fuse block.

Diagnostic Aids

If the sunroof is experiencing an intermittent inoperative condition, check the sunroof switch ground circuit for an open. If the sunroof switch ground circuit is open, the switch may take a redundant path to ground through the switch illumination circuit. When the lights are turned ON, the redundant path to ground is removed, and the sunroof will become inoperative.

Connector End View Reference

Component Connector End Views

Description and Operation

Sunroof Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Circuit/System Verification

1. With the sunroof in the closed position, turn the rotary dial switch clockwise through each of the open slide positions. It should open in increments to the fully open position. When the rotary dial switch is brought back to the close position the sunroof should express close.
2. With the sunroof in the closed position, turn the rotary dial switch counter clockwise through each of the vent positions. It should vent open in increments to the fully vent open position. When the rotary dial switch is brought back to the close position the sunroof should express close.

Circuit/System Testing

Note: Portions of the circuit/system testing require removal of the headliner. It is suggested that the sunroof switch component test is performed prior to removing the headliner.

1. Ignition OFF, disconnect the harness connector at the sunroof control module.
2. Ignition OFF, test for less than 5 Ω between the ground circuit terminal 10 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Verify that a test lamp illuminates between the B+ circuit terminal 6 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the sunroof control module.
4. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 9 and ground.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the sunroof control module.
5. Ignition OFF, connect the harness connector at the sunroof control module.

6. Disconnect the harness connector at the sunroof switch.
7. Test for less than 5 Ω between the ground circuit terminal 1 and ground.
   If greater than the specified range, test the ground circuit for an open/high resistance.
8. Ignition ON, test for B+ between the signal circuit terminal 2 and ground.
   If less than the specified value, test for a short to ground or an open/high resistance. If the circuit tests normal, replace the sunroof control module.
9. Ignition ON, test for B+ between the signal circuit terminal 3 and ground.
   If less than the specified value, test for a short to ground or an open/high resistance. If the circuit tests normal, replace the sunroof control module.
10. Ignition ON, test for B+ between the signal circuit terminal 5 and ground.
   If less than the specified value, test for a short to ground or an open/high resistance. If the circuit tests normal, replace the sunroof control module.
11. Ignition ON, test for B+ between the signal circuit terminal 6 and ground.
   If less than the specified value, test for a short to ground or an open/high resistance. If the circuit tests normal, replace the sunroof control module.
12. If all circuits test normal, test or replace the sunroof switch.

Component Testing

Sunroof Switch

1. Ignition OFF, disconnect the harness connector at the sunroof switch.
2. Test for continuity between the terminals indicated for each position of the switch. The continuity should display as indicated in the test table.
   If not the specified value for all switch positions, test the appropriate signal circuit for a short to battery voltage. If all circuits test normal, replace the sunroof switch.

Switch Position	Terminal 1 & Terminal 2	Terminal 1 & Terminal 3	terminal 1 & Terminal 5	Terminal 1 & Terminal 6
Vent Position 3	0-200 Ω	Infinite	Infinite	Infinite
Vent Position 2	Infinite	0-200 Ω	Infinite	Infinite
Vent Position 1	0-200 Ω	0-200 Ω	Infinite	Infinite
Close	0-200 Ω	0-200 Ω	Infinite	0-200 Ω
Roof Position 1	Infinite	0-200 Ω	Infinite	0-200 Ω
Roof Position 2	Infinite	Infinite	Infinite	0-200 Ω
Roof Position 3	0-200 Ω	Infinite	Infinite	0-200 Ω
Roof Position 4	0-200 Ω	Infinite	0-200 Ω	0-200 Ω
Roof Position 5	Infinite	Infinite	0-200 Ω	0-200 Ω
Roof Position 6	Infinite	0-200 Ω	0-200 Ω	0-200 Ω

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

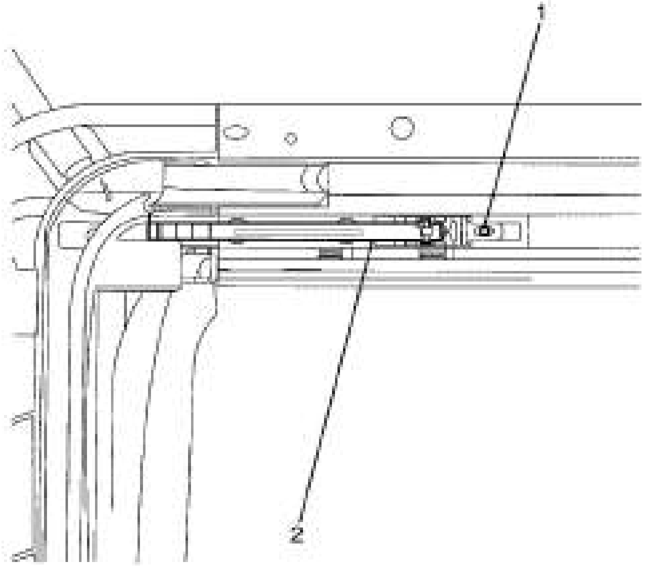
- Sunroof Switch Replacement
- Control Module References for sunroof motor/actuator replacement, setup, and programming

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Roof | Sunroof | Repair Instructions | **Document ID: 1976194**

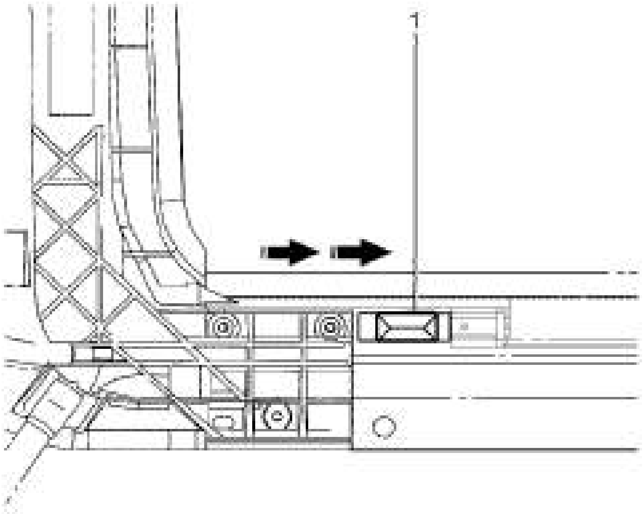
Sunroof Air Deflector Replacement

Removal Procedure

1. Cycle the sunroof window to the rear.



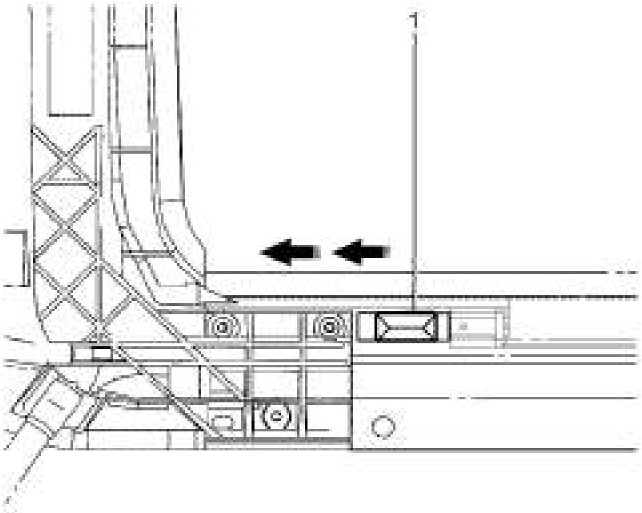
2. Remove the air deflector to sunroof module retaining bolt (1). Repeat for the opposite side.
3. Disconnect deflector spring (2) from the sunroof module. Repeat for opposite side.



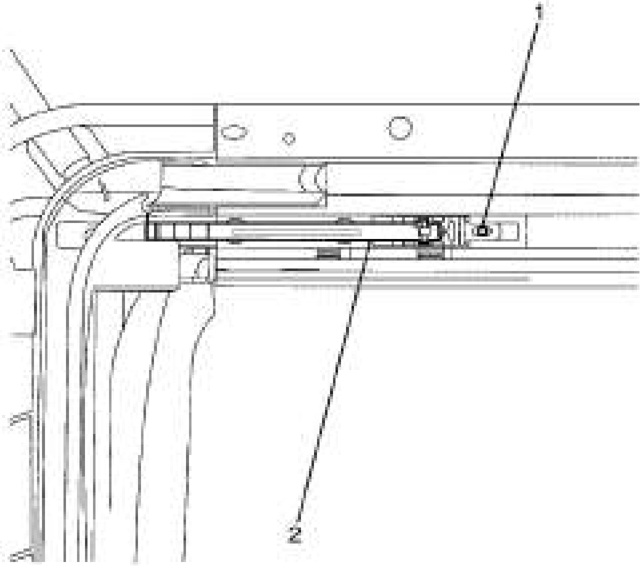
4. With the aid of an assistant, slide the air deflector towards the rear of the vehicle to disengage the retaining clips (1) of the sunroof module.
5. Remove the air deflector from the vehicle.

Installation Procedure

1. Install the air deflector to the sunroof module.



2. With the aid of an assistant, slide the air deflector towards the front of the vehicle to engage the retaining clips (1) of the sunroof module.
3. While holding the right side down push the left front side of the air deflector towards the right side.
4. Pull up on the left side until the lower tab (1) clears the roof opening.



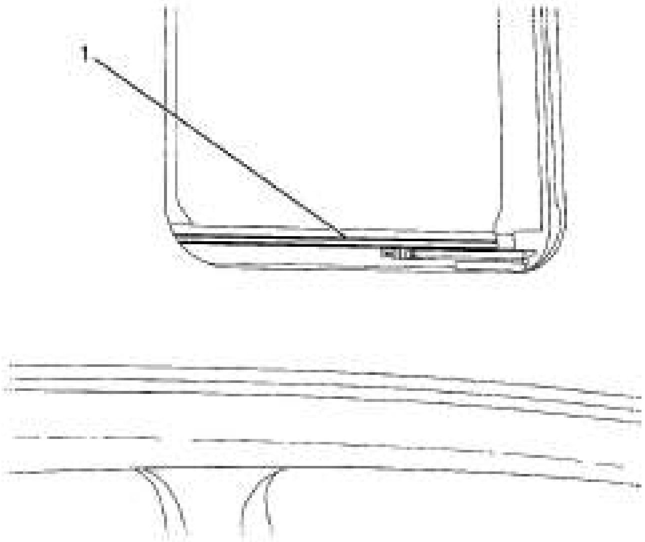
5. Connect the deflector spring (2) to the sunroof module. Repeat for opposite side.
6. Install the air deflector to sunroof module retaining bolt (1). Repeat for opposite side.

   Tighten
   Tighten the bolts to 1 N·m (9 lb in).

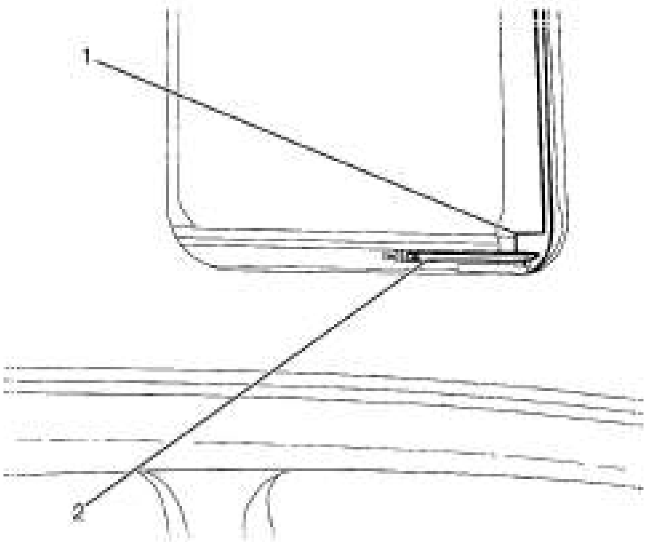
7. Push the left front side of the air deflector inwards and down so the tab clears the roof opening.
8. Close the sunroof window.

Sunroof Cleaning and Inspection

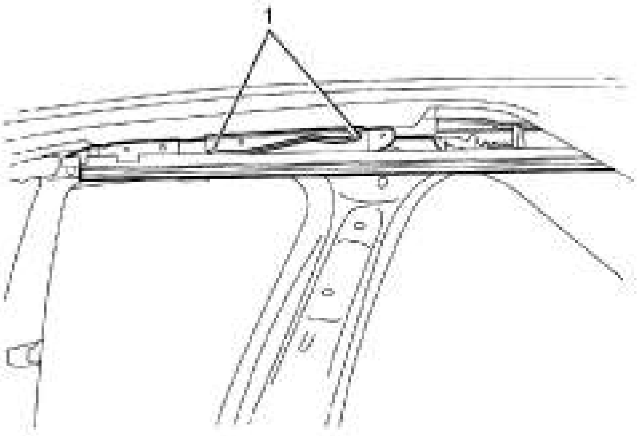
1. Open the sunshade to the full rearward position.
2. Cycle the sunroof window from the full closed to the full open position.
3. Remove the sunroof side panel cover. Refer to Sunroof Panel Side Opening Closeout Cover Replacement.



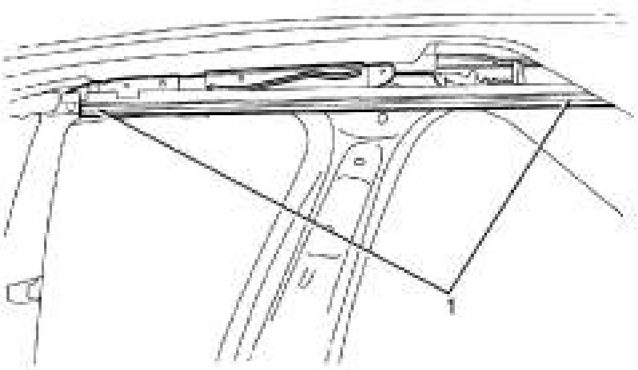
4. Remove the excess dirt from the sunroof runner guide (1).
5. Clean the sunroof drains. Refer to Sunroof Drain Inspection and Cleaning.



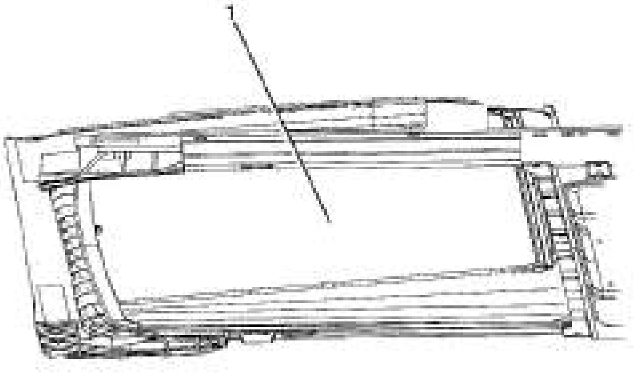
6. Remove the excess dirt around the sunroof air deflector (1) and sunroof air deflector spring (2).



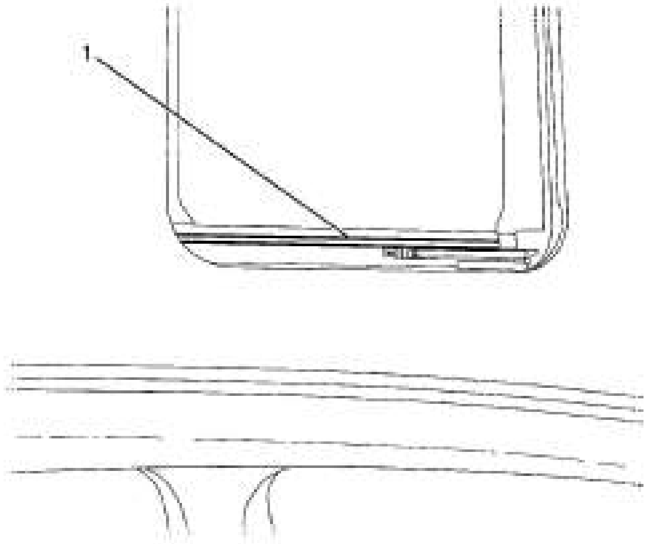
7. Remove the excess dirt around the sunroof glass guide (1).
8. Inspect the sunroof glass guide (1) for wear or deterioration of the sunroof mechanism.



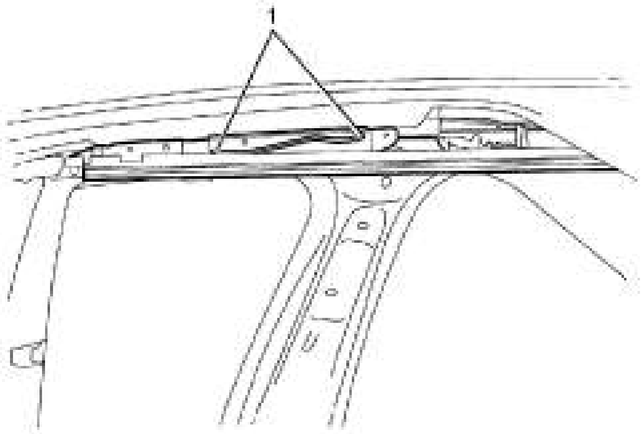
9. Remove the excess dirt from the sunroof shade panel runner (1).



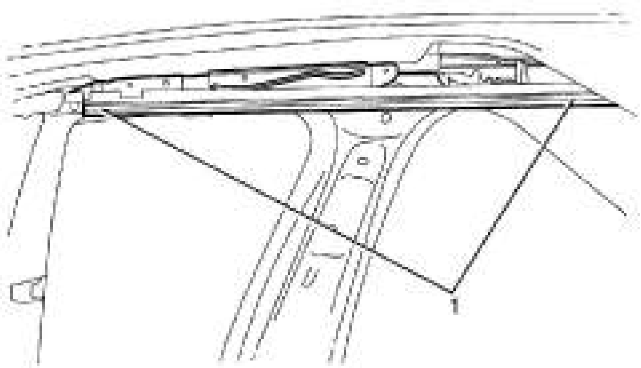
10. Clean the excess dirt around the sunroof glass (1).



11. Lubricate the sunroof runner guide (1) with an approved grease or equivalent.



12. Lubricate the sunroof glass guide (1) with an approved grease or equivalent.



13. Lubricate the sunroof shade panel runner (1) with an approved grease or equivalent.

Important: Before fitment of the sunroof side opening cover make sure that the cover is clean.

14. Install the sunroof side panel cover. Refer to Sunroof Panel Side Opening Closeout Cover Replacement.

Sunroof Control Module Replacement

Important: The sunroof control module is an integral part of the sunroof motor/actuator and must be replaced as an assembly. For replacement refer to Sunroof Motor/Actuator Replacement.

Sunroof Drain Inspection and Cleaning

Important: The drain hoses are pushed on as an interference fit and are not clamped or cemented. Do NOT disconnect the hose from the drain channel spouts while cleaning.

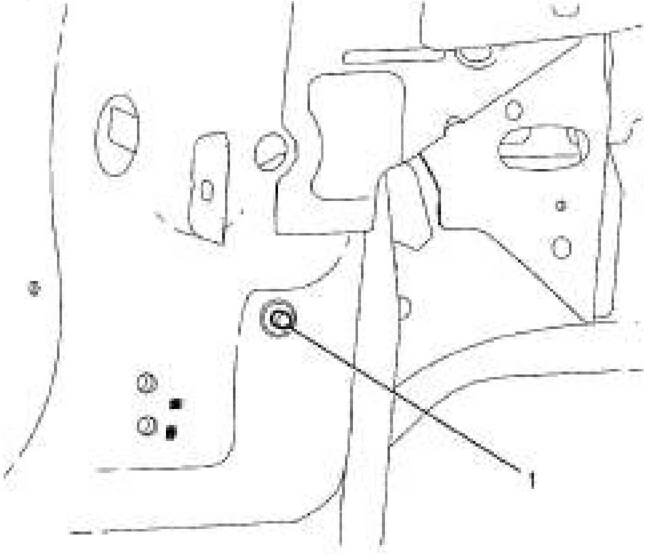
A drain trough encircles the sliding panel which leads to the drain spouts and into the hoses. The drain hoses are located at each corner of the housing. The two front drain hoses route down the windshield pillars and exit out the hinge pillars between the door hinges. The two rear drain hoses route down the quarter panels and exit the inner wheelhouse panels.

If you encounter a wet headliner or other water leak, inspect the following areas for the source of the leak:

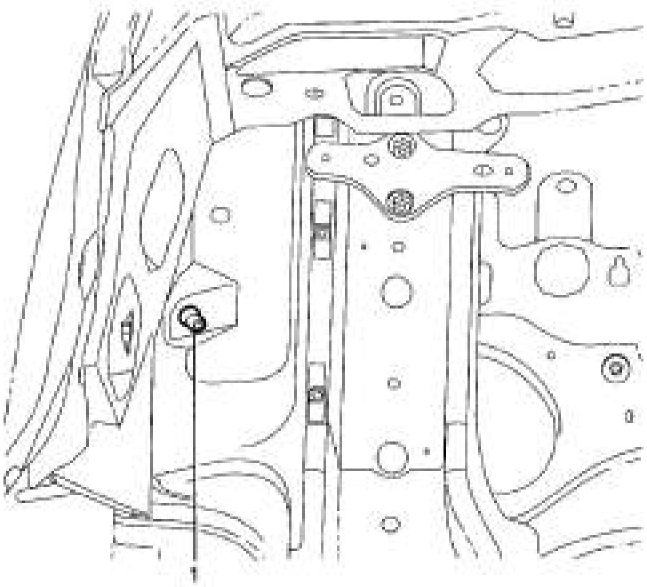
- The windshield
- The rear window

Verify the drainage system is not plugged or restricted. Use the following procedure:

1. With the sunroof open, using a one litre container, pour water into the drain trough.
2. Open the front doors.



3. Inspect for water drainage exiting through the grommets (1) at the hinge pillar.

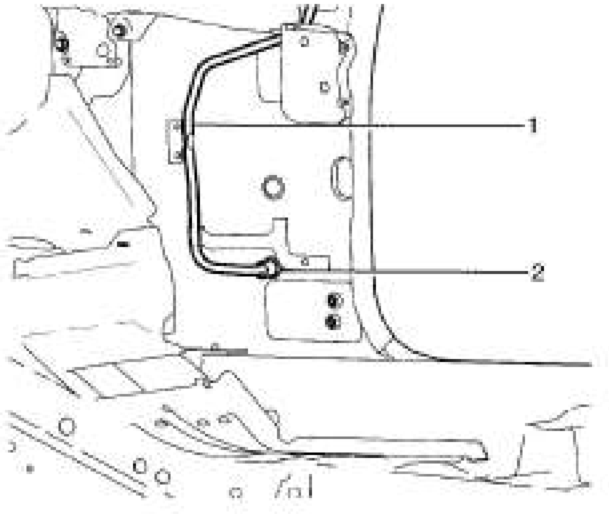


4. Look at the rear of the inner wheelhouse panels for water exiting the rear drain grommet (1).
5. If the water flow is restricted, use a low volume of compressed air in order to clear the drainage system.
6. Retest the system.
7. If water drips from the headliner above the doors, lower the headliner. Refer to Headlining Trim Panel Replacement. Inspect for proper drain tube connections at the housing drain spouts.
8. If necessary, secure the tubes onto the housing drain spouts.
9. If blockage is still present, replace the restricted drain hose. Refer to Sunroof Housing Front Drain Hose Replacement or Sunroof Housing Rear Drain Hose Replacement.

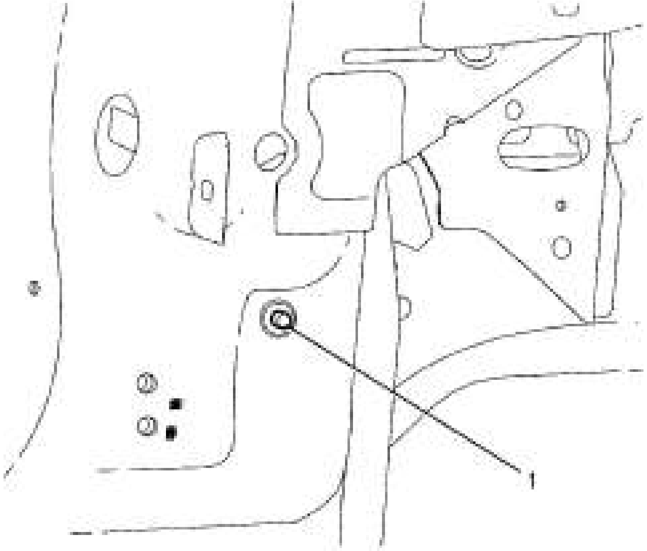
Sunroof Housing Front Drain Hose Replacement (Lower)

Removal Procedure

1. Remove the front fender. Refer to Front Fender Replacement.
2. Remove the hinge pillar trim panel. Refer to Body Hinge Pillar Trim Panel Replacement.



3. Disengage the drain tube (1) from the front sunroof grommet.



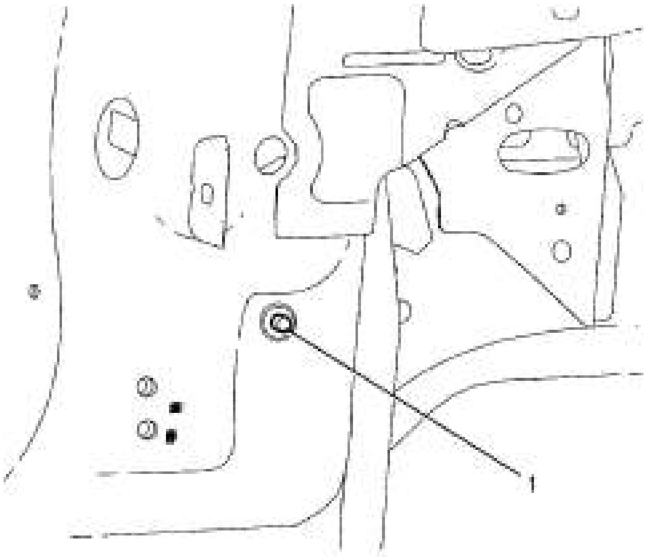
Important: Heat the front sunroof grommet to aid in removal.

4. Remove the front sunroof grommet (1) from the front hinge pillar.

   Discard the front sunroof drain grommet.

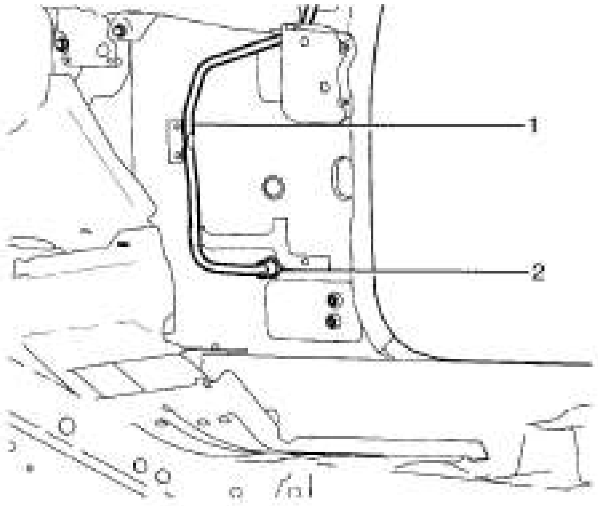
5. Scrape the remaining adhesive of the front sunroof grommet from the front hinge pillar.

Installation Procedure



1. Install the NEW front sunroof grommet (1) to the front hinge pillar.
2. Heat the front sunroof grommet to allow adhesion of the front sunroof grommet to the front hinge pillar.

   Important: The only suitable lubricant is clean water for the drain hose installation.



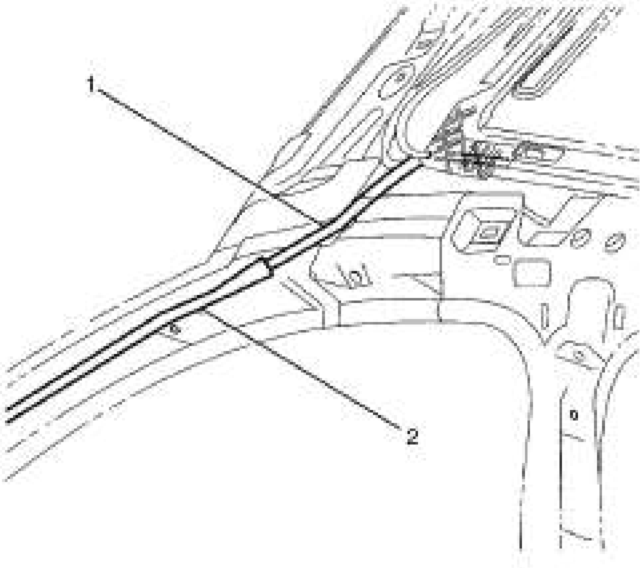
3. Connect the front lower drain tube (1) to the front sunroof grommet (2).
4. Inspect for proper drainage.
5. Install the hinge pillar trim panel. Refer to Body Hinge Pillar Trim Panel Replacement.
6. Install the front fender. Refer to Front Fender Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Roof | Sunroof | Repair Instructions | **Document ID: 2005565**

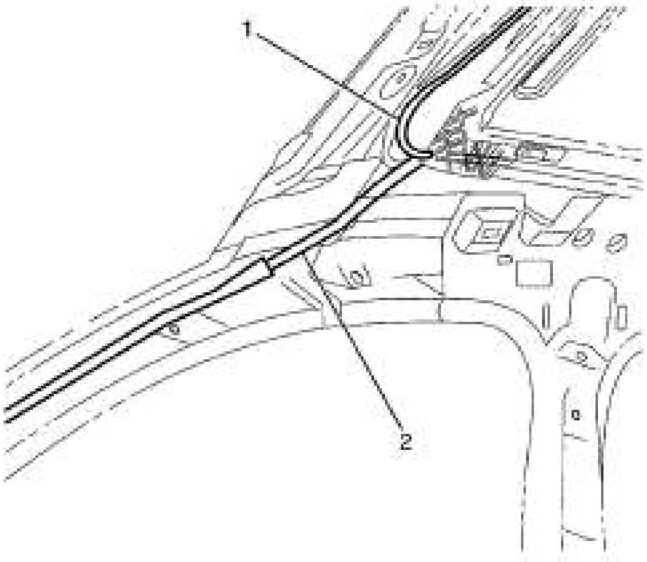
Sunroof Housing Front Drain Hose Replacement (Upper)

Removal Procedure

1. Remove the headliner. Refer to Headlining Trim Panel Replacement.



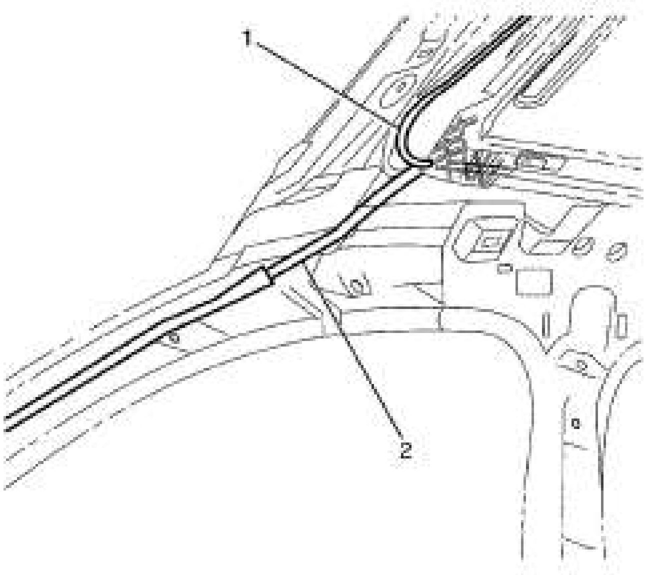
2. Disengage the front drain hose from the front drain tube (2).



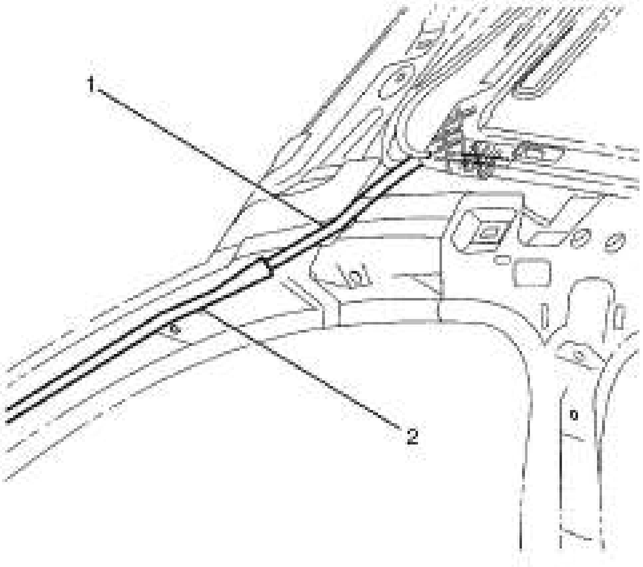
3. Disengage the front drain hose from the sunroof front drain spout (1).
4. Remove the front drain hose (2) from the vehicle.

Installation Procedure

Important: The only suitable lubricant is clean water for the drain hose installation.



1. Install the front drain hose (2) to the vehicle.
2. Connect the front drain hose to the sunroof front drain spout (1).

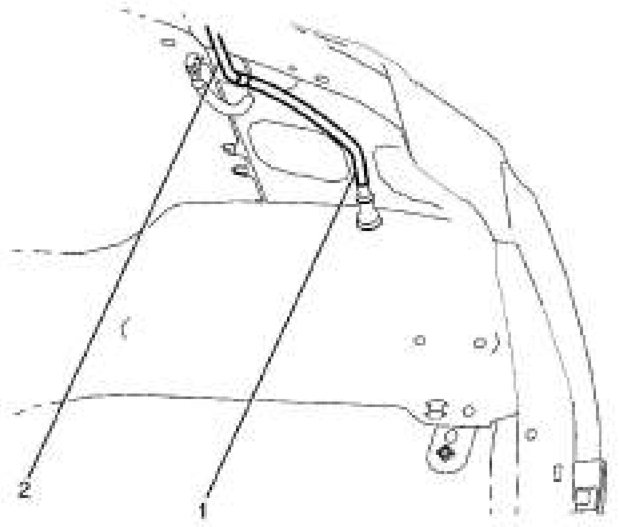


3. Connect the front drain hose to the front drain tube (1).
4. Inspect for proper drainage.
5. Install the headliner. Refer to Headlining Trim Panel Replacement.

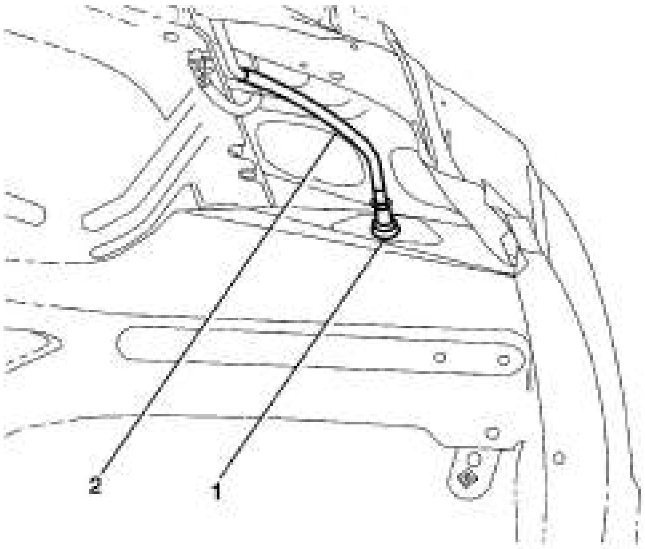
Sunroof Housing Rear Drain Hose Replacement (Lower)

Removal Procedure

1. Remove the rear compartment side trim panel. Refer to Rear Corner Trim Panel Carpet Replacement.



2. Disconnect the rear lower drain hose (1) from the rear drain tube (2).



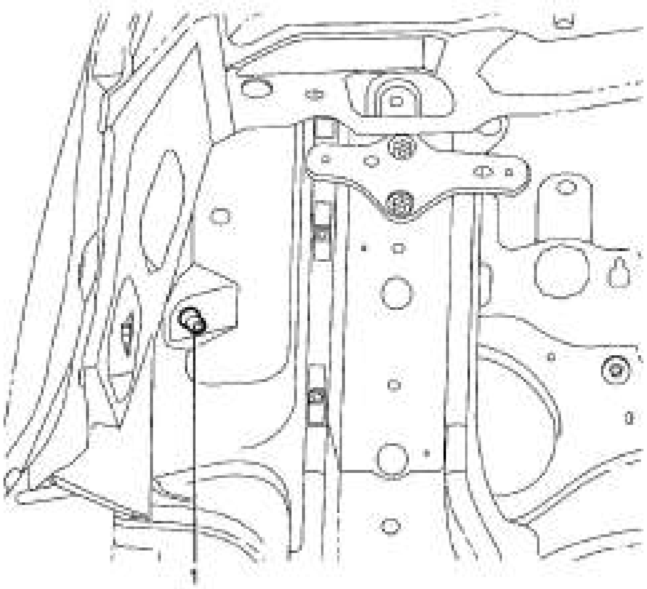
3. Disconnect the rear lower drain hose (2) from the rear drain hose grommet (1).
4. Remove the rear lower drain hose (2) from the vehicle.

Important: Heat the rear lower drain hose grommet to aid in removal.

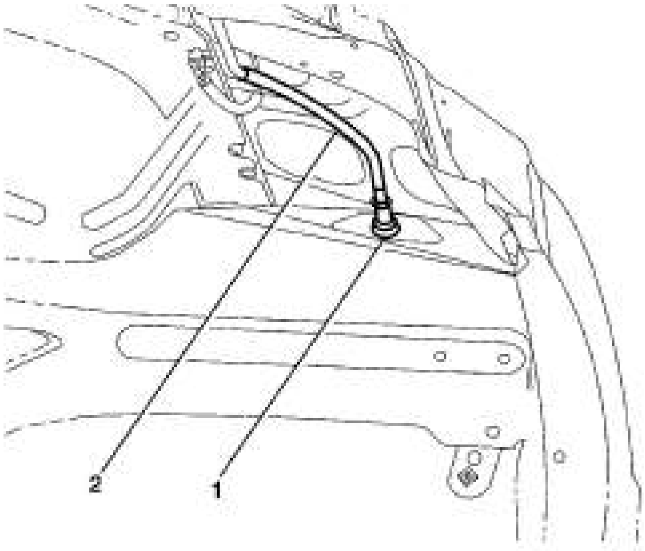
5. Remove the rear lower drain hose grommet (1) from the vehicle.
6. Scrape the remaining adhesive of the rear lower drain hose grommet from the rear inner wheelhouse.

Installation Procedure

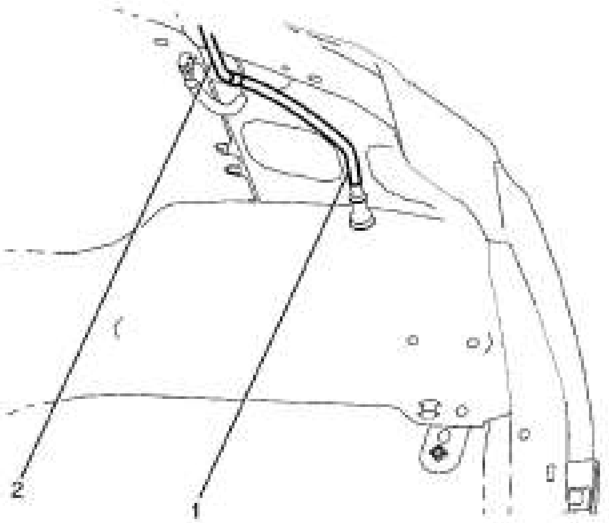
Important: The only suitable lubricant is clean water for the drain hose installation.



1. Install the rear lower drain hose grommet (1) to the rear inner wheelhouse.
2. Heat the rear lower drain hose grommet (1) to allow adhesion of the sunroof grommet to the rear inner wheelhouse.



3. Install the rear lower drain hose to the vehicle.
4. Connect the rear lower drain hose (2) to the rear lower drain hose grommet (1).



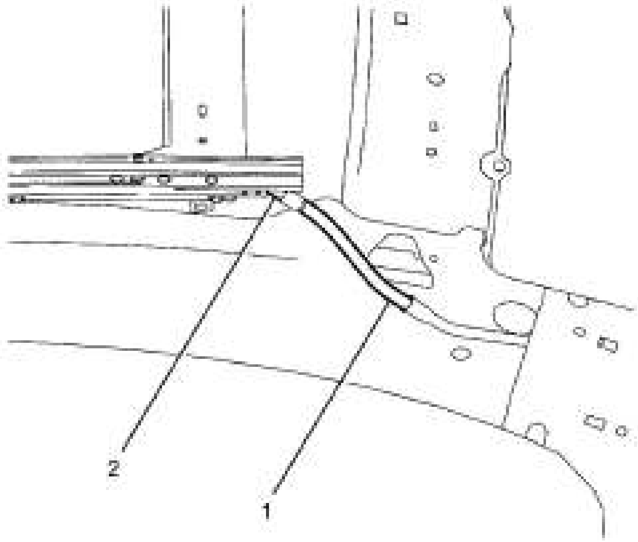
5. Connect the rear drain hose (1) to the rear drain tube (2).
6. Inspect for proper drainage.
7. Install the rear compartment side trim panel. Refer to Rear Corner Trim Panel Carpet Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Roof | Sunroof | Repair Instructions | Document ID: 1995608

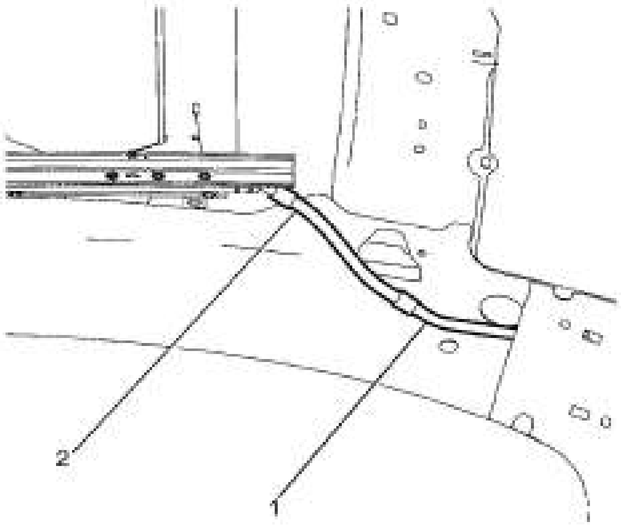
Sunroof Housing Rear Drain Hose Replacement (Upper)

Removal Procedure

1. Remove the rear quarter trim panel. Refer to Quarter Upper Trim Panel Replacement.
2. Remove the headliner in order to access the upper rear drain hose connections. Refer to Headlining Trim Panel Replacement.



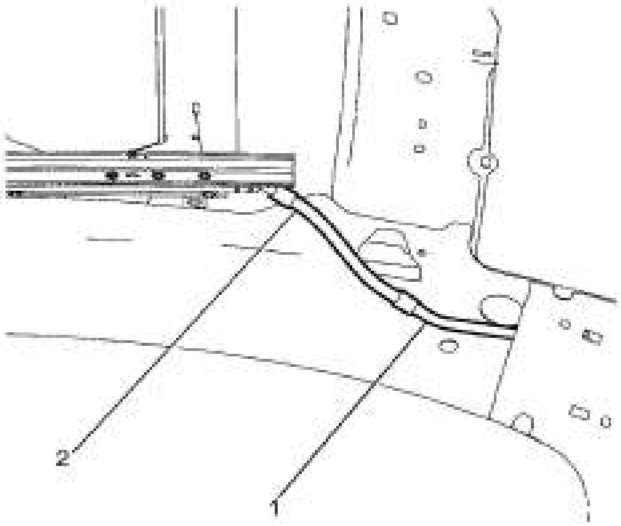
3. Disconnect the rear upper drain hose (1) from the sunroof spout (2).



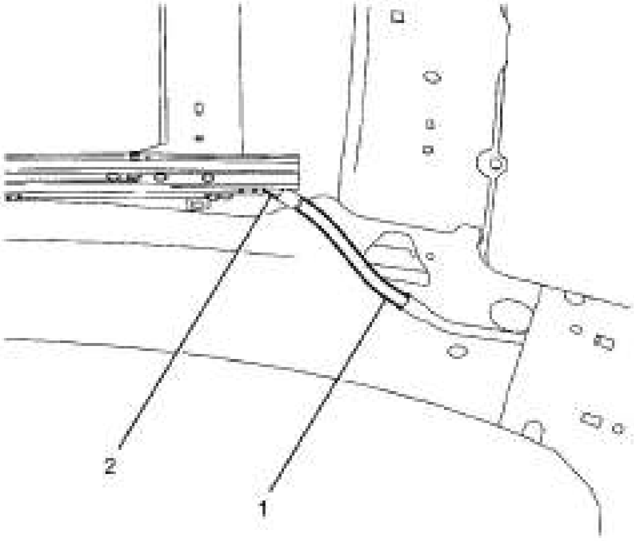
4. Disconnect the rear upper drain hose (2) from the rear drain tube (1).
5. Remove the rear upper drain hose (2) from the rear of the sunroof module.

Installation Procedure

Important: The only suitable lubricant is clean water for the drain hose installation.



1. Connect the rear upper drain hose (2) to the rear drain tube (1).



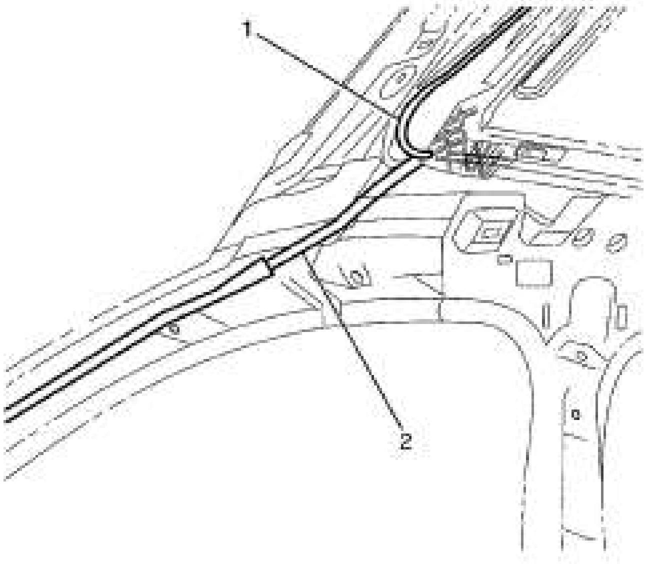
2. Connect the rear upper drain hose (1) to the sunroof spout (2).
3. Inspect for proper drainage.
4. Install the headliner with the aid of an assistant. Refer to Headlining Trim Panel Replacement.
5. Install the rear quarter trim panel. Refer to Quarter Upper Trim Panel Replacement.

Sunroof Module Assembly Replacement

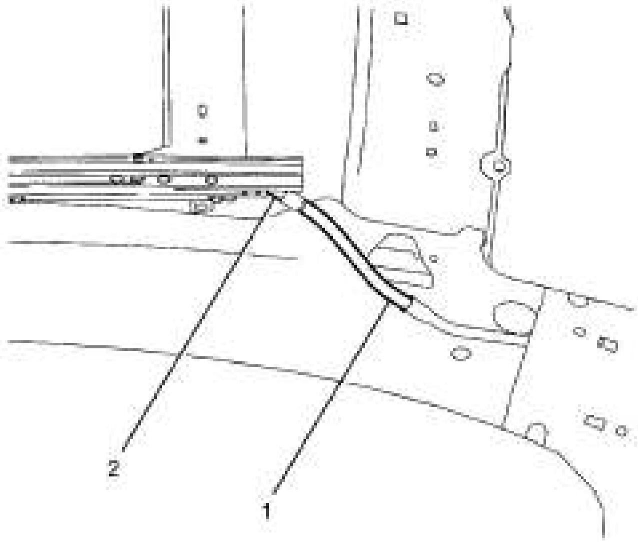
Removal Procedure

Important: A new sunroof module will not have the sunroof window or the sunshade as components of the new service part.

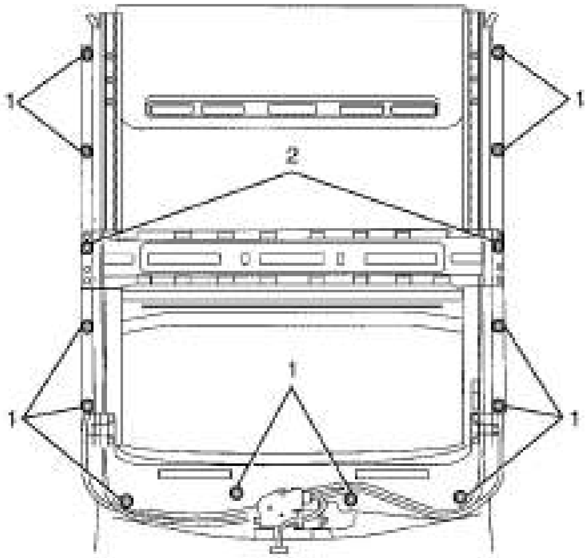
1. The old sunroof window and sunshade will need to be installed to the new sunroof module.
2. Remove the headliner. Refer to Headlining Trim Panel Replacement .



3. Disconnect the front drain hoses from the sunroof front drain spouts (1).



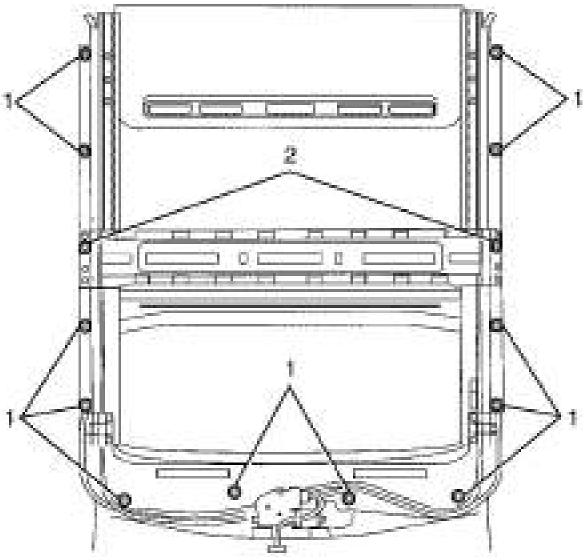
4. Disconnect the rear upper drain hoses (1) from the sunroof rear drain spouts (2).



5. Remove the sunroof module to roof ring retaining bolts (1).
6. Remove the two centre, side to side, bolts last in order to help support the sunroof module to the roof ring.
7. With the aid of an assistant, remove the last two sunroof module to roof ring retaining bolts.
8. With the aid of an assistant, lower and remove the sunroof module out the front passenger side door.
9. Remove the sunroof window. Refer to Sunroof Window Replacement .
10. Remove the sunshade panel. Refer to Sunroof Sunshade Replacement .
11. Remove the air deflector. Refer to Sunroof Air Deflector Replacement .

Installation Procedure

1. Install the air deflector. Refer to Sunroof Air Deflector Replacement .
2. Install the sunshade panel. Refer to Sunroof Sunshade Replacement .
3. Install the sunroof window and loosely install the retaining screws. Refer to Sunroof Window Replacement .

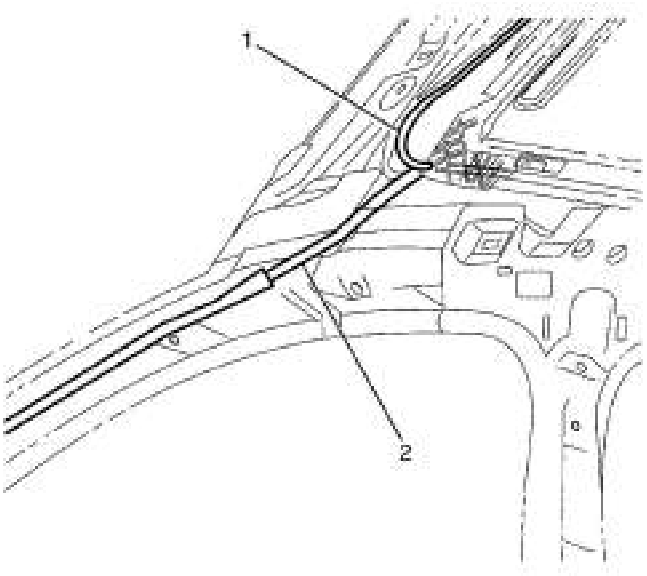


4. With the aid of an assistant, position the new sunroof module into the alignment pins (2) located on the roof ring.
5. Hand start the two centre, side to side, sunroof module to roof ring retaining bolts (1) in order to hold the sunroof module in place.
6. Finger tighten the two centre retaining bolts.

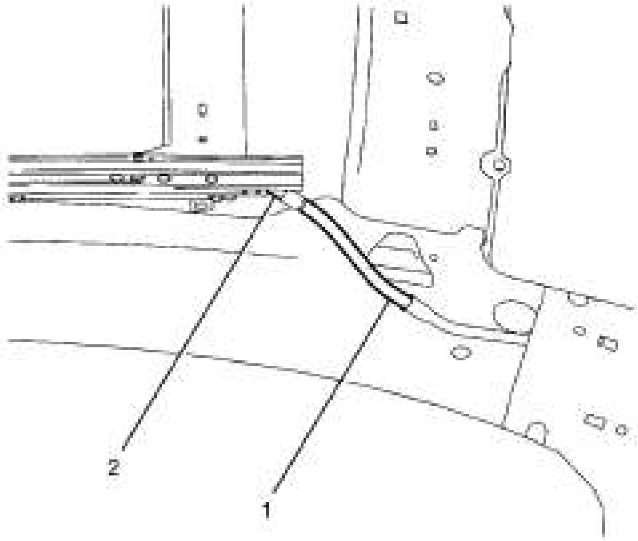
Notice: Refer to Fastener Notice in the Preface section.

7. Install the remaining sunroof module to roof ring retaining bolts (1).

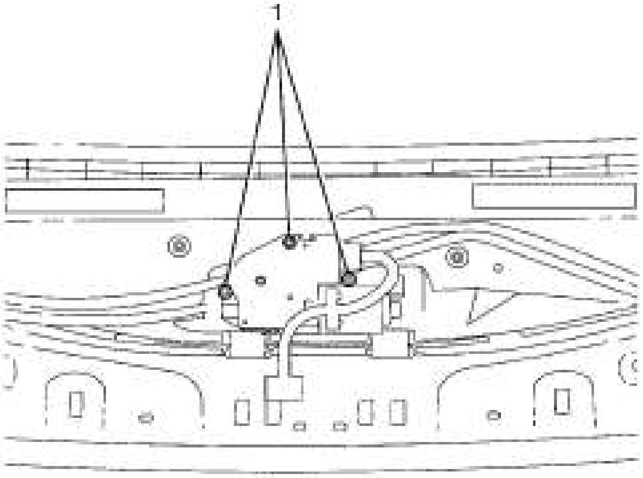
Tighten
Tighten the bolts to 2 N·m (18 lb in).



8. Connect the front drain hoses to the drain spouts (1).



9. Connect the rear drain hoses to the drain spouts (1).



10. Install sunroof motor/actuator to the module.
11. Install the motor/actuator to sunroof module retaining screws (1).

Tighten
Tighten all of the bolts to 2 N·m (18 lb in).

12. Connect the electrical connector to the sunroof motor/actuator.
13. Secure the harness with suitable straps.
14. Adjust the sunroof window. Refer to Sunroof Window Height and Opening Fit Adjustment .

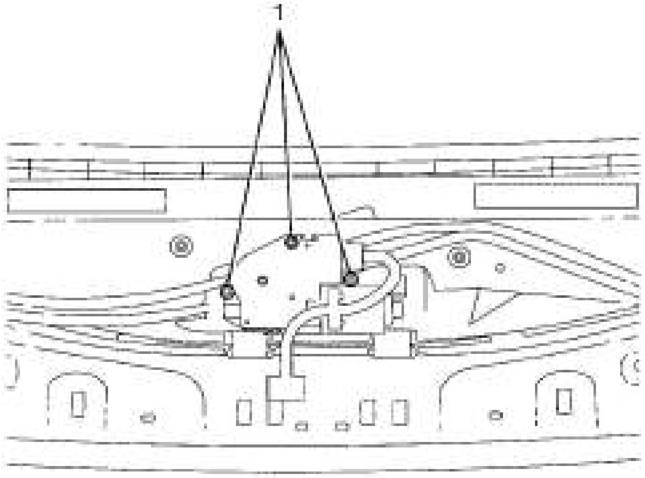
15. If re-programming is required. Refer to Control Module References .
16. Verify the proper operation of the sunroof before securing the headliner.
17. Initilization /Teach the sunroof motor. Refer to Sunroof Motor/Actuator Synchronization .
18. Install the headliner, with an assistant. Refer to Headlining Trim Panel Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Roof | Sunroof | Repair Instructions | **Document ID: 1995627**

Sunroof Motor / Actuator Replacement

Removal Procedure

1. Lower the headliner to access the sunroof actuator. Refer to Headlining Trim Panel ReplacementHeadliner Replacement in Interior Trim.



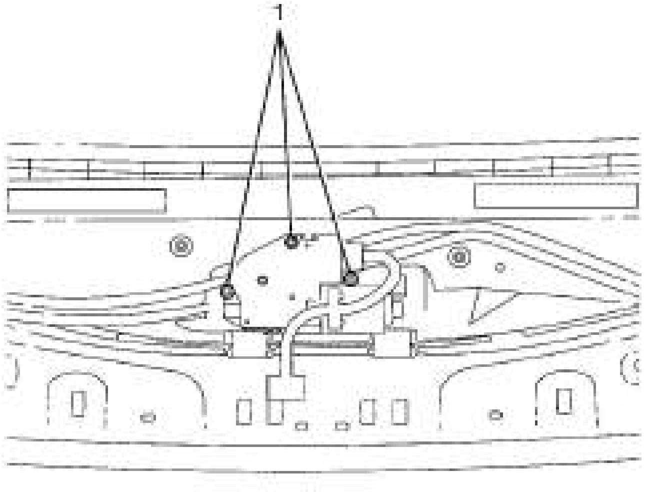
Important: If the sunroof window is partially closed, remove the actuator first, before moving the sunroof window forward.

2. Remove the sunroof actuator to sunroof module retaining bolts (1).
3. Disconnect the sunroof actuator wiring connector.
4. Remove the sunroof actuator from the sunroof module.

Installation Procedure

1. Manually move the sunroof window to the fully closed position.
2. Install the sunroof actuator to the sunroof module.

Notice: Refer to Fastener Notice in the Preface section.



3. Install the sunroof actuator to sunroof module retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).

4. Connect the sunroof actuator wiring connector to the sunroof actuator.
5. Initilization /Teach the sunroof motor. Refer to Sunroof Motor/Actuator Synchronization.
6. Verify the sunroof operation.
7. Install the headliner. Refer to Headlining Trim Panel ReplacementHeadliner Replacement in Interior Trim.

Sunroof Motor / Actuator Synchronization

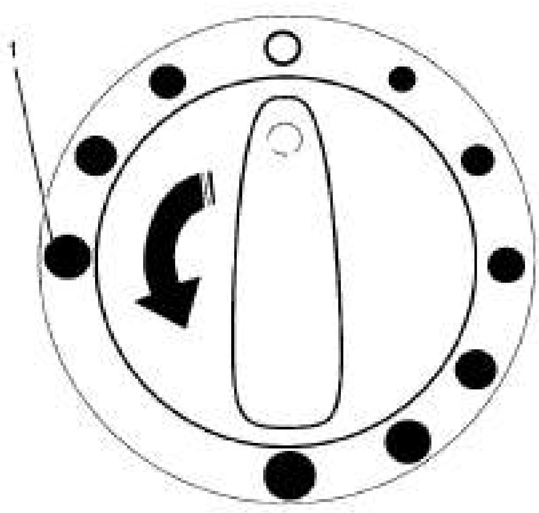
Important: The sunroof actuator is timed at the factory. If there is battery voltage applied to a new sunroof actuator, the pre-timed settings within the sunroof actuator are lost and cannot be reset or used to accommodate proper installation.

There should be no battery voltage applied to a new sunroof actuator until the following conditions are satisfied:

The power sunroof actuator is installed to the sunroof control module.

Initialization Procedure

1. Install the power sunroof actuator. Refer to Sunroof Motor/Actuator Replacement.
2. Ensure that all electrical harness connectors are connected.
3. Turn ignition ON.



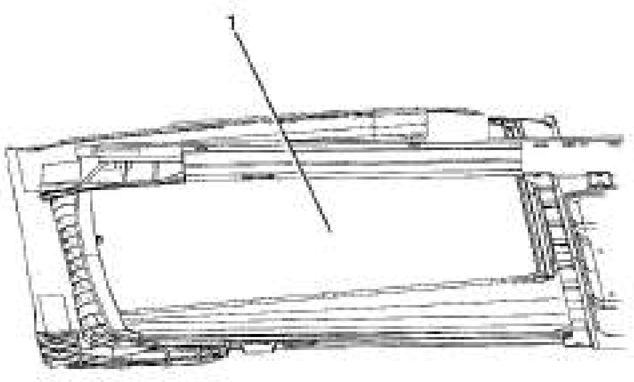
4. Turn the sunroof dial to the full vent position (1).
5. Press and hold the sunroof dial switch in for a minimum of five seconds to activate the sunroof initialization process. The sunroof will move to the hard stop position and will stop in the soft stop position.
6. Release the switch.

Teach Mode Procedure

1. Press and hold the sunroof switch in within 2 seconds of the initialization procedure.
2. Hold the switch in until the sunroof moves to the full open position then moves to the closed position and stops.
3. Release the switch.
4. Verify the operation of the sunroof in all positions.

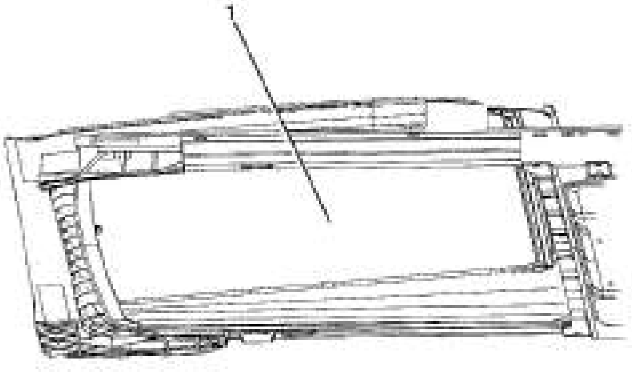
Sunroof Panel Side Opening Closeout Cover Replacement

Removal Procedure



1. Open the sunshade to the full rearward position.
2. Open the sunroof window to the vent position.
3. Detach both sides of the sunroof panel side opening covers (2) from the sunroof window (1).
4. Open the sunroof to the full open position.
5. Using a suitable tool, press the locking tab (4) outward, from inside the roof opening, in order to detach the sunroof panel side opening cover from the sunroof track channel (3).
6. With the lock tab (4) depressed, lift the front edge of the sunroof panel side opening cover from the track, working towards the rear of the sunroof opening.
7. Repeat the steps for the entire length of the sunroof panel side opening cover (6).
8. Remove the sunroof panel side opening cover from the sunroof module track assembly.

Installation Procedure

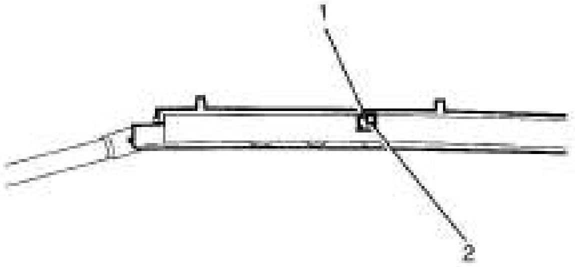


1. Place in position, the new sunroof panel side opening cover to the sunroof module track assembly.
2. Hold the lower part of the sunroof panel side opening cover firmly and press the locking tab (2) into the track assembly.
3. Make sure the entire length of the sunroof panel side opening cover is secure to the sunroof assembly track.
4. Close the sunroof window (1).
5. Open the sunroof window to the vent position.
6. Secure the sunroof panel side opening cover to the three clips (1) located on the inside edge of the sunroof window.
7. Close the sunroof window.
8. Cycle the sunroof window to the vent position and full open positions in order to make sure the sunroof panel side opening covers are secure to the attachment clips.
9. Close the sunroof window.
10. Close the sunshade.

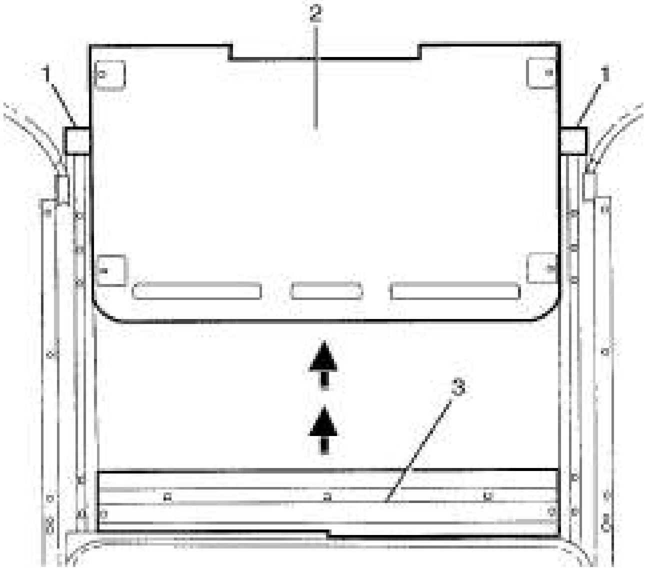
Sunroof Sunshade Replacement

Removal Procedure

1. Cycle the sunroof window to the vent position in order to ease in the removal of the sunshade panel.
2. Remove the headliner. Refer to Headlining Trim Panel Replacement.
3. Remove the sunroof module. Refer to Sunroof Module Assembly Replacement.



4. Remove the sunshade stop rubber to sunroof module retaining screw (2). Repeat for the opposite side.
5. Remove the sunshade stop rubber (1) from the sunroof module by sliding the sunshade stop rubber to the rear of the sunroof module. Repeat for the opposite side.

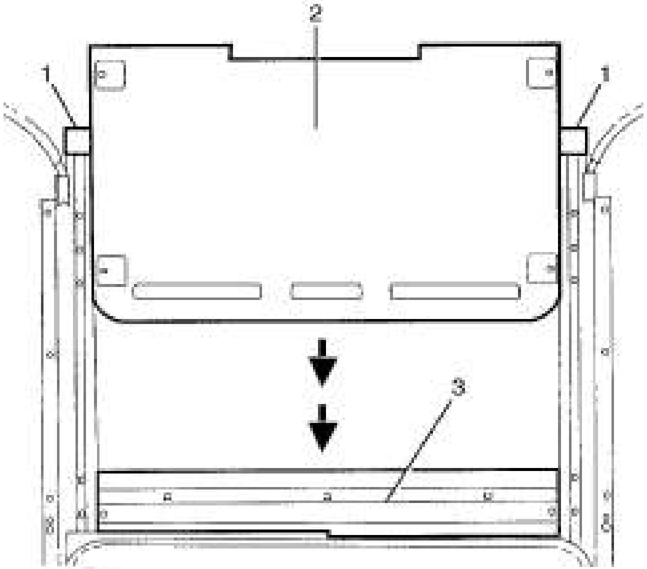


6. Remove the end caps (1) from the sunroof rail.
7. Carefully remove the sunshade panel (2) by sliding the sunshade panel towards the rear of the sunroof.

   Important: Do not apply excessive pressure when arching the sunshade panel, failure to comply may result in damage to the sunshade panel.

8. Remove the sunshade panel (1) from the sunroof module (3).

Installation Procedure



1. Position front edge of the sunshade panel (2) to the track.

   Important: Do not apply excessive pressure to the sunshade panel, failure to comply may result in damage to the sunshade panel.

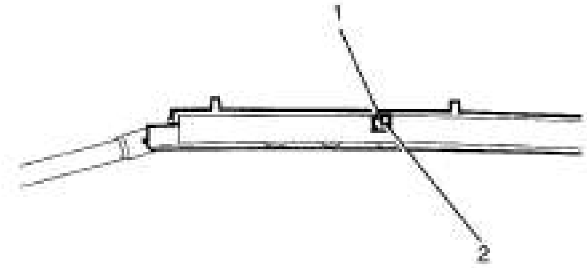
2. Carefully install the sunshade panel (2) by sliding the sunshade panel toward to the front of the sunroof module (3).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the sunroof end caps (1) to the sunroof rail.

   Tighten
   Tighten the screw to 1 N·m (9 lb in).

4. Slide the sunshade panel forward and rearward to make sure free operation is present.



5. Install the sunshade stop rubber (1) to the sunroof module. Repeat for the opposite side.
6. Install the sunshade stop rubber to sunroof module retaining screw (2). Repeat for the opposite side.

   Tighten
   Tighten the screws to 1 N·m (9 lb in).

7. Install the sunroof module. Refer to Sunroof Module Assembly Replacement.
8. Install the headliner. Refer to Headlining Trim Panel Replacement.

Sunroof Switch Replacement

Removal Procedure

1. Disconnect the electrical connector to the sunroof switch.
2. Disengage the retaining clips (1) securing the sunroof switch to the sunroof overhead console.
3. Remove the sunroof switch from the sunroof overhead console.

Installation Procedure

1. Install the sunroof switch to the sunroof overhead console.
2. Engage the retaining clips (1) to secure the sunroof switch to the sunroof overhead console.
3. Connect the electrical connector to the sunroof switch.

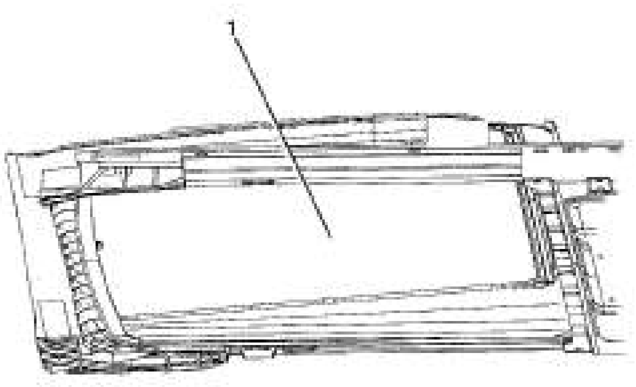
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Roof | Sunroof | Repair Instructions | **Document ID: 1976202**

Sunroof Window Height and Opening Fit Adjustment

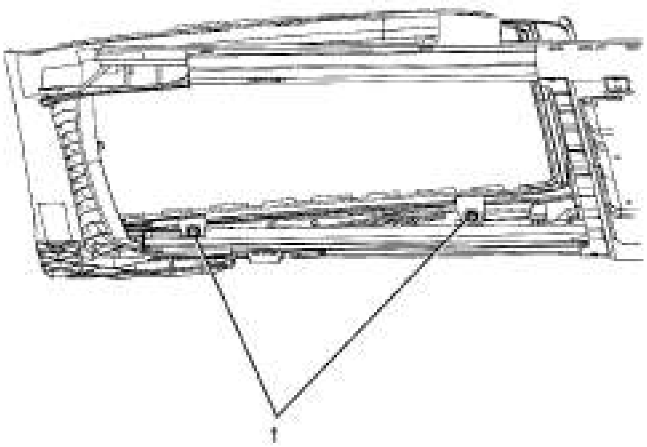
Adjustment Procedure

1. Cycle the sunroof window from the full open to the full closed position.

   Important: Correct adjustment cannot be achieved if the sunroof window is closed from the vent position.



2. Remove the top side of the sunroof panel side opening closeout panel covers (1) from the 3 clips located on the inner edge of the sunroof window (2) in order to access the window adjustment screws.
3. Cycle the sunroof to the closed position.



4. Loosen the adjusting screws (1) on each side of the sunroof window.
5. Centre the window front to rear in the opening.

Important: Do not fully tighten the sunroof retaining screws at this stage.

6. Adjust the front of the sunroof window (2) from flush to 1 mm (0.04 in) (1) below the top surface of the roof panel (3).

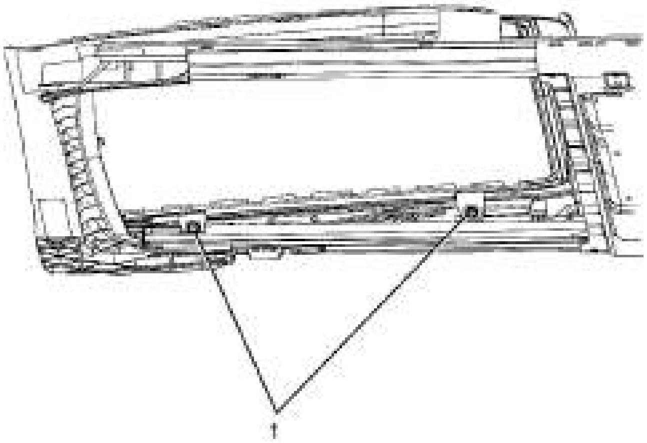
   Do not fully tighten at this stage.

   Important: Do not fully tighten the sunroof retaining screws at this stage.

7. Adjust the rear of the sunroof window (2) from flush to 1 mm (0.04 in) above the top surface of the roof panel (1).

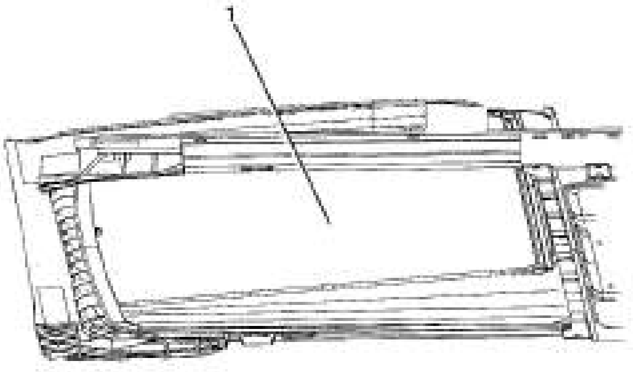
   Do not fully tighten at this stage.

   Notice: Refer to Fastener Notice in the Preface section.



8. Tighten the sunroof glass to the sunroof frame retaining screws (1).

   Tighten
   Tighten the screws to 3 N·m (27 lb in).



9. Install the sunroof panel side opening closeout covers (2).
10. Cycle the sunroof window through all of the positions.
11. Verify the sunroof window fore/aft adjustment.
12. Verify the front and rear height adjustment.
13. Readjust the sunroof window, if necessary.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Roof | Sunroof | Repair Instructions | Document ID: 1996307

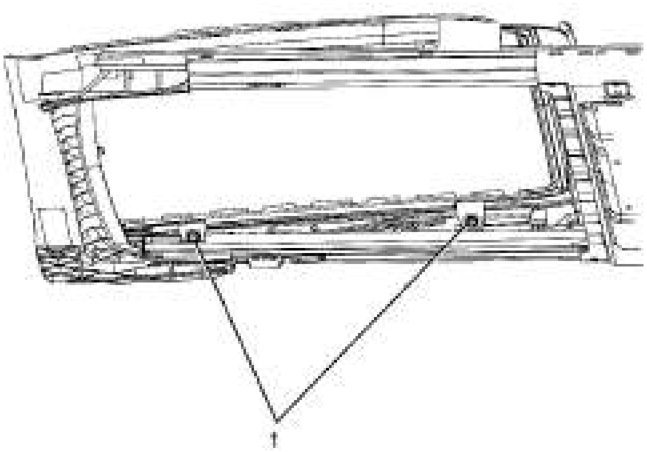
Sunroof Window Replacement

Removal Procedure

Notice: Refer to General Repair Instructions in the Preface section.

Notice: In order to prevent damage to the paint, mask the roof panel in front of the sunroof opening using masking tape and paper.

1. Cycle the sunroof window to the vent position.
2. Slide the sunshade rearward.
3. Remove the sunroof panel side opening covers. Refer to Sunroof Panel Side Opening Closeout Cover Replacement.

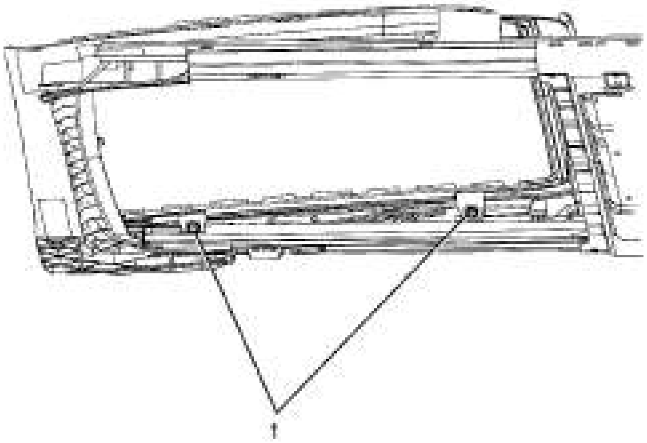


4. Remove the sunroof window to sunroof module retaining screws (1). Repeat for the opposite side.

Important: Be careful not to scratch the roof surface or the sunroof window.

5. Lift the sunroof window (3) from the sunroof module.

Installation Procedure



1. Position the sunroof window (3) into the opening, with the window trade mark pointing rearward.

   Important: Do not fully tighten the sunroof window to sunroof module retaining screws (1) at this stage.

2. Install the sunroof window to sunroof module retaining screws (1).

   Do not fully tighten at this stage.

3. Carefully close the sunroof window from the vent position to the fully closed position.
4. Adjust the sunroof window. Refer to Sunroof Window Height and Opening Fit Adjustment.
5. Install the sunroof panel side opening covers. Refer to Sunroof Panel Side Opening Closeout Cover Replacement.
6. Close the sunshade.
7. Cycle the sunroof window to make sure proper operation and fit.

Sunroof Description and Operation

Power Sunroof System Components

The Power Sunroof System consists of the following components:

- Sunroof control module
- Sunroof switch
- Sunroof glass, tilt-slide-vent style with glass sliding between the headliner and the roof panel
- Rail and track assembly upon which the sunroof glass rides
- Sunroof sunshade panel
- SUNROOF Fuse 20 A
- Ground G201

Power and Grounds

Battery positive voltage is supplied at all times to the sunroof control module from the 20 A SUNROOF fuse located in the instrument panel fuse block. Ground is supplied to the sunroof control module through the module ground circuit and G201.

Ground is supplied to the sunroof switch through the switch ground circuit and G201.

Power Sunroof Operation

The Power Sunroof System will operate only with the ignition turned to the RUN or Accessory positions. Once the ignition is turned OFF and the sunroof is open, the sunroof might automatically close.

The power sunroof is operated from the sunroof switch. The sunroof switch, when rotated to a selection, will send coded information to the sunroof control module as to what position the sunroof window is to move to. The sunroof control module will then command the motor to slide the sunroof glass to the requested position.

Sunroof Switch

The sunroof switch is a rotary dial type switch with four output signals to the sunroof control module. The coded inputs to the sunroof control module will initiate a request to open the sunroof window to a specific position. The sunroof switch is located in the dome light assembly. The sunroof switch positions are:

- 6 sliding open positions
- 3 vent positions
- Flush close position
- Emergency stop/resume position

Express Open

To express open the sunroof select any of the 6 express sliding open positions by rotating the sunroof switch clockwise. The sunroof switch will send a sunroof position request signal through the switch output signals to the sunroof control module. The sunroof control module will interpret the inputs and command the motor to slide the window to the specified requested position. The sunshade will slide open along with the window.

Express Fully Close

To express close the sunroof rotate the sunroof switch to the flush close position. The sunroof switch will send a sunroof position request signal through the sunroof switch output signals to the sunroof control module. The sunroof control module will interpret the inputs and command the motor to slide the window to the close position. The sunroof control module will continue to control the sunroof motor until the sunroof window reaches the flush close position. The sunshade panel will have to be manually slid closed.

Express Vent Open

To express open the sunroof to a vent position rotate the sunroof switch counterclockwise to any of the three vent selections. The sunroof switch will send a coded input through the sunroof switch output signals to the sunroof control module. The sunroof control module will interpret the inputs and command the motor to slide the window to the specified requested position. The sunshade panel will have to be manually slid open.

Emergency Stop

When the sunroof is performing an automatic open or automatic close operation, the automatic sliding action of the sunroof can be interrupted by pressing the sunroof switch upward. When the sunroof switch is pressed again, the sunroof will resume and complete the previous requested action.

Anti-Pinch Guard

If the sunroof encounters an obstruction when closing from a sliding position, it immediately returns to the fully open position. If the sunroof encounters an obstruction when closing from the vent position, it immediately returns to the fully open vent position. The sunroof will not operate again until the sunroof switch is pressed upwards or a different position is selected.

Power Sunroof Motor

The sunroof motor is a reversible drive permanent magnet DC motor. The sunroof control module manipulates the voltage polarity at the motor to achieve the different opening and closing positions.

Limit Switch

When closing the sunroof window from any vent position, the sunroof window drops slightly below the flush close position and returns, swiping the seal and coming to rest in the flush close position. When closing the sunroof window from any of the 6 sliding open positions, the sunroof module considers the position of the sunroof window and stops the sunroof window in the flush close position.

#PIT4636: GM Accessories Wheel Appearance Standards - keywords accessory aesthetics blister chrome ding dent dust peel rim wheel - (May 1, 2008)

Subject: GM Accessories Wheel Appearance Standards

Models: 1996-2009 GM Passenger Cars and Light Duty Trucks (including Saturn)

2009 and Prior HUMMER H2, H3

2005-2009 Saab 9-7X

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition / Concern:

GM Dealers and ADIs may occasionally question the initial quality of a GM Accessories Wheel Assembly from an aesthetics perspective.

Recommendation / Instructions:

When in doubt, the general rule that should be followed (as approved by GM Tire & Wheel Systems) is:

"No visible defects with the wheel in car position in daylight at a distance of 3 feet."

Otherwise, GM Dealers should reference TSB 07-03-10-015A to determine which issues are covered under warranty and which are not for plant-installed (OE) wheels as well as GM Accessories Wheels that have already been installed on a customer's vehicle.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, DO NOT assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. See your GM dealer for information on whether your vehicle may benefit from

WE SUPPORT VOLUNTARY TECHNICIAN CERTIFICATION

the information.

CH-49405 Ball Joint Release Tool.

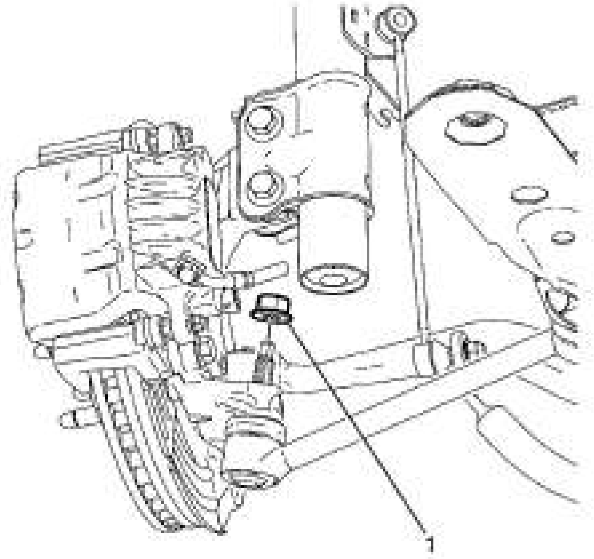
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Important: The front control arm ball joint is non-serviceable, if found faulty, the complete front control arm assembly must be replaced..

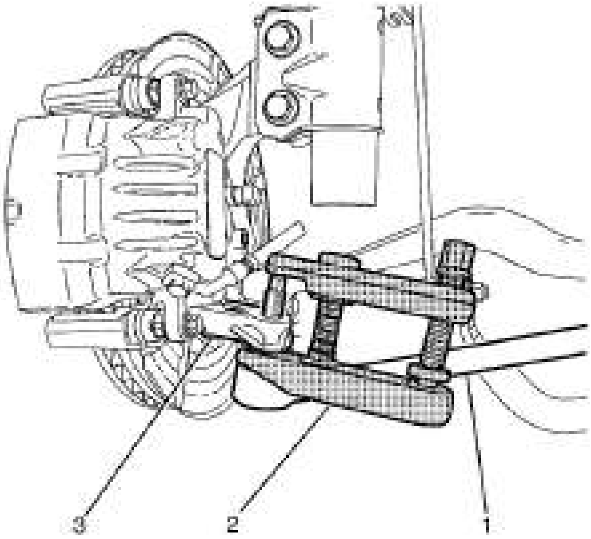
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation.



Important: Bolts and nuts with micro-encapsulated thread sealant must be discarded after removal.

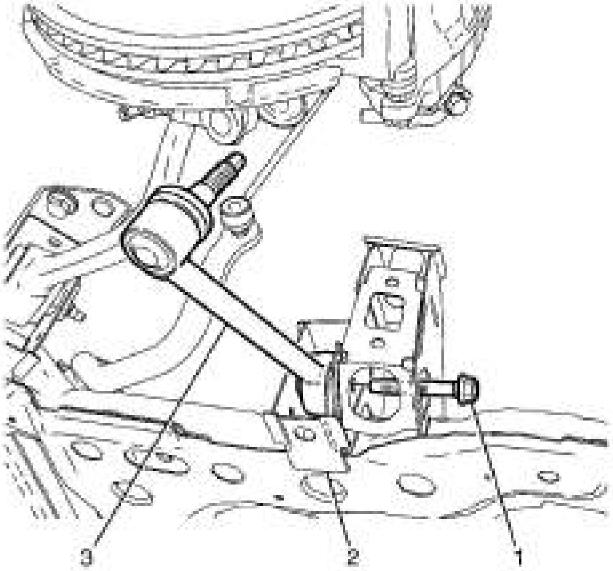
3. Remove the control arm to steering knuckle retaining nut (1).

   Discard the nut.



Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

4. Separate the front control arm (1) from the steering knuckle (3) using the CH-49405 (2).
5. Disconnect the front control arm (1) from the steering knuckle (3).



6. Remove the front control arm to subframe retaining bolt (1).

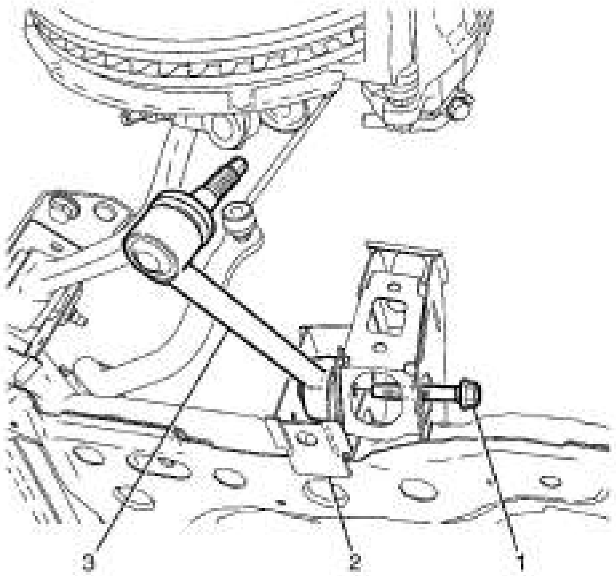
   Discard the bolt.

7. Remove the front control arm (3) from the subframe (2).

Important: Clean the captive nut thread free of loctite with a suitable tap. This enables the correct torque value to be achieved on fitment.

8. Clean the captive nut thread.
9. Inspect all parts for wear and damage.

Installation Procedure

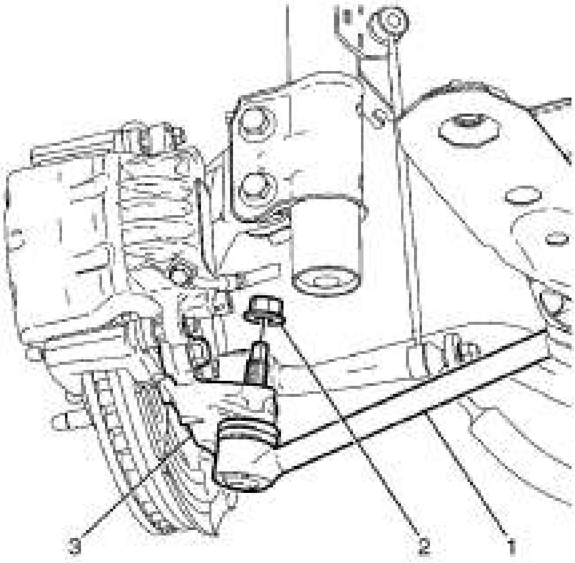


1. Install the front control arm (3) to the subframe (2).

   Important: The NEW front control arm to subframe retaining bolt (1) must not be fully tightened at this stage.

2. Install the NEW front control arm to subframe retaining bolt (1).

   Do not fully tighten at this stage.



3. Install the front control arm (1) to the steering knuckle (3).

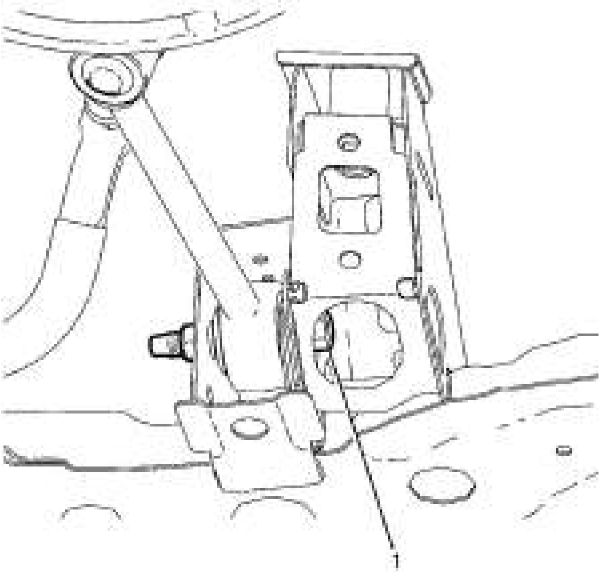
   Notice: Refer to Fastener Notice in the Preface section.

4. Install the NEW control arm to steering knuckle retaining nut (2).

   Tighten
   Tighten the bolts a first pass to 40 N·m (30 lb ft).

   Tighten the bolts an additional 60 degrees.

5. Install the front wheel. Refer to Tire and Wheel Removal and Installation.
6. Remove the safety stands.
7. Lower the vehicle to the ground.



8. Bounce the vehicle several times to settle the suspension.
9. Tighten the front control arm to subframe retaining bolt (1).

    Tighten
    Tighten the bolts a first pass to 50 N·m (37 lb ft).

    Tighten the bolts an additional 120 degrees.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Front Suspension | Repair Instructions | **Document ID: 1993274**

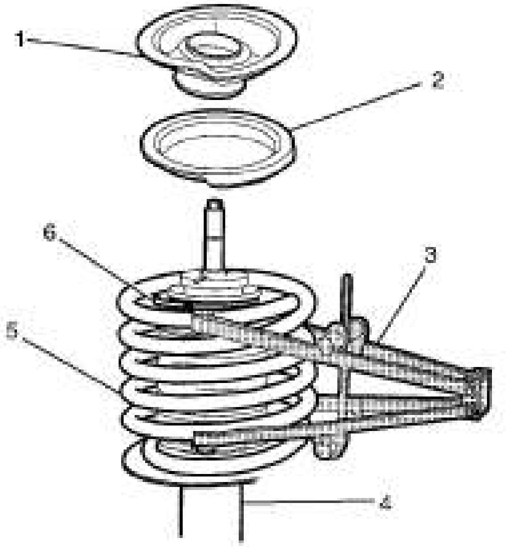
Front Coil Springs Replacement (LWB SWB Clubsport CSV VXR8)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation .
3. Remove the front strut assembly. Refer to Strut Assembly Replacement
4. Remove the strut assembly support bearing and mount. Refer to Front Suspension Strut Mount and Bearing Replacement .



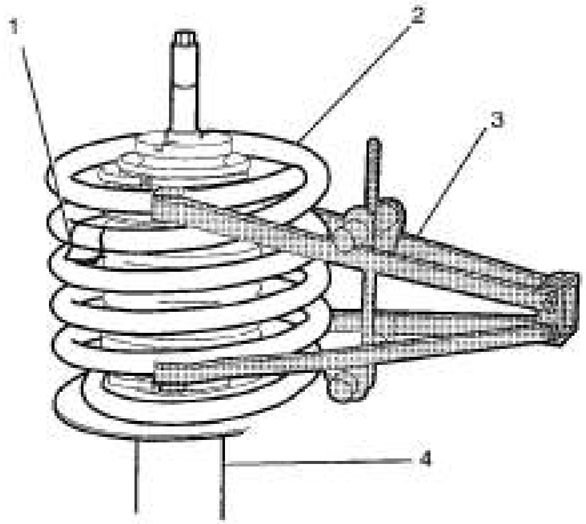
5. Remove the dust boot upper retaining clamp (6).

   Discard the clamp.

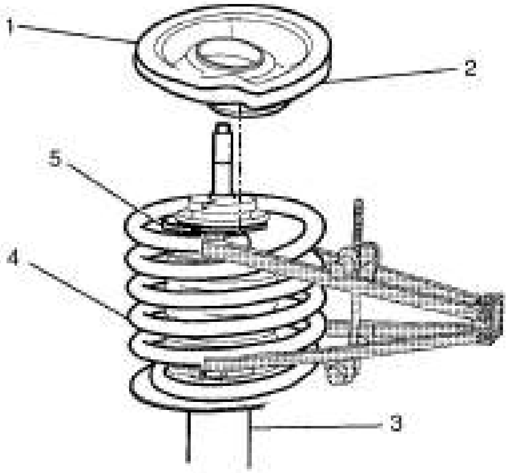
6. Remove the coil spring seat (1) and coil spring insulator (2).
7. Remove the coil spring (5) from the strut unit (4) and release the spring compressor (3).
8. Inspect all parts for wear and damage.

Installation Procedure

Notice: Refer to Fastener Tightening Specifications in the Preface section.



1. Make sure that all components have been cleaned and inspected.
2. Install the spring compressor (3) to the coil spring (2) and compress coil spring.
3. Install the coil spring (2) to the strut unit (4).



Important: The coil spring insulator (2) and seat (1) have a step which locates on to the straight projecting end of the spring. The step must be correctly orientated in relation to the spring.

4. Install the coil spring insulator (2) and coil spring seat (1).

Important: Align the mark on the spring seat with the mark on the strut unit when installing, with straight projecting end of the spring correctly located in the coil spring insulator (2) and seat (1).

5. Position the coil spring (5) and spring seat on the strut unit (4).
6. Install the NEW dust boot upper retaining clamp (6) securing the dust boot to the coil spring seat (1).
7. Install the strut assembly support bearing and mount. Refer to Front Suspension Strut Mount and Bearing Replacement
8. Install the front strut assembly. Refer to Strut Assembly Replacement .
9. Install the front wheel. Refer to Tire and Wheel Removal and Installation .
10. Remove the safety stands.
11. Lower the vehicle to the ground.

Front Lower Control Front Arm Replacement

Tools Required

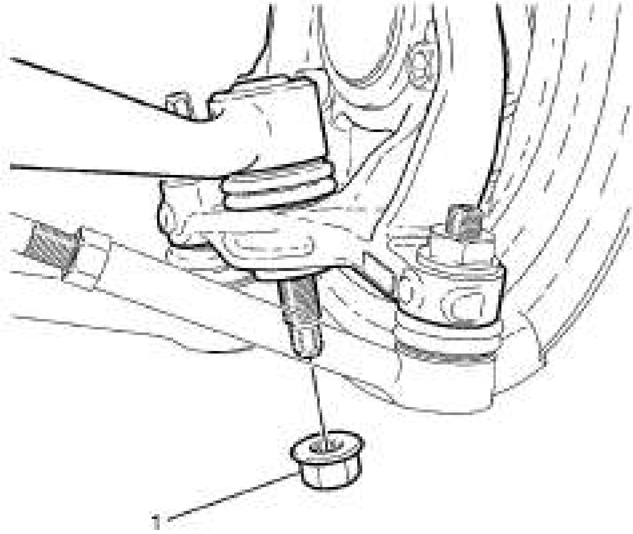
CH-49405 Ball Joint Release Tool.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

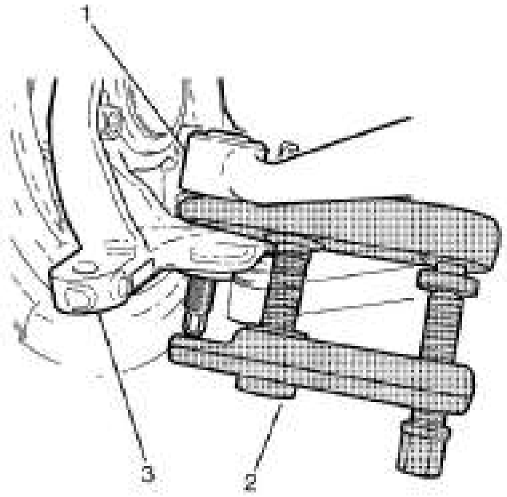
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation.



Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

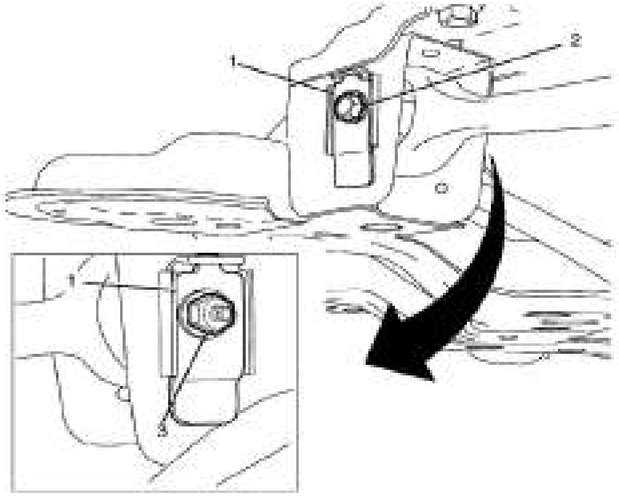
3. Remove the front caster arm to steering knuckle retaining nut (1).

   Discard the nut.



Important: Once a load is applied by the release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

4. Separate the front caster arm (1) from the steering knuckle (3) using the CH-49405 (2).
5. Disconnect the front caster arm (1) from the steering knuckle (3).

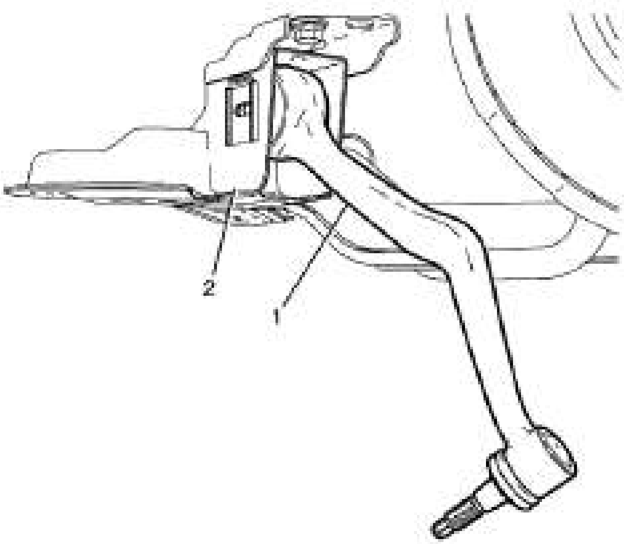


6. Remove the front caster arm to subframe retaining nut (3).

   Discard the nut.

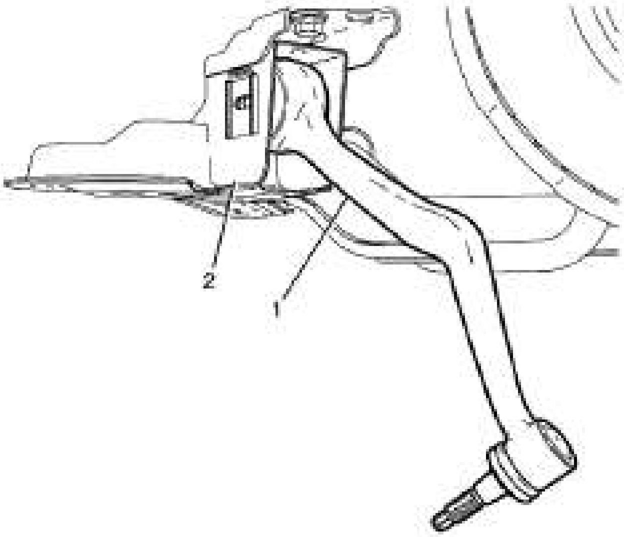
7. Remove the front caster arm to subframe retaining bolt (2).

   Discard the bolt.

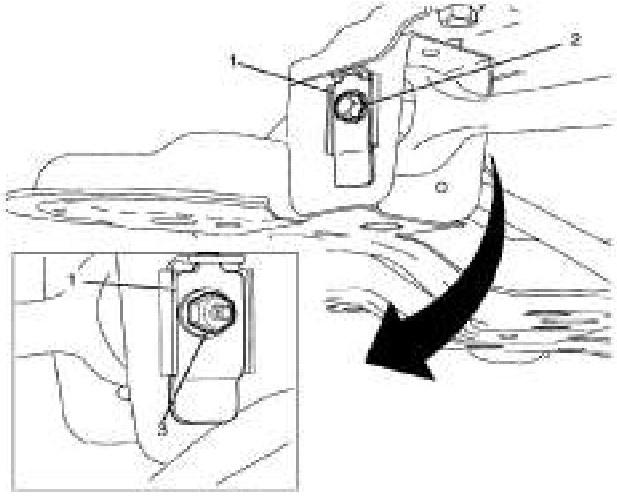


8. Remove the front caster arm (1) from the subframe (2).
9. Inspect all parts for wear and damage.

Installation Procedure

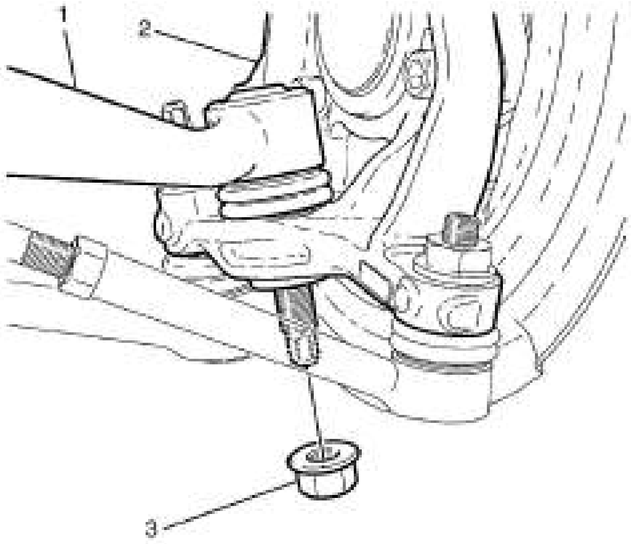


1. Install the front caster arm (1) from the subframe (2).



2. Install the NEW lower caster arm to the subframe retaining bolt (2).
3. Install the NEW lower caster arm to the subframe retaining nut (3).

   Do not fully tighten at this stage.



4. Install the front caster arm ball joint (1) to the steering knuckle (2).

   Notice: Refer to Fastener Notice in the Preface section.

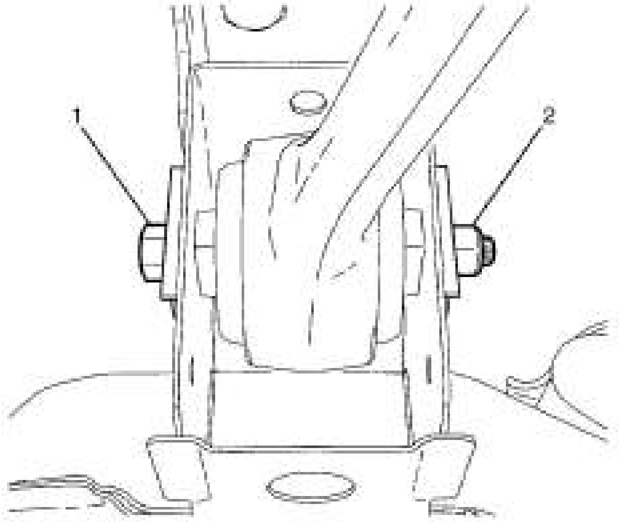
5. Install the NEW front caster arm to steering knuckle retaining nut (3).

   Tighten

Tighten the bolts a first pass to 40 N·m (30 lb ft).

Tighten
Tighten the bolts an additional 60 degrees.

6. Install the front wheel. Refer to Tire and Wheel Removal and Installation.
7. Remove the safety stands.
8. Lower the vehicle to the ground.



9. Bounce the vehicle several times to settle the suspension.
10. Check and adjust the wheel alignment. Refer to Wheel Alignment Measurement in Wheel Alignment.

Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the bolts and nuts that have been partially tightened. Failure to comply with to this requirement may adversely affect the ride and handling characteristics of the vehicle and reduce bushing life.

11. Tighten the front caster arm to subframe retaining bolt (1).

Tighten
Tighten the bolts a first pass to 50 N·m (37 lb ft).

Tighten
Tighten the bolts an additional 120 degrees.

Front Suspension Strut Mount and Bearing Replacement

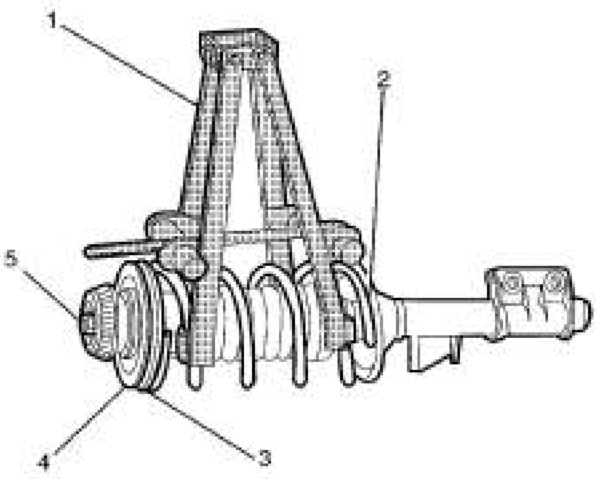
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

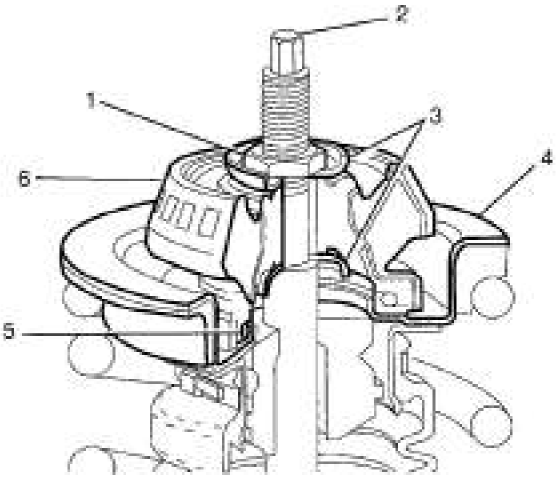
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation.
3. Remove the front strut assembly. Refer to Strut Assembly Replacement.

Caution: Refer to General Repair Instructions in the Preface section.



4. Install the spring compressor (1) on to the front coil spring (2), make sure the hooks are seated on the coil spring (2) correctly.
5. Mark the coil spring seat in relation to the strut unit.
6. Compress the coil spring (2) until the coil spring insulator (4) has clearance at the coil spring seat (3).



Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

Important: Use the hex on the strut unit piston shaft to hold the strut unit piston shaft (2) while loosening the strut assembly retaining nut (1).

7. Remove the strut assembly retaining nut (1).

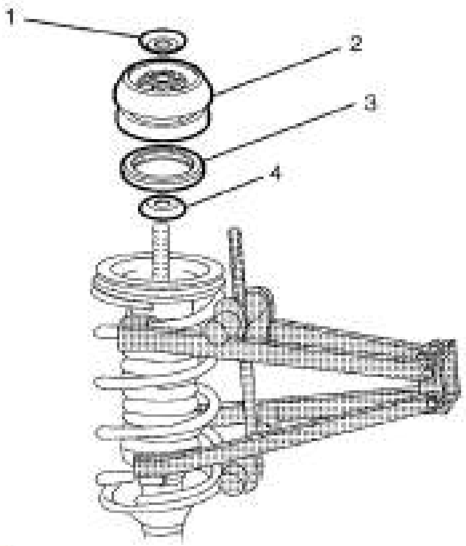
Important: Special attention must be paid to the orientation of the cup washers (3) in relation to strut assembly support mount (6).

Important: Special attention must be paid to the orientation of the strut assembly support bearing (5) in relation to the coil spring seat (4).

Important: The strut assembly support bearing (5) is sealed for life. If considered to be faulty, the bearing must be replaced as an assembly.

8. Remove the strut assembly support mount (6), bearing (5) and the two washers (3) on both sides of the bearing.
9. Inspect all parts for wear and damage.

Installation Procedure

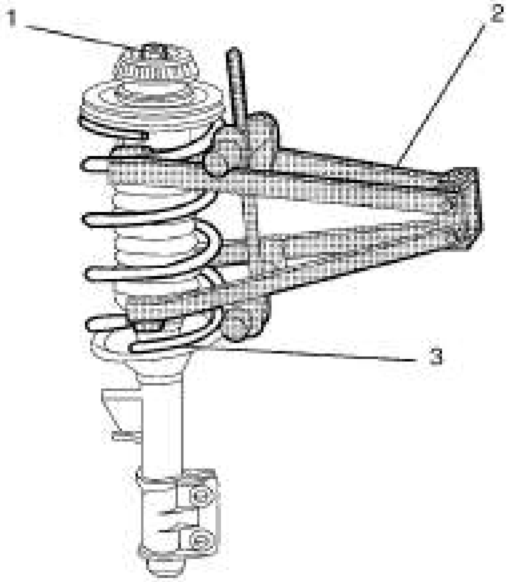


1. Install the lower cup washer (4) with the dished side facing downward.

   Important: Before installing the bearing, the bearing must be properly aligned and orientated.

2. Install the strut assembly support bearing (3) with the same orientation as noted on removal.
3. Install the strut assembly support mount (2).
4. Install the upper cup washer (1) with the dished side facing upward.

   Notice: Refer to Fastener Notice in the Preface section.



Important: Align the mark on the coil spring seat with the strut unit before tightening the strut assembly retaining nut (1).

5. Install the strut assembly retaining nut (1).

   Tighten
   Tighten the nut to 75 N·m (55 lb ft).

6. Remove the spring compressor (2) from the front coil spring (3).
7. Install the front strut assembly. Refer to Strut Assembly Replacement.
8. Install the front wheel. Refer to Tire and Wheel Removal and Installation.
9. Remove the safety stands.
10. Lower the vehicle to the ground.

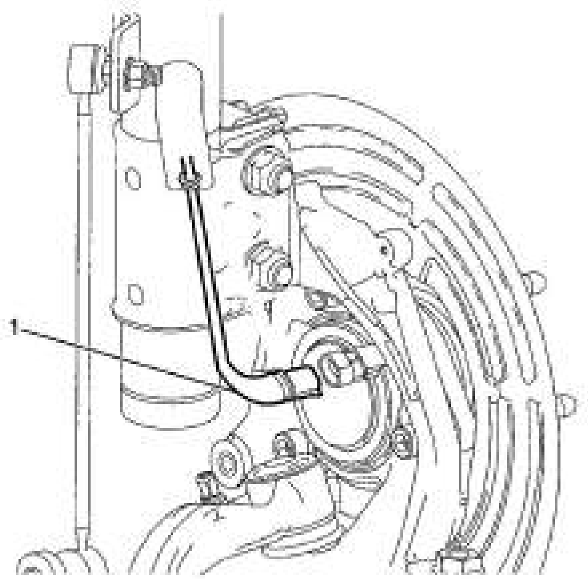
Front Wheel Bearing and Hub Replacement

Removal Procedure

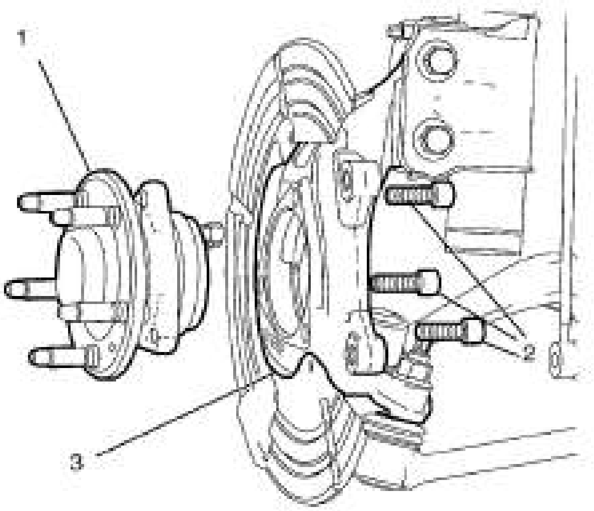
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
3. Remove the brake disc. Refer to Front Brake Rotor ReplacementFront Brake Rotor Replacement.



4. Disconnect the wheel speed sensor electrical connector (1).



Important: Before a hub assembly is replaced, the end-float measurement must be checked. Refer to Front Wheel Hub Assembly InspectionFront Wheel Hub Assembly Inspection

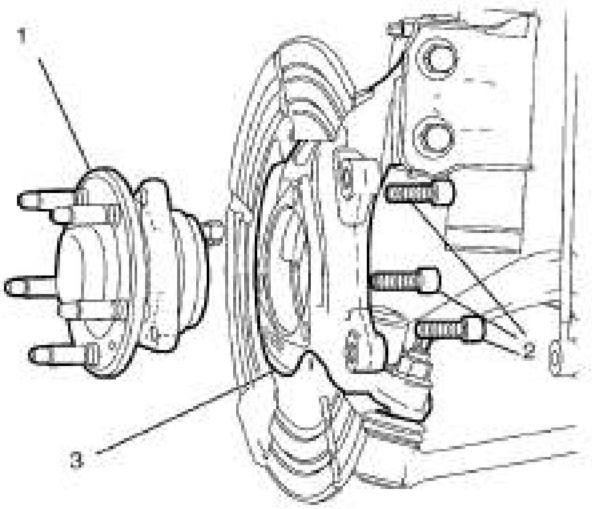
Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

5. Remove the hub assembly to steering knuckle retaining bolts (2).

   Discard the bolts.

6. Remove the hub assembly (1) from the steering knuckle (3).

Installation Procedure



Important: Wheel studs are the only serviceable item of the front wheel hub assembly.

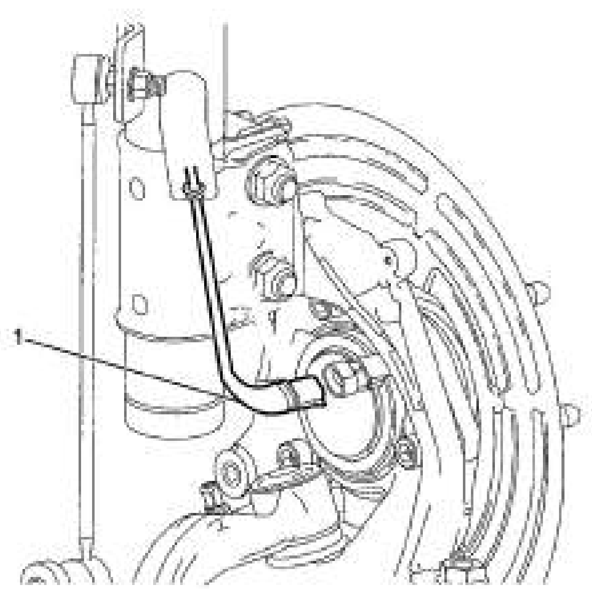
1. Install the hub assembly (1) to the steering knuckle (3).

   Notice: Refer to Fastener Notice in the Preface section.

   Important: After a hub assembly is replaced, the end-float measurement must be checked. Refer to Front Wheel Hub Assembly InspectionFront Wheel Hub Assembly Inspection

2. Install the NEW hub assembly to steering knuckle retaining bolts (2).

   Tighten
   Tighten the bolts to 107 N·m (79 lb ft).



3. Connect the wheel speed sensor electrical connector (1).
4. Install the brake disc. Refer to Front Brake Rotor ReplacementFront Brake Rotor Replacement.
5. Install the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
6. Remove the safety stands.
7. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Front Suspension | Repair Instructions | **Document ID: 1993267**

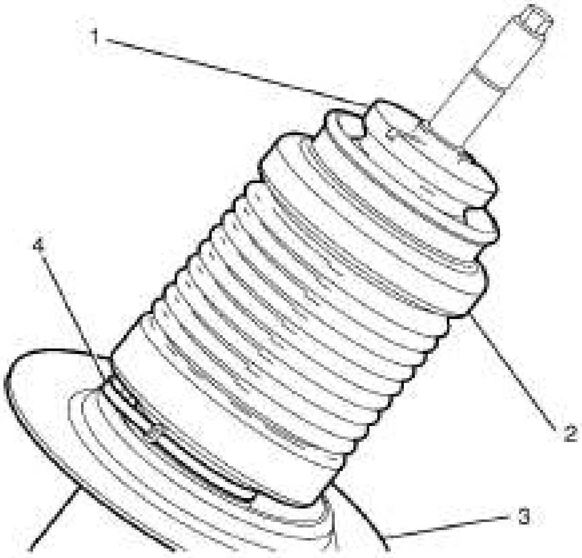
Shock Absorber Replacement (LWB SWB Clubsport CSV VXR8)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation .
3. Remove the front strut assembly. Refer to Strut Assembly Replacement .
4. Remove the front strut assembly support bearing and mount. Refer to Front Suspension Strut Mount and Bearing Replacement
5. Remove the front coil spring. Refer to Coil Spring Replacement in Front Suspension.



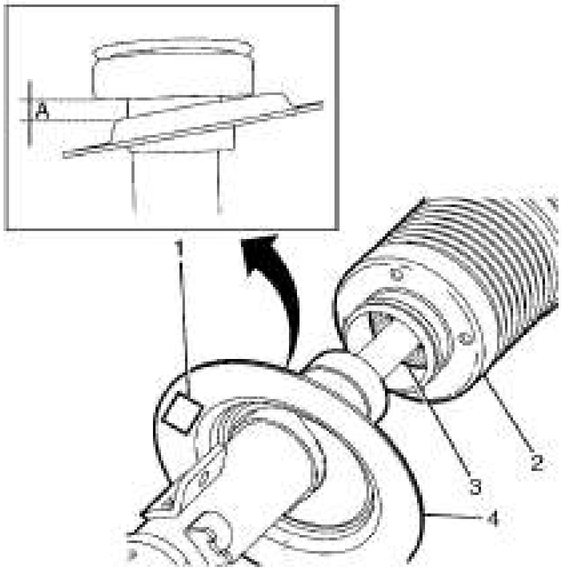
6. Remove the compression bumper (1).
7. Remove the dust boot lower retaining clamp (4).

   Discard the clamp.

8. Remove the dust boot and filter assembly (2) from the strut unit (3).
9. Inspect all parts for wear and damage.

Installation Procedure

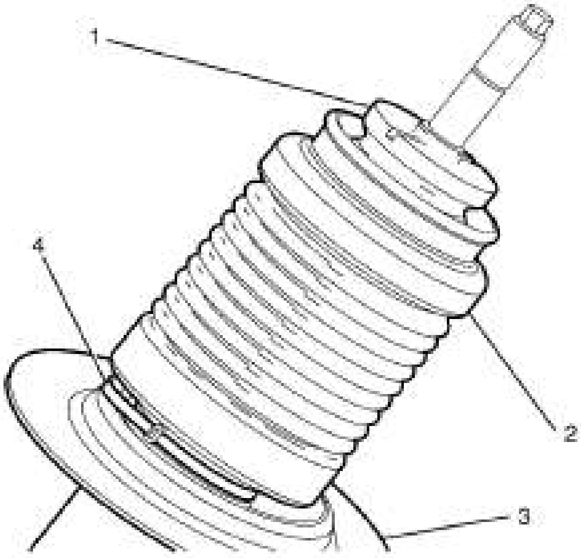
Notice: Refer to Fastener Tightening Specifications in the Preface section.



Important: The filter (3) must remain correctly seated inside the dust boot (2).

Important: The bottom of the dust boot and filter assembly (2) must be positioned so that the lower lip of the dust boot completely passes over the strut body retaining ring.

1. Install the dust boot and filter assembly (2) over the strut unit (3).



2. Install the NEW dust boot lower retaining clamp (4) securing the dust boot (2) to the strut unit (3).
3. Install the compression bumper (1).
4. Install the coil spring. Refer to Coil Spring Replacement in Front Suspension.
5. Install the front strut assembly support bearing and mount. Refer to Front Suspension Strut Mount and Bearing Replacement

6. Install the front strut assembly. Refer to Strut Assembly Replacement .
7. Install the front wheel. Refer to Tire and Wheel Removal and Installation .
8. Remove the safety stands.
9. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Front Suspension | Repair Instructions | Document ID: 1994544

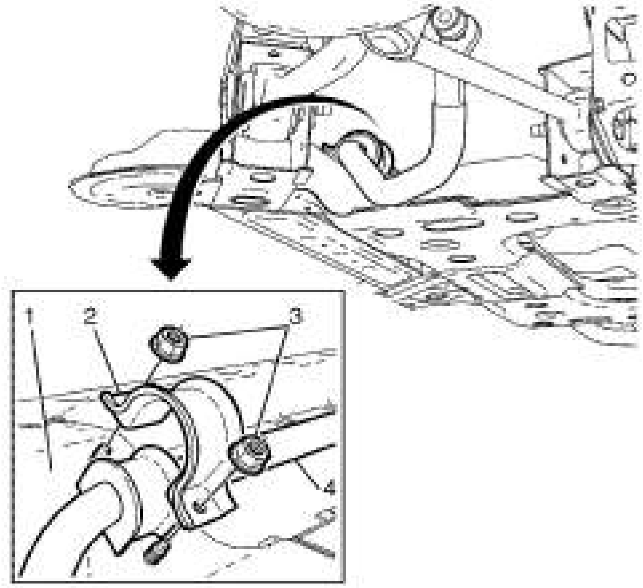
Stabilizer Shaft Insulator Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

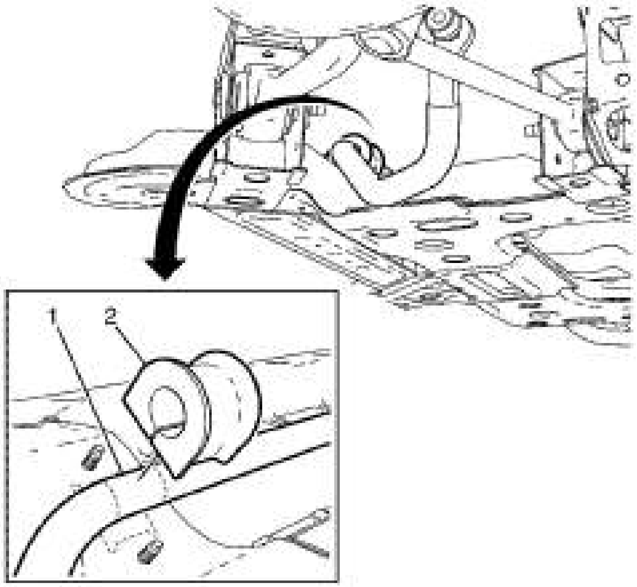


Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

2. Remove the stabliser bar insulator bracket to subframe retaining nuts (3) on both sides of the stabiliser bar (4).

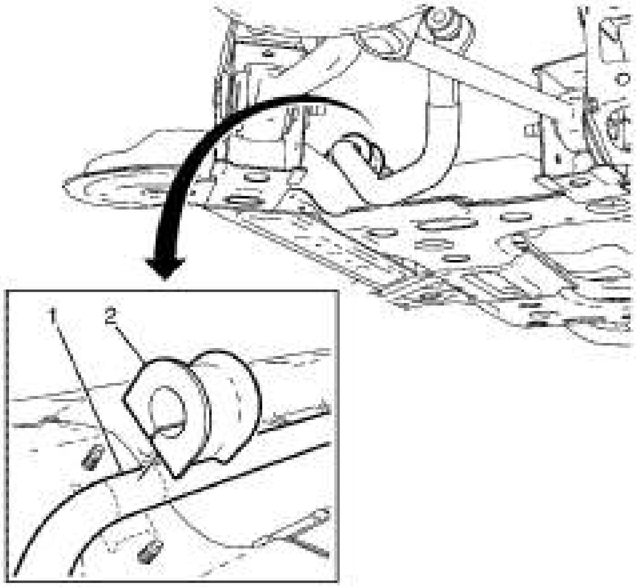
   Discard the nuts.

3. Remove the stabliser bar insulator bracket (2) from the subframe (1) on both sides of the stabiliser bar.

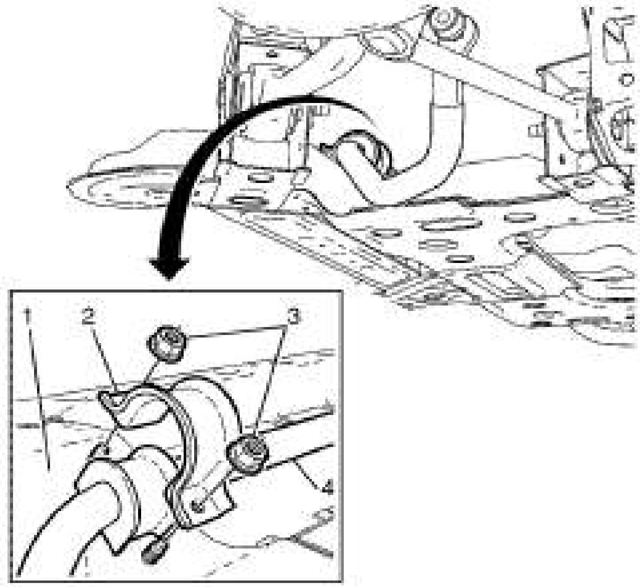


4. Remove the stabliser bar insulator (2) from both sides of the stabiliser bar (1).
5. Inspect all parts for wear and damage.

Installation Procedure



1. Install the stabliser bar insulator (2) to both sides of the stabiliser bar (1).



2. Install the stabliser bar insulator bracket (2) to the subframe (1) on both sides of the stabiliser bar.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install stabliser bar insulator bracket to subframe retaining nuts (3) on both sides of the stabiliser bar.

   Tighten
   Tighten the nuts to 22 N·m (16 lb ft).

4. Remove the safety stands.
5. Lower the vehicle to the ground.

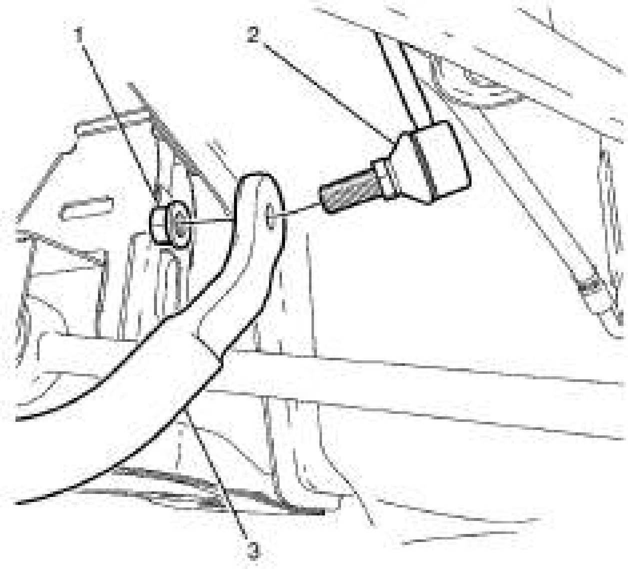
Stabilizer Shaft Link Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation.

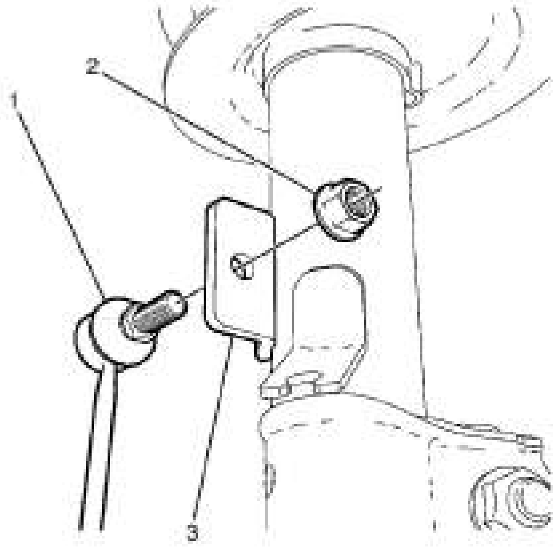


Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

3. Remove the stabiliser bar link to stabiliser bar retaining nut (1).

   Discard the nut.

4. Disconnect the stabiliser bar link (2) from the stabiliser bar (3).

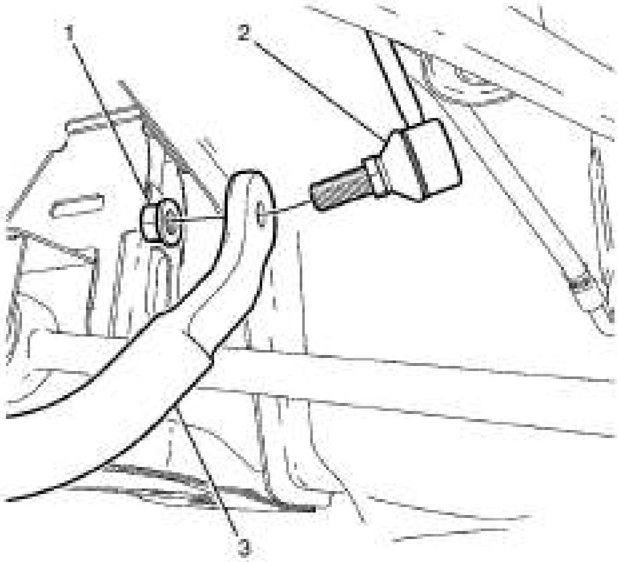


5. Remove the stabiliser bar link to strut assembly retaining nut (2).

   Discard the nut.

6. Remove the stabiliser link bar (1) from the strut assembly bracket (3).
7. Inspect all parts for wear and damage.

Installation Procedure



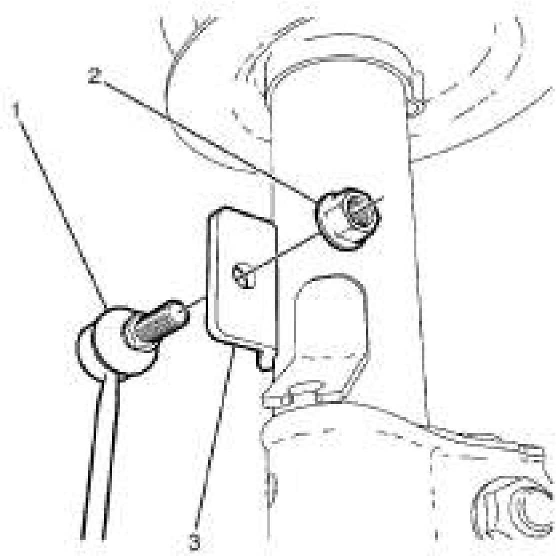
Important: Install the shorter link end to the stabilizer bar.

1. Install the stabiliser bar link (2) to the stabiliser bar (3).

   Caution: Refer to Fastener Notice in the Preface section.

2. Install the NEW stabiliser bar link to stabiliser bar retaining nut (1).

   Tighten
   Tighten the nut to 50 N·m (37 lb ft).



Important: Install the longer link end to the strut.

3. Install the stabiliser bar link (1) to the strut assembly bracket (3).
4. Install the NEW stabiliser bar link to strut assembly retaining nut (2).

   Tighten
   Tighten the nut to 50 N·m (37 lb ft).

5. Install the front wheel. Refer to Tire and Wheel Removal and Installation.
6. Remove the safety stands.
7. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Front Suspension | Repair Instructions | **Document ID: 2035179**

Stabilizer Shaft Replacement

Tools Required

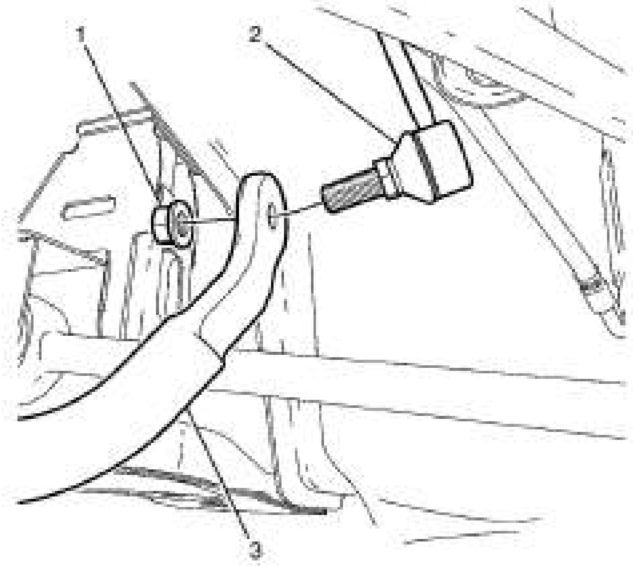
6297 Ball Joint Release Tool.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation.

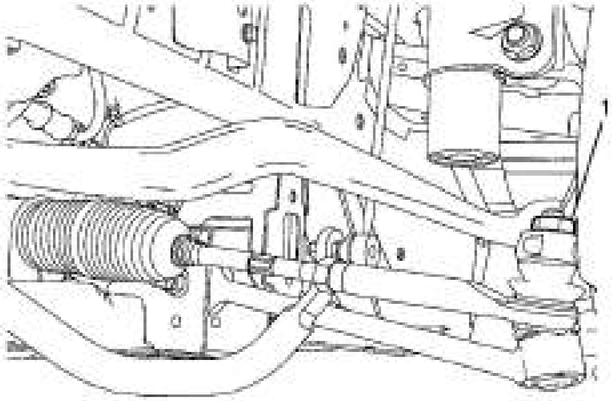


Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

3. Remove the stabiliser bar link to stabiliser bar retaining nut (1) from both sides of the stabiliser bar.

   Discard the nuts.

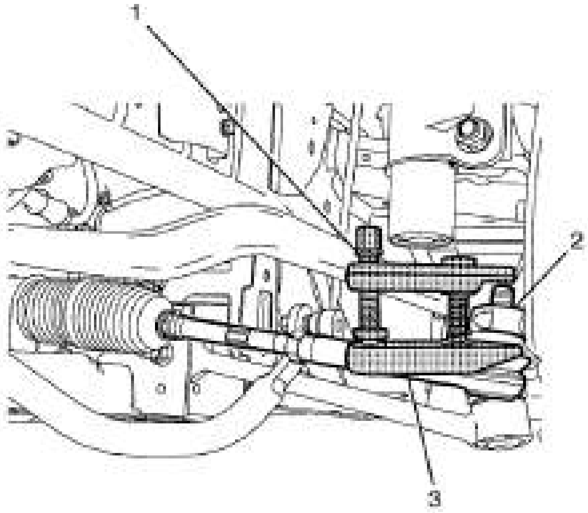
4. Disconnect the stabiliser bar link (2) from the stabiliser bar (3) from both sides of the stabiliser bar.



Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

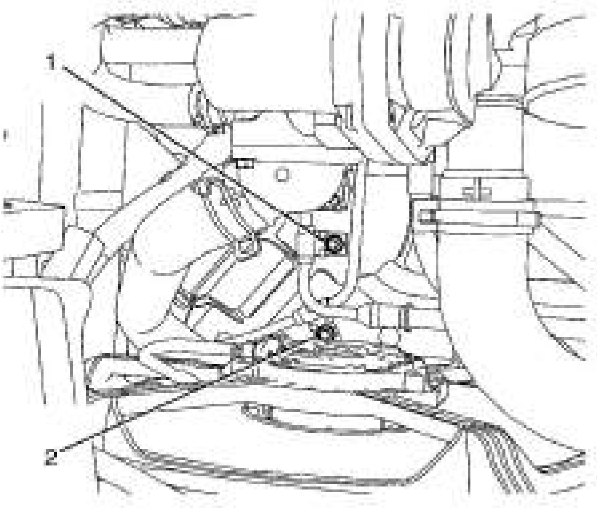
5. Remove the tie rod end ball joint to steering knuckle retaining nut (1) on both sides of the vehicle.

   Discard the nuts.



Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

6. Disconnect the tie rod (3) from the steering knuckle (2) using the 6297 (1) on both sides of the vehicle.
7. Remove the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 3.6L engine or Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 6.0L engine.
8. Remove the upper section of the air box. Refer to Air Cleaner Assembly Replacement for 3.6L engine or Air Cleaner Assembly Replacement for 6.0L engine.



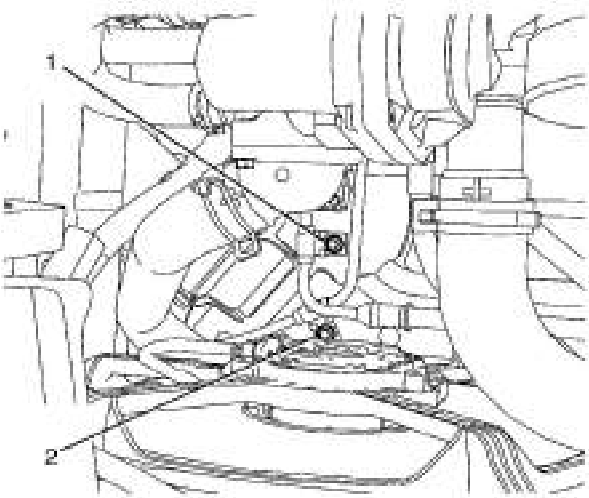
9. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (2).
10. Remove the power steering gear outlet pipe/hose bracket to subframe retaining bolt (1).
11. Remove the stabiliser bar insulators from the stabiliser bar. Refer to Stabilizer Shaft Insulator Replacement .
12. Remove the stabiliser bar from the vehicle.

Installation Procedure

Notice: Refer to Fastener Tightening Specifications in the Preface section.

1. Install the stabiliser bar to the vehicle.
2. Install the stabiliser bar insulators. Refer to Stabilizer Shaft Insulator Replacement .
3. Install the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 3.6L engine or Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 6.0L engine.
4. Install the upper section of the air box. Refer to Air Cleaner Assembly Replacement for 3.6L engine or Air Cleaner Assembly Replacement for 6.0L engine.

Notice: Refer to Fastener Notice in the Preface section.

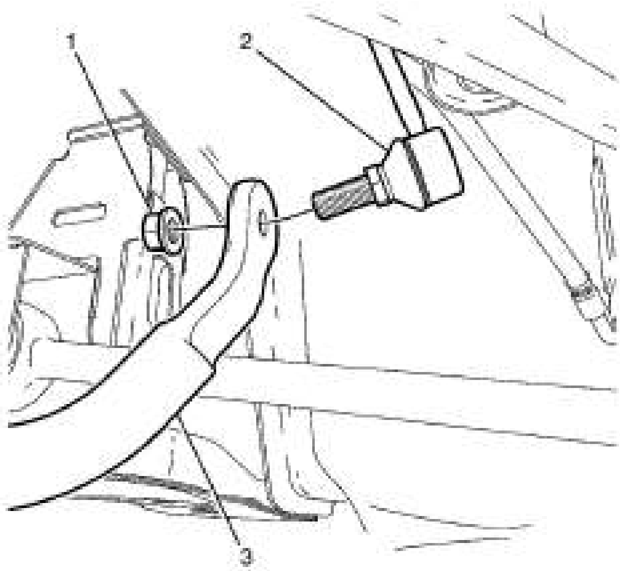


5. Remove the power steering gear inlet pipe/hose bracket to subframe retaining bolt (2).

   Tighten
   Tighten the bolt to 9 N·m (80 lb in).

6. Remove the power steering gear outlet pipe/hose bracket to subframe retaining bolt (1).

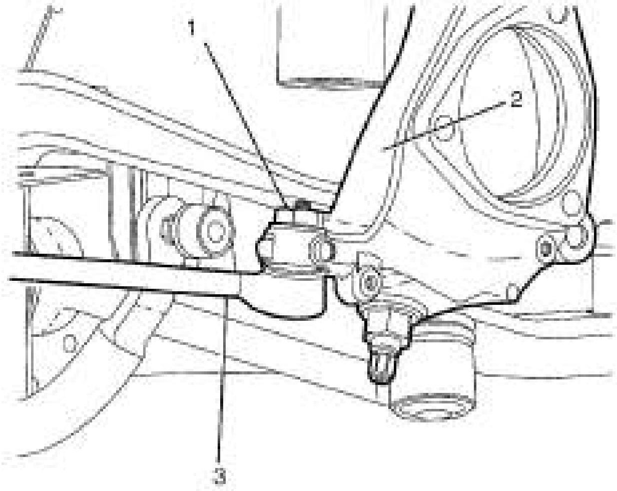
   Tighten
   Tighten the bolt to 9 N·m (80 lb ft).



7. Install the stabiliser bar link (2) to the stabiliser bar (3) to both sides of the vehicle.
8. Install the NEW stabiliser bar link to stabiliser bar retaining nut (1) to both sides of the

vehicle.

Tighten
Tighten the nut to 50 N·m (37 lb ft).



9. Install the tie rod (3) to the steering knuckle (2) on both sides of the vehicle.
10. Install the NEW tie rod to steering knuckle retaining nut (1) on both sides of the vehicle.

Tighten
Tighten the nut to 70 N·m (52 lb ft).

11. Install the front wheel. Refer to Tire and Wheel Removal and Installation .
12. Remove the safety stands.
13. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Front Suspension | Repair Instructions | **Document ID: 2193592**

Steering Knuckle Replacement

Tools Required

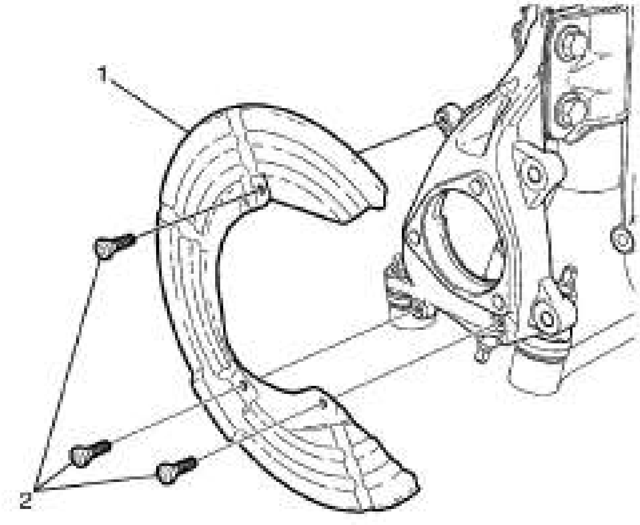
- 6297 6297 Ball Joint Release Tool.
- E7115 E7115 Angle Wrench.

Removal Procedure

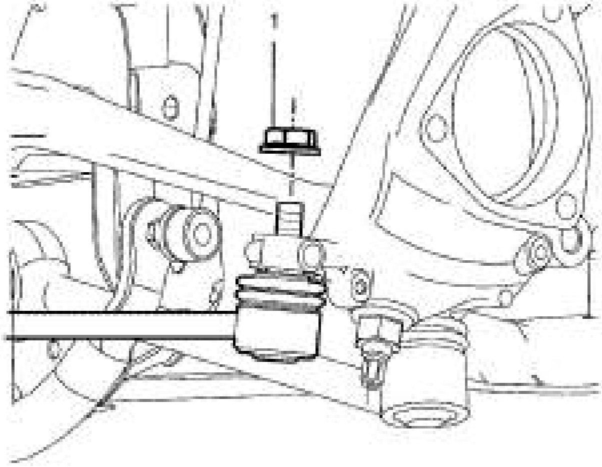
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
3. Remove the front wheel hub assembly. Refer to Front Wheel Bearing and Hub ReplacementFront Wheel Bearing and Hub Replacement.



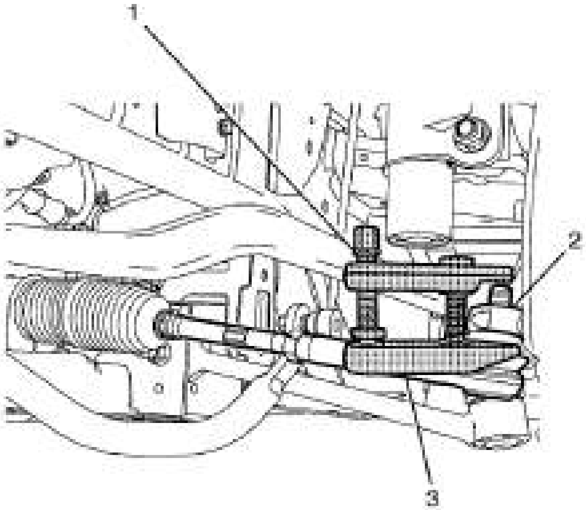
4. Remove the brake disc splash shield to steering knuckle retaining bolts (2).
5. Remove the brake disc splash shield (1) from the steering knuckle.



Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

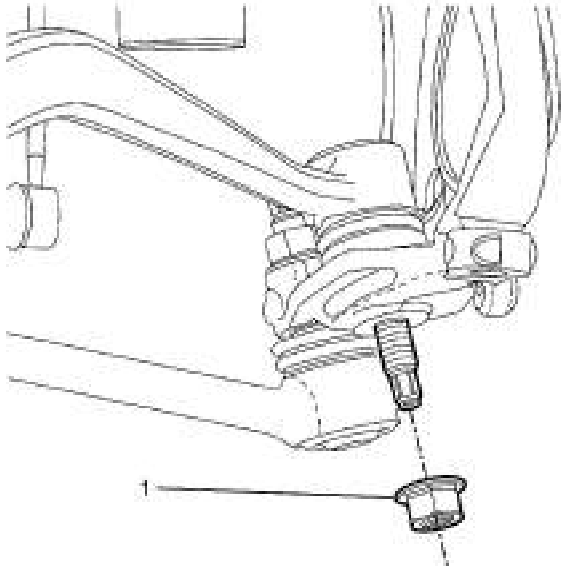
6. Remove the tie rod end to steering knuckle retaining nut (1).

   Discard the nut.



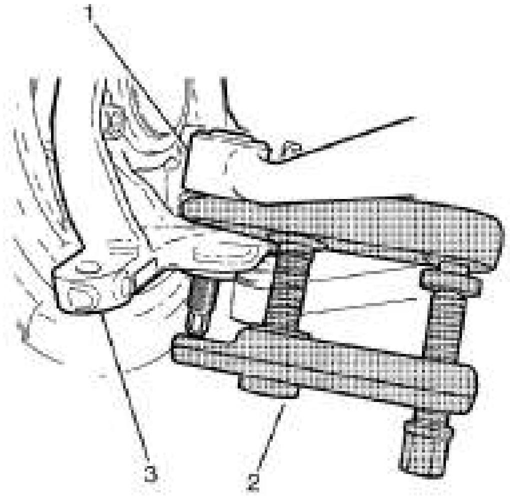
Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

7. Disconnect the tie rod (3) from the steering knuckle (2) using the 6297 6297 (1).



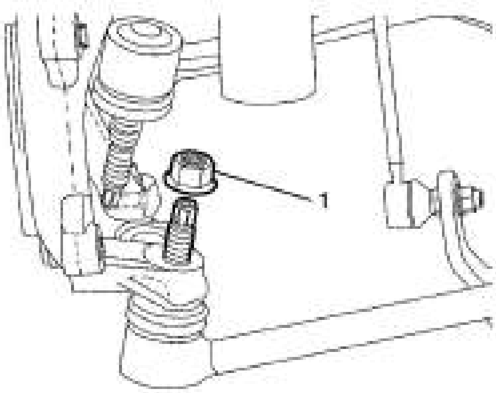
8. Remove the caster arm to steering knuckle retaining nut (1).

   Discard the nut.



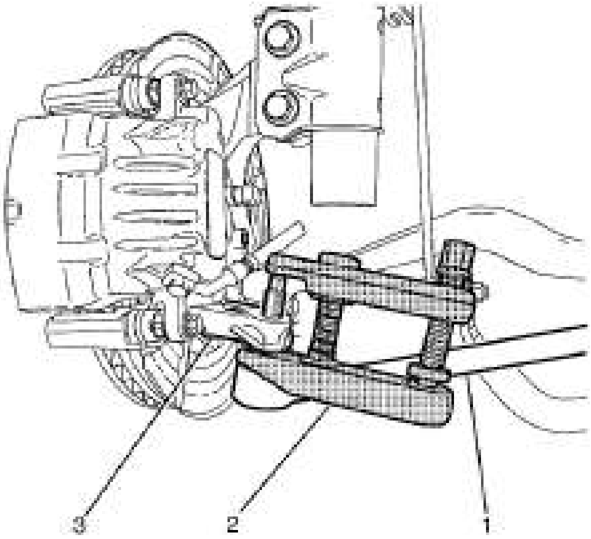
Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

9. Separate the caster arm (1) from the steering knuckle (3) using the 6297 6297 (2).
10. Remove the 6297 6297 (2).
11. Disconnect the caster arm (1) from the steering knuckle (3).



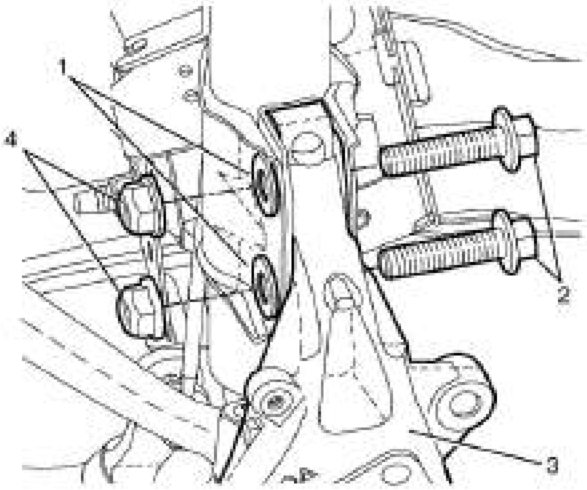
12. Remove the control arm to steering knuckle retaining nut (1).

    Discard the nut.



Important: Once a load is applied by the ball joint release tool loading bolt, a quick tap on the nut end of the tool will reduce the separating force required.

13. Separate the control arm (1) from the steering knuckle (3) using the 6297 6297 (2).
14. Remove the 6297 6297 (2).
15. Disconnect the control arm (1) from the steering knuckle (3).

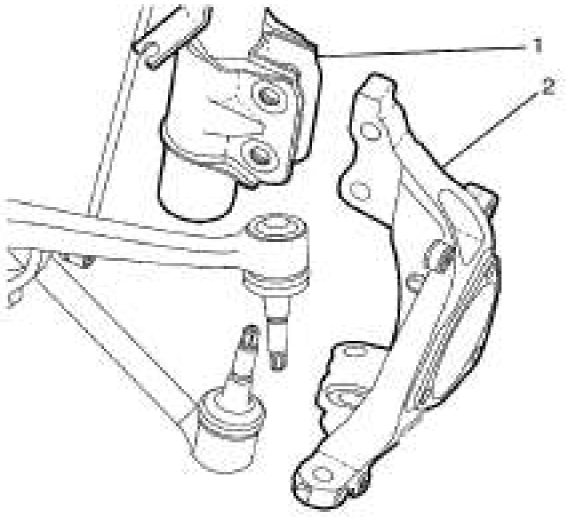


Important: The strut assembly to steering knuckle retaining bolts (2) nuts (4) and washers (1) are single use parts. They must be discarded after removal.

Important: Suitably support the steering knuckle (3) before removing strut assembly to steering knuckle retaining bolts (2)

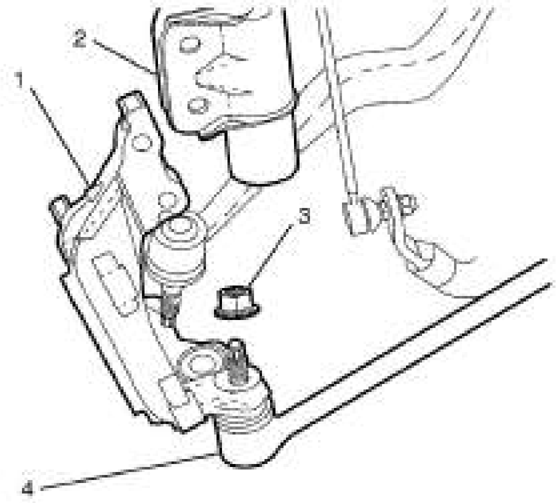
16. Remove the strut assembly to steering knuckle retaining bolts (2) nuts (4) and washers (1).

    Discard the bolts, nuts and washers.



17. Remove the steering knuckle (2) from the strut assembly (1).

Installation Procedure



1. Install the steering knuckle (1) to the control arm (4).

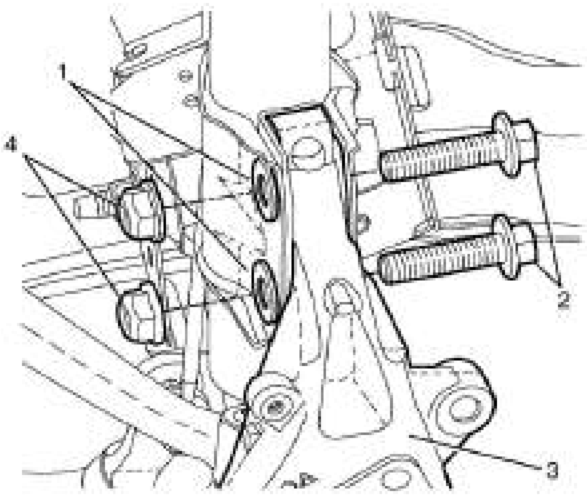
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the NEW control arm to steering knuckle retaining nut (3).

   Tighten
   Tighten the nuts a first pass to 40 N·m (30 lb ft).

   Tighten
   Tighten the nuts an additional 60 degrees.

3. Install the steering knuckle (1) to the strut assembly (2).

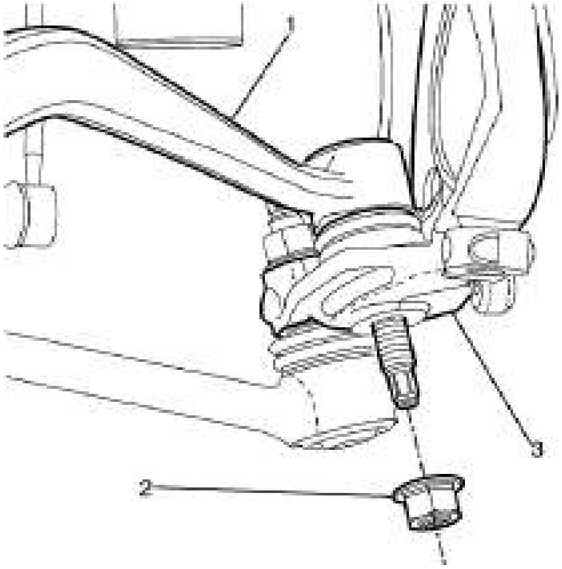


Important: The steering knuckle (3) to strut assembly retaining bolts (2), nuts (4) and washers (1) are not to be fully tightened at this stage.

4. Install the NEW steering knuckle to strut assembly retaining bolts (2), nuts (4) and washers (1).

   Do not fully tighten at this stage.

5. Install the caster arm to the steering knuckle.

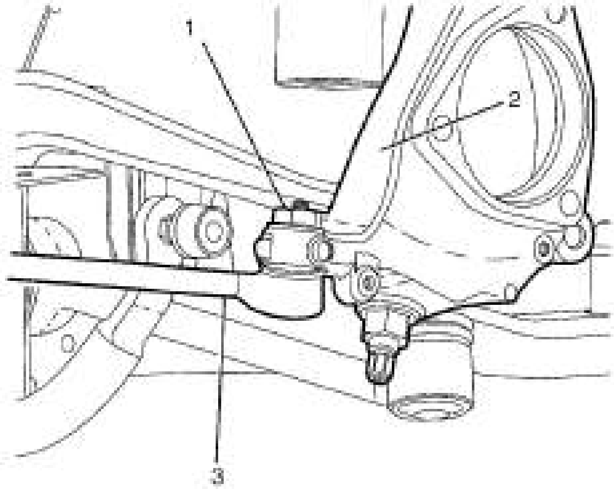


6. Install the NEW caster arm (1) to steering knuckle (3) retaining nut (2).

   Tighten

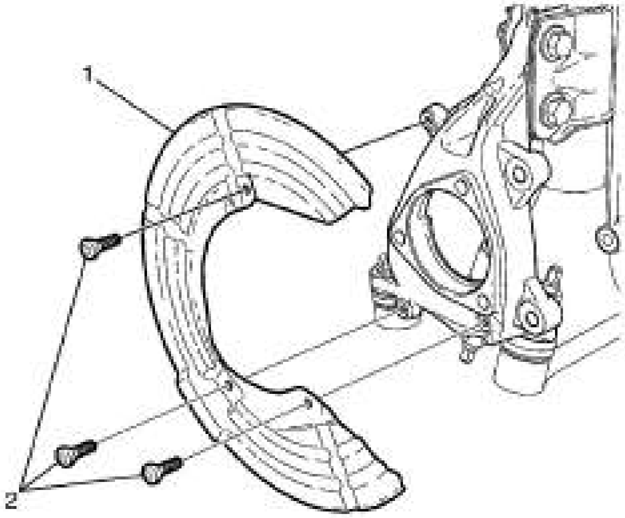
Tighten the nuts a first pass to 40 N·m (30 lb ft).

Tighten
Tighten the nuts an additional 60 degrees.



7. Install the tie rod (3) to the steering knuckle (2).
8. Install the NEW tie rod to steering knuckle retaining nut (1).

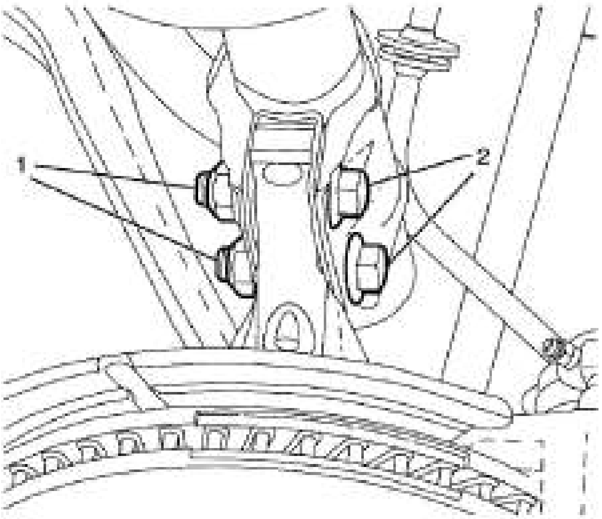
Tighten
Tighten the nut to 25 N·m+ 120 degrees (18 lb ft + 120 degrees).



9. Install the brake disc splash shield (1).
10. Install the brake disc splash shield to steering knuckle retaining bolts (2).

    Tighten
    Tighten the bolts to 9 N·m (80 lb in).

11. Install the front wheel hub assembly. Refer to Front Wheel Bearing and Hub ReplacementFront Wheel Bearing and Hub Replacement.



Important: If the steering knuckle has been replaced, the end-float measurement must be checked. Refer to Front Wheel Hub Assembly InspectionFront Wheel Hub Assembly Inspection.

12. Install the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
13. Remove the safety stands.
14. Lower the vehicle to the ground.
15. Bounce the vehicle several times to settle the suspension.
16. Check and adjust the wheel alignment. Refer to Wheel Alignment MeasurementWheel Alignment Measurement.
17. Tighten the strut assembly to steering knuckle retaining bolts (2) and nuts (1).

    Tighten
    Tighten the bolts a first pass to 100 N·m (74 lb ft).

    Tighten
    Tighten the bolts an additional 90 degrees.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Front Suspension | Repair Instructions | Document ID: 2193594

Strut Assembly Replacement (LWB SWB Clubsport CSV VXR8)

Tools Required

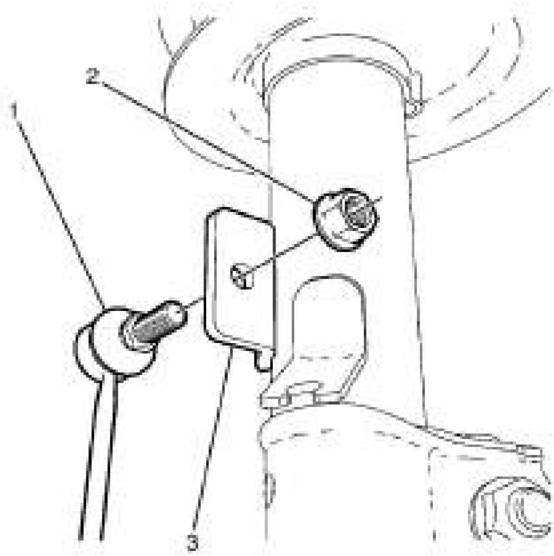
E7115 E7115 Angle Wrench.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.

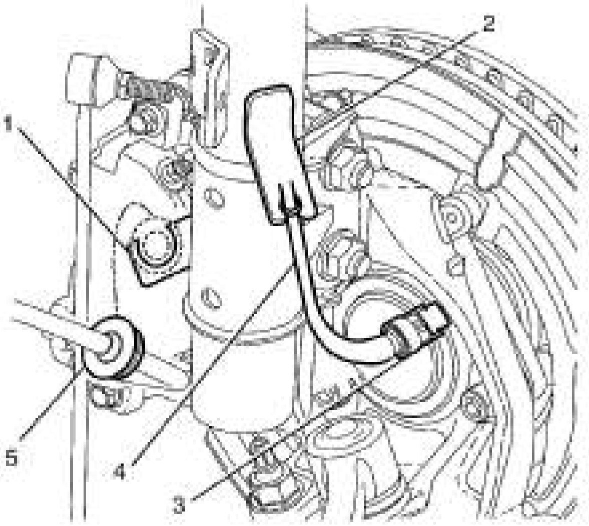


Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

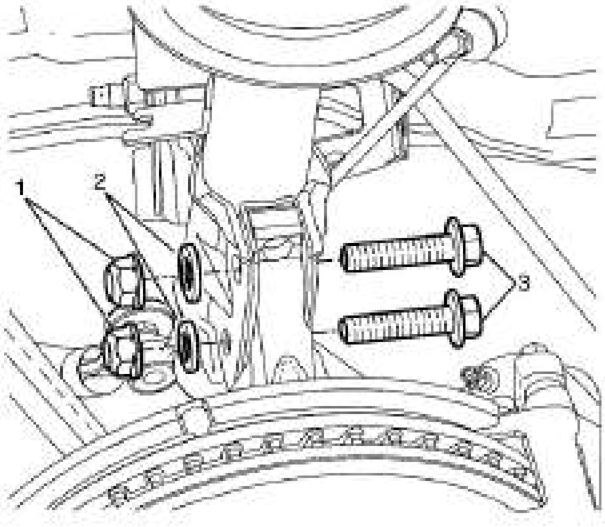
3. Remove the stabiliser bar link to strut assembly retaining nut (2).

   Discard the nut.

4. Disconnect the stabiliser bar link (1) from the strut assembly bracket (3).



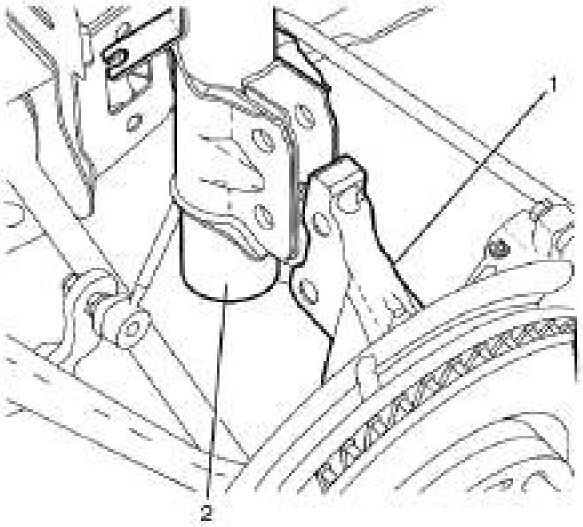
5. Disconnect the wheel speed sensor electrical connector (3).
6. Disconnect the wheel speed sensor wiring harness (4) from the strut assembly bracket (2).
7. Disconnect the brake hose (5) from the strut bracket (1).



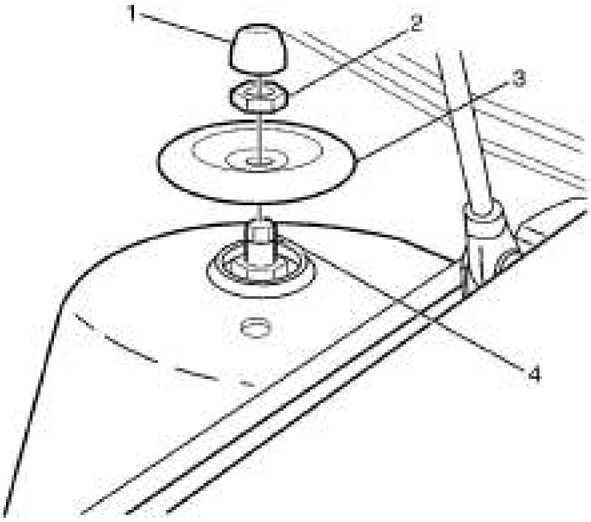
Important: The strut assembly to steering knuckle retaining bolts (3) nuts (1) and washers (2) are single use parts. They must be discarded after removal.

8. Remove the strut assembly to steering knuckle retaining bolts (3), nuts (1) and washers (2).

   Discard the bolts, nuts and washers.



9. Disconnect the steering knuckle (1) from the strut assembly (2).
10. Lower the vehicle.



11. Remove the stud dust cover (1) from the strut assembly to body retaining nut (2).

    Important: The strut assembly (4) must be supported from underneath before the strut assembly to body retaining nut (2) is removed.

12. Remove the strut assembly to body retaining nut (2) while holding the strut piston shaft (4).

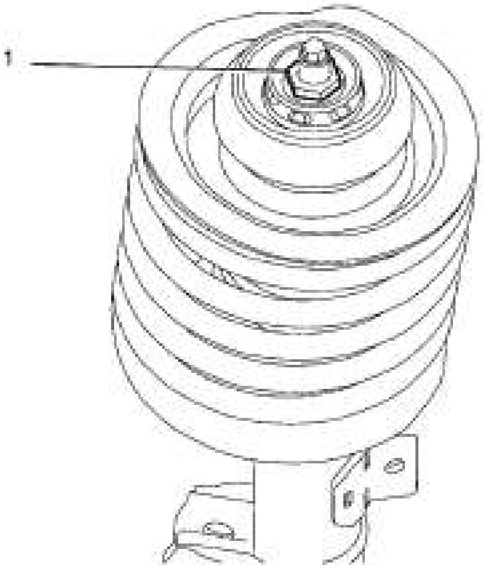
    Discard the nut.

13. Remove the strut assembly to body retaining plate (3).
14. Remove the strut assembly from the vehicle.

15. Inspect all parts for wear and damage.

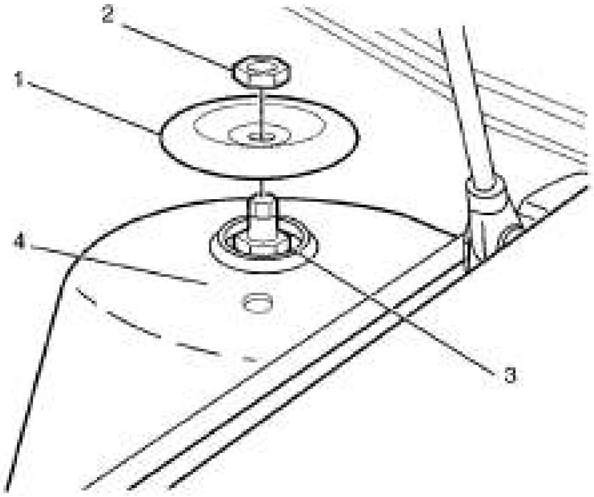
Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



Important: The strut assembly retaining nut (1) must be checked for correct torque before installing the strut assembly into the vehicle. The strut assembly retaining nut torque must be 75 N·m (55 lb ft).

1. Check the torque of the strut assembly retaining nut (1), correct if necessary.



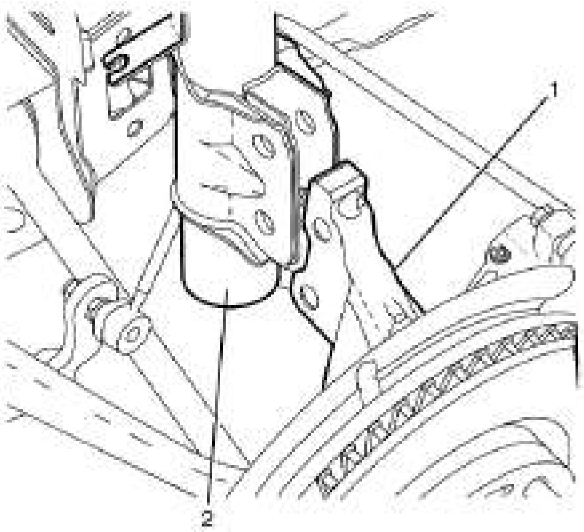
2. Install the strut assembly (3) to the vehicle (4).
3. Install strut assembly to body retaining plate (1).

Important: The strut assembly to body retaining nut (2) must not be fully tightened at this stage.

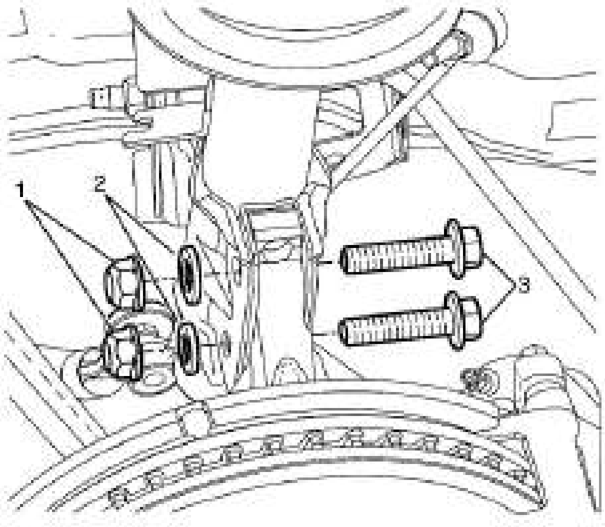
4. Install the NEW strut assembly to body retaining nut (2) to the strut assembly (3).

   Do not fully tighten at this stage.

5. Raise the vehicle.



6. Install the steering knuckle (1) to the strut assembly (2).



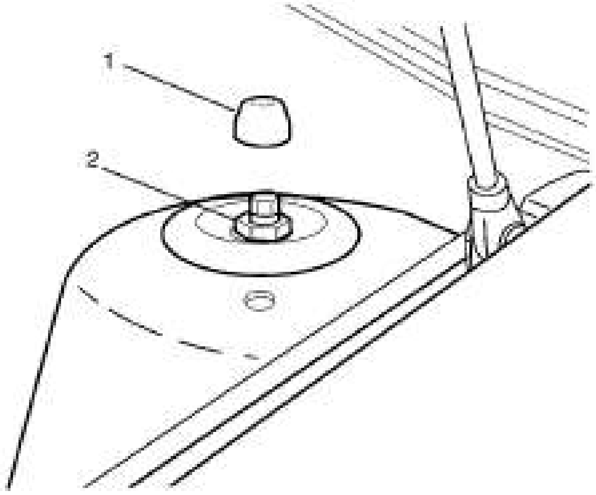
Important: Pivot the hub and steering knuckle assembly sufficiently to line up the bolt holes in the steering knuckle and strut assembly.

Important: The strut assembly to steering knuckle retaining bolts (3) and nuts (1) must not be fully tightened at this stage.

7. Install the NEW Strut assembly to steering knuckle retaining bolts (3), nuts (1) and washers (2).

   Do not fully tighten at this stage.

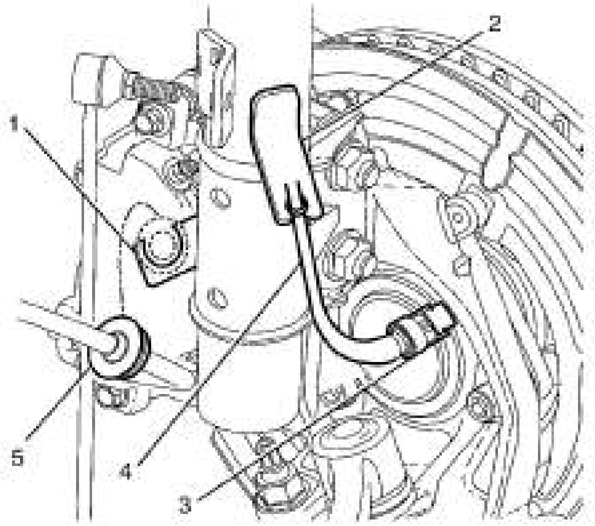
8. Lower the vehicle.



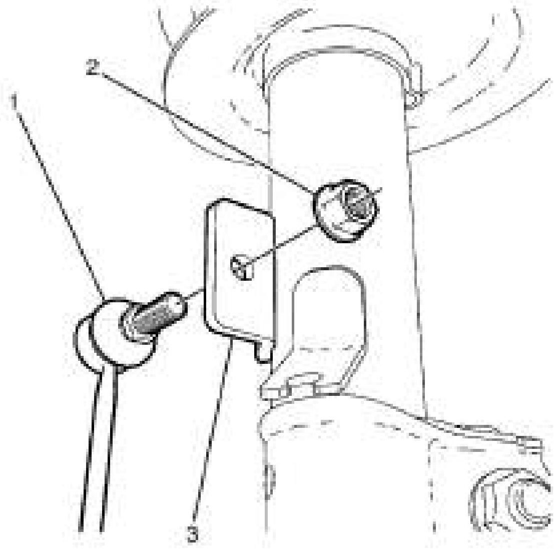
9. Tighten the NEW strut assembly to body retaining nut (2).

   Tighten
   Tighten the nut to 55 N·m (40 lb ft).

10. Install the dust cover (1) to the strut assembly to body retaining nut (2).
11. Raise the vehicle.



12. Install the brake hose (5) to the strut assembly bracket (1).
13. Connect the wheel speed sensor electrical connector (3).
14. Install the wheel speed sensor wiring harness (4) to the strut assembly bracket (2).

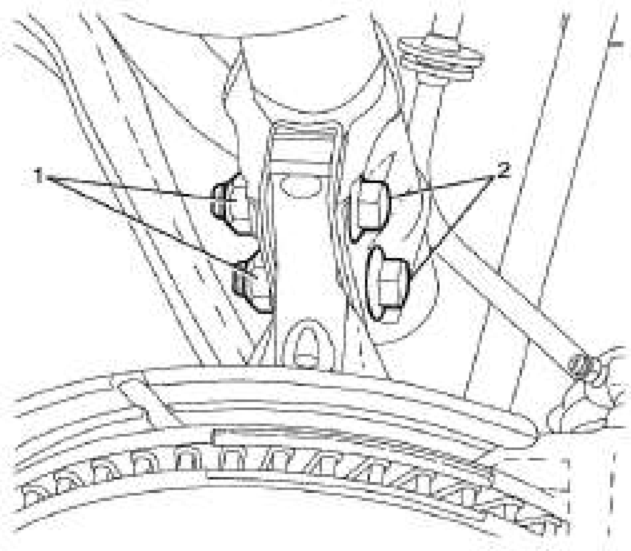


15. Connect the stabiliser bar link (1) to the strut assembly bracket (3).
16. Install the stabiliser bar link to strut assembly bracket retaining nut (2).

    Tighten
    Tighten the nut to 50 N·m (37 lb ft).

17. Install the front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
18. Remove the safety stands.
19. Lower the vehicle to the ground.

20. Bounce the vehicle several times to settle the suspension.
21. Check and adjust the wheel alignment. Refer to Wheel Alignment MeasurementWheel Alignment Measurement in Wheel Alignment.



22. Tighten the strut assembly to steering knuckle retaining bolts (2) and nuts (1).

Tighten
Tighten the nuts a first pass to 100 N·m (74 lb ft).

Tighten
Tighten the nuts an additional 90 degrees.

Wheel Stud Replacement

Tools Required

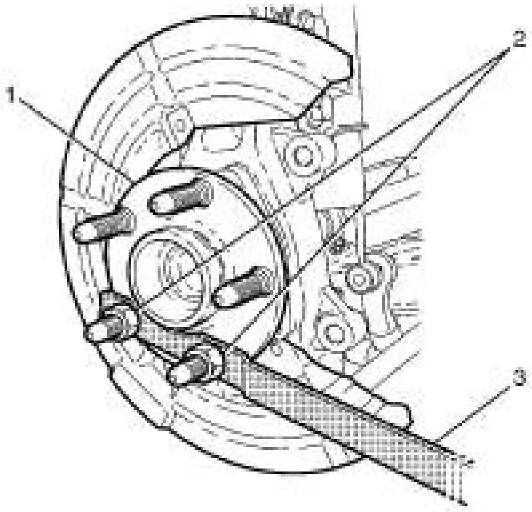
- C-4150-C Press Tool.
- KM-468 Holding Bar.

Removal Procedure

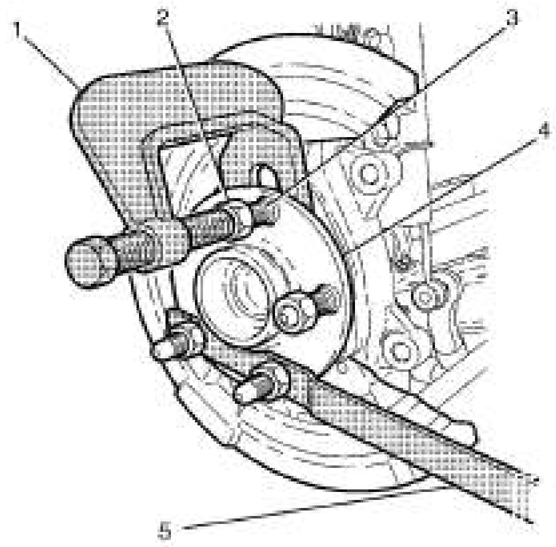
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation .
3. Remove the brake disc. Refer to Front Brake Rotor Replacement .

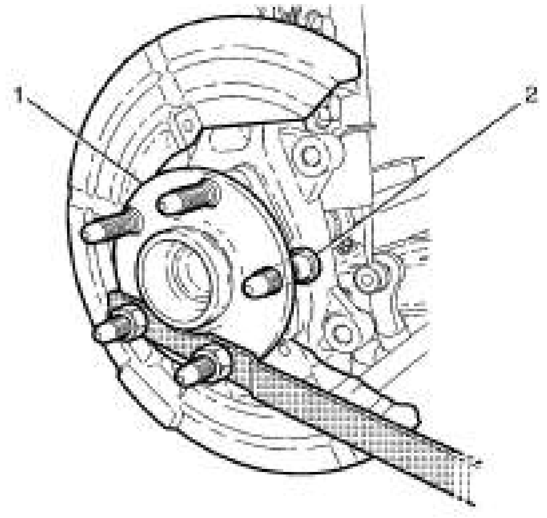


4. Attach the KM-468 (3), to the wheel hub (1) using two inverted wheel nuts (2).

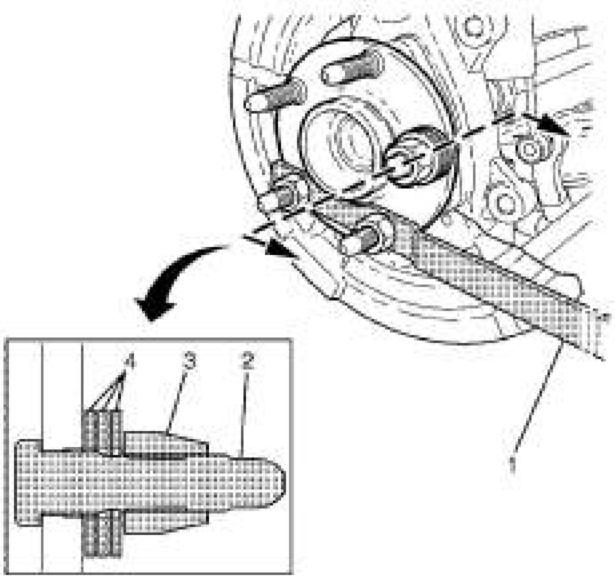


5. Install a wheel nut (2) flush with the end of the wheel stud (3).
6. Secure the KM-468 (5) and remove the wheel stud (3) from the wheel hub (4) using the C-4150-C (1).
7. Repeat steps 5 and 6 for any additional wheel studs that require replacement.

Installation Procedure



1. Install the replacement wheel stud (2) to the wheel hub flange (1).



Important: Suitable sized spacing washers (4) must be used to seat the wheel stud (2) fully.

2. Install spacing washers (4) and a inverted wheel nut (3) onto the replacement wheel stud (2).
3. Secure the KM-468 (1) and tighten the wheel nut (3) to pull the wheel stud (2) into place.
4. Remove the wheel nut (3) and spacing washers (4).
5. Repeat steps 1 to 4 for any additional studs that require replacement.
6. Remove the KM-468 (1).
7. Install the brake disc. Refer to Front Brake Rotor Replacement .
8. Install the front wheel. Refer to Tire and Wheel Removal and Installation .
9. Remove the safety stands.
10. Lower the vehicle to the ground.

General Description

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tyres travelling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system. The suspension system must allow for the vertical movement of the tyre and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tyre's horizontal relationship to the road.

This requires that the steering knuckle be suspended between a lower control arm and a strut assembly. The lower control arm attaches from the steering knuckle at the outermost point of the control arm. The attachment is through a ball and socket type joint. The innermost end of the control arm is attached to the vehicle frame through a bushing. The upper portion of the steering knuckle is attached to a strut assembly by two bolts and nuts. The strut assembly then connects to the vehicle's body by way of a support bearing and mount. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame. A shock absorber is used in conjunction with this system in order to dampen out the oscillations of the coil spring. A shock absorber is a basic hydraulic cylinder.

The shock absorber is filled with oil and has a moveable shaft that connects to a piston inside the strut unit. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilise this recoil action of a spring alone. Each end of the strut unit is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut assembly to utilise the dampening action to reduce the recoil of a spring alone.

The lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface. The subframe is bolted to both longitudinal frame side members. The front subframe to side member attaching bolts incorporate a tapered boss near the head of the bolt on the front bolts, to assist in front subframe to body alignment during assembly while the pivots of the front control arms are rubber bushed and are attached to the subframe by bolts and nuts.

A stabiliser bar is mounted to the subframe by two brackets and insulating rubbers. The link connecting the stabiliser bar to each front suspension strut assembly has a ball joint and nut at each end. There are numerous configurations for each suspension option, depending on body type and powertrain combination. For further information regarding the identification of which suspension option is fitted to a particular vehicle, refer to Vehicle, Engine and Transmission ID and VIN Location, Derivative and Usage. For all other information regarding the suspension specification fitted to a particular vehicle, refer to Fastener Tightening Specifications.

Fastener Tightening Specifications (SWB)

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Disc Brake Backing Plate to Knuckle Retaining Bolt - Upper	60 N·m	44 lb ft
Disc Brake Backing Plate to Knuckle Retaining Bolts - Lower	130 N·m	96 lb ft
I-Link to Knuckle Retaining Bolt	140 N·m	103 lb ft
I-Link to Subframe Retaining Bolt and Nut	175 N·m	129 lb ft
Lower Control Arm to Knuckle Retaining Bolt and Nut		
• First Pass	40 N·m	30 lb ft
• Final Pass	120 Degrees	
Lower Control Arm to Subframe Retaining Bolt	175 N·m	129 lb ft
Lower Control Arm to Strut Assembly Retaining Bolt and Nut		
• First Pass	40 N·m	30 lb ft
• Final Pass	120 Degrees	
Rear Drive Shaft to Rear Hub Retaining Nut There are two alternate methods of achieving the required Rear Hub Retaining Nut torque. **Important:** DO NOT EXCEED THE SPECIFIED TIGHTENING VALUES, otherwise premature bearing failure may result.		
Preferred Method		
• First Pass	150 N·m	110 lb ft
• Loosen	-180 Degrees	
• Final Pass	425 N·m	313 lb ft
Alternate Method		
• First Pass	150 N·m	110 lb ft
• Loosen	-180 Degrees	
• Second Pass	50 N·m	37 lb ft
• Final Pass	45 Degrees	
Stabiliser Bar Insulator Bracket to Subframe Retaining Bolts	22 N·m	16 lb ft
Stabiliser Bar Link to Lower Control Arm Retaining Nut	50 N·m	37 lb ft
Stabiliser Bar Link to Stabiliser Bar Retaining Nut	50 N·m	37 lb ft
Strut Assembly Retaining Nut	45 N·m	33 lb ft
Strut Assembly to Body Retaining Bolts	58 N·m	43 lb ft
Upper Control Arm Ball Joint to Subframe Retaining Bolt and Nut		
• First Pass	80 N·m	59 lb ft
• Final Pass	120 Degrees	

Upper Control Arm Pivot Bushing Bracket to Subframe Retaining Bolts		
● First Pass	40 N·m	29 lb ft
● Final Pass	90 Degrees	
Upper Control Arm Pivot Bushing to Upper Control Arm Retaining Bolt	170 N·m	125 lb ft
Upper Control Arm to Knuckle Retaining Bolt and Nut		
● First Pass	60 N·m	44 lb ft
● Final Pass	90 Degrees	
Wheel Speed Sensor to Knuckle Retaining Bolt	7 N·m	62 lb In
Y-Link to Knuckle Retaining Bolt and Nut		
● First Pass	40 N·m	30 lb ft
● Final Pass	120 Degrees	
Y-Link to Subframe Retaining Bolt and Nut	100 N·m	74 lb ft

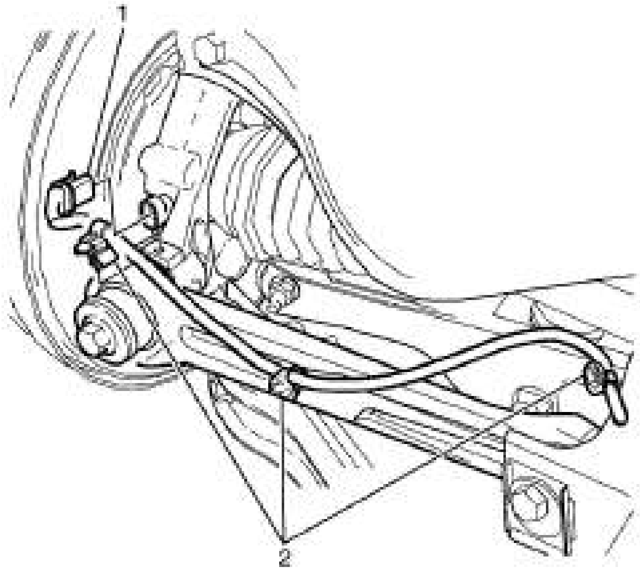
Adjust Link Replacement (LWB SWB)

Removal Procedure

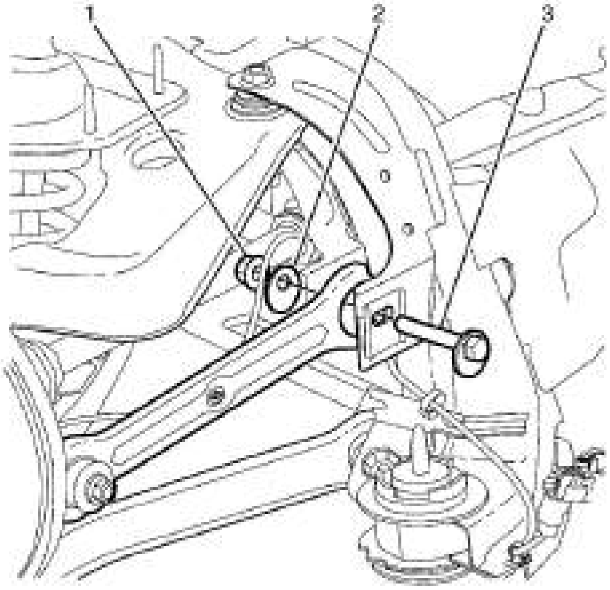
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.

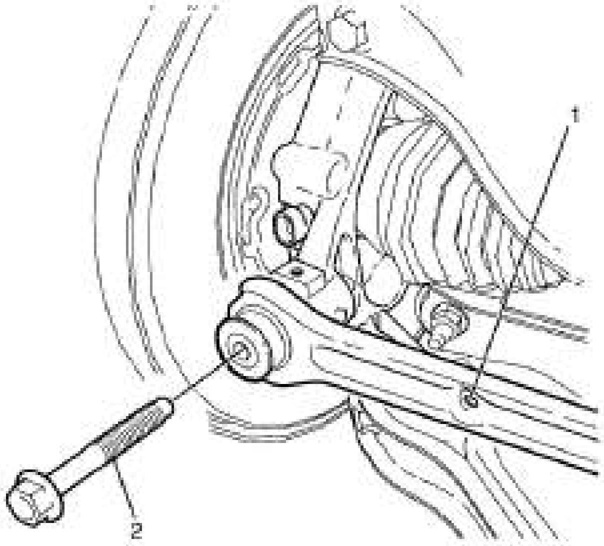


3. Disconnect the wheel speed sensor electrical connector (1).
4. Detach the wheel speed sensor wiring harness retainers (2).



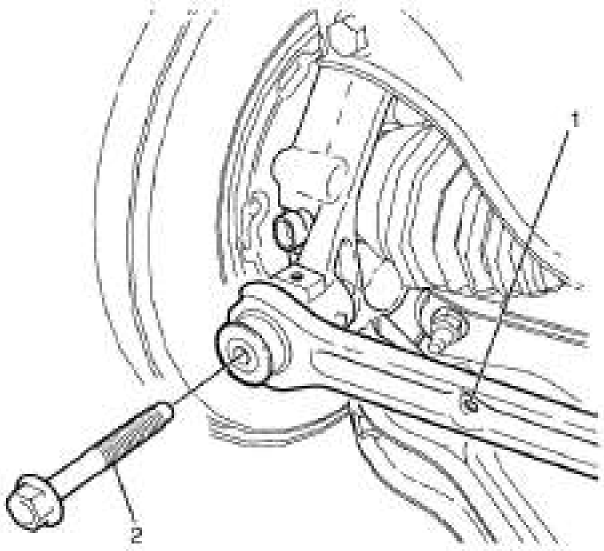
Important: Mark the I-Link to subframe retaining bolt (3) in relation to the subframe before removing the I-Link to subframe retaining nut (1).

5. Remove the I-Link to subframe retaining nut (1), eccentric washer (2) and retaining bolt (3).
6. Discard the I-Link to subframe retaining nut (1).



7. Remove the I-Link to knuckle retaining bolt (2).
8. Remove the I-Link from the subframe (1).

Installation Procedure

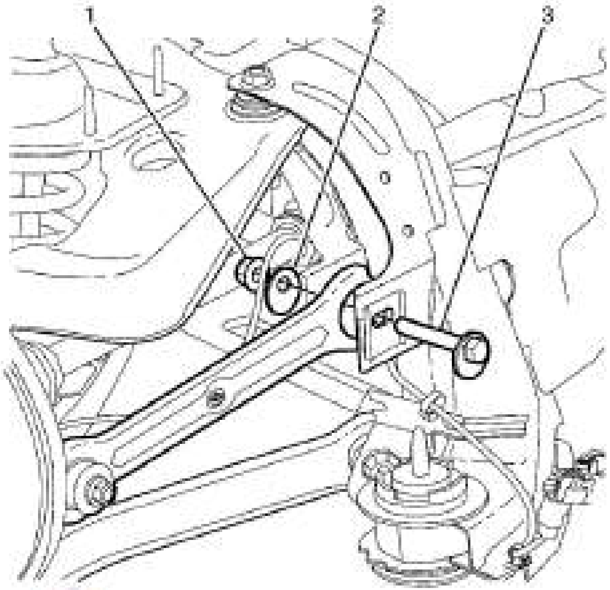


Important: The I-Link to knuckle retaining bolt (1) is not to be fully tightened at this stage.

1. Install the NEW I-Link (1)
2. Install the I-Link to knuckle retaining bolt (2).

   Tighten
   Tighten the bolt to 20 N·m (15 lb ft).

3. Loosen the bolt by 90 degrees



Important: The I-Link to subframe retaining bolt and nut must not to be fully tightened at this stage.

4. Install the I-Link to subframe retaining bolt (3), washer (2) and NEW nut (1).
5. Using a suitable tool, align the previously made aligning mark on the I-Link to subframe retaining bolt (3) to the corresponding rear subframe mark.
6. Using a suitable tool, hold the I-Link to subframe retaining bolt (3) in the correct position and tighten the NEW nut (1).

   Tighten
   Tighten the nut to 20 N·m (15 lb ft).

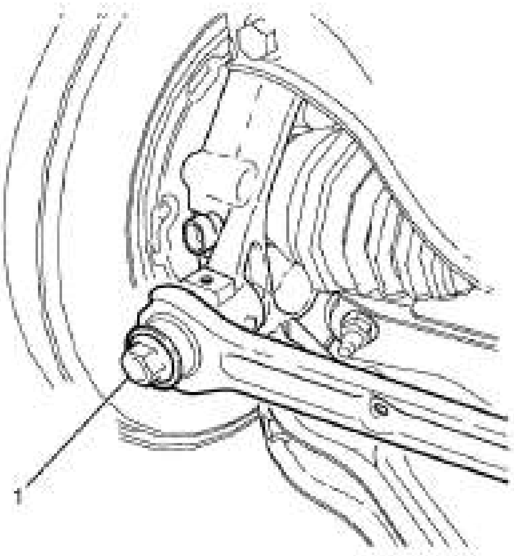
7. Loosen the nut by 90 degrees.
8. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

9. Lower the vehicle. Refer to Lifting and Jacking the Vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

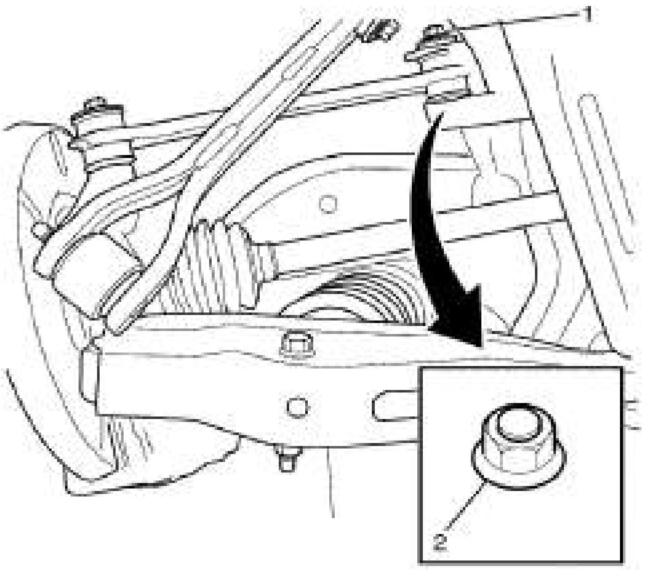


Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nut.

Important: The suggested method to settle the rear suspension is with the wheels on the ground, open rear compartment lid and support the lid with a suitable brace. Using your hands press down hard on the rear compartment floor and release a number of times.

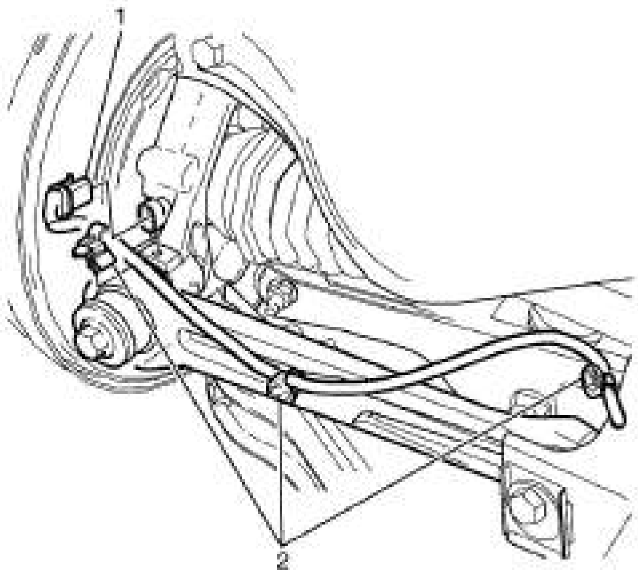
10. Settle the suspension.
11. Tighten the I-Link to knuckle retaining bolt (1).

Tighten
Tighten the bolt to 140 N·m (103 lb ft).



12. Using a suitable tool, align the previously made aligning marks on the I-Link to subframe retaining bolt (1) and hold in position.
13. Tighten the I-Link to subframe retaining nut (2).

Tighten
Tighten the nut to 175 N·m (129 lb ft).



14. Connect the wheel speed sensor electrical connector (1).
15. Attach the wheel speed sensor wiring harness retainers (2).
16. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Specifications.
17. Correct the wheel alignment of the vehicle, if necessary. Refer to Rear Camber Adjustment

and Rear Toe Adjustment

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | Document ID: 1996022

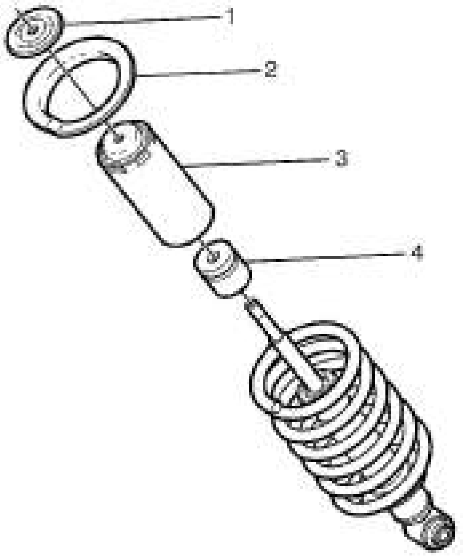
Coil Spring Replacement (LWB SWB Clubsport CSV VXR8)

Removal Procedure

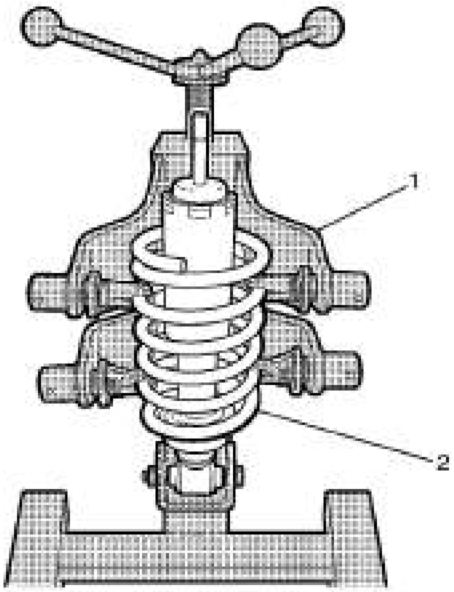
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

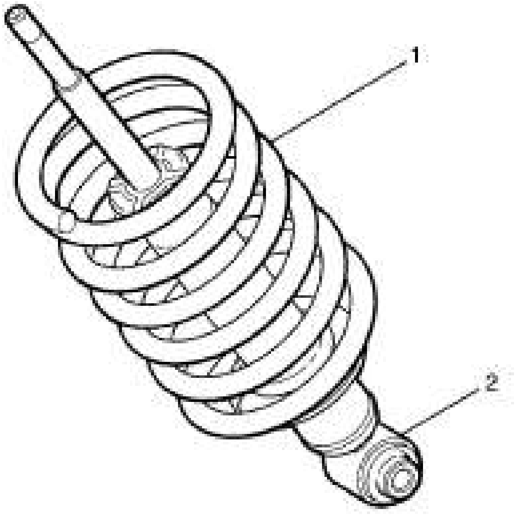
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .
3. Remove the ESC strut assembly. Refer to Strut Assembly Replacement .
4. Remove the strut assembly support mount. Refer to Rear Suspension Strut Mount Replacement .



5. Remove the spring insulator (2).
6. Note the orientation and remove the lower washer (1).
7. Remove the dust shield (3).
8. Remove the compression bumper (4).



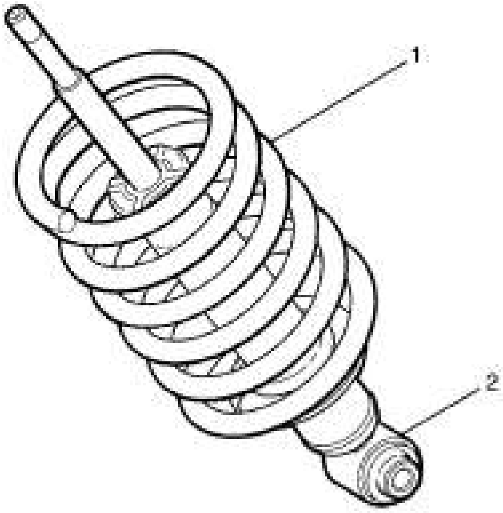
9. Release and remove the spring compressor (1) from the coil spring (2).



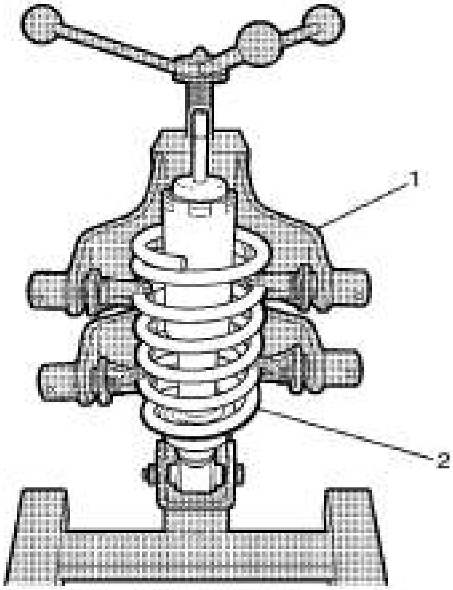
10. Remove the coil spring (1) from the shock absorber (2).
11. Inspect parts for wear and damage.

Installation Procedure

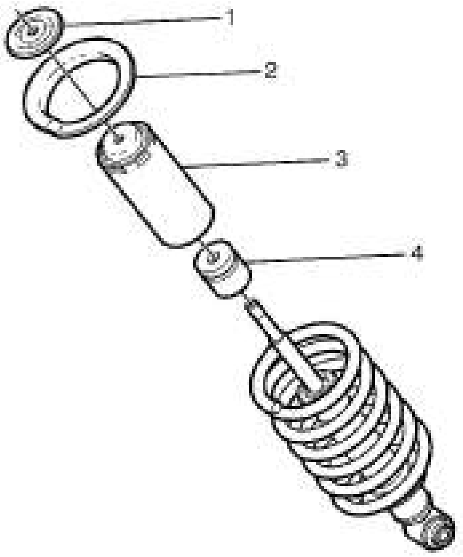
Notice: Refer to General Repair Instructions in the Preface section.



1. Install the coil spring (1) to the shock absorber (2).



2. Compress the coil spring (2) using the spring compressor (1).



3. Install the compression bumper (4).
4. Install the dust shield (3).
5. Note the orientation and install the lower washer (1).
6. Install the spring insulator (2).
7. Install the rear strut assembly support mount. Refer to Rear Suspension Strut Mount Replacement .
8. Install the rear strut assembly. Refer to Strut Assembly Replacement .
9. Install the rear wheel. Refer to Tire and Wheel Removal and Installation .
10. Remove the safety stands.
11. Lower the vehicle to the ground.

Control Arm Bushing Replacement

Tools Required

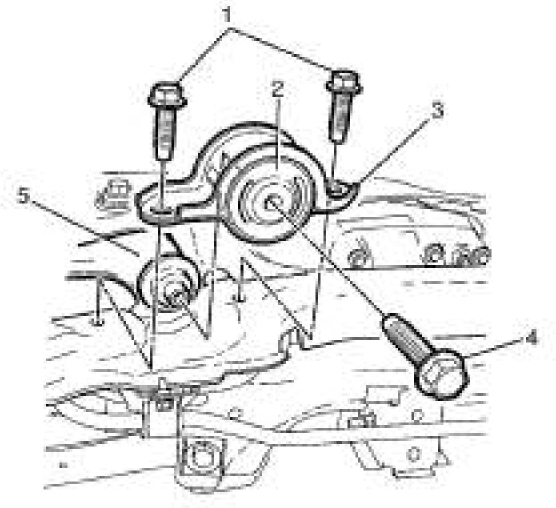
KM-619 Bushing Remover/Installer.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear frame. Refer to Rear Frame Replacement.

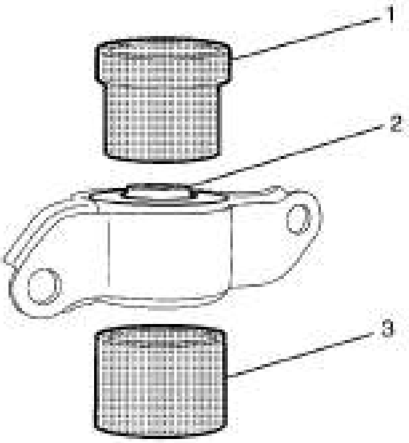


Important: Mark the location of the pivot bushing bracket relative to the rear frame for correct re-assembly.

3. Remove the upper control arm pivot bushing to upper control arm retaining bolt (4).

Important: If both upper control arm pivot bushings are to be replaced at the same time, the upper control arm pivot bushing brackets must be marked as left or right. In all cases, the upper control arm pivot bushing bracket must be marked with an arrow facing towards the front of the vehicle.

4. Remove the upper control arm pivot bushing bracket to subframe retaining bolts (1).
5. Remove the upper control arm pivot bushing (2) and bracket (3) assembly from the upper control arm (5).

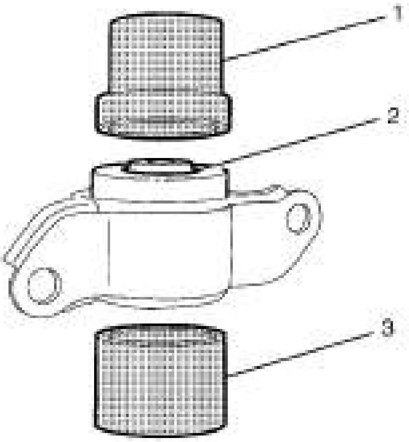


Important: The orientation of the asymmetrical bush is critical to its function. Observe the orientation and depth of the upper control arm pivot bushing (2) with reference to the original position. Adhering to this recommendation will minimize the poential of incorrect upper control arm pivot bushing (2) installation.

Important: The upper control arm pivot bushing (2) must be lubricated with soapy water solution to ease the removal process.

6. Remove the upper control arm pivot bushing (2) using the KM-619 (1, 3).
7. Inspect all parts for wear and damage.

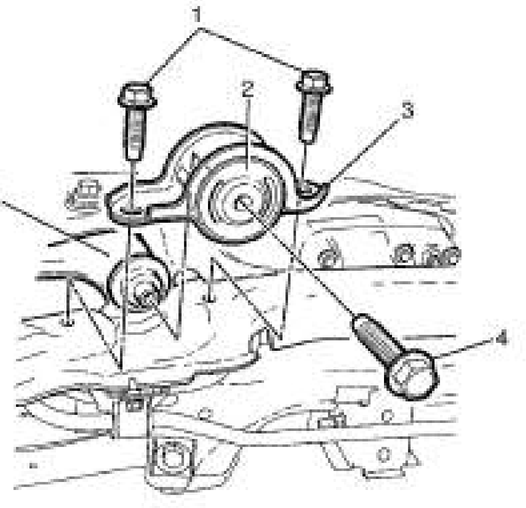
Installation Procedure



Important: The upper control arm pivot bushing (2) must be lubricated with soapy water solution to ease the installation process.

Important: Before installing, the upper control arm pivot bushing (2) must be correctly aligned and orientated. The depth to which the upper control arm pivot bushing (2) is going to travel must also be observed and maintained.

1. Install the upper control arm pivot bushing (2) to the upper control arm (3) using the KM-619 (1, 3).



Important: Align the pivot bushing bracket to the mark made prior to removal.

Important: The upper control arm pivot bushing bracket directional marks must be observed before installation.

2. Install the upper control arm pivot bushing (2) and bracket (3) assembly to the upper control arm (5).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the upper control arm pivot bushing bracket to subframe retaining bolts (1).

Tighten
Tighten the bolts a first pass to 40 N·m (29 lb ft).

Tighten the bolts a final pass 90 Degrees.

4. Install the upper control arm pivot bushing to upper control arm retaining bolt (4).

Tighten
Tighten the bolt to 170 N·m (125 lb ft).

5. Install the rear frame. Refer to Rear Frame Replacement.
6. Remove the safety stands.
7. Lower the vehicle to the ground.
8. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Specifications.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | Document ID: 1975643

Knuckle Bushing Replacement- Lower

Tools Required

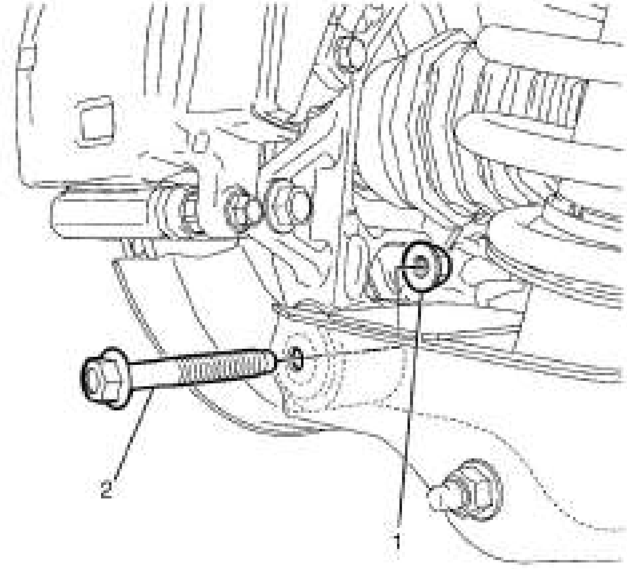
KM-619 Bushing Remover/Installer.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

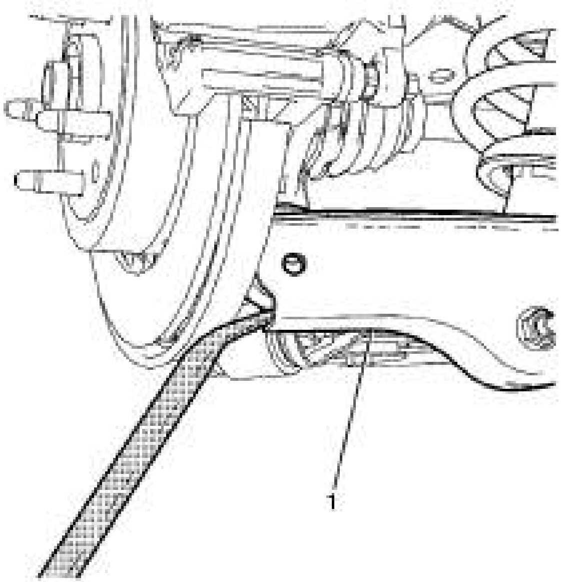
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.
3. Support the lower control arm with a suitable jack.



Important: Prevailing torque nuts must be discarded after removal.

4. Remove the lower control arm to knuckle retaining bolt (2) and nut (1).

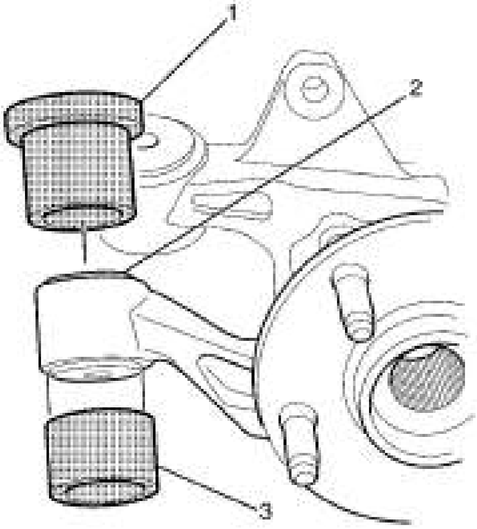
   Discard the nut.



Important: Do not apply pressure to the rear brake disc backing plate while levering.

5. Detach the lower control arm (1) using a suitable pry bar.

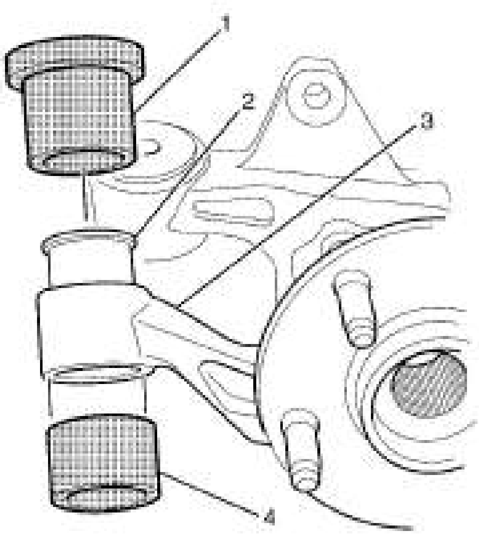
   Reposition the jack as necessary.



Important: It is recommended to observe the orientation and depth of the lower control arm to knuckle bushing (2) with reference to the original position. Adhering to this recommendation will minimize the potential of incorrect lower control arm to knuckle bushing (2) installation.

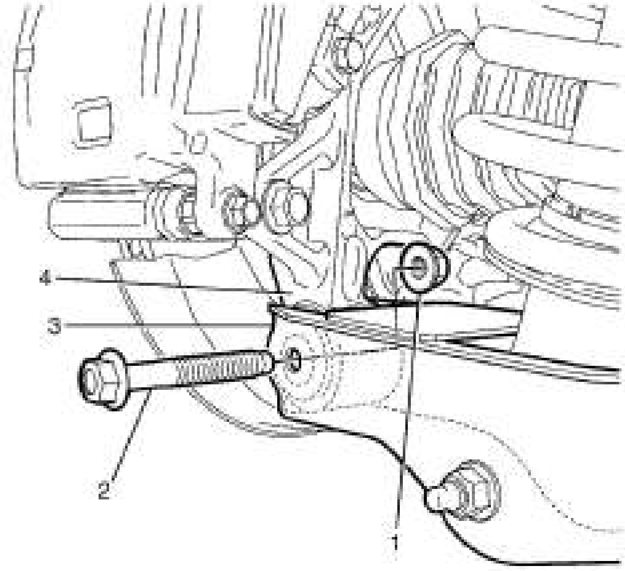
6. Remove the lower control arm to knuckle arm bushing (2) using the KM-619 (1, 3).
7. Inspect all parts for wear and damage.

Installation Procedure



Important: Before installing, the lower control arm to knuckle arm bushing (2) must be correctly aligned and orientated.

1. Install the lower control arm to knuckle arm bushing (2) to the knuckle (3) using the KM-619 (1, 4).



2. Connect the lower control arm (3) to the knuckle (4).

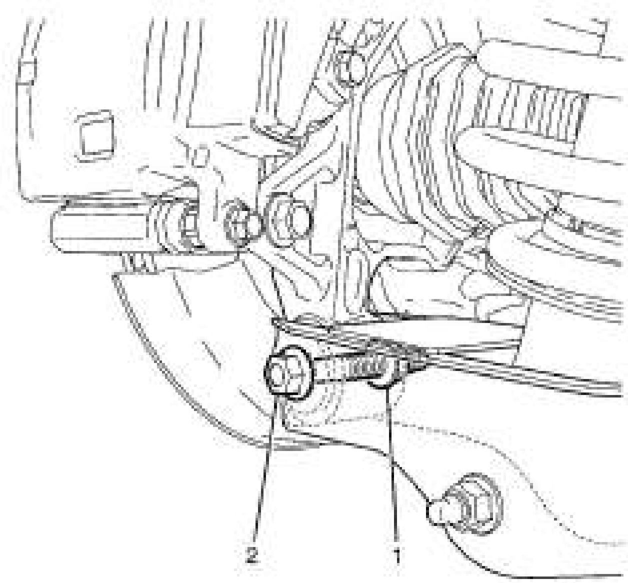
Important: The lower control arm to knuckle arm retaining bolt (2) and nut (1) must not to be fully tightened at this stage.

3. Install the lower control arm to knuckle retaining bolt (2) and NEW nut (1).

   Do not fully tighten at this stage.

4. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
5. Remove the safety stands.
6. Lower the vehicle to the ground.
7. Bounce the vehicle several times to settle the suspension.

   Notice: Refer to Fastener Notice in the Preface section.



Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nuts and bolts.

8. Tighten the lower control arm to knuckle retaining bolt (2) and NEW nut (1).

   Tighten
   Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

   Tighten the bolt and nut a final pass 120 Degrees.

Knuckle Replacement

Tools Required

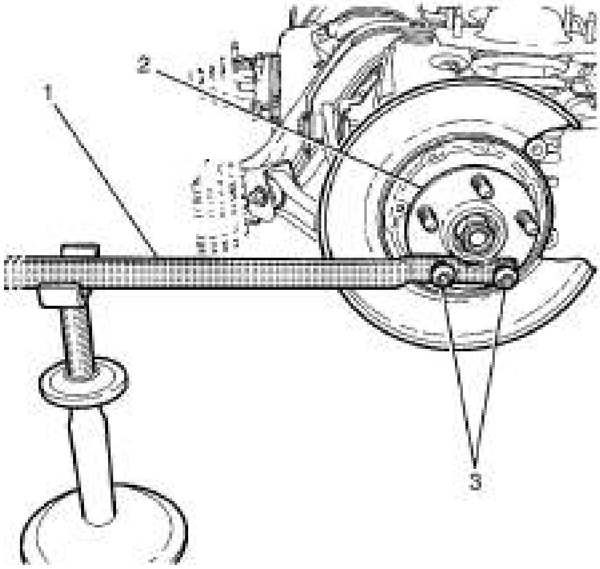
- 7208 Drive Shaft Remover.
- KM-468 Hub Holding Tool.

Removal Procedure - Up to 13 Aug 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

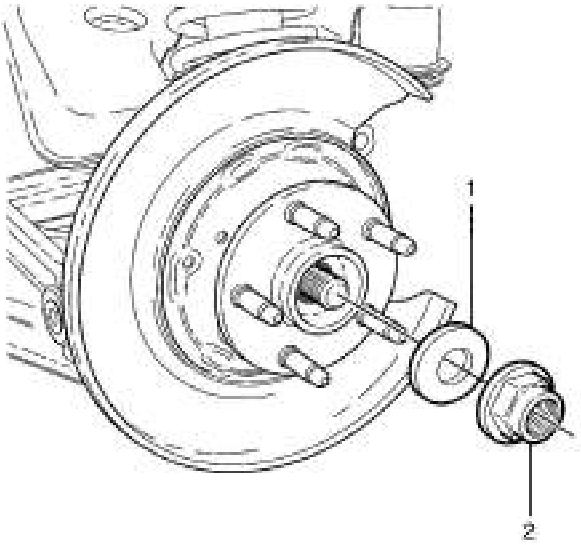
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.
3. Remove the rear brake disc. Refer to Rear Brake Rotor Replacement.



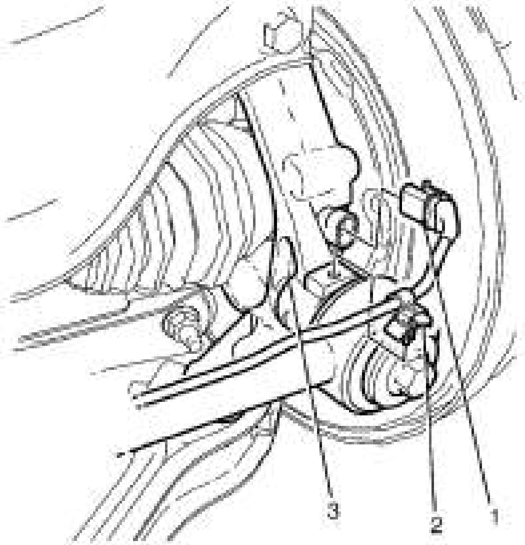
4. Install the KM-468 (1) to the wheel hub (2) with two inverted wheel nuts (3).

   Support the KM-468 outer end on a safety stand.



Important: The wheel drive shaft retaining nut (2) and washer (1) must be discarded after removal.

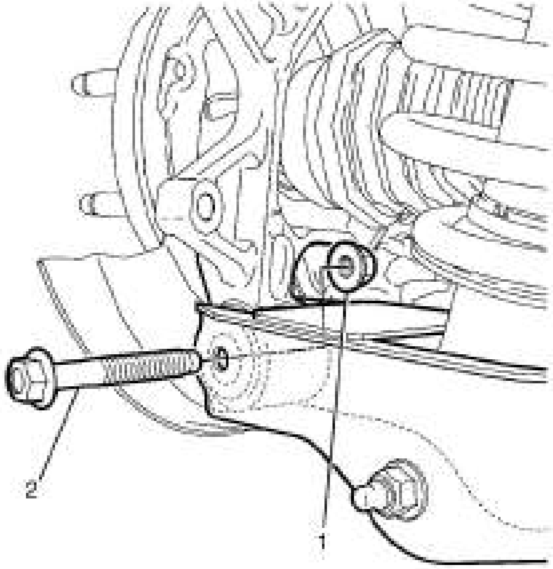
5. Remove the wheel drive shaft retaining nut (2) and washer (1).
   - Discard the nut.
   - Discard the washer.
6. Remove the 7208 from the wheel hub.



Important: The wheel speed sensor cable must be secured to protect it from damage.

7. Disconnect the wheel speed sensor electrical connector (1).

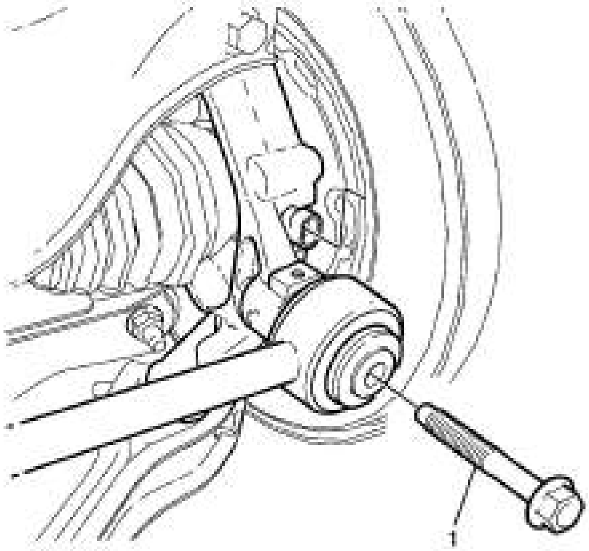
8. Detach the wheel speed sensor wiring harness mounting clip (2) from the knuckle (3).



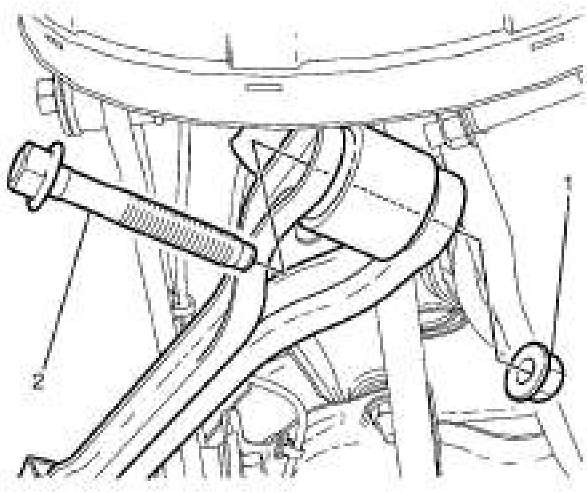
Important: Prevailing torque nuts must be discarded after removal.

9. Remove the lower control arm to knuckle retaining bolt (2) and nut (1).

   Discard the nut.



10. Remove the I-Link to knuckle retaining bolt (1).

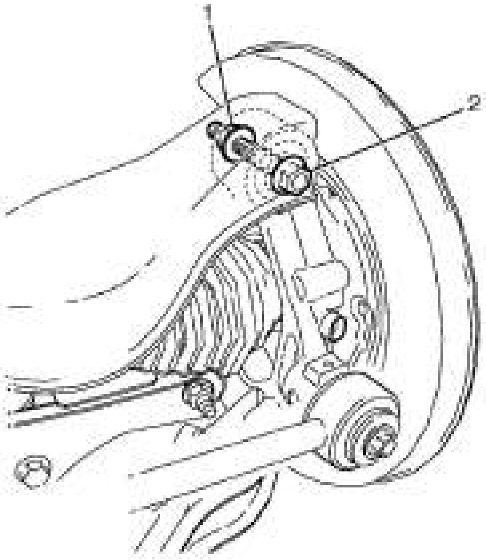


Important: Mark the location of the bolt and nut relative to the Y-Link for correct re-assembly.

Important: Prevailing torque nuts must be discarded after removal.

11. Remove the Y-Link to knuckle retaining bolt (2) and nut (1).

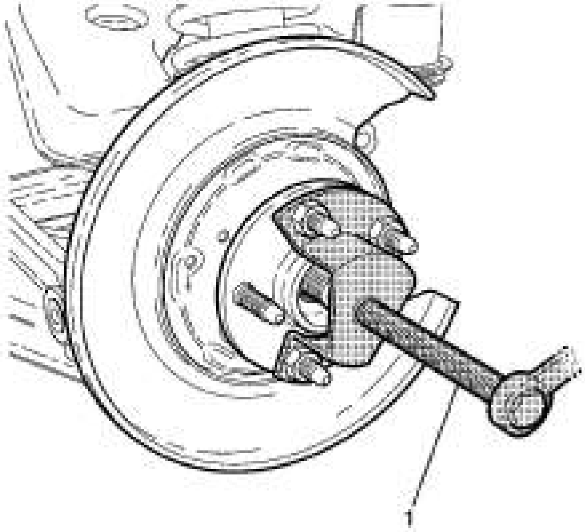
    Discard the nut.



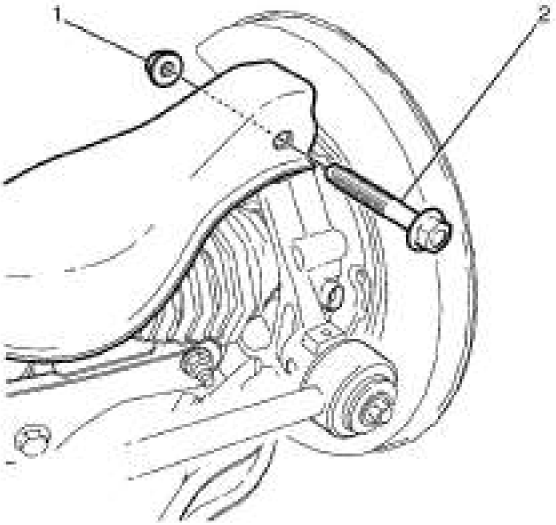
Important: Mark the location of the bolt and nut relative to the upper control arm for correct re-assembly.

12. Loosen the upper control arm to knuckle retaining bolt (2) and nut (1).

    Do not remove the bolt and nut.



13. Secure the rear driveshaft with wire to protect it from damage.
14. Install the 7208 to the wheel hub.
15. Press the wheel drive shaft from the wheel hub using the 7208 (1).
16. Remove the 7208 from the wheel hub.

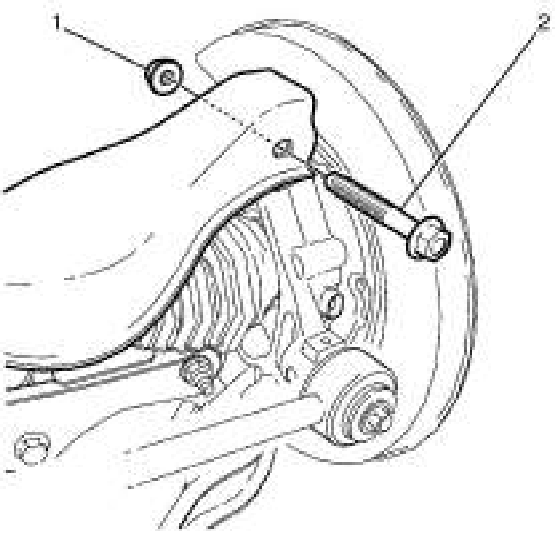


Important: Prevailing torque nuts must be discarded after removal.

17. Remove the upper control arm to knuckle bolt (2) and nut (1).
18. Remove the wheel hub and knuckle assembly.
19. Disassemble the wheel hub and knuckle assembly. Refer to Rear Wheel Bearing and Hub Replacement.

Installation Procedure - Up to 13 Aug 2007

1. Assemble the wheel hub and knuckle assembly. Refer to Rear Wheel Bearing and Hub Replacement.

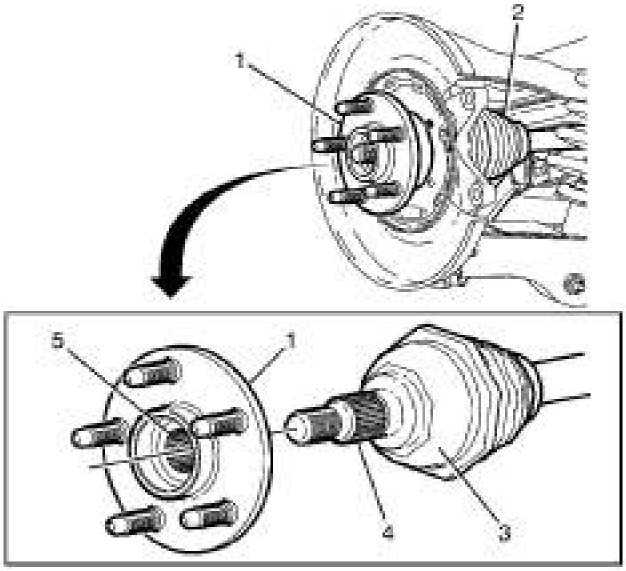


2. Install the wheel hub and knuckle assembly to the upper control arm.

   Important: The upper control arm to knuckle retaining bolt (2) and nut (1) must not to be fully tightened at this stage.

3. Install the upper control arm to knuckle retaining bolt (2) and nut (1).

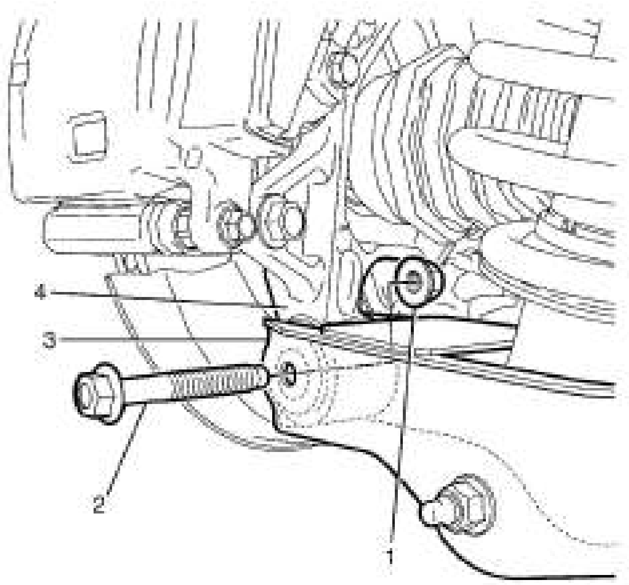
   Do not fully tighten at this stage.



Important: Lightly lubricate the wheel drive shaft outer splined end (4) with the recommended differential lubricant.

Important: Do not excessively push the wheel drive shaft (3) through the wheel hub (1).

4. Push the wheel drive shaft outer splined end (4) into the splined cavity (5) of the wheel hub (1).
5. Remove the wheel drive shaft securing wire, used in the removal process to prevent damage.

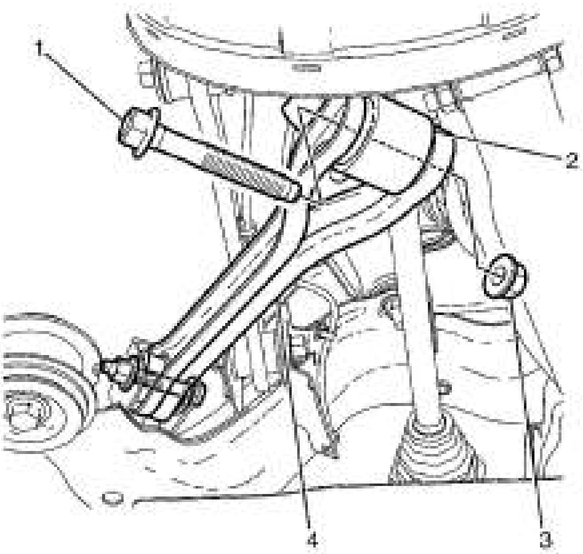


6. Install the lower control arm (3) to the knuckle (4).

Important: The lower control arm to knuckle retaining bolt (2) and nut (1) must not to be fully tightened at this stage.

7. Install the lower control arm to knuckle retaining bolt (2) and NEW nut (1).

   Do not fully tighten at this stage.

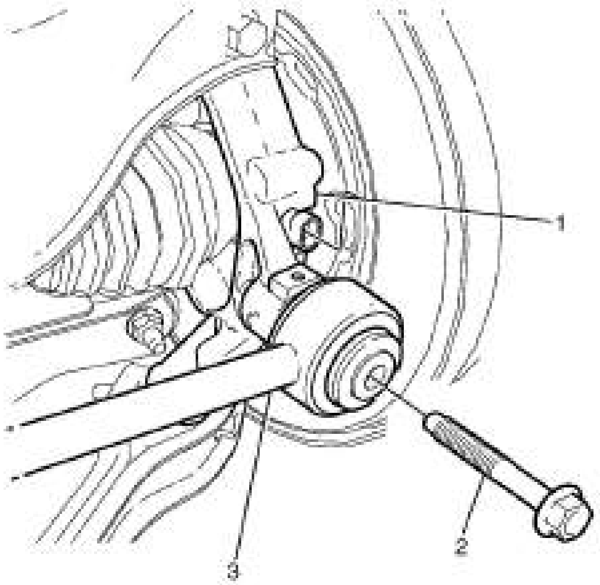


8. Install the Y-Link (4) to the knuckle (2).

   Important: The Y-Link to knuckle retaining bolt (1) and nut (3) must not to be fully tightened at this stage.

9. Install the Y-Link to knuckle retaining bolt (1) and NEW nut (3).

   Do not fully tighten at this stage.

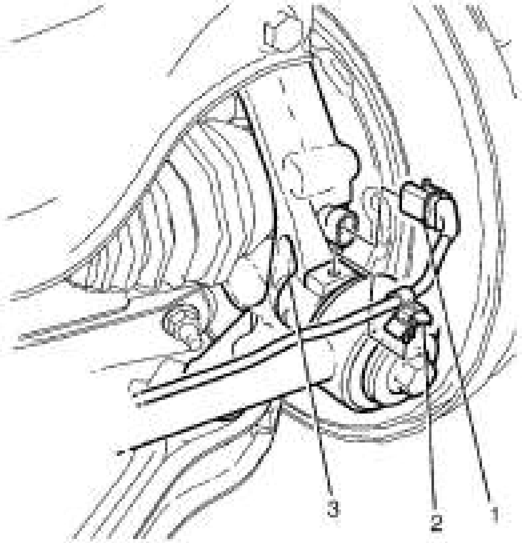


10. Install the I-Link (4) to the knuckle (1).

    Important: The I-Link to knuckle retaining bolt (2) and nut (3) must not to be fully tightened at this stage.

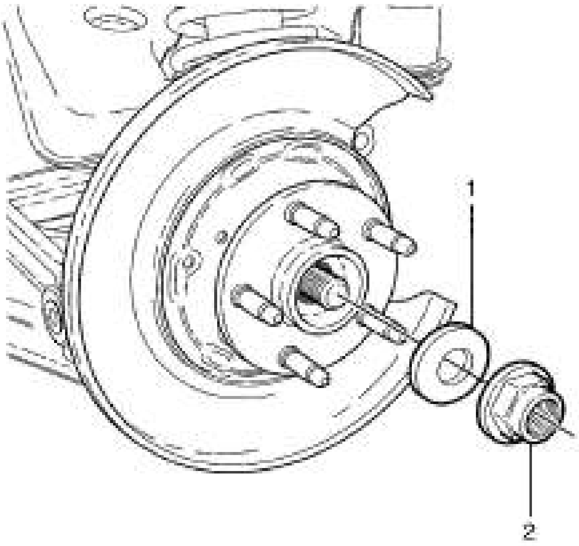
11. Install the I-Link to knuckle retaining bolt (2) and washer (3).

    Do not fully tighten at this stage.



12. Connect the wheel speed sensor electrical connector (1).
13. Attach the wheel speed sensor wiring harness mounting clip (2) to the knuckle (3).

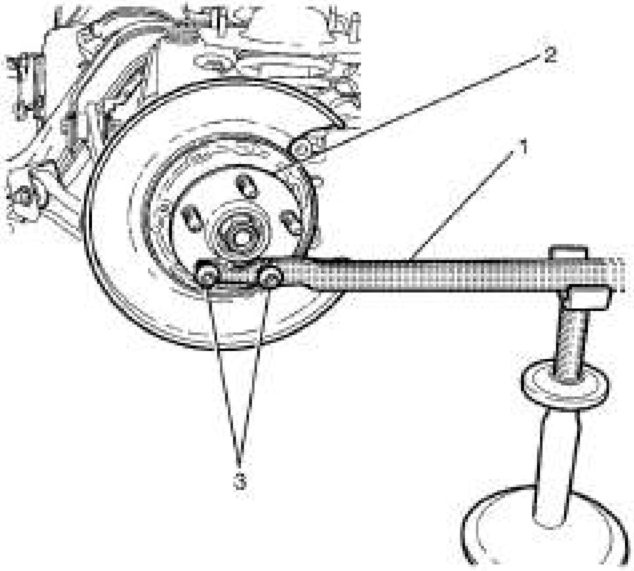
Notice: Refer to Fastener Notice in the Preface section.



Important: A NEW nut and NEW washer must be used when installing the wheel drive shaft.

14. Install NEW retaining washer (1) and NEW nut (2) to the wheel drive shaft.

Notice: Refer to Fastener Notice in the Preface section.



15. Install the KM-468

Support the KM-468

Notice: Refer to Fastener Notice in the Preface section.

Important: There are two suitable methods of tightening the wheel drive shaft retaining nut. DO NOT EXCEED THE SPECIFIED TIGHTENING VALUES, otherwise premature bearing failure may result.

16. Preferred Method

    Tighten
    Tighten the nut on first pass to 150 N·m (111 lb ft).

    Loosen
    Loosen the nut on second pass by 180 Degrees.

    Tighten
    Tighten the nut on third pass to 425 N·m (313 lb ft)

    Crimp nut.

    Alternate Method

    Tighten
    Tighten the nut on first pass to 150 N·m (111 lb ft).

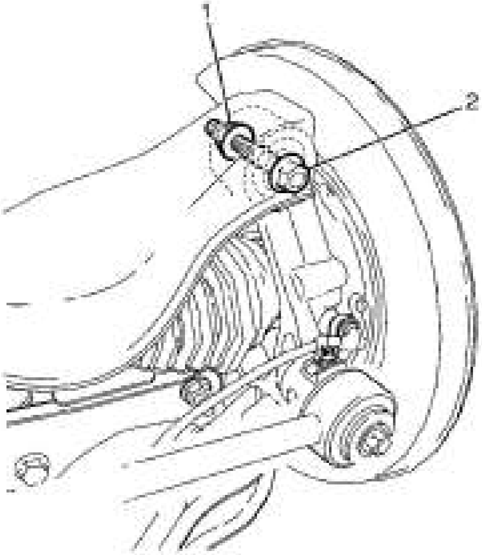
    Loosen
    Loosen the nut on second pass by 180 Degrees.

    Tighten
    Tighten the nut on the third pass to 50 N·m (37 lb ft)

    Tighten
    Tighten the nut on the forth pass by 45 Degrees

    Crimp nut.

17. Remove the KM-468 (1).
18. Install the rear brake disc. Refer to Rear Brake Rotor Replacement
19. Install the rear wheel. Refer to Tire and Wheel Removal and Installation
20. Remove the safety stands.
21. Lower the vehicle to the ground.
22. Bounce the vehicle several times to settle the suspension.



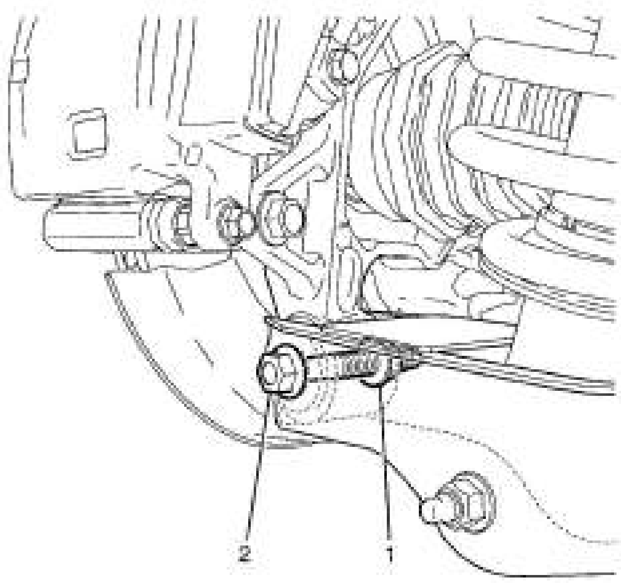
Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nuts and bolts.

Important: Align the bolt to the mark made prior to removal.

23. Tighten the upper control arm to knuckle retaining bolt (2) and NEW nut (1).

Tighten
Tighten the bolt and nut first pass to 60 N·m(44 lb ft).

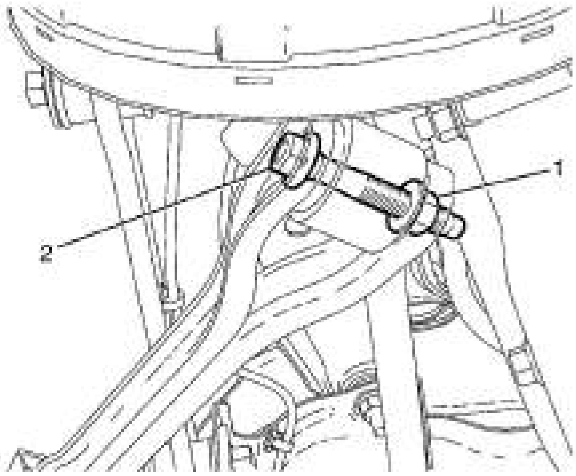
Tighten the bolt and nut final pass to 90 Degrees.



24. Tighten the lower control arm to knuckle retaining bolt (2) and NEW nut (1).

    Tighten
    Tighten the nut a first pass to 40 N·m (30 lb ft).

    Tighten the nut in a final pass 120 Degrees.

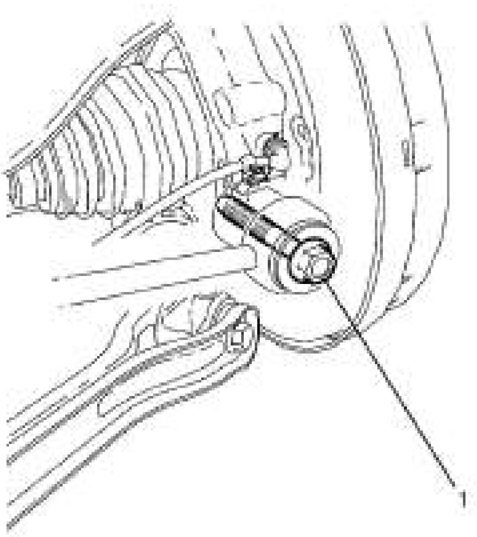


Important: Align the mark from bolt to Y-Link made prior to removal.

25. Tighten the Y-Link to knuckle retaining bolt (2) and NEW nut (1).

    Tighten
    Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

    Tighten the bolt and nut in a second pass 120 Degrees.



26. Tighten the I-Link to knuckle retaining bolt (1).

    Tighten
    Tighten the bolt to 140 N·m (103 lb ft).

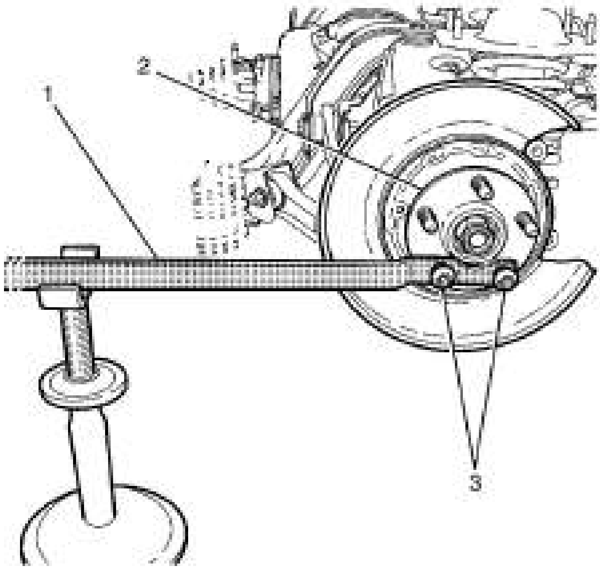
27. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Specifications.

Removal Procedure - After 13 Aug 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

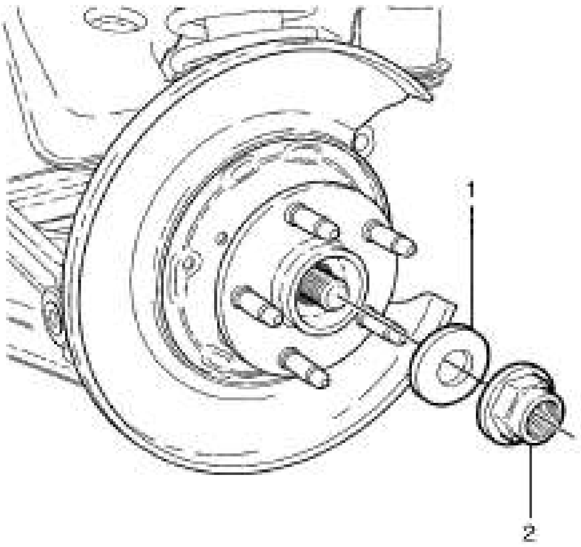
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.
3. Remove the rear brake disc. Refer to Rear Brake Rotor Replacement.



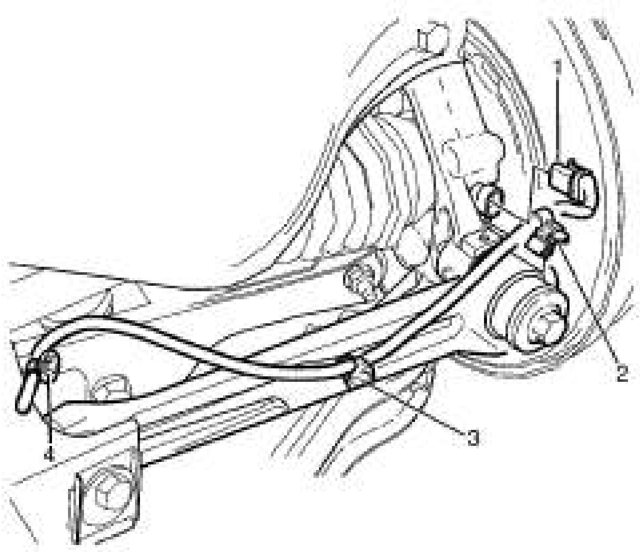
4. Install the KM-468 (1) to the wheel hub (2) with two inverted wheel nuts (3).

   Support the KM-468 (1) outer end on a safety stand.



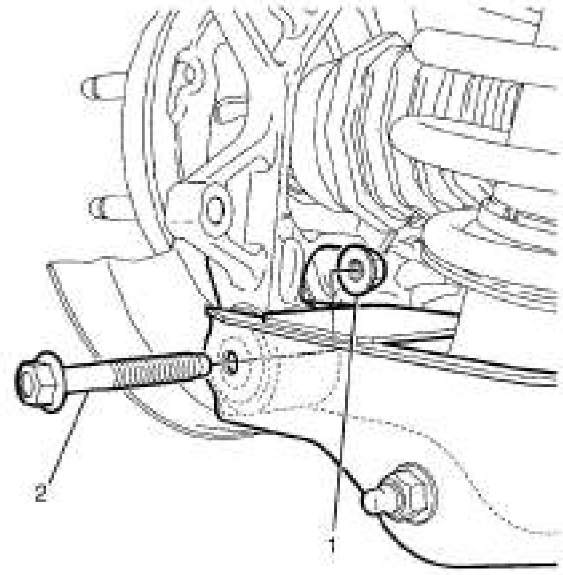
Important: The wheel drive shaft retaining nut (2) and washer (1) must be discarded after removal.

5. Remove the wheel drive shaft retaining nut (2) and washer (1).
   - Discard the nut.
   - Discard the washer.



Important: The wheel speed sensor cable must be secured to protect it from damage.

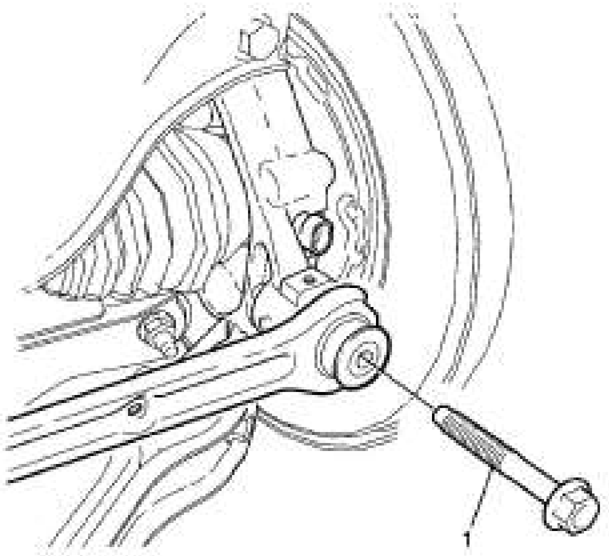
6. Disconnect the wheel speed sensor electrical connector (1).
7. Detach the wheel speed sensor wiring harness mounting clips (2, 3 and 4).



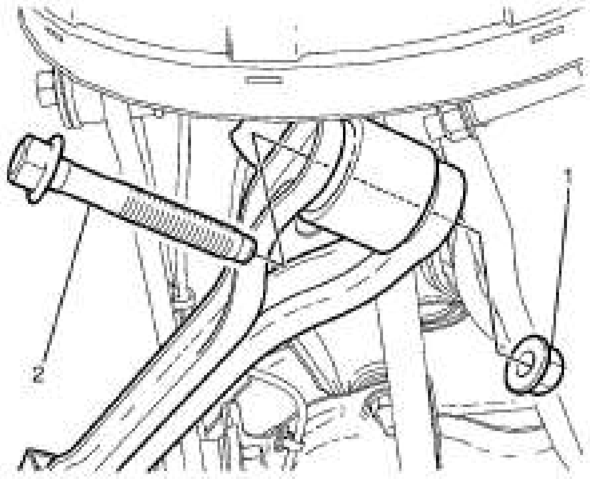
Important: Prevailing torque nuts must be discarded after removal.

8. Remove the lower control arm to knuckle retaining bolt (2) and nut (1).

   Discard the nut.



9. Remove the I-Link to knuckle retaining bolt (1).

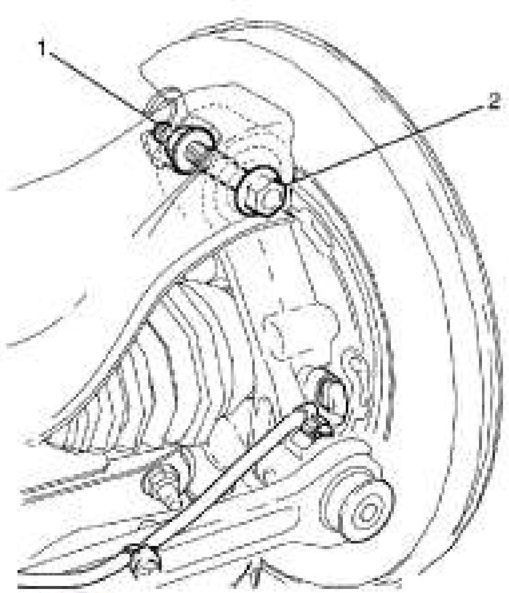


Important: Mark the location of the Y-Link to knuckle retaining bolt and nut relative to the Y-Link for correct re-assembly.

Important: Prevailing torque nuts must be discarded after removal.

10. Remove the Y-Link to knuckle retaining bolt (2) and nut (1).

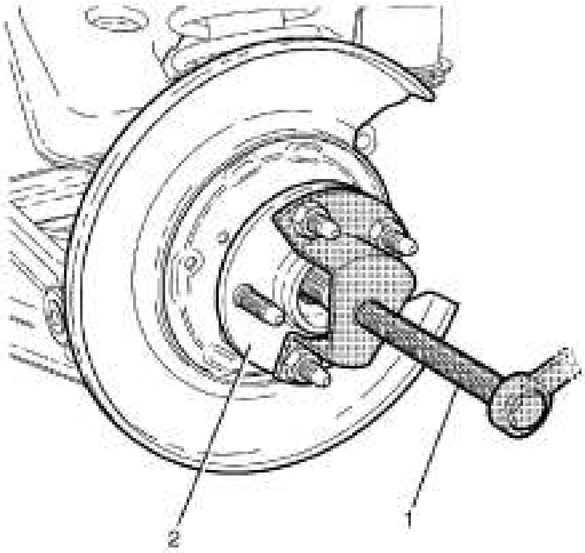
    Discard the nut.



Important: Mark the location of the bolt and nut relative to the upper control arm for correct assembly.

11. Loosen the upper control arm to knuckle retaining bolt (2) and nut (1).

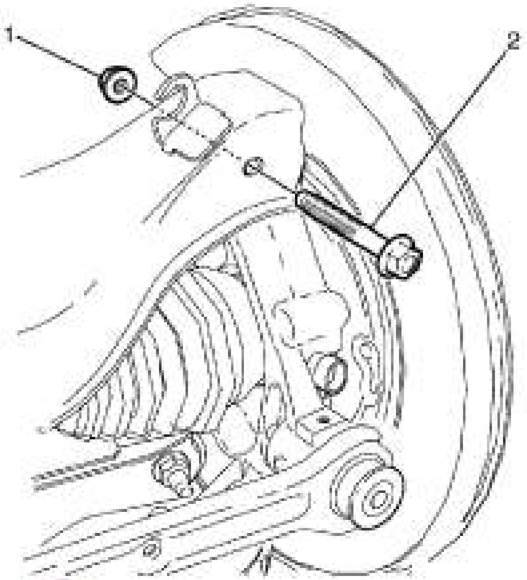
    Do not remove the bolt and nut.



Important: Secure the wheel drive shaft with wire to protect it from damage.

12. Install the 7208 (1) to the wheel hub (2).

13. Press the wheel drive shaft from the wheel hub using the 7208 (1).
14. Remove the 7208 (1) from the wheel hub (2).



Important: Prevailing torque nuts must be discarded after removal.

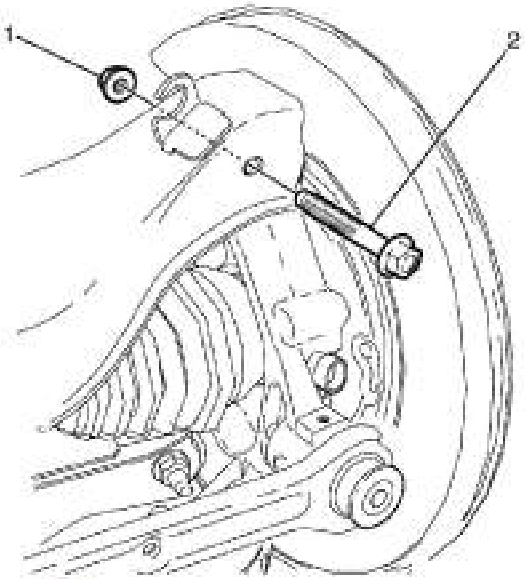
15. Remove the upper control arm to knuckle bolt (2) and nut (1).

    Discard the nut.

16. Remove the wheel hub and knuckle assembly.
17. Disassemble the wheel hub and knuckle assembly. Refer to Rear Wheel Bearing and Hub Replacement.

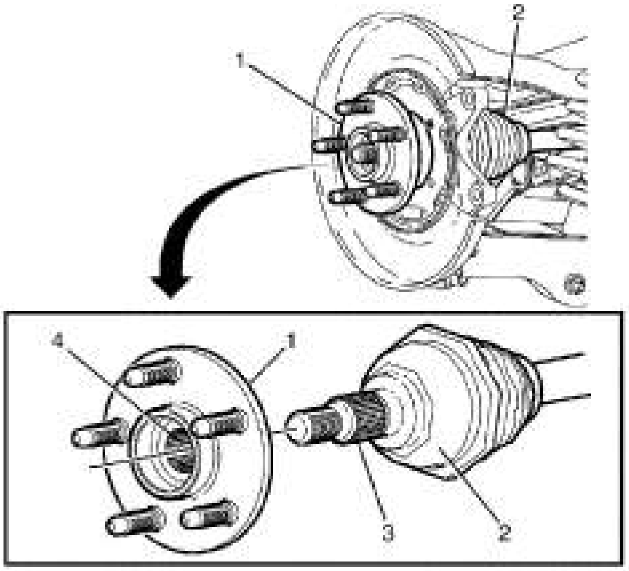
Installation Procedure - After 13 Aug 2007

1. Assemble the wheel hub and knuckle assembly. Refer to Rear Wheel Bearing and Hub Replacement.
2. Install the wheel hub and knuckle assembly to the upper control arm.



Important: The upper control arm to knuckle retaining bolt (2) and NEW nut (1) must not to be fully tightened at this stage.

3. Install the upper control arm to knuckle retaining bolt (2) and NEW nut (1).

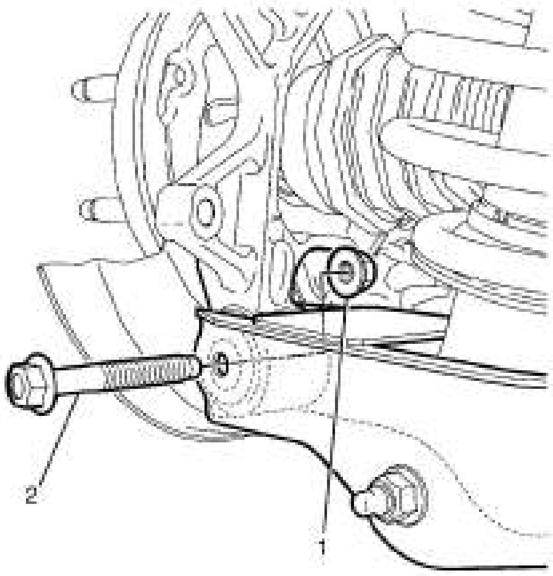


Important: Lightly lubricate the wheel drive shaft outer splined end (3) with the recommended differential lubricant.

Important: Do not excessively push the wheel drive shaft (2) through the wheel hub (1).

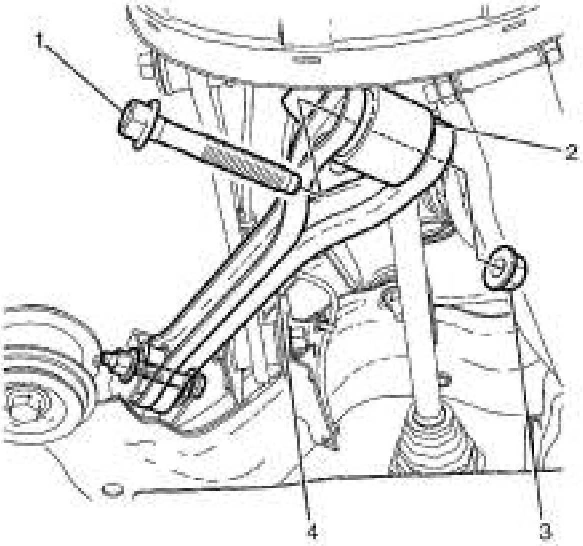
4. Push the wheel drive shaft outer splined end (3) into the splined cavity (4) of the wheel hub (1).

5. Remove the wheel drive shaft securing wire, used in the removal process to prevent damage.



Important: The lower control arm to knuckle retaining bolt (2) and NEW nut (1) must not to be fully tightened at this stage.

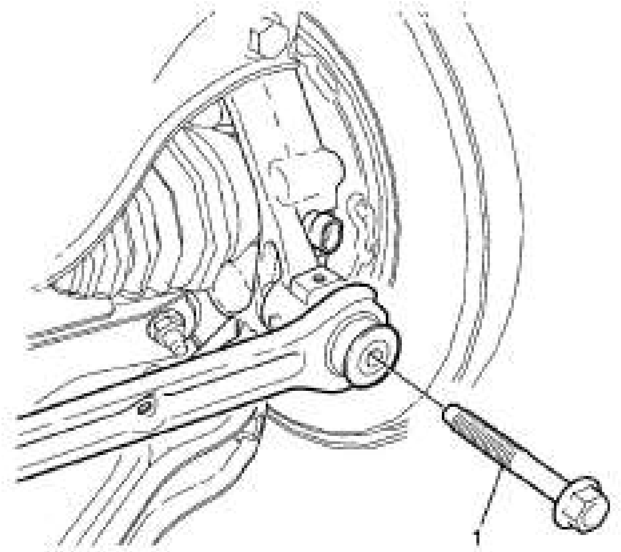
6. Install the lower control arm to knuckle retaining bolt (2) and NEW nut (1).



7. Install the Y-Link (4) to the knuckle (2).

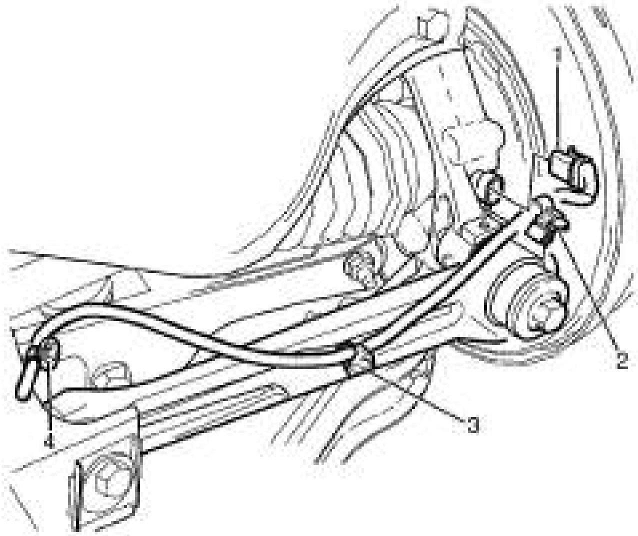
Important: The Y-Link to knuckle retaining bolt (1) and NEW nut (3) must not to be fully tightened at this stage.

8. Install the Y-Link to knuckle retaining bolt (1) and NEW nut (3).

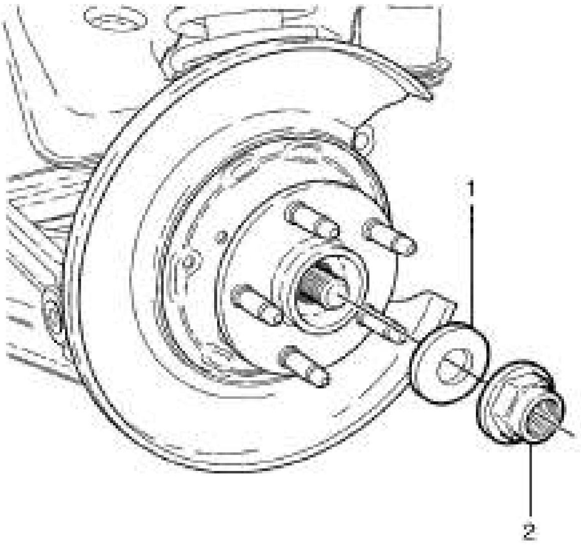


Important: The I-Link to knuckle retaining bolt (1) must not to be fully tightened at this stage.

9. Install the I-Link to knuckle retaining bolt (1).



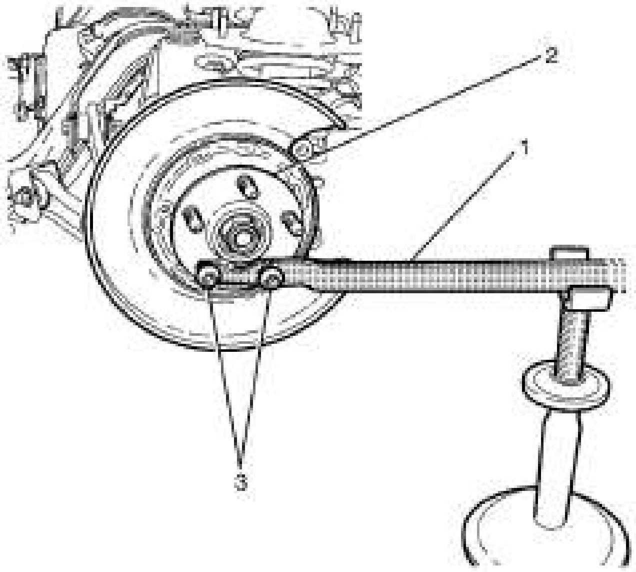
10. Connect the wheel speed sensor electrical connector (1).
11. Attach the wheel speed sensor wiring harness mounting clips (2, 3 and 4).



Important: A NEW wheel drive shaft retaining nut and NEW washer must be used when installing the wheel drive shaft.

12. Install the NEW wheel drive shaft retaining nut (2) and NEW washer (1).

    Notice: Refer to Fastener Notice in the Preface section.



13. Install the KM-468 (1) to the wheel hub (2) with two inverted wheel nuts (3).

    Support the KM-468 (1) outer end on a safety stand.

Notice: Refer to Fastener Notice in the Preface section.

Important: There are two suitable methods of tightening the wheel drive shaft retaining nut. DO NOT EXCEED THE SPECIFIED TIGHTENING VALUES, otherwise premature bearing failure may result.

14. Preferred Method

    Tighten
    Tighten the nut on first pass to 150 N·m (111 lb ft).

    Loosen
    Loosen the nut on second pass by 180 Degrees.

    Tighten
    Tighten the nut on third pass to 425 N·m (313 lb ft)

    Crimp nut.

    Alternate Method

    Tighten
    Tighten the nut on first pass to 150 N·m (111 lb ft).

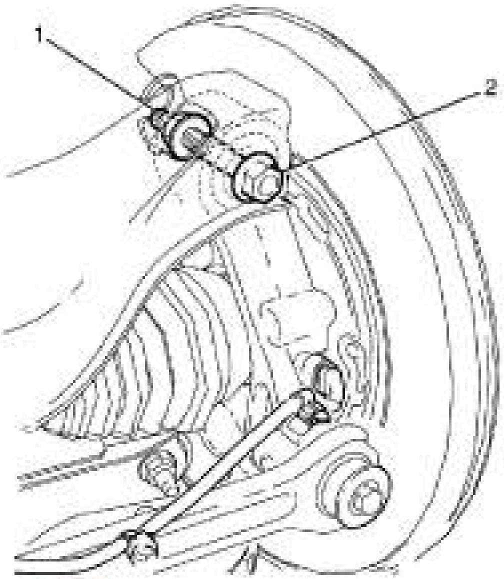
    Loosen
    Loosen the nut on second pass by 180 Degrees.

    Tighten
    Tighten the nut on the third pass to 50 N·m (37 lb ft)

    Tighten
    Tighten the nut on the forth pass by 45 Degrees

    Crimp nut.

15. Remove the KM-468 (1).
16. Install the rear brake disc. Refer to Rear Brake Rotor Replacement.
17. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
18. Remove the safety stands.
19. Lower the vehicle to the ground.
20. Bounce the vehicle several times to settle the suspension.



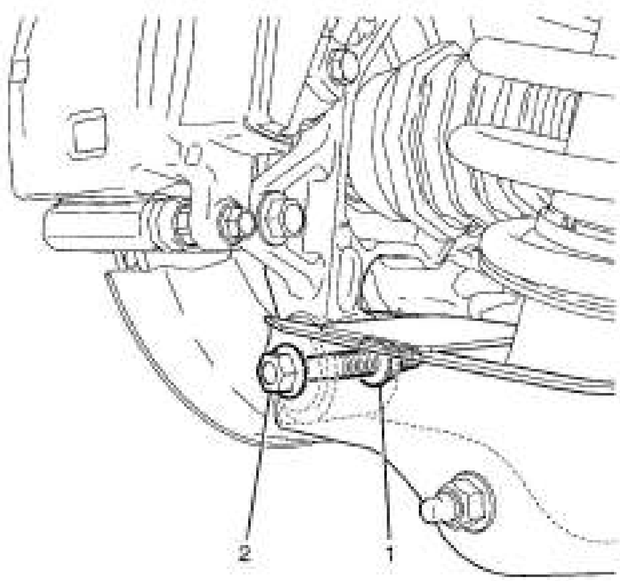
Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nuts and bolts.

Important: Align the bolt to the mark made prior to removal.

21. Tighten the upper control arm to knuckle retaining bolt (2) and NEW nut (1).

Tighten
Tighten the bolt and nut first pass to 60 N·m(44 lb ft).

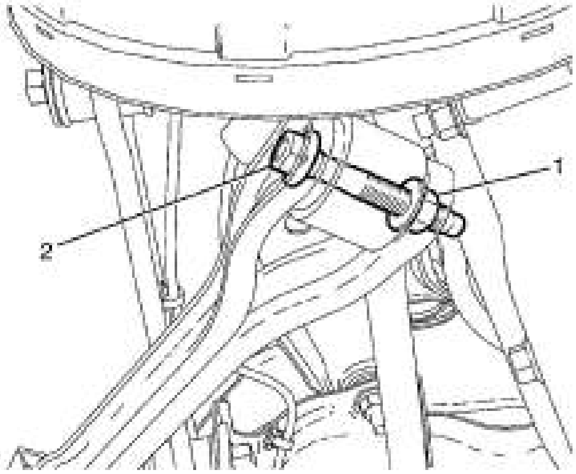
Tighten the bolt and nut final pass to 90 Degrees.



22. Tighten the lower control arm to knuckle retaining bolt (2) and NEW nut (1).

Tighten
Tighten the nut a first pass to 40 N·m (30 lb ft).

Tighten the nut in a final pass 120 Degrees.

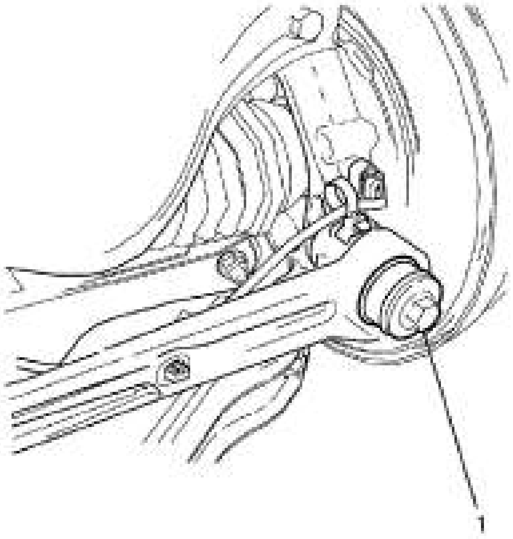


Important: Align the mark from bolt to Y-Link made prior to removal.

23. Tighten the Y-Link to knuckle retaining bolt (2) and NEW nut (1).

Tighten
Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

Tighten the bolt and nut in a second pass 120 Degrees.



24. Tighten the I-Link to knuckle retaining bolt (1).

    Tighten
    Tighten the bolt to 140 N·m (103 lb ft).

25. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Specifications.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | Document ID: 1975625

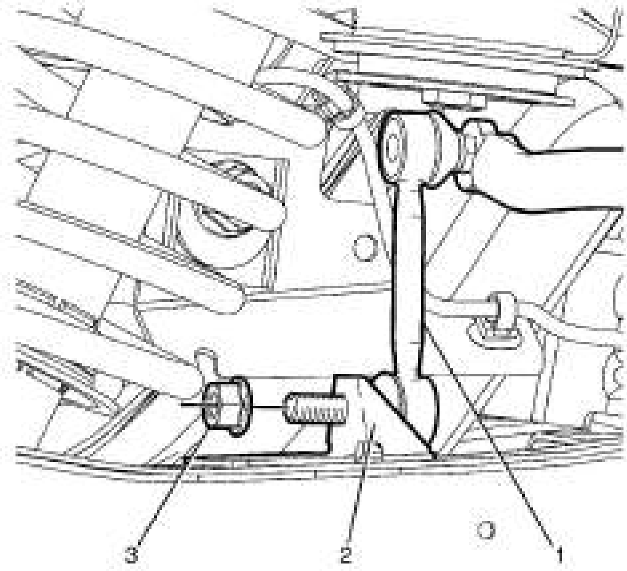
Lower Control Arm Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.
3. Support the lower control arm using a suitable jack.

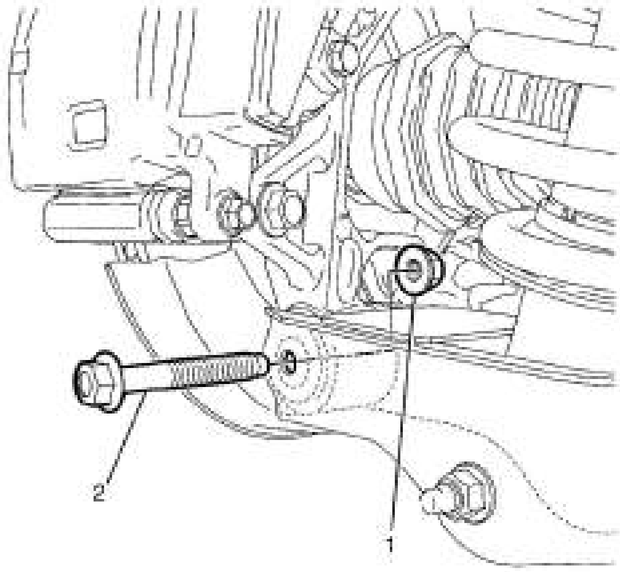


Important: Prevailing torque nuts must be discarded after removal.

4. Remove the stabiliser bar link to lower control arm retaining nut (3).

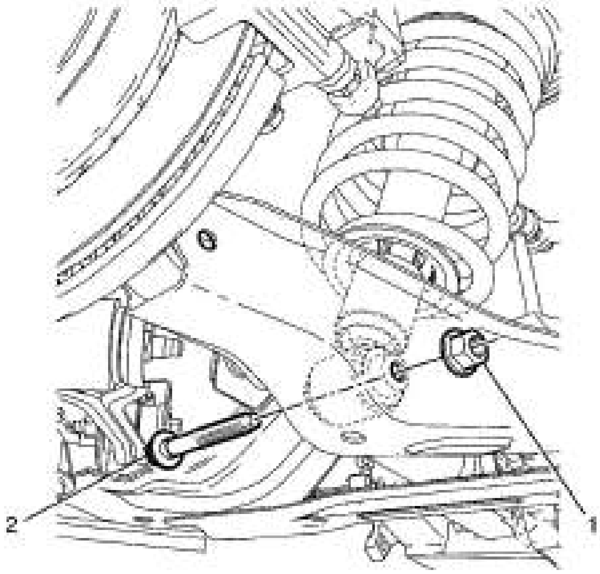
   Discard the nut.

5. Disconnect the stabiliser bar link (1) from the lower control arm (2).



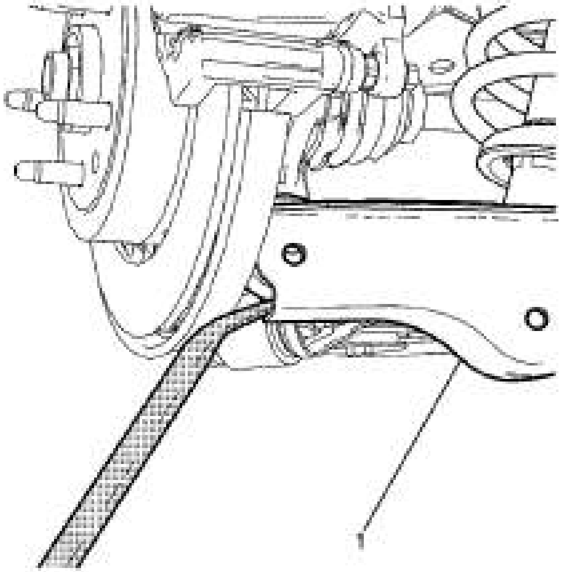
6. Remove the lower control arm to knuckle retaining bolt (2) and nut (1).

   Discard the nut.



7. Remove the lower control arm to strut assembly retaining bolt (2) and nut (1).

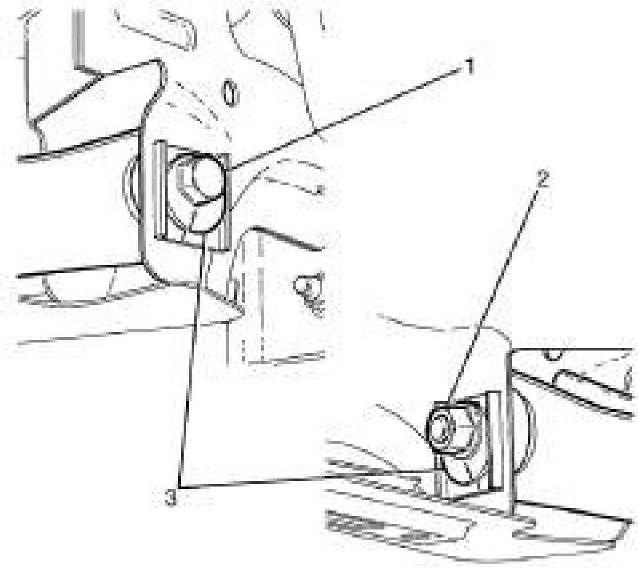
   Discard the nut.



Important: Do not apply pressure to the rear brake disc backing plate while levering.

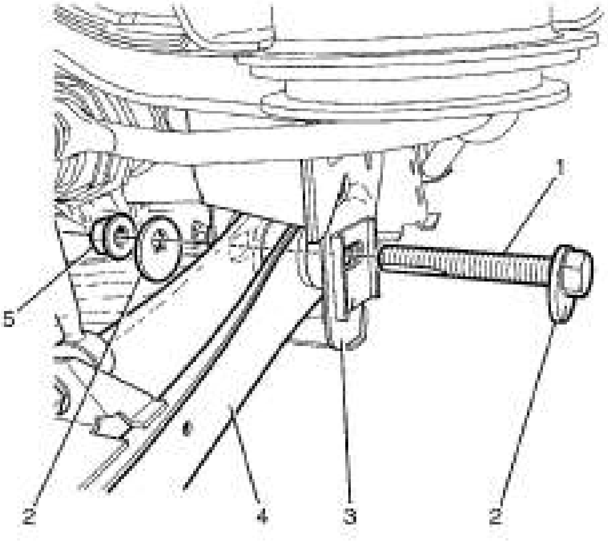
8. Detach the lower control arm (1) using a suitable pry bar.

   Reposition the jack as necessary.



Important: The lower control arm to subframe retaining bolt (1) and nut (2) eccentric washers (3) are used to adjust the rear suspension camber. One eccentric washer (3) is mounted directly to the head of the lower control arm to subframe retaining bolt (1).

9. Scribe the eccentric washers (3) with reference to their seating position relative to the subframe.

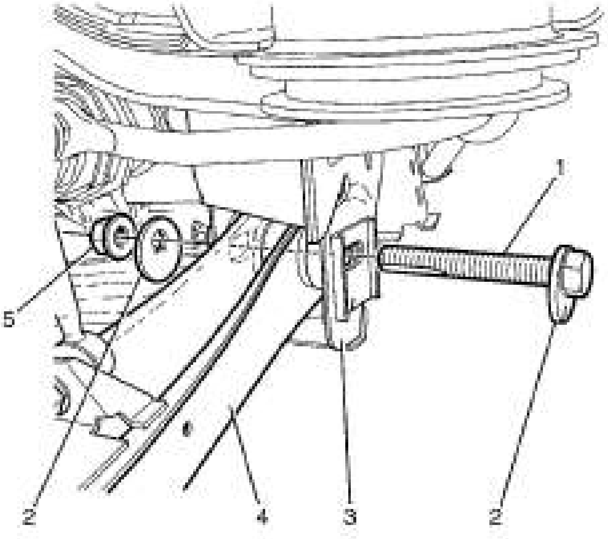


10. Remove the lower control arm to subframe retaining bolt (1) and nut (5).

    Discard the nut.

11. Remove the lower control arm (4) from the subframe (3).

Installation Procedure



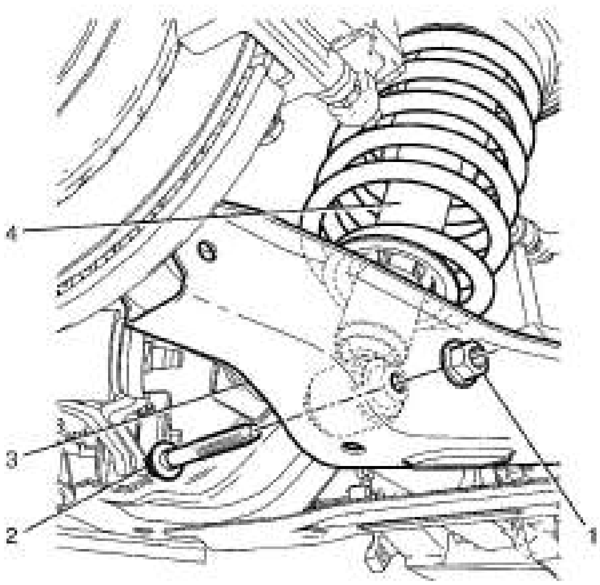
1. Install the lower control arm (4) into the subframe (3).

Important: The eccentric washers (2) must be fitted correctly in terms of their orientation and alignment marks.

Important: Do not fully tighten the lower control arm to subframe retaining bolt (1) and nut (5) at this stage.

2. Install the lower control arm to subframe retaining bolt (1).
3. Install the eccentric washer (2) and the NEW nut (5).

   Do not fully tighten at this stage.

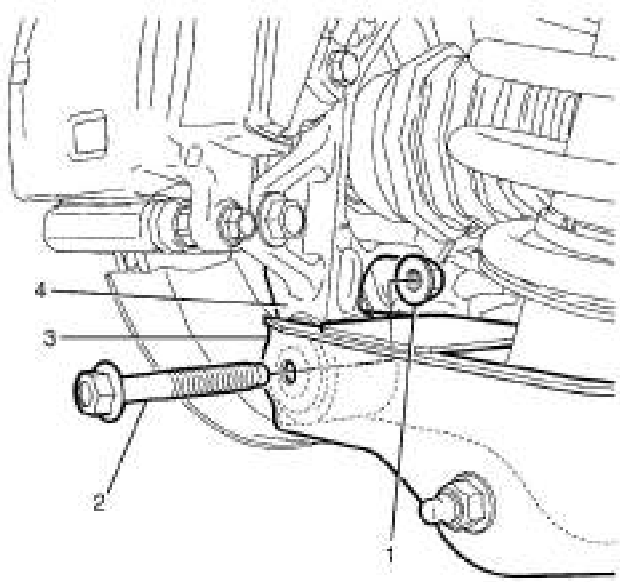


4. Connect the rear strut assembly (4) to the lower control arm (3).

   Important: Do not fully tighten the lower control arm to strut assembly retaining bolt (2) and nut (1) at this stage.

5. Install the lower control arm to strut assembly retaining bolt (2) and NEW nut (1).

   Do not fully tighten at this stage.

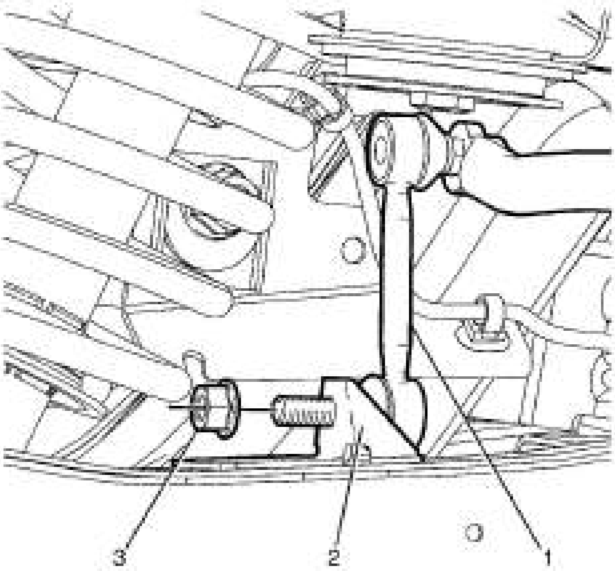


6. Connect the lower control arm (3) to the knuckle (4) using a suitable jack.

   Important: Do not fully tighten the lower control arm to knuckle retaining bolt (2) and nut (1) at this stage.

7. Install the lower control arm to the knuckle retaining bolt (2) and NEW nut (1).

   Do not fully tighten at this stage.



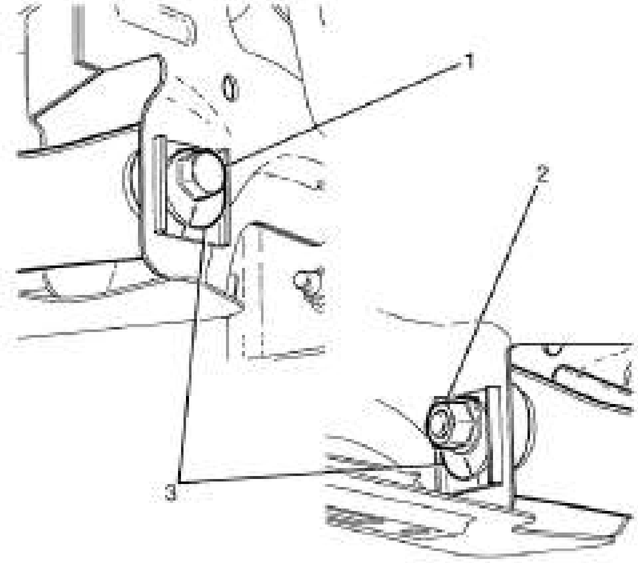
8. Connect the stabiliser bar link (1) to the lower control arm (2).

   Notice: Refer to Fastener Notice in the Preface section.

9. Install the stabiliser bar link to lower control arm retaining NEW nut (3).

   Tighten
   Tighten the nut to 50 N·m (37 lb ft).

10. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
11. Remove the safety stands.
12. Lower the vehicle to the ground.
13. Bounce the vehicle several times to settle the suspension.



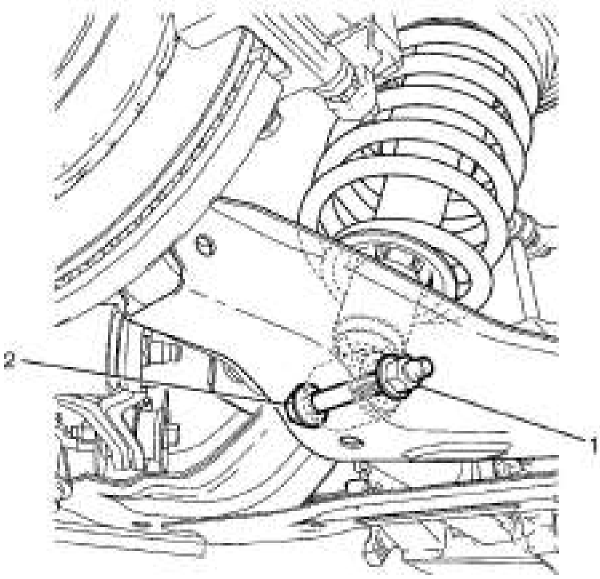
Important: The lower control arm to the subframe retaining bolt (1) and nut (2) eccentric washers (3) are used to adjust rear suspension camber.

14. Align the marks on the eccentric washers (3) with the marks on the subframe.

    Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nuts and bolts.

15. Tighten the lower control arm to subframe retaining bolt (1) and nut (2).

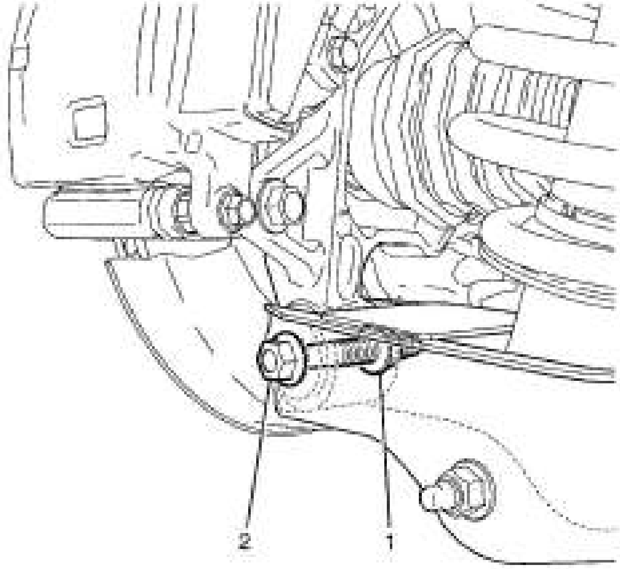
    Tighten
    Tighten the bolt and nut to 175 N·m (129 lb ft).



16. Tighten the lower control arm to strut assembly retaining bolt (2) and nut (1).

    Tighten
    Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

    Tighten the bolt and nut a final pass 120 Degrees.



17. Tighten the lower control arm to knuckle retaining bolt (2) and nut (1).

    Tighten
    Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

Tighten the bolt and nut a final pass 120 Degrees.

18. Check the wheel alignment of the vehicle. Refer to Wheel Alignment Measurement.
19. Correct the wheel alignment of the vehicle, if necessary. Refer to Rear Camber Adjustment and Rear Toe Adjustment.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | Document ID: 1991469

Rear Axle Lower Control Arm Bushing Replacement

Tools Required

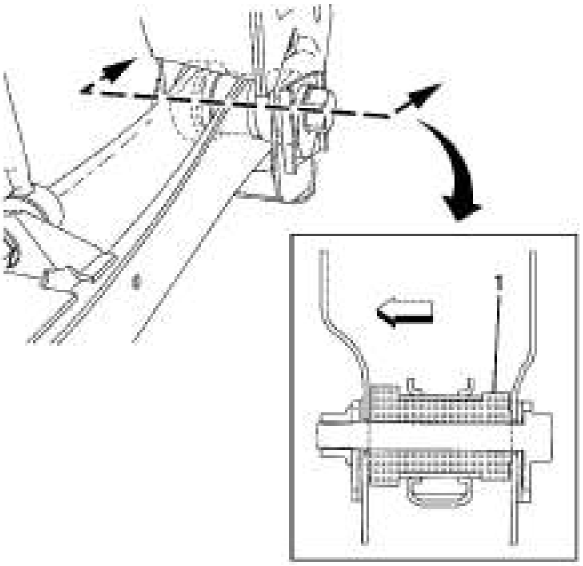
KM-619 Control Arm Bushing Remover/Installer.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

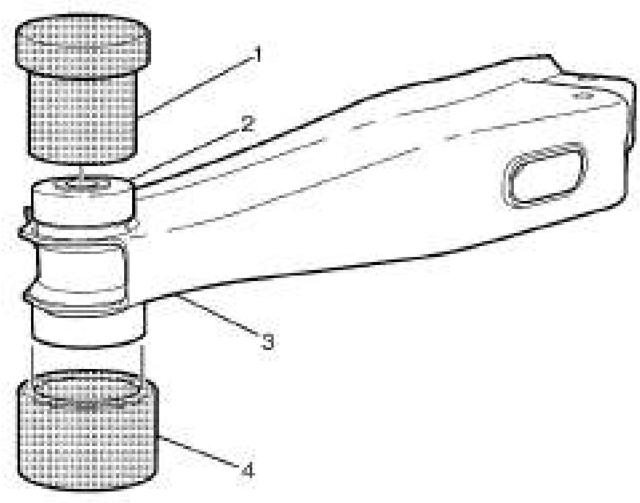
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the lower control arm. Refer to Lower Control Arm Replacement.



Important: The lower control arm bushing (1) has a conical shape with a mid-section recess that fits inside the lower control arm bushing cavity. The wider end of the lower control arm bushing (1) faces towards the front of the vehicle.

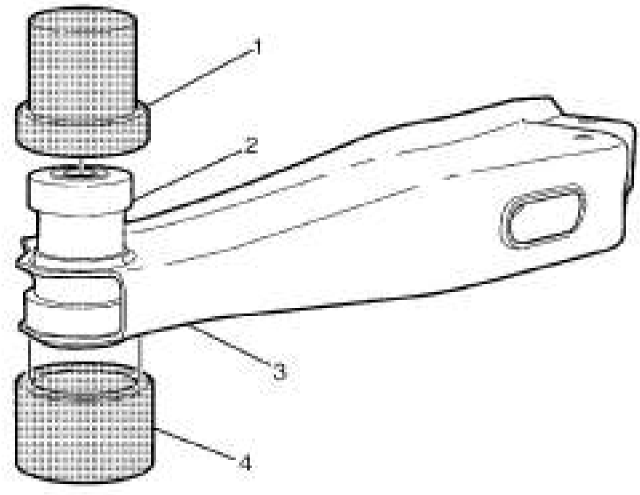
3. Check the orientation of the lower control arm bushing.



Important: The lower control arm bushing (2) must be lubricated with soapy water solution to ease the removal process.

4. Remove the lower control arm bushing (2) from the lower control arm (3) using the KM-619 (1, 4).

Installation Procedure



Important: The wider end of the lower control arm bushing (2) must be installed facing towards the front of the vehicle.

Important: The lower control arm bushing (2) must be lubricated with soapy water solution to ease the installation process.

1. Install the lower control arm bushing (2) using the KM-619 (1, 4).
2. Install the lower control arm (3). Refer to Lower Control Arm Replacement.
3. Remove the safety stands.
4. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | **Document ID: 1995436**

Rear Axle Upper Control Arm Replacement

Tools Required

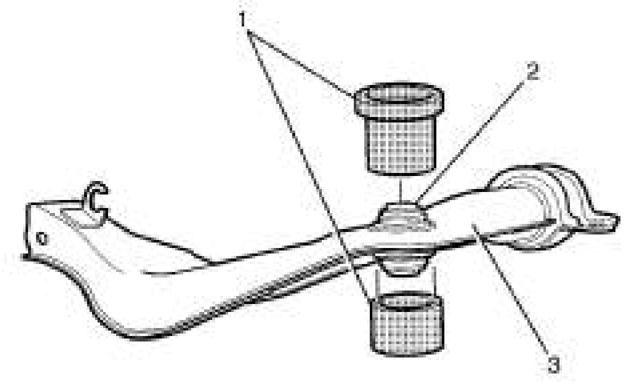
KM-619 Bushing Remover/Installer.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

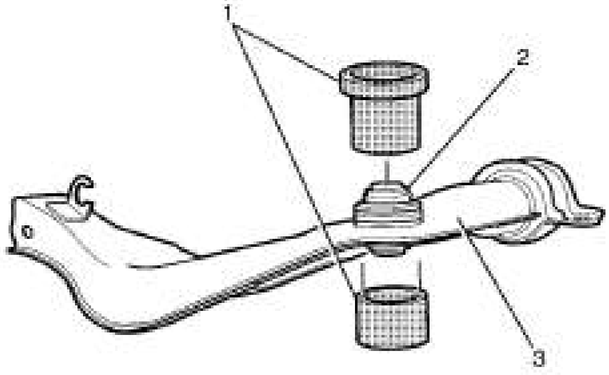
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the subframe. Refer to Rear Frame Replacement .
3. Remove the upper control arm pivot bushing. Refer to Control Arm Bushing Replacement
4. Remove the upper control arm. Refer to Upper Control Arm Replacement .



Important: It is recommended to observe the orientation and depth of the upper control arm ball joint bushing (2) with reference to the original position. Adhering to this recommendation will minimize the potential of incorrect upper control arm ball joint bushing (2) installation.

5. Remove the upper control arm ball joint bushing (2) from the upper control arm (3) using the KM-619 (1).
6. Inspect all parts for wear and damage.

Installation Procedure



Important: Before installing, the upper control arm ball joint bushing (2) must be correctly aligned and orientated. The depth to which the bushing is going to travel must also be observed and maintained.

1. Install the upper control arm ball joint bushing (2) using the KM-619 (1).
2. Install the upper control arm (3). Refer to Upper Control Arm Replacement .
3. Install the upper control arm pivot bushing. Refer to Control Arm Bushing Replacement .
4. Install the subframe. Refer to Rear Frame Replacement .
5. Remove the safety stands.
6. Lower the vehicle to the ground.
7. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Measurement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | Document ID: 1975613

Rear Suspension Knuckle Upper Bushing Replacement

Tools Required

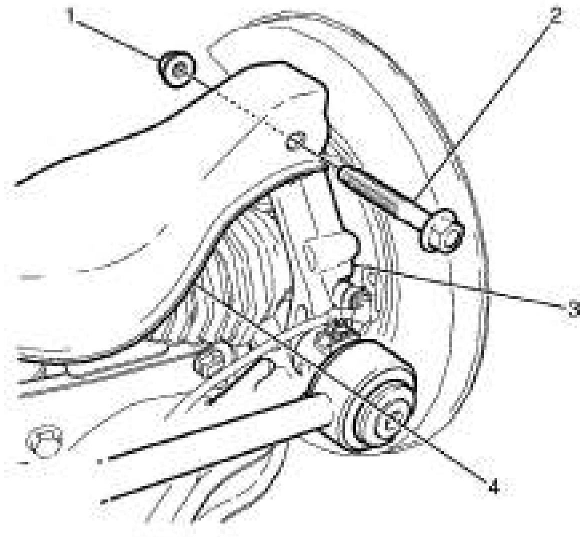
KM-619 Bushing Remover/Installer.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.



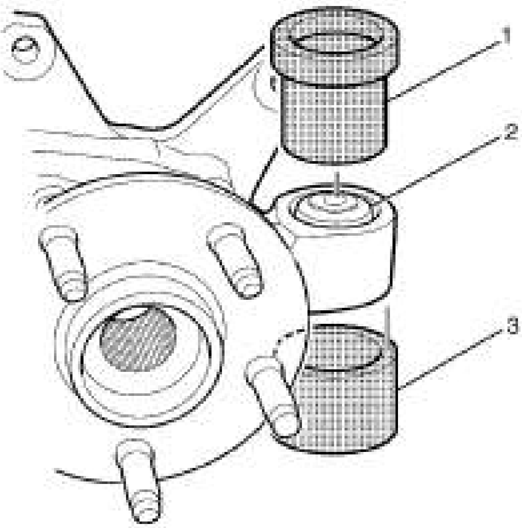
Important: Mark the location of the bolt and nut relative to the upper control arm for correct re-assembly.

Important: Nuts with micro-encapsulated thread sealant must be replaced after removal.

3. Remove the upper control arm to knuckle retaining bolt (2) and nut (1).

   Discard the nut.

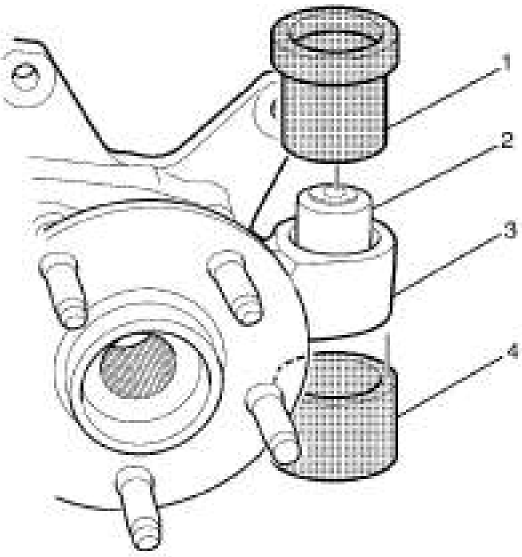
4. Disconnect the upper control arm (4) from the knuckle (3).



Important: It is recommended to observe the orientation and depth of the knuckle to upper control arm bushing (2) with reference to the original position. Adhering to this recommendation will minimize the potential of incorrect knuckle to upper control arm bushing (2) installation.

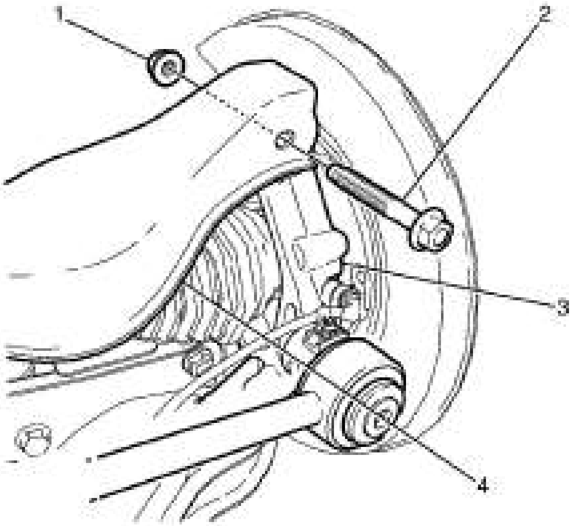
5. Remove the upper control arm to knuckle bushing (2) using the KM-619 (1, 3).
6. Inspect all parts for wear and damage.

Installation Procedure



Important: Before installing, the upper control arm to knuckle bushing (2) must be correctly aligned and orientated.

1. Install the upper control arm to knuckle bushing (2) to the knuckle (3) using the KM-619 (1, 4).



2. Connect the upper control arm (4) to the knuckle (3).

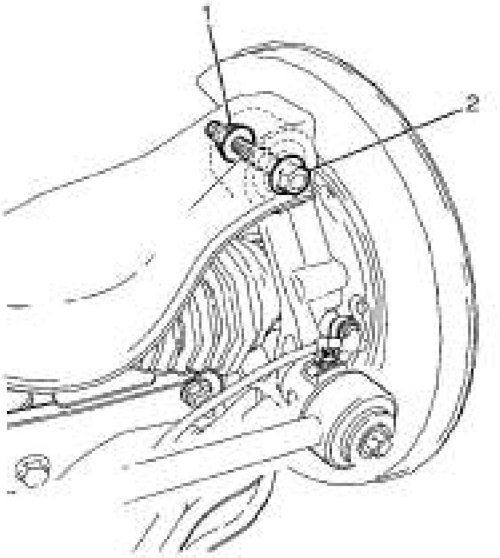
Important: The upper control arm to knuckle retaining bolt and nut must not to be fully tightened at this stage.

3. Install the upper control arm to knuckle retaining bolt (2) and NEW nut (1).

   Do not fully tighten at this stage.

4. Remove the safety stands.
5. Lower the vehicle to the ground.
6. Bounce the vehicle several times to settle the suspension.

Notice: Refer to Fastener Notice in the Preface section.



Important: Align the mark from bolt to upper control arm made prior to removal.

Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nuts and bolts.

7. Tighten the upper control arm to knuckle retaining bolt (2) and NEW nut (1).

   Tighten
   Tighten the bolt and nut to 60 N·m(44 lb ft).

   Tighten the bolt and nut to 90 Degrees.

8. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Specifications.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | **Document ID: 1995440**

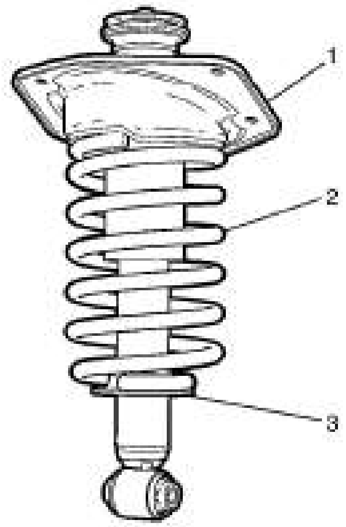
Rear Suspension Strut Mount Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .
3. Remove the rear strut assembly. Refer to Strut Assembly Replacement .

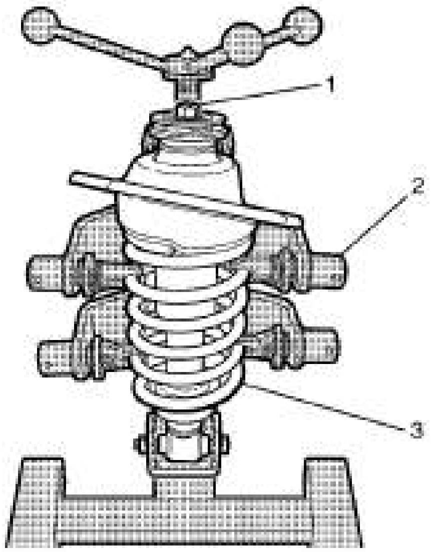


Important: Before disassembling the rear strut assembly observe the seating position of the coil spring (2) relative to the rear strut carrier plate (3) and rear strut assembly support mount (1).

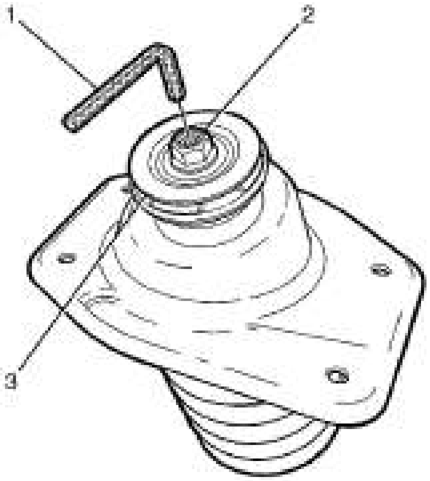
4. Inspect the rear strut.

Caution: Refer to General Repair Instructions in the Preface section.

Caution: Refer to General Repair Instructions in the Preface section.



5. Mount the rear strut assembly on a mounting trestle, or a vice.
6. Fasten the spring compressor (2) to the rear strut assembly. Make sure the hooks are seated on the coil spring (3) correctly.
7. Compress the coil spring (3) using the spring compressor (2).



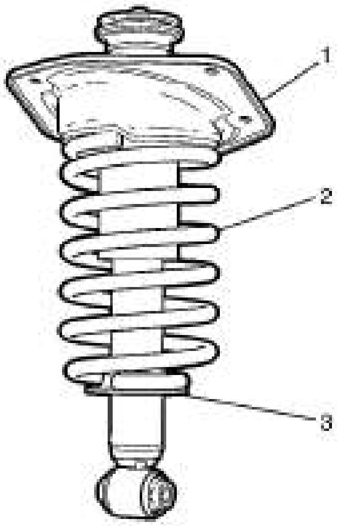
Important: Use a hex key (1) to prevent the rear strut assembly piston shaft from rotating while removing the strut assembly retaining nut (2).

Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

8. Remove the rear strut assembly retaining nut (2).

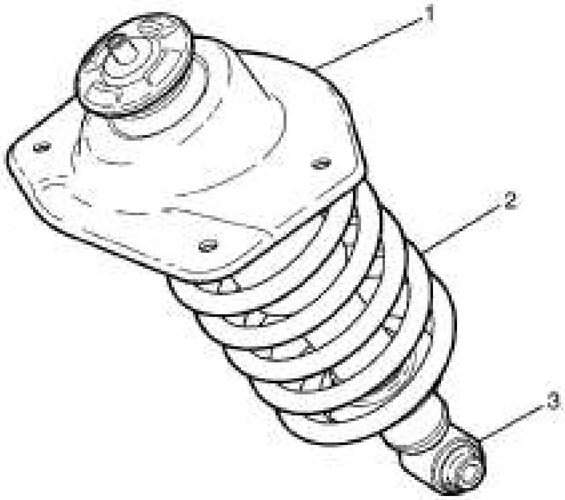
   Discard the nut.

9. Note the orientation and remove the upper washer (3).



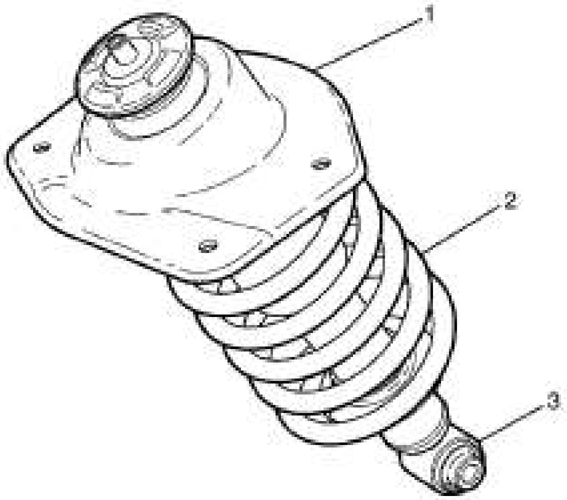
Important: The correct seating position of the coil spring (2) relative to the rear strut carrier plate (3) and rear strut assembly support mount (1) must be observed before removing the rear strut assembly support mount (1).

10. Inspect the rear strut.

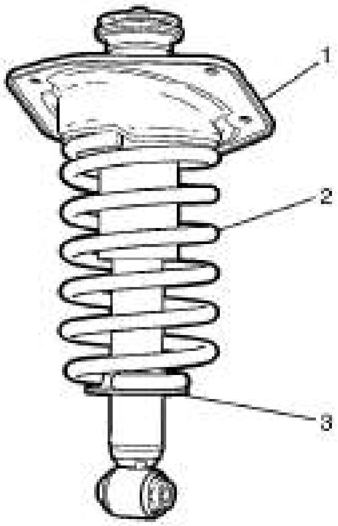


11. Remove the rear strut assembly support mount (1) from the coil spring (2) and rear strut unit (3).
12. Inspect all parts for wear and damage.

Installation Procedure



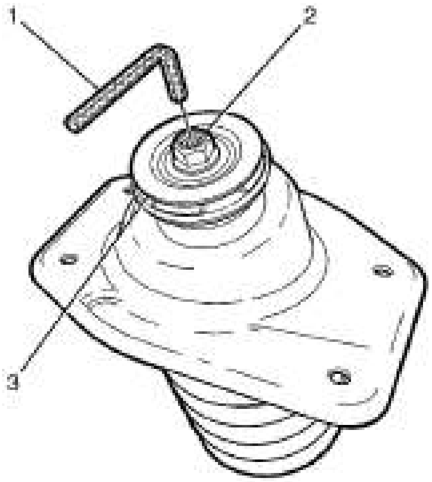
1. Install the rear strut assembly support mount (1) to the coil spring (2) and rear strut unit (3).



Important: The correct seating position of the coil spring (2) relative to the rear strut carrier plate (3) and rear strut assembly support mount (1) must be maintained.

2. Inspect the rear strut.

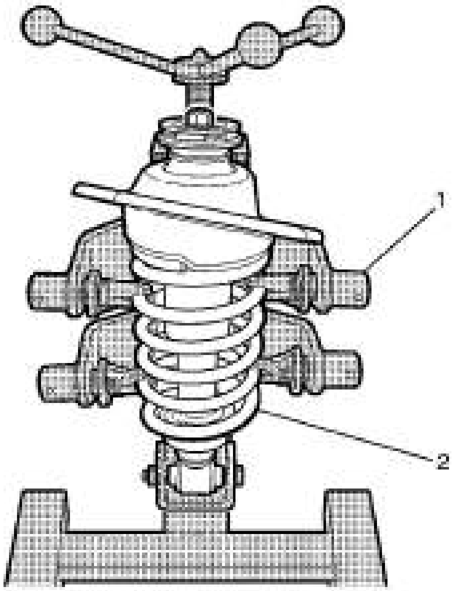
Notice: Refer to Fastener Notice in the Preface section.



Important: Use a hex key (1) to prevent the rear strut unit piston shaft from rotating while tightening the rear strut assembly retaining nut (2).

3. Note the orientation and install the upper washer (3).
4. Install a NEW rear strut assembly retaining nut (2).

Tighten
Tighten the nut to 45 N·m (33 lb ft).



5. Release and remove the spring compressor (1) from the coil spring (2).
6. Remove the rear strut unit from the mounting trestle, or the vice.

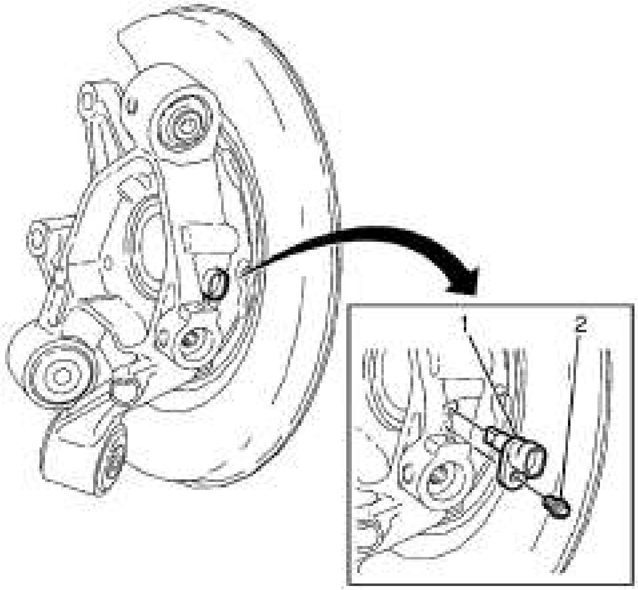
7. Install the rear strut assembly into the vehicle. Refer to Strut Assembly Replacement .
8. Remove the safety stands.
9. Lower the vehicle to the ground.

Rear Wheel Bearing and Hub Replacement (Original)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

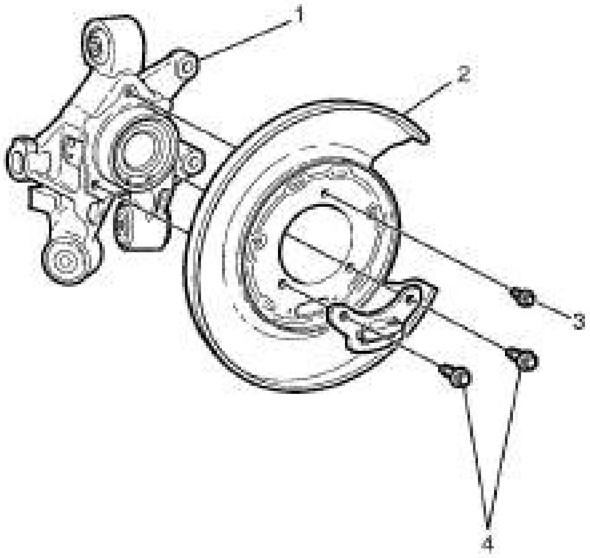
1. Remove the wheel hub and knuckle assembly. Refer to Knuckle Replacement.
2. Secure the wheel hub and knuckle assembly using a suitable vice.



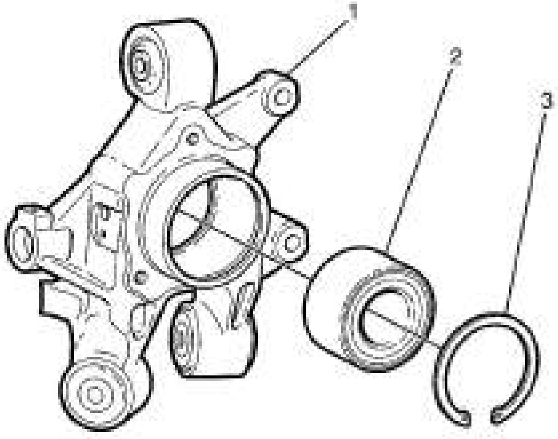
3. Remove the wheel speed sensor to knuckle retaining bolt (2).
4. Remove the wheel speed sensor (1).

Important: The wheel bearing will be damaged when pressing out the wheel hub flange. The wheel bearing must be replaced every time the wheel hub is removed.

5. Remove the wheel hub flange using a suitable workshop press.
6. Remove the park brake shoes. Refer to Parking Brake Shoe Replacement.



7. Remove the disc brake backing plate to knuckle retaining bolts (3 and 4).
8. Remove the disc brake backing plate (2) from the knuckle (1).



9. Remove the wheel bearing retaining circlip (3) using suitable circlip pliers.

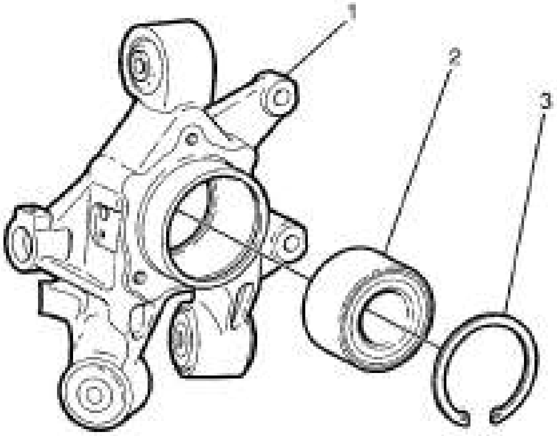
   Important: The wheel bearing will be damaged when pressing out the wheel hub flange. The wheel bearing must be replaced every time the wheel hub is removed.

10. Press the wheel bearing (2) from the knuckle (1) using a suitable workshop press.

    Discard the wheel bearing.

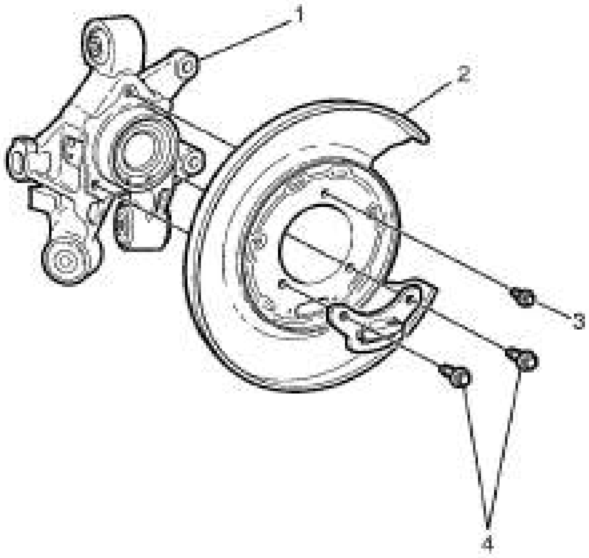
Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.



Important: Prior to installing the NEW wheel bearing it is essential that the correct orientation is attained, the wheel speed sensor decoder ring MUST face inboard, towards the wheel speed sensor. Failure to install in the correct orientation will result in ABS/ESP faults.

1. Install the NEW wheel bearing (2) to the knuckle (1) using a workshop press.
2. Install the wheel bearing retaining circlip (3) using suitable circlip pliers.



3. Install the disc brake backing plate (2) to the knuckle (1).

Notice: Refer to Fastener Notice in the Preface section.

4. Install the upper disc brake backing plate to knuckle retaining bolt (3).

   Tighten
   Tighten the bolts to 60 Nm (44 lb ft).

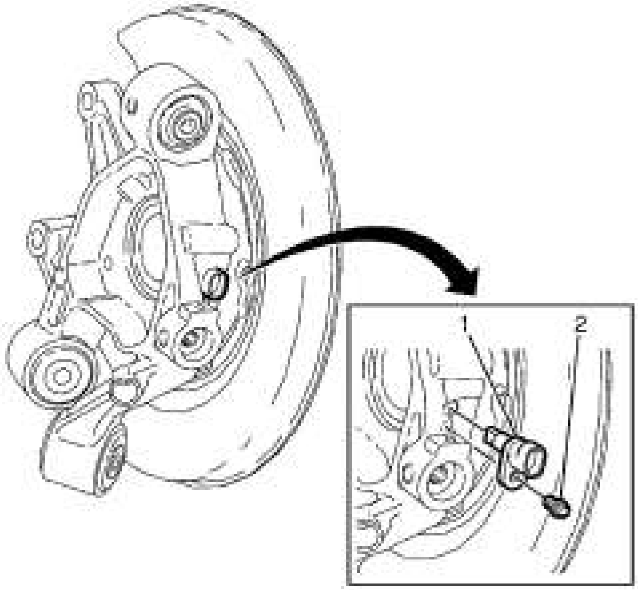
5. Install the lower disc brake backing plate to knuckle retaining bolts (4).

   Tighten
   Tighten the bolts to 130 Nm (96 lb ft).

6. Install the park brake shoes. Refer to Parking Brake Shoe Replacement.

   Important: The wheel hub flange (1) must be fully seated against the wheel bearing.

7. Install the wheel hub flange (1) using a suitable press.



8. Install the wheel speed sensor (1).

   Notice: Refer to Fastener Notice in the Preface section.

9. Install the wheel speed sensor to knuckle retaining bolt (2).

   Tighten
   Tighten the bolt to 7 N·m (62 lb in).

10. Remove the hub and knuckle assembly from the vice.
11. Install the wheel hub and knuckle assembly. Refer to Knuckle Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | **Document ID: 1995416**

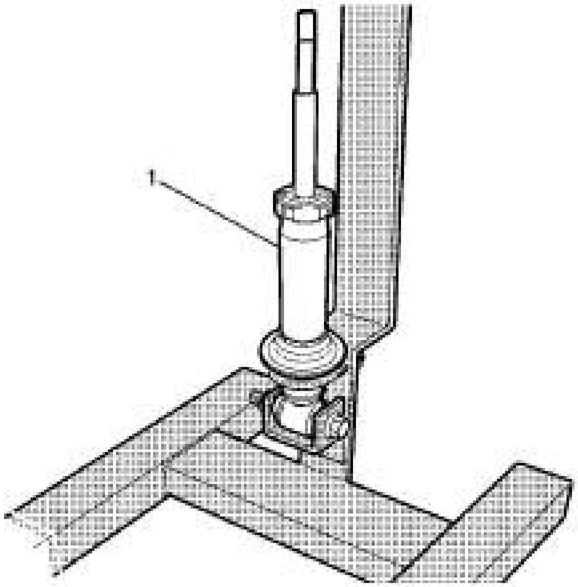
Shock Absorber Replacement (LWB SWB Clubsport CSV VXR8)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

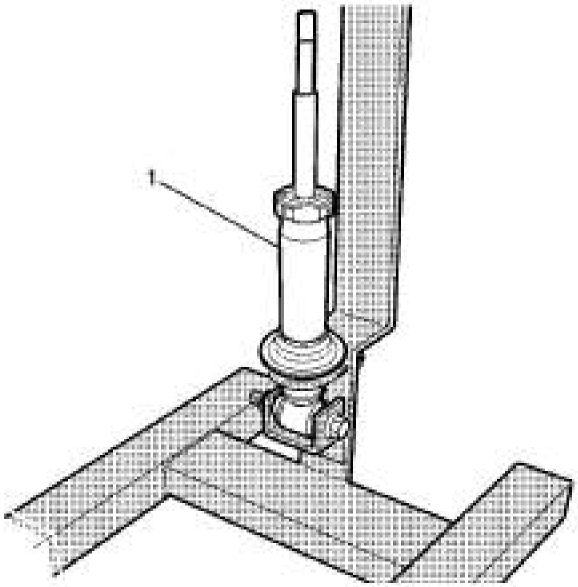
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation.
3. Remove the rear strut assembly. Refer to Strut Assembly Replacement.
4. Remove the rear strut assembly support mount. Refer to Rear Suspension Strut Mount Replacement.
5. Remove the rear coil spring. Refer to Coil Spring Replacement.



6. Remove the shock absorber (1) from the mounting trestle, or vice.
7. Inspect all parts for wear and damage.

Installation Procedure

Notice: Refer to General Repair Instructions in the Preface section.



1. Mount the shock absorber (1) on a mounting trestle, or a vice.
2. Install the rear coil spring. Refer to Coil Spring Replacement.
3. Install the rear strut assembly support mount. Refer to Rear Suspension Strut Mount Replacement.
4. Install the rear strut assembly. Refer to Strut Assembly Replacement.
5. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
6. Remove the safety stands.
7. Lower the vehicle to the ground.

Stabilizer Shaft Insulator Replacement

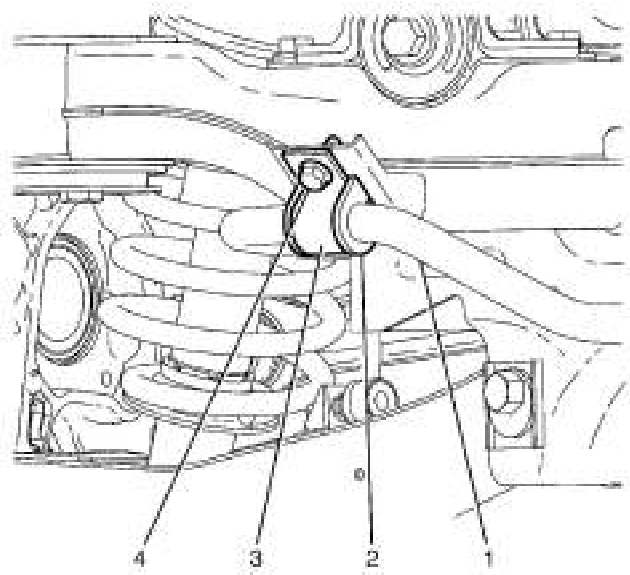
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

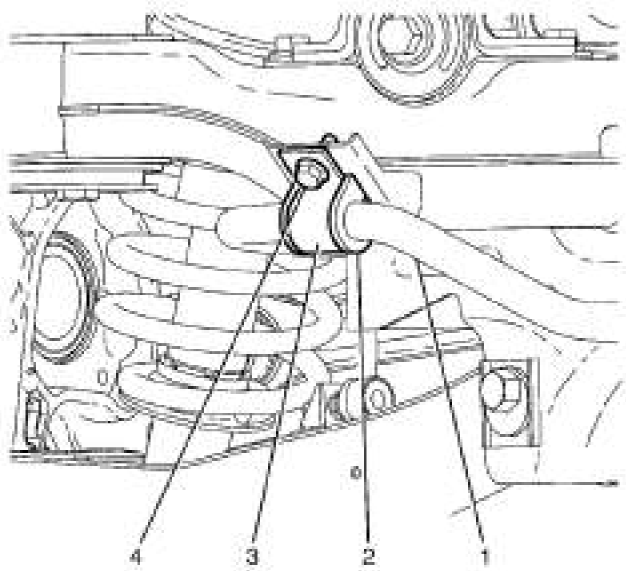
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

Caution: Refer to General Repair Instructions in the Preface section.



2. Remove the stabiliser bar insulator bracket to subframe retaining bolts (4) on both sides of the stabiliser bar (1).
3. Remove the stabiliser bar insulator bracket (3) from the subframe on both sides of the stabiliser bar (1).
4. Remove the stabiliser bar insulator (2) from both sides of the stabiliser bar (1).
5. Inspect all parts for wear and damage.

Installation Procedure



1. Install the stabiliser bar insulator (2) to both sides of the stabiliser bar (1).
2. Install the stabiliser bar insulator bracket (3) to the subframe on both sides of the stabiliser bar (1).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the stabiliser bar insulator bracket to subframe retaining bolts (4) on both sides of the stabiliser bar (1).

   Tighten
   Tighten the bolts to 22 N·m (16 lb ft).

4. Remove the safety stands.
5. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | **Document ID: 1975672**

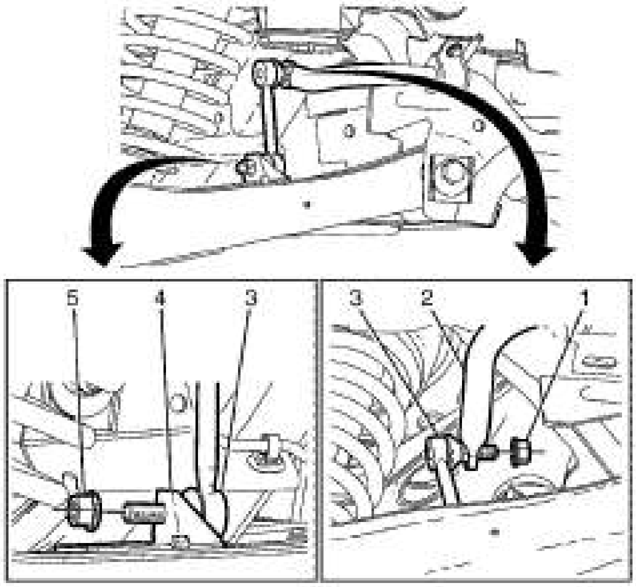
Stabilizer Shaft Link Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

2. Remove the stabiliser bar link to stabiliser bar retaining nut (1).

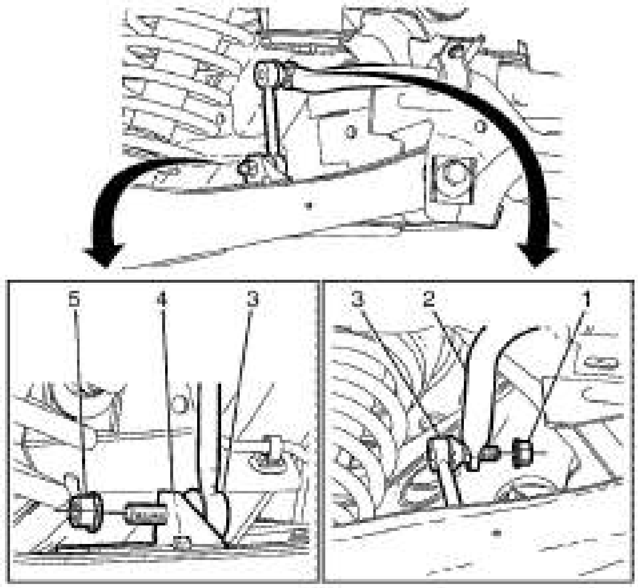
   Discard the nut.

3. Disconnect the stabiliser bar link (3) from the stabiliser bar (2).
4. Remove and the stabiliser bar link to lower control arm retaining nut (5).

   Discard the nut.

5. Remove the stabiliser bar link (3) from the lower control arm (4).
6. Remove the stabiliser bar link (3).
7. Inspect all parts for wear and damage.

Installation Procedure



1. Connect the stabiliser bar link (3) to the stabiliser bar (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the stabiliser bar link to stabiliser bar NEW retaining nut (1).

   Tighten
   Tighten the nut to 50 N·m (37 lb ft).

3. Install the stabiliser bar link (3) to the lower control arm (4).
4. Install the stabiliser bar link to lower control arm retaining NEW nut (5).

   Tighten
   Tighten the nut to 50 N·m (37 lb ft).

5. Remove the safety stands.
6. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | **Document ID: 1995414**

Stabilizer Shaft Replacement

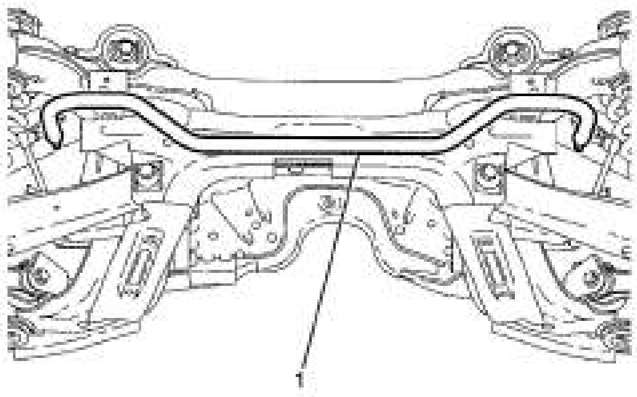
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Disconnect the stabiliser bar links from the stabiliser bar. Refer to Stabilizer Shaft Link Replacement .
3. Remove the stabiliser bar insulators. Refer to Stabilizer Shaft Insulator Replacement .

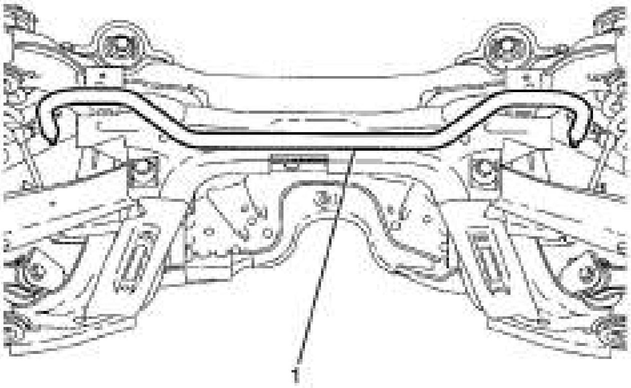
Caution: Refer to General Repair Instructions in the Preface section.



4. Remove the stabiliser bar (1) from the vehicle.
5. Inspect all parts for wear and damage.

Installation Procedure

Notice: Refer to General Repair Instructions in the Preface section.



1. Install the stabiliser bar (1) to the vehicle.
2. Install the stabiliser bar insulators and brackets. Refer to Stabilizer Shaft Insulator Replacement .
3. Install the stabiliser bar links to the stabiliser bar. Refer to Stabilizer Shaft Link Replacement .
4. Remove the safety stands.
5. Lower the vehicle to the ground.

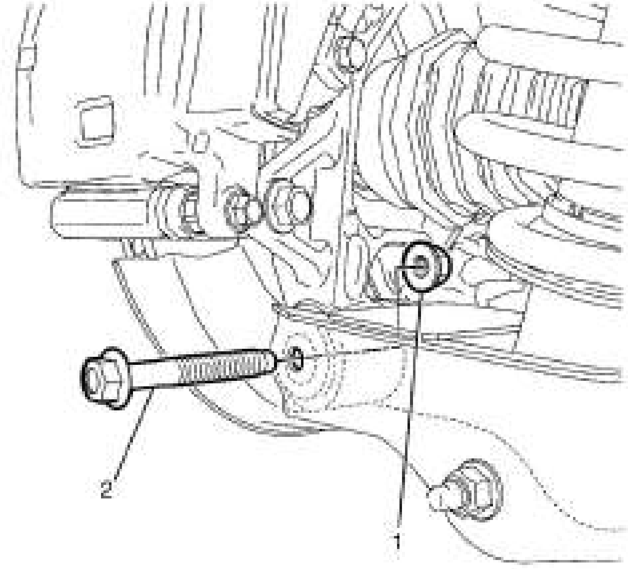
Strut Assembly Replacement (LWB SWB Clubsport CSV VXR8)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

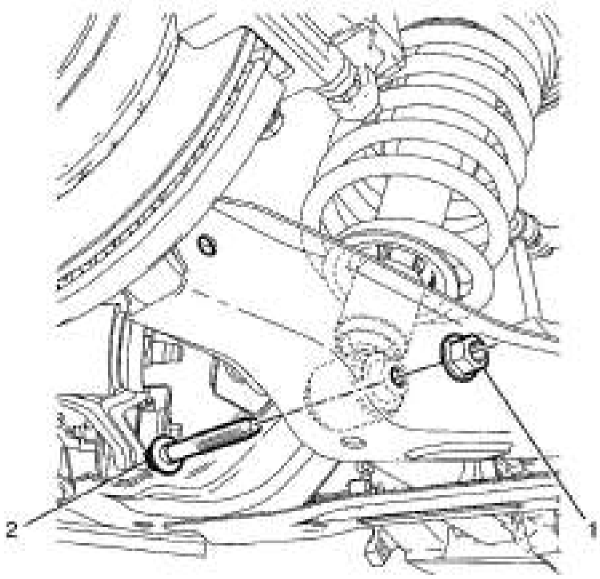
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.
3. Support the lower control arm with a suitable jack.



Important: Prevailing torque nuts must be discarded after removal.

4. Remove the lower control arm to knuckle retaining bolt (2) and nut (1).

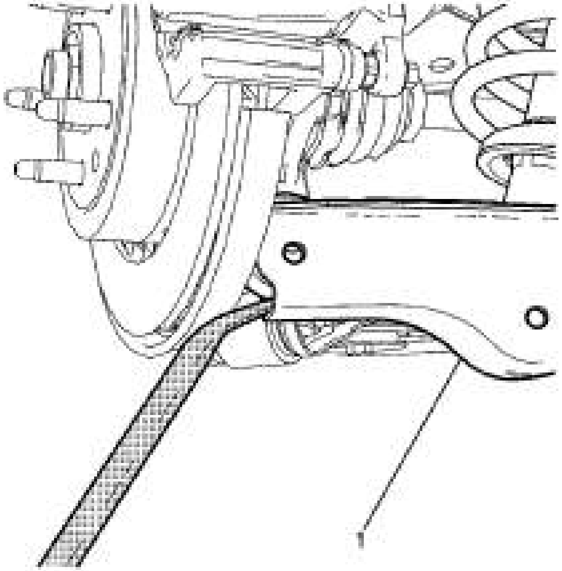
   Discard the nut.



Important: Prevailing torque nuts must be discarded after removal.

5. Remove the lower control arm to rear strut assembly retaining bolt (2) and nut (1).

   Discard the nut.

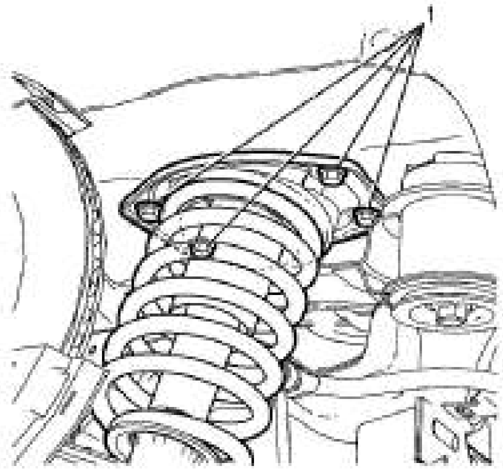


Important: Do not apply pressure to the rear brake disc backing plate while levering.

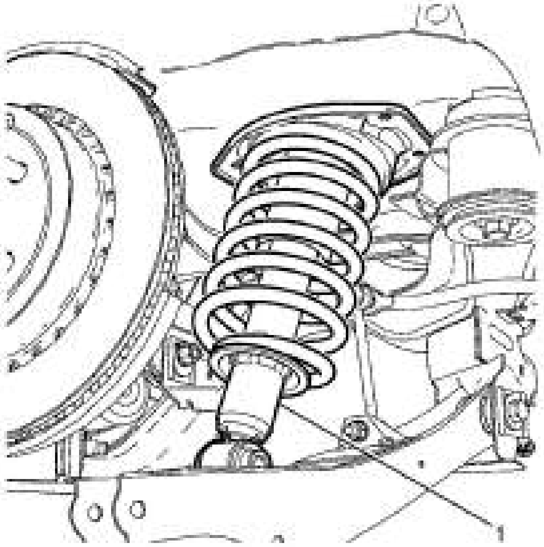
6. Detach the lower control arm (1) using a suitable pry bar.

Reposition the jack as necessary.

Caution: Refer to General Repair Instructions in the Preface section.

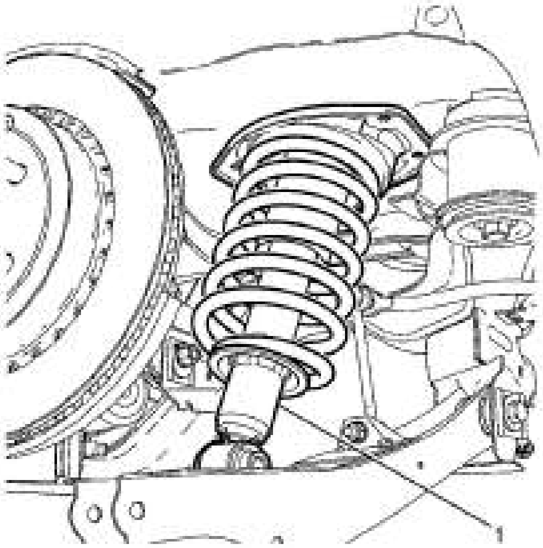


7. Remove the rear strut assembly to body retaining bolts (1).



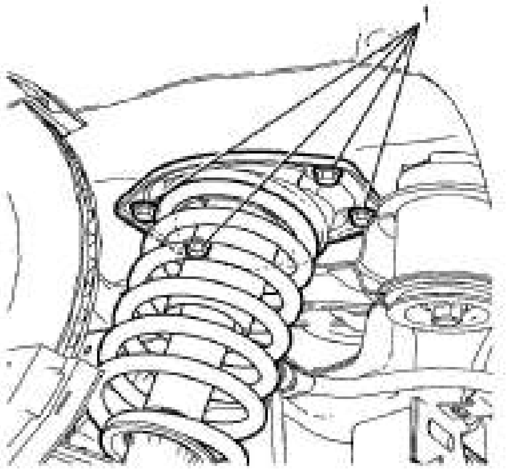
8. Remove the rear strut assembly (1) from the vehicle.
9. Inspect all parts for wear and damage.

Installation Procedure



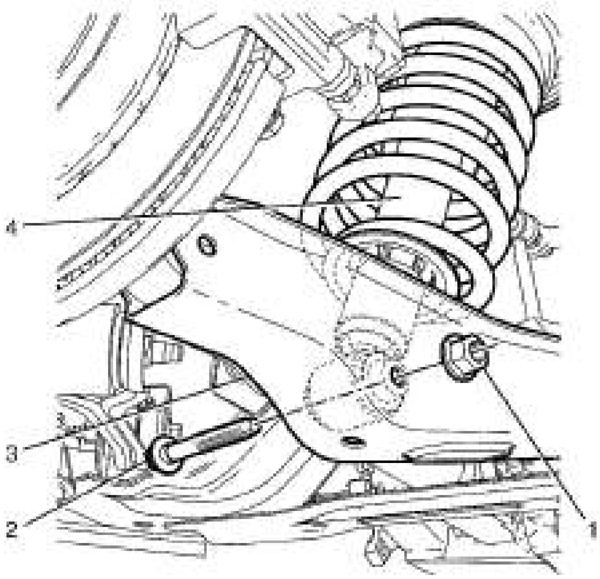
1. Install the rear strut assembly (1) into the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the rear strut assembly to body retaining bolts (1).

   Tighten
   Tighten the bolts to 58 N·m (43 lb ft).

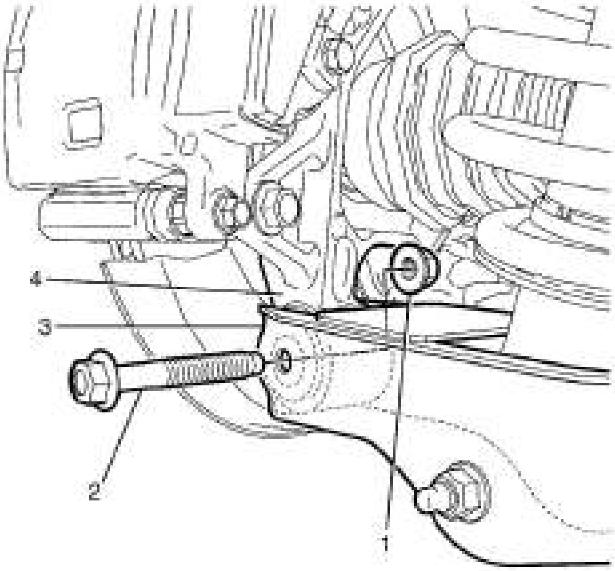


3. Connect the rear strut assembly (4) to the lower control arm (3).

   Important: Do not fully tighten the lower control arm to strut assembly retaining bolt (2) and nut (1) at this stage.

4. Install the lower control arm to strut assembly retaining bolt (2) and NEW nut (1).

   Do not fully tighten at this stage.



5. Connect the lower control arm (3) to the knuckle (4) using a suitable jack.

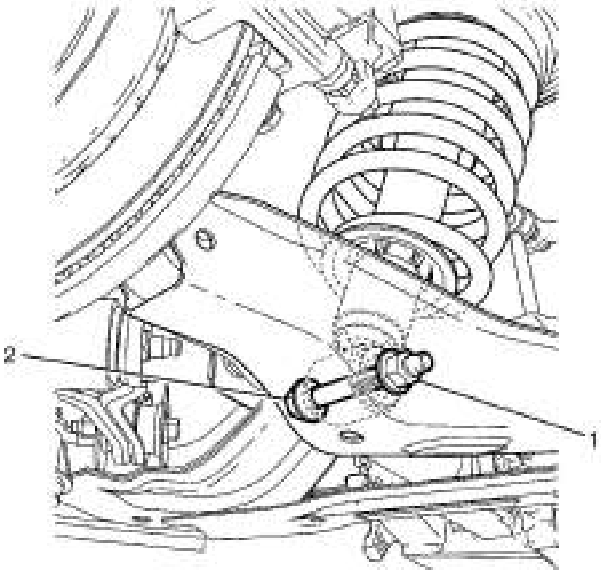
   Important: Do not fully tighten the lower control arm to knuckle retaining bolt (2) and nut

(1) at this stage.

6. Install the lower control arm to the knuckle retaining bolt (2) and NEW nut (1).

   Do not fully tighten at this stage.

7. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
8. Remove the safety stands.
9. Lower the vehicle to the ground.
10. Bounce the vehicle several times to settle the suspension.

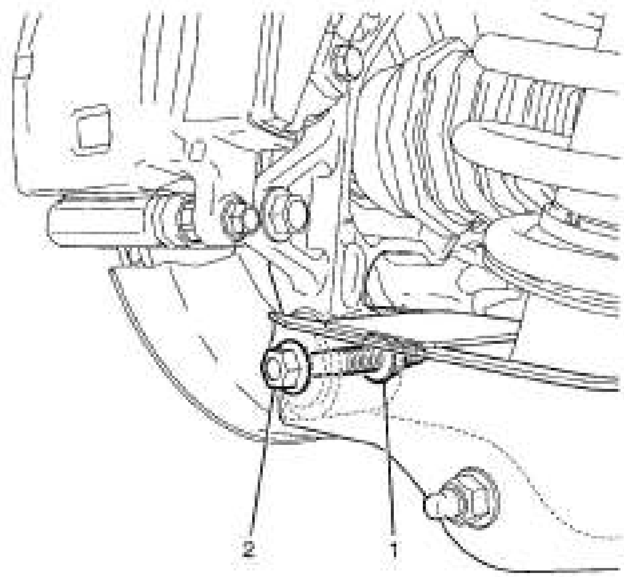


Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nuts and bolts.

11. Tighten the lower control arm to strut assembly retaining bolt (2) and NEW nut (1).

    Tighten
    Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

    Tighten the bolt and nut a final pass 120 Degrees.



12. Tighten the lower control arm to knuckle retaining bolt (2) and NEW nut (1).

    Tighten
    Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

    Tighten the bolt and nut a final pass 120 Degrees.

13. Check the wheel alignment of the vehicle. Refer to Wheel Alignment Measurement.
14. Correct the wheel alignment of the vehicle, if necessary. Refer to Rear Camber Adjustment and Rear Toe Adjustment.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | **Document ID: 2005889**

Trailing Arm Bushing Replacement

Tools Required

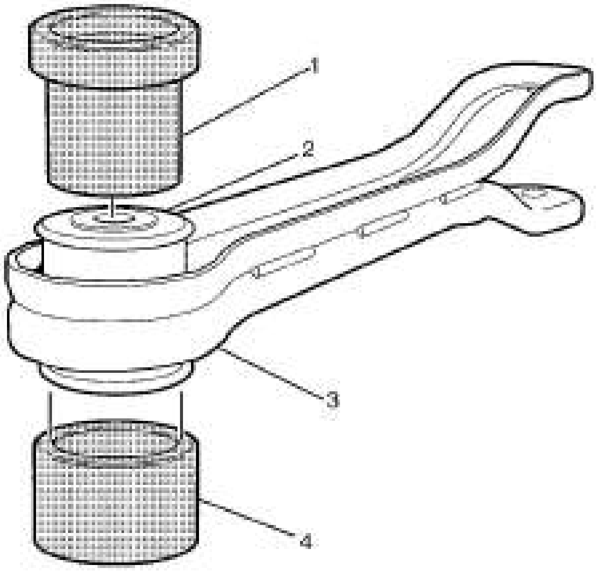
KM-906-B Control Arm Bushing Remover/Installer.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

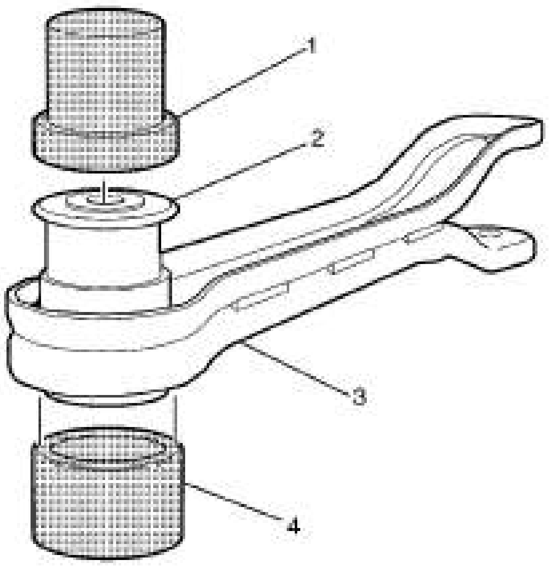
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the Y-Link. Refer to Trailing Arm Replacement.



Important: It is recommended to observe the orientation and depth of the Y-Link bushing (2) with reference to the original position. Adhering to this recommendation will minimize the potential of incorrect Y-Link bushing (2) installation.

3. Remove the Y-Link bushing (2) from the Y-Link (3) using the KM-906-B (1, 4).
4. Inspect all parts for wear and damage.

Installation Procedure



Important: Before installing, the Y-Link bushing (2) must be correctly aligned and orientated.

1. Install the Y-Link (2) bushing to the Y-Link (3) using the KM-906-B 9 (1, 4).
2. Install the Y-Link (3). Refer to Trailing Arm Replacement.
3. Remove the safety stands.
4. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | Document ID: 2005888

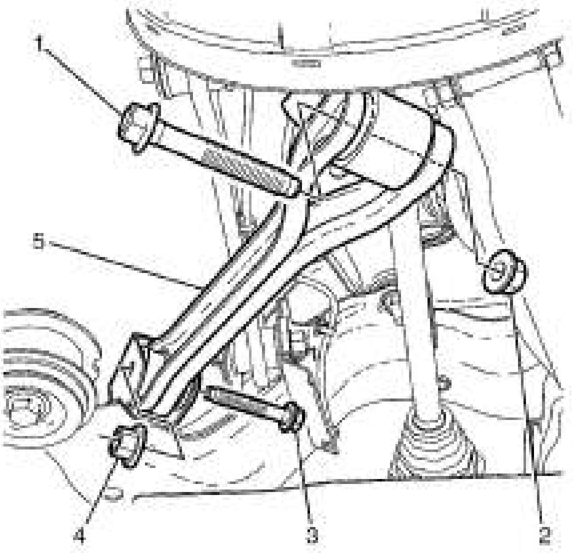
Trailing Arm Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.



Important: Mark the location of the bolt and nut relative to the Y-Link for correct re-assembly.

Important: Prevailing torque nuts must be discarded after removal.

3. Remove the Y-Link to knuckle retaining bolt (1) and nut (2).

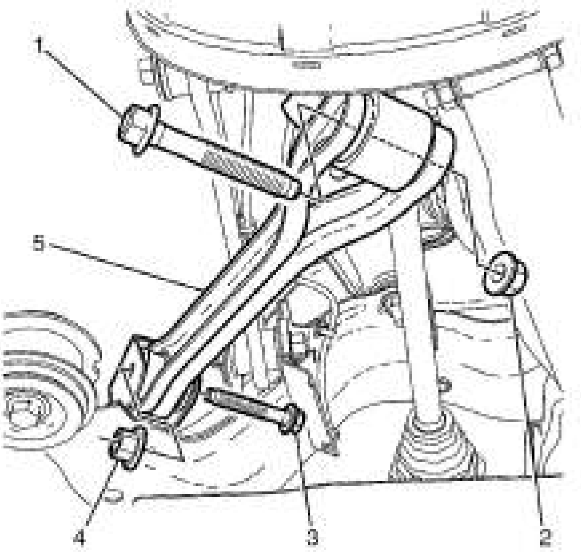
   Discard the nut.

4. Remove the Y-Link to subframe retaining bolt (3) and nut (4).

   Discard the nut.

5. Remove the Y-Link (5).
6. Inspect all parts for wear and damage.

Installation Procedure



1. Install the Y-Link (5) into the subframe.

   Important: The Y-Link to subframe retaining bolt (3) and nut (4) must not to be fully tightened at this stage.

2. Install the Y-Link to subframe retaining bolt (3) and NEW nut (4).

   Do not fully tighten at this stage.

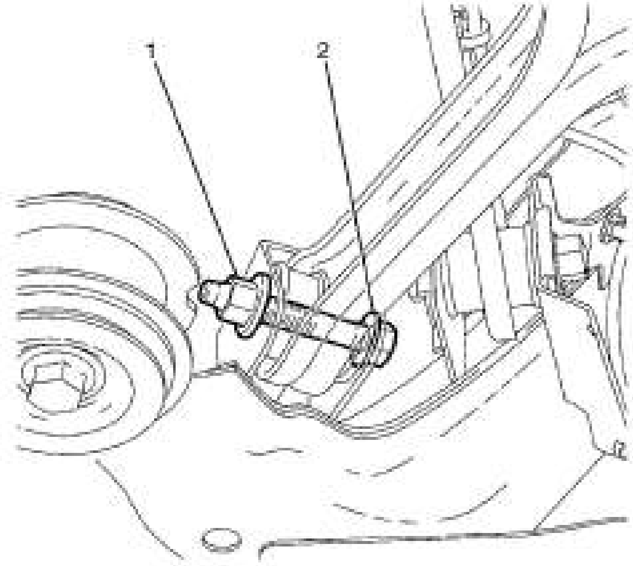
   Important: The Y-Link to knuckle retaining bolt (1) and nut (2) must not to be fully tightened at this stage.

3. Install the Y-Link to knuckle retaining bolt (1) and NEW nut (2).

   Do not fully tighten at this stage.

4. Lower the vehicle to the ground.
5. Bounce the vehicle several times to settle the suspension.
6. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Specifications.

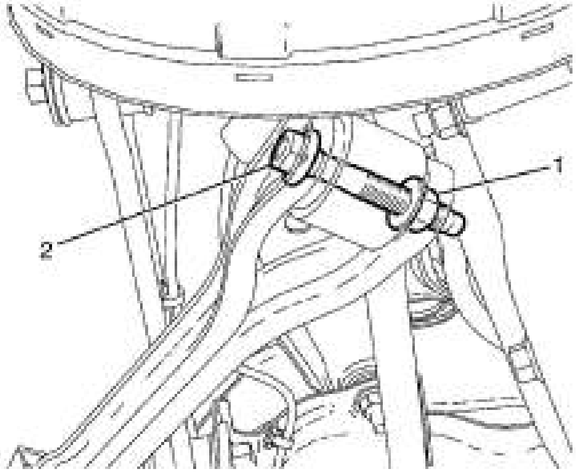
   Notice: Refer to Fastener Notice in the Preface section.



Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nuts and bolts.

7. Tighten the Y-Link to subframe retaining bolt (2) and NEW nut (1).

Tighten
Tighten the bolt and nut to 100 N·m (74 lb ft).



8. Tighten the Y-Link to knuckle retaining bolt (2) and NEW nut (1).

Tighten

Tighten the bolt and nut a first pass to 40 N·m (30 lb ft).

Tighten the bolt and nut a final pass 120 Degrees.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Repair Instructions | **Document ID: 1995423**

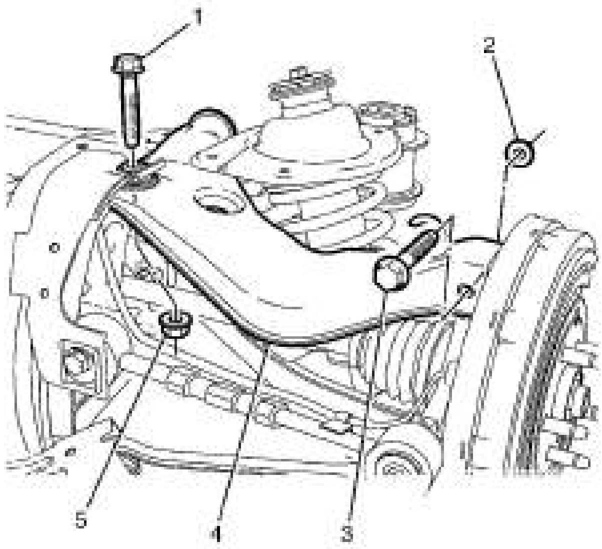
Upper Control Arm Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the subframe. Refer to Rear Frame Replacement.
3. Remove the upper control arm pivot bushing. Refer to Control Arm Bushing Replacement.



Important: Mark the location of the bolt and nut relative to the Y-Link for correct re-assembly.

Important: Prevailing torque nuts must be replaced after removal.

4. Remove the upper control arm ball joint bushing to subframe retaining bolt (1) and nut (5).

   Discard the nut.

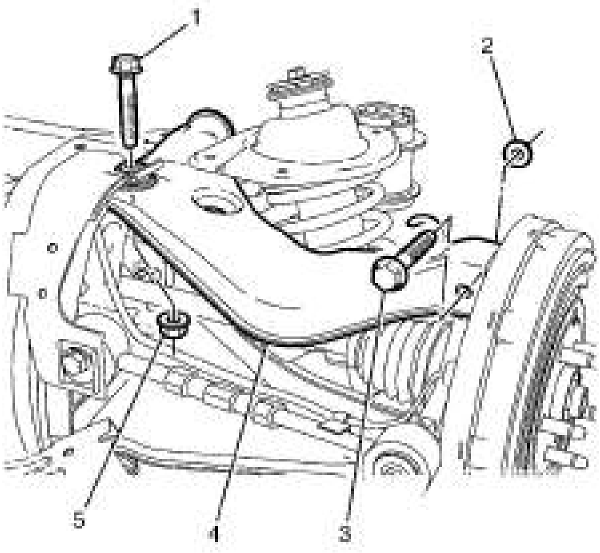
5. Remove the upper control arm to knuckle retaining bolt (3) and nut (2).

   Discard the nut.

6. Remove the upper control arm (4).
7. Inspect all parts for wear and damage.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the upper control arm (4) into the subframe.
2. Install the upper control arm ball joint bushing to subframe retaining bolt (1) and NEW nut (5).

   Tighten
   Tighten the bolt and nut a first pass to 80 N·m (59 lb ft).

   Tighten
   Tighten the bolt and nut a final pass 120 Degrees.

3. Install the upper control arm to knuckle retaining bolt (3) and NEW nut (2).

   Tighten
   Tighten the bolt and nut a first pass to 60 N·m (44 lb ft).

   Tighten
   Tighten the bolt and nut a final pass 90Degrees.

4. Install the upper control arm pivot bushing. Refer Control Arm Bushing Replacement.
5. Install the subframe. Refer to Rear Frame Replacement.
6. Remove the safety stands.
7. Lower the vehicle to the ground.
8. Check the vehicle rear wheel alignment and adjust if necessary. Refer to Wheel Alignment Specifications.

Wheel Stud Replacement

Tools Required

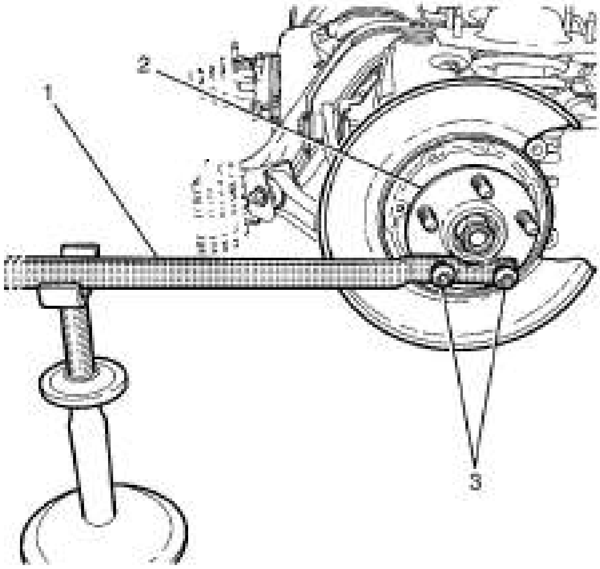
- C-4150-C Press Tool.
- 7208 Drive Shaft Remover.
- KM-468 Hub Holding Tool.

Removal Procedure

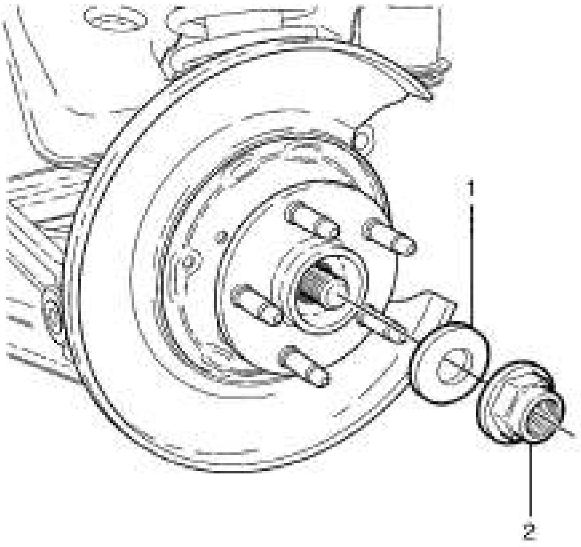
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation.
3. Remove the rear brake disc. Refer to Rear Brake Rotor Replacement.



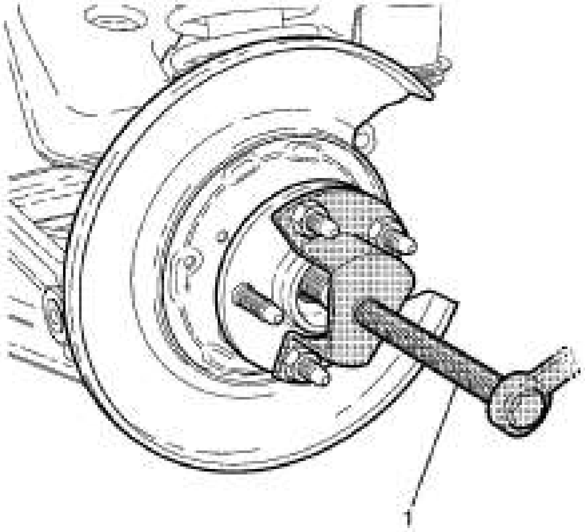
4. Install the KM-468 (1) to the wheel hub (2) with two inverted wheel nuts (3).
5. Support the KM-468 (1) outer end on a safety stand.



Important: The rear driveshaft retaining nut (2) and washer (1) must be discarded after removal.

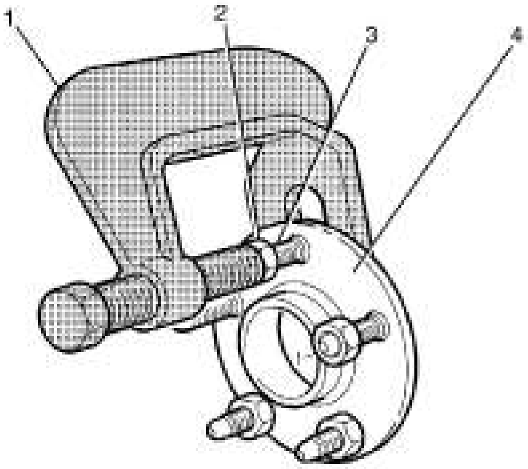
6. Remove the rear driveshaft retaining nut (2) and washer (1).
   - Discard the nut.
   - Discard the washer.

Notice: Refer to General Repair Instructions in the Preface section.



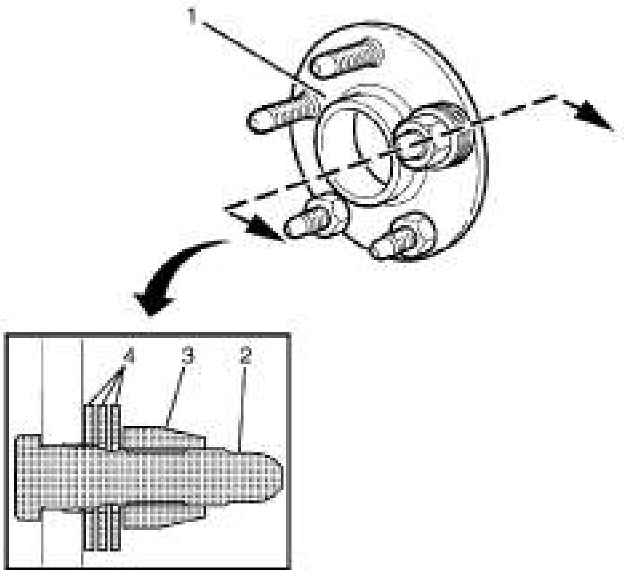
7. Secure the rear driveshaft with wire to protect it from damage.

8. Install the 7208 (1) to the wheel hub (2).
9. Press the rear driveshaft from the wheel hub using the 7208 (1).
10. Remove the 7208 (1) from the wheel hub (2).



11. Install a wheel nut (2) flush with the end of the wheel stud (3).
12. Remove the wheel stud (3) from the wheel hub (4) using the C-4150-C (1).
13. Repeat steps 11 and 12 for any additional wheel studs that require replacement.

Installation Procedure



1. Install the wheel stud (2) to the wheel hub (1).

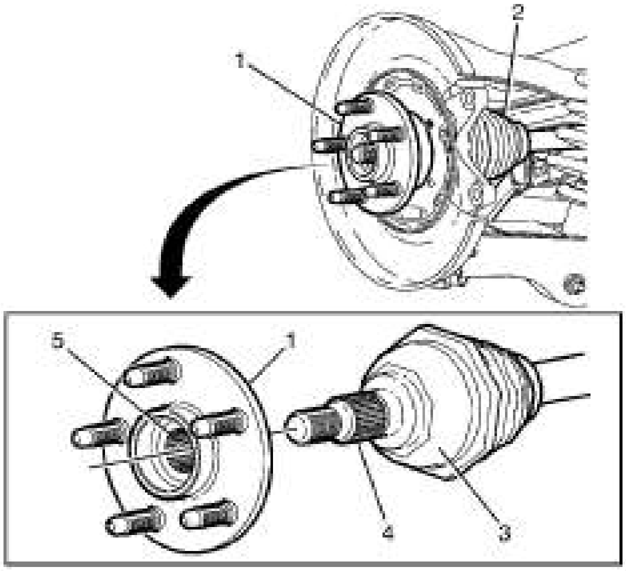
Notice: Refer to Fastener Notice in the Preface section.

Important: Suitable sized spacing washers (4) must be used to fully seat the wheel stud (2).

2. Install spacing washers (4) and an inverted wheel nut (3) onto the replacement wheel stud (2).

   Tighten
   Tighten the nut to 170 N·m (125 lb ft).

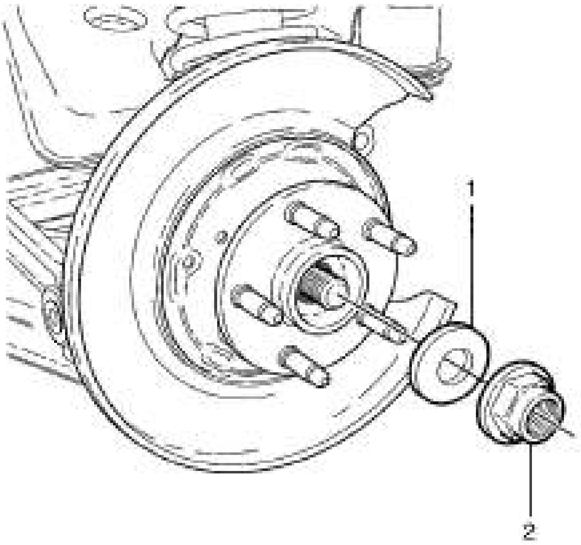
3. Remove the wheel nut (3) and spacing washers (4).
4. Repeat steps 1 to 3 for any additional studs that require replacement.



Important: Lightly lubricate the rear driveshaft outer splined end (4) with the recommended differential lubricant.

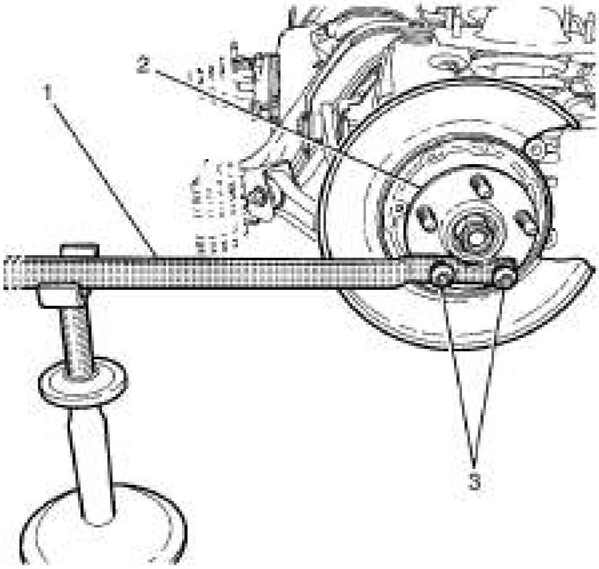
Important: DO NOT excessively push the rear driveshaft (3) through the wheel hub (1).

5. Remove the rear driveshaft securing wire, used in the removal process to prevent damage.
6. Push the rear driveshaft outer splined end (4) into the splined cavity (5) of the wheel hub (1).



Important: A NEW nut and NEW washer must be used when installing the rear drive shaft.

7. Install the rear driveshaft NEW retaining nut (2) and NEW washer (1).



8. Install the KM-468 (1) to the wheel hub (2) with two inverted wheel nuts (3).

   Support the KM-468 (1) outer end on a safety stand.

   Notice: Refer to Fastener Notice in the Preface section.

   Important: There are two suitable methods of tightening the wheel drive shaft retaining nut. DO NOT EXCEED THE SPECIFIED TIGHTENING VALUES, otherwise premature bearing failure may result.

9. Preferred Method

   Tighten
   Tighten the nut on first pass to 150 N·m (111 lb ft).

   Loosen
   Loosen the nut on second pass by 180 Degrees.

   Tighten
   Tighten the nut on third pass to 425 N·m (313 lb ft)

   Crimp nut.

   Alternate Method

   Tighten
   Tighten the nut on first pass to 150 N·m (111 lb ft).

   Loosen
   Loosen the nut on second pass by 180 Degrees.

   Tighten
   Tighten the nut on the third pass to 50 N·m (37 lb ft)

   Tighten
   Tighten the nut on the forth pass by 45 Degrees

   Crimp nut.

10. Remove the KM-468 (1).
11. Install the rear brake disc. Refer to Rear Brake Rotor Replacement.
12. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
13. Remove the safety stands.
14. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Rear Suspension | Description and Operation | Document ID: 1995433

Rear Suspension Description and Operation

After - 13 Aug 2007

The rear suspension has been designed to maximize the ride and road handling characteristics, as well as, the road isolation of the vehicle.

The rear suspension absorbs the impact of the tyres travelling over irregular road surfaces and dissipates this energy throughout the suspension system.

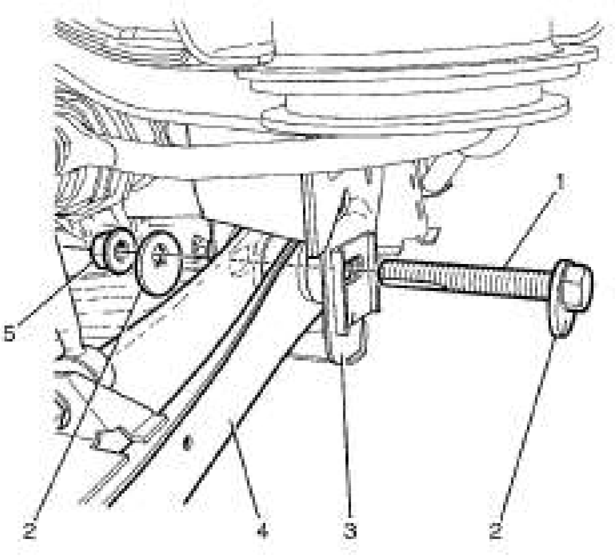
This process isolates the vehicle occupants from the road surface.

The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system.

The suspension system must allow for the vertical movement of the tyre and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tyre's contact and horizontal relationship to the road.

The knuckle is suspended between a lower and an upper control arm.

The lower control arm attaches to the knuckle at the outermost point of the control arm. The innermost point of the lower control arm is attached to the subframe through bushings.

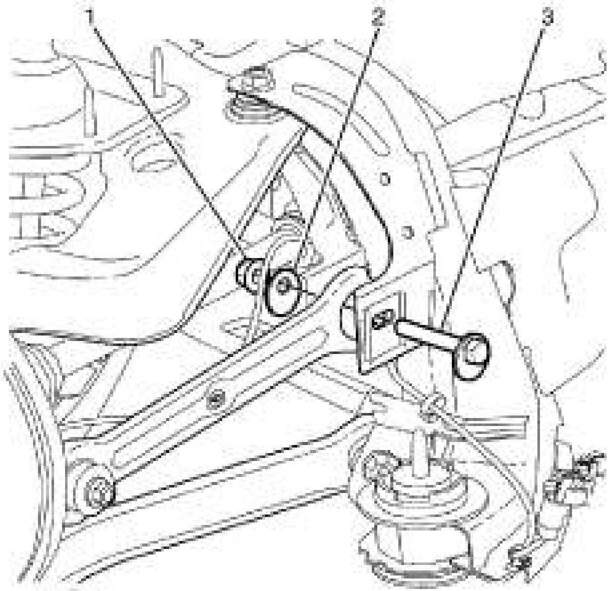


A nut (5) and bolt (1) with eccentric washers (2) connect the lower control arm (4) to the subframe (3), this arrangement provides camber adjustment of the rear suspension.

The supporting function of the lower control arm is further enhanced by the Y-Link, which extends between the knuckle and the subframe.

The upper control arm attaches from the knuckle at the outermost point of the control arm. The innermost end of the upper control arm attaches to the subframe through pivot and ball joint bushings.

The I-Link provides a side attachment between the knuckle and the subframe.



Loosen the I-Link retaining lock nut (1) from the I-Link retaining bolt (3). Rotate the I-Link retaining bolt (3) which also rotates the eccentric washer (2) to adjust the rear toe.

The rear strut assembly attaches the lower control arm to the body of the vehicle.

The knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension within the strut assembly. A shock absorber is used in conjunction with this system in order to dampen the oscillations of the coil spring. The shock absorber is filled with oil and has a moveable shaft that connects to a piston inside. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of the spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone.

The subframe is bolted to the body of the vehicle. The subframe to body attaching bolts incorporate a tapered boss near the head of the bolt on the front bolts, to assist in the alignment during assembly. The front and rear mount bushings enhance the road isolation characteristics of the rear suspension structure.

A stabiliser bar is mounted to the subframe by two brackets and insulating rubbers. The link connecting the stabiliser bar to each lower control arm has a ball joint socket stud and nut, at each end of it.

There are numerous configurations for each suspension option, depending on body type and powertrain combination. For further information regarding the identification of which suspension option is fitted to a particular vehicle. Refer to Vehicle, Engine and Transmission ID and VIN Location, Derivative and Usage in General Information.

For all other information regarding the suspension specification fitted to a particular vehicle, refer to Fastener Tightening Specifications in Rear Suspension. Although the rear suspension components are lubricated for life and require no routine lubrication, they should be inspected periodically for damage and wear.

Up to - 13 Aug 2007

The rear suspension has been designed to maximize the ride and road handling characteristics, as well as, the road isolation of the vehicle.

The rear suspension absorbs the impact of the tyres travelling over irregular road surfaces and dissipates this energy throughout the suspension system.

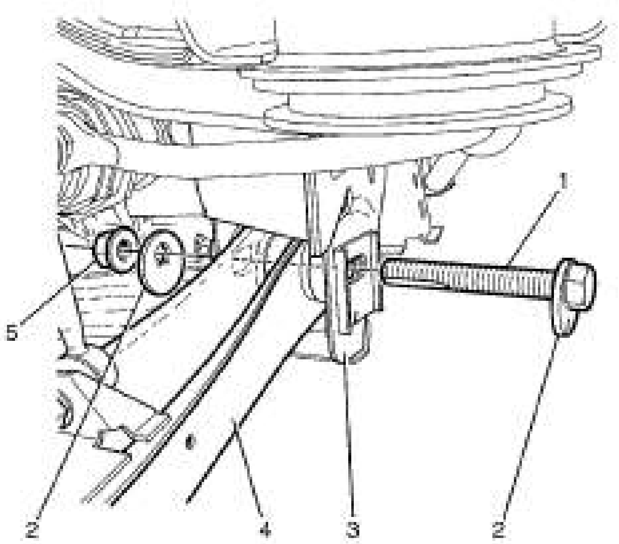
This process isolates the vehicle occupants from the road surface.

The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system.

The suspension system must allow for the vertical movement of the tyre and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tyre's horizontal relationship to the road.

The knuckle is suspended between a lower and an upper control arm.

The lower control arm attaches to the knuckle at the outermost point of the control arm. The innermost point of the lower control arm is attached to the subframe through bushings.

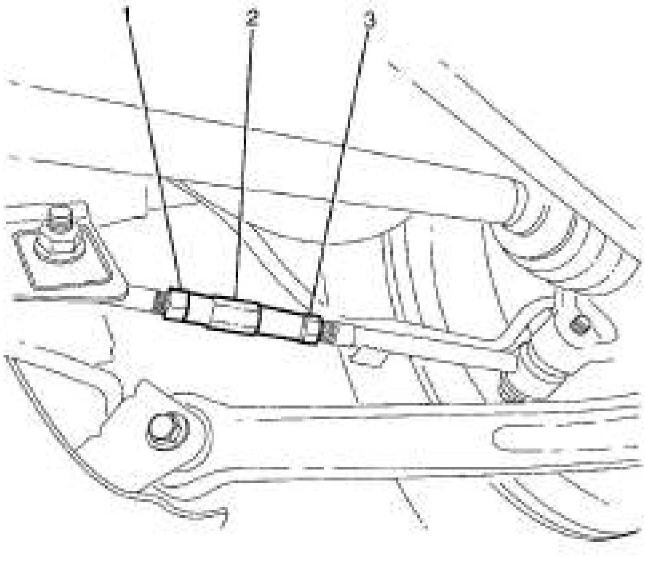


The two eccentric washers (2) of the bolt (1) and under the nut (2) connecting the lower control arm (4) to the subframe (5) are used to adjust the camber of the rear suspension.

The supporting function of the lower control arm is further enhanced by the Y-Link, which extends between the knuckle and the subframe.

The upper control arm attaches from the knuckle at the outermost point of the control arm. The innermost end of the upper control arm attaches to the subframe through pivot and ball joint bushings.

The I-Link provides a side attachment between the knuckle and the subframe.



Loosen the I-Link adjuster lock nuts (1, 3) from the I-Link adjuster (2). Rotate the I-Link adjuster (2) to adjust the camber.

The rear strut assembly attaches the lower control arm to the body of the vehicle.

The knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension within the strut assembly. A shock absorber is used in conjunction with this system in order to dampen the oscillations of the coil spring. A shock absorber is a basic hydraulic cylinder, it is filled with oil and has a moveable shaft that connects to a piston inside. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone.

The subframe is bolted to the body of the vehicle. The subframe to body retaining bolts incorporate a tapered boss near the head of the bolt on the front bolts, to assist in the alignment during assembly. The front and rear mount bushings enhance the road isolation characteristics of the rear suspension structure.

A stabiliser bar is mounted to the subframe by two brackets and insulating rubbers. The link connecting the stabiliser bar to each lower control arm has a ball joint socket stud and nut, at each end of it.

There are numerous configurations for each suspension option, depending on body type and powertrain combination. For further information regarding the identification of which suspension option is fitted to a particular vehicle, refer to Vehicle, Engine and Transmission ID and VIN Location, Derivative and Usage .

For all other information regarding the suspension specification fitted to a particular vehicle, refer to Fastener Tightening Specifications .

Although the rear suspension components are lubricated for life and require no routine lubrication, they should be inspected periodically for damage and wear.

Ball Joint Inspection

Ball Joint Inspection

Step	Action	Values	Yes	No
1	Did you review the General Description and perform the necessary inspections?	--	Go to Step 2	Go to Symptoms - Suspension General Diagnosis in Suspension General Diagnosis.
2	Clean the ball joint and inspect the seal for damage. Is the ball joint seal damaged?	--	Go to Step 5	Go to Step 3
3	**Important:** Remove tension from the ball joints. Check the ball joint for horizontal looseness using the following procedure: 1. Mount the J 8001 dial indicator to the arm housing the ball joint to be inspected. 2. Position the J 8001 dial indicator mounted against the side of the ball joint stud. 3. Move the wheel in and out in the direction of the arm while reading the dial indicator. Does the dial indicator measure greater than the specified value?	3.18 mm (0.125 in)	Go to Step 5	Go to Step 4
4	**Important:** Remove tension from the ball joints. Check the ball joint for vertical looseness using the following procedure: 1. Mount the J 8001 dial indicator to the arm housing the ball joint to be inspected. 2. Position the J 8001 dial indicator against the top of the ball joint stud. 3. Move wheel up and down while reading the dial indicator. Does the dial indicator measure greater than the specified value?	3.18 mm (0.125 in)	Go to Step 5	Go to Step 6

5	Repair as required or replace the affected component. Refer to the affected components repair procedure for service. Did you complete the repair?	--	Go to Step 6	--
6	Operate the system in order to verify the repair. Did you correct the condition?	--	System OK	Go to Step 2

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 2076142**

Body Leans or Sways in Corners

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	Verify the vehicle leans or sways in corners. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect the following components for wear or damage: • The front coil springs • The rear coil springs Are the components worn or damaged?	Go to Step 7	Go to Step 4
4	Inspect the stabiliser bar links for wear or damage. Are the stabiliser bar links worn or damaged?	Go to Step 8	Go to Step 5
5	Inspect the stabiliser bar insulators for wear or damage. Are the stabiliser bar insulators worn or damaged?	Go to Step 9	Go to Step 6
6	Inspect the stabiliser bars for wear or damage. Are the stabiliser bars worn or damaged?	Go to Step 10	Go to Strategy Based Diagnosis.
7	Replace the springs. Refer to the appropriate procedure: • Front Coil Springs Replacement for Front. • Coil Spring Replacement for Rear. Did you complete the repair?	Go to Step 11	--
8	Replace the stabiliser bar link(s). Refer to Stabilizer Shaft Link Replacement for Front or Stabilizer Shaft Link Replacement for Rear. Did you complete the repair?	Go to Step 11	--
9	Replace the stabiliser bar Insulators. Refer to Stabilizer Shaft Insulator Replacement for Front or Stabilizer Shaft Insulator Replacement for Rear. Did you complete the repair?	Go to Step 11	--
	Replace the stabiliser bar. Refer to Stabilizer Shaft Replacement for Front or Stabilizer Shaft		

10	Replacement for Rear. Did you complete the repair?	Go to Step 11	--
11	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Diagnostic Starting Point - Suspension General Diagnosis

Begin the system diagnosis by reviewing the Description and Operation information, and the vehicle RPO, this will help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Suspension General Diagnosis, in order to identify the correct procedure for diagnosing the system and where the procedure is located.

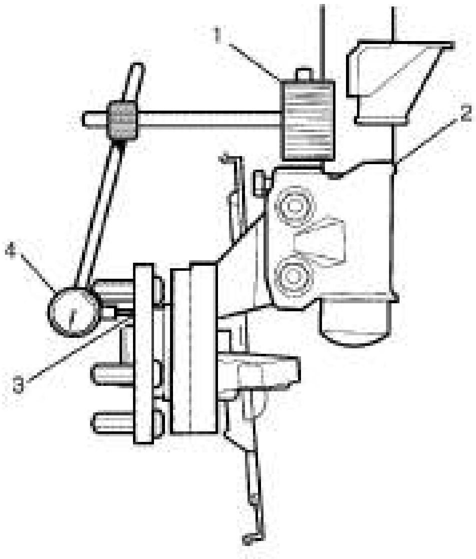
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 1995685**

Front Wheel Hub Assembly Inspection

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

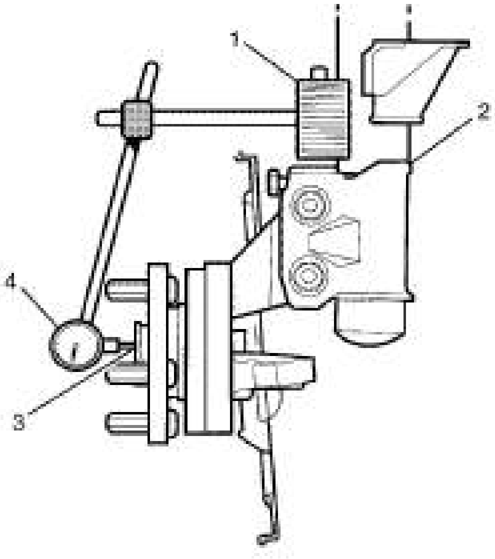
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation.
3. Remove the brake disc. Refer to Front Brake Rotor Replacement.
4. Clean the wheel mounting surface of the front wheel hub assembly of any loose debris, rust, and/or corrosion.



Important: The dial gauge mounting base (1) must be securely mounted to the front strut unit (2).

5. Position a dial indicator (4), on the wheel mounting surface of the front wheel hub assembly (3) perpendicular to the surface.
6. Slowly rotate the front wheel hub assembly one complete revolution in order to find the low spot.
7. Set the dial indicator to zero at the low spot.
8. Slowly rotate the front wheel hub assembly one more complete revolution and measure the total amount of radial runout.

Specification
Maximum front wheel hub assembly runout 0.025 mm (0.001 in)



Important: The dial gauge mounting base (1) must be securely mounted to the front strut unit (2).

9. Position the dial indicator (4) on the centre of the wheel mounting flange (3) of the front wheel hub assembly perpendicular to the surface.
10. Push the wheel mounting flange towards the centre of the car, set the dial indicator to zero.
11. Pull the wheel mounting flange towards the outside of the car and measure the total amount of axial end float.

Specification
The front wheel hub assembly has zero axial end float (preload).

12. If the measurements are not within the specified range replace the front wheel hub assembly. Refer to Front Wheel Bearing and Hub Replacement.
13. Install the brake disc. Refer to Front Brake Rotor Replacement.
14. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
15. Remove the safety stands.
16. Lower the vehicle to the ground.

Noise Diagnosis - Front Suspension

Step	Action	Yes	No
DEFINITION: Any noise emitted from the front of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the front suspension.			
1	Did you review the General Description and perform the necessary Inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to Step 3	System OK
3	Is the noise reactive to vehicle load or speed?	Go to Step 4	Go to Step 5
4	1. Inspect the tyres and wheels for the following condition: • Correct tyre Inflation. Refer to Tire Inflation Pressure Specifications. • Abnormal tyre wear or damage. Refer to Tire Diagnosis - Irregular or Premature Wear. • Inspect the wheel nuts for looseness. Refer to Fastener Tightening Specifications. 2. Repair as necessary. Did you find and correct the condition?	Go to Step 11	Go to Step 5
5	Bounce the front of the vehicle in order to duplicate the noise. Did you duplicate the noise?	Go to Step 6	Go to Step 7
6	1. Inspect the front suspension and steering components for looseness. 2. Tighten as necessary. Refer to Fastener Tightening Specifications or Fastener Tightening Specifications. Did you find and correct the condition?	Go to Step 11	Go to Step 7
7	Inspect the front suspension and steering ball joints for wear and damage. Refer to Ball Joint Inspection. Did you find and correct the condition?	Go to Step 11	Go to Step 8
8	Inspect the front struts. Refer to Suspension Strut and Shock Absorber Testing - On Vehicle. Did you find and correct the condition?	Go to Step 11	Go to Step 9

9	1. Inspect the front stabiliser bar, links, and insulators for wear or damage. 2. Replace as necessary. • Refer to Stabilizer Shaft Replacement. • Refer to Stabilizer Shaft Insulator Replacement. • Refer to Stabilizer Shaft Link Replacement. Did you find and correct the condition?	Go to Step 11	Go to Step 10
10	1. Inspect the front suspension control arms, caster arms for wear or damage. 2. Repair as necessary. • Refer to Control Arm Replacement. • Refer to Front Lower Control Front Arm Replacement . Did you find and correct the condition?	Go to Step 11	Go to Strategy Based Diagnosis in General Information.
11	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 2076148**

Noise Diagnosis - Rear Suspension

Step	Action	Yes	No
DEFINITION: Any noise emitted from the rear of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the rear suspension.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to Step 3	System OK
3	Is the noise reactive to vehicle load or speed?	Go to Step 4	Go to Step 7
4	1. Inspect the tyres and wheels for the following condition: • Correct tyre inflation. Refer to Tire Inflation Pressure Specifications. • Abnormal tyre wear or damage. Refer to Tire Diagnosis - Irregular or Premature Wear. • Inspect the wheel nuts for looseness. Refer to Fastener Tightening Specifications. 2. Repair as necessary. Did you find and correct the condition?	Go to Step 11	Go to Step 5
5	Inspect the differential for noise. Refer to Diagnostic Starting Point - Rear Drive Axle. Did you find and correct the condition?	Go to Step 11	Go to Step 6
6	Bounce the rear of the vehicle in order to duplicate the noise. Did you duplicate the noise?	Go to Step 8	Go to Step 9
7	1. Inspect the rear suspension components for looseness. Refer to Fastener Tightening Specifications. 2. Tighten as necessary. Refer to Fastener Tightening Specifications. Did you find and correct the condition?	Go to Step 11	Go to Step 9
8	Inspect the rear struts. Refer to Suspension Strut and Shock Absorber Testing - On Vehicle. Did you find and correct the condition?	Go to Step 11	Go to Step 10

9	1. Inspect the rear stabiliser bar, links, and insulators for wear or damage. 2. Replace as necessary. • Refer to Stabilizer Shaft Replacement. • Refer to Stabilizer Shaft Insulator Replacement. • Refer to Stabilizer Shaft Link Replacement. Did you find and correct the condition?	Go to Step 11	Go to Step 10
10	1. Inspect the rear suspension control arms, caster arms for wear or damage. 2. Repair as necessary. • Refer to Lower Control Arm Replacement. • Refer to Upper Control Arm Replacement. • Refer to Adjust Link Replacement . • Refer to Trailing Arm Replacement . Did you find and correct the condition?	Go to Step 11	Go to Strategy Based Diagnosis in General Information.
11	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 2076146**

Poor Directional Stability

Step	Action	Yes	No
DEFINITION: Driver is unable to maintain consistent, predictable vehicle driving control in any direction.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	Verify that the directional stability is poor. Does the system operate normally?	System OK	Go to Step 3
3	1. Inspect the stabiliser bar, links, and insulators for wear or damage. 2. Replace as necessary. • Refer to Stabilizer Shaft Replacement for Front Suspension and Stabilizer Shaft Replacement for Rear Suspension. • Refer to Stabilizer Shaft Insulator Replacement for Front Suspension and Stabilizer Shaft Insulator Replacement for Rear Suspension • Refer to Stabilizer Shaft Link Replacement for Front Suspension and Stabilizer Shaft Link Replacement for Rear Suspension. Did you find and correct the condition?	Go to Step 10	Go to Step 4
4	1. Inspect the front suspension control arms, caster arms, tie rods and ball joints for wear or damage. For ball joint inspection refer to Ball Joint Inspection . 2. Repair as necessary. • Refer to Control Arm Replacement. • Refer to Front Lower Control Front Arm Replacement . • Refer to Steering Linkage Outer Tie Rod Replacement. Did you find and correct the condition?	Go to Step 10	Go to Step 5
5	Inspect the wheel bearing for wear or damage. Refer to Front Wheel Hub Assembly Inspection and Rear Wheel Hub Assembly Inspection. Did you find and correct the condition?	Go to Step 10	Go to Step 6
6	1. Inspect the vehicle trim height. Refer to Trim Height Inspection in Suspension General Diagnosis. 2. Repair as necessary.		

	Did you find and correct the condition?	Go to Step 10	Go to Step 7
7	Inspect the steering column for looseness. Refer to Looseness in Steering Column . Did you find and correct the condition?	Go to Step 10	Go to Step 8
8	Inspect the steering gear mounting bolts for looseness. Refer to Fastener Tightening Specifications. Did you find and correct the condition?	Go to Step 10	Go to Step 9
9	Inspect and adjust the wheel alignment as necessary. Refer to Wheel Alignment Measurement . Did you complete the alignment?	Go to Step 10	Go to Strategy Based Diagnosis in General Information. --
10	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

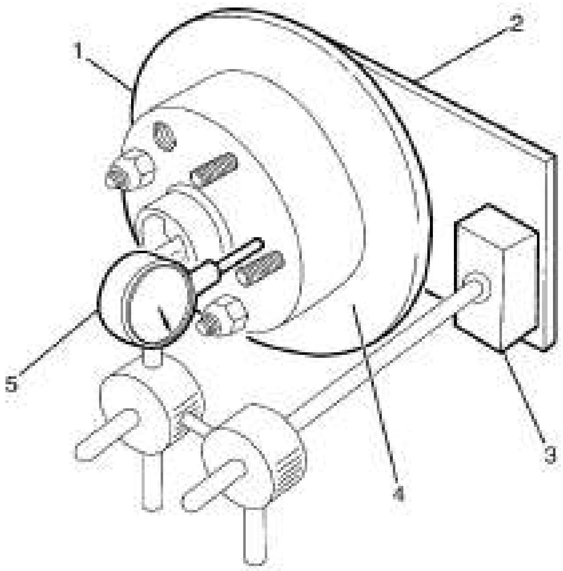
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 1995682**

Rear Wheel Hub Assembly Inspection

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and Installation.
3. Remove the brake disc. Refer to Rear Brake Rotor Replacement.
4. Clean the wheel mounting surface of the rear wheel hub assembly of any loose debris, rust, and/or corrosion.



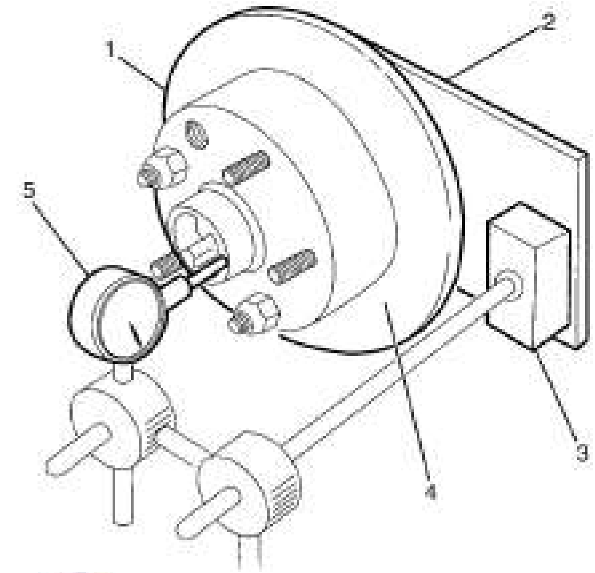
5. Install the dial indicator plate (2) to the rear knuckle assembly (1).

Important: The dial gauge mounting base (3) must be securely mounted to the dial indicator plate (2).

Important: The hub runout should not be measured on the top of the rotor.

6. Position a dial indicator (5) fitted with a roller, on the wheel mounting surface of the rear wheel hub assembly perpendicular to the surface (4).
7. Slowly rotate the rear wheel hub assembly (1) one complete revolution in order to find the low spot.
8. Set the dial indicator to zero at the low spot.
9. Slowly rotate the rear wheel hub assembly one more complete revolution and measure the total amount of runout.

Specification
Maximum rear wheel hub assembly radial runout 0.025 mm (0.001 in)



Important: The dial gauge mounting base (3) must be securely mounted to the dial indicator plate (2).

10. Position a dial indicator (5) on the centre of the wheel mounting flange of the rear wheel hub assembly (4) perpendicular to the surface.
11. Push the wheel mounting flange towards the centre of the car, set the dial indicator to zero.
12. Pull the wheel mounting flange towards the outside of the car and measure the total amount of axial end float.

Specification
The rear wheel hub assembly has zero axial end float (preload).

13. If the measurements are not within the specified range replace the rear wheel bearing. Refer to Rear Wheel Bearing and Hub Replacement.
14. Remove the dial indicator plate (1) to the rear knuckle assembly (2).
15. Install the brake disc. Refer to Rear Brake Rotor Replacement.
16. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
17. Remove the safety stands.
18. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 2075720**

Ride Diagnosis

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Trim Height Specifications.
2	**Important:** Verify the vehicle suspension package RPO. Verify that the ride is too soft or too hard. Does the vehicle ride normally?	System OK	Go to Step 3
3	Inspect the tyres for the correct inflation pressure. Refer to Tire Inflation Pressure Specifications. Is the tyre inflation pressure correct?	Go to Step 4	Go to Step 6
4	Inspect the vehicle trim height. Refer to Trim Height Inspection. Is the vehicle trim height correct?	Go to Step 5	Go to Step 7
5	Inspect the following suspension components for wear or damage: • Coil Springs. • Strut Units. Refer to Suspension Strut and Shock Absorber Testing - On Vehicle. Are any of the components the worn or damaged?	Go to Step 8	Go to Strategy Based Diagnosis in General Information.
6	Inflate the tyres to the correct pressure. Did you complete the repair?	Go to Step 9	--
7	Replace the suspension components as necessary. Did you complete the repair?	Go to Step 9	--
8	Replace all of the worn or damaged components. • For shock absorber replacement, refer to Strut Assembly Replacement or Strut Assembly Replacement. • For coil spring replacement, refer to Front Coil Springs Replacement or Coil Spring Replacement.	Go to	

	Did you complete the repair?	Step 9	--
9	Drive the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Suspension Bottoms

Step	Action	Yes	No
DEFINITION: A loud bang or thump that can usually be felt and/or heard when the vehicle is driven over bumps. This condition is commonly noticed when the vehicle trim height is too low.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	Verify that the suspension bottoms. Does the vehicle operate normally?	System OK	Go to Step 3
3	Check for vehicle overloading and correct the overloading condition as necessary. Did you find and correct the condition?	Go to Step 7	Go to Step 4
4	Inspect the suspension struts. Refer to Suspension Strut and Shock Absorber Testing - On Vehicle. Did you find and correct the condition?	Go to Step 7	Go to Step 5
5	Inspect the suspension coil springs for wear or damage: Are the suspension coil springs worn or damaged?	Go to Step 7	Go to Step 6
6	Inspect the vehicle trim height. Refer to Trim Height Inspection. Did you find and correct the condition?	Go to Step 7	Go to Strategy Based Diagnosis in General Information.
7	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Suspension Strut and Shock Absorber Testing - On Vehicle

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	Verify that the customer's concern is present. Does the vehicle operate normally?	System OK	Go to Step 3
3	1. Use your hands in order to lift up and push down each corner of the vehicle 3 times. 2. Remove your hands from the vehicle. 3. Locate a shock or strut that exceeds 2 undulations. Did you locate a shock or strut that exceeds 2 undulations?	Go to Step 5	Go to Step 4
4	**Important:** A strut does not require replacement if any or a combination of the following are present: • A build up of oil up to 11 mm wide at the end of the piston rod. • Oily sludge accumulated from normal operating conditions to 4 cm from the top of the strut body. • Road grease, oil, sand and dust discoloration on the body. Inspect each strut for external fluid leakage. Is a strut leaking?	Go to Step 5	Go to Strategy Based Diagnosis.
5	Replace the strut unit or shock absorber. Refer to the appropriate procedure: • Shock Absorber Replacement for Front. • Shock Absorber Replacement for Rear. Did you complete the repair?	Go to Step 6	--
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Symptoms - Suspension General Diagnosis

Important: The following step must be completed before using the symptom tables.

Review the system description and operation in order to familiarise yourself with the system functions. Refer to the appropriate description and operation:

- General Description.
- Rear Suspension Description and Operation.
- General Description.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of any of the suspension sub-systems.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for correct tyre size and inflation pressure. Refer to Tire Placard.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Ride Diagnosis.
- Vehicle Leads/Pulls.
- Body Leans or Sways in Corners.
- Suspension Bottoms.
- Poor Directional Stability.
- Noise Diagnosis - Front Suspension.
- Noise Diagnosis - Rear Suspension.
- Suspension Strut and Shock Absorber Testing - On Vehicle.
- Wheel Bearings Diagnosis.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 2126740**

Trim Height Inspection (Sportwagon)

Trim Height Measurement

Trim height is a predetermined measurement relating to vehicle ride height. Incorrect trim heights can cause the vehicle to bottom out over bumps causing damage to the suspension components and symptoms similar to wheel alignment concerns. Check the trim heights when diagnosing suspension concerns and before checking the wheel alignment.

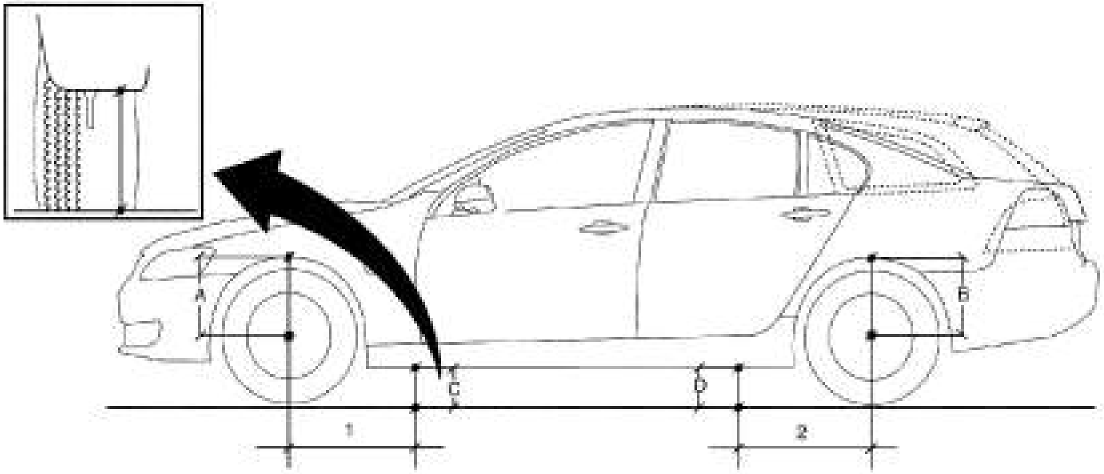
The vehicle must be on a flat level surface and all dimensions must be measured vertical from the ground. Trim heights should be within 13 mm (0.51 in) to be considered correct.

The suspension and trim height dimensions are for standard vehicles with base equipment only. The dimensions are for a new vehicle built to standard specification and are intended as a guide when checking trim height dimensions at normal kerb weight.

Perform the following before measuring the trim heights:

- Check the tyre pressures. Refer to Tire Inflation Pressure Specifications.
- Check the fuel level. Add additional weight if necessary to simulate a full tank.
- Make sure the passenger and rear compartments are empty, except for the spare tyre.
- Make sure the vehicle is on a flat and level surface, such as an alignment rack.
- Check that all the vehicle doors are securely closed.
- Check that the vehicle hood and trunk are securely closed.
- Check for installed after market accessories or modifications that could affect trim height measurement.

Measuring the trim height



Important: The vehicle must be on a flat level surface

1. Using your hands, lift the front bumper approximately 38 mm (1.49 in).
2. Gently remove your hands and allow the vehicle to lower.
3. Using your hands, bounce the front of the vehicle downward approximately 38 mm (1.49 in).
4. Gently remove your hands and allow the vehicle to rise.
5. Measure and note the C dimension for the left and right side of the vehicle, inboard of the pinch-weld flange at 544 mm (21.42 in) (1) from the centreline of the front wheel.
6. Measure and note the A dimension for the left and right side of the vehicle from the bottom of the front wheel rim to the wheel arc along the centreline of the front wheel.
7. Using your hands, lift the front bumper approximately 38 mm (1.49 in).
8. Gently remove your hands and allow the vehicle to lower.
9. Using your hands, bounce the front of the vehicle downward approximately 38 mm (1.49 in).
10. Gently remove your hands and allow the vehicle to rise.
11. Measure and note the D dimension for the left and right side of the vehicle, inboard of the pinch-weld flange at 544 mm (21.42 in) (1) from the centreline of the rear wheel.
12. Measure and note the B dimension for the left and right side of the vehicle from the bottom of the rear wheel rim to the wheel arc along the centreline of the rear wheel.
13. Compare the A, B, C and D dimension measurements to the trim height specifications. Refer to Trim Height Specifications.
14. Compare the right and left and front and rear dimension measurements to the trim height variation specifications. Refer to Trim Height Specifications.
15. If the measurements are not within the specified range, replace the coil springs as required. Refer to Coil Spring Replacement or Coil Spring Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | Document ID: 1995672

Trim Height Inspection (SWB)

Trim Height Measurement

Trim height is a predetermined measurement relating to vehicle ride height. Incorrect trim heights can cause the vehicle to bottom out over bumps causing damage to the suspension components and symptoms similar to wheel alignment concerns. Check the trim heights when diagnosing suspension concerns and before checking the wheel alignment.

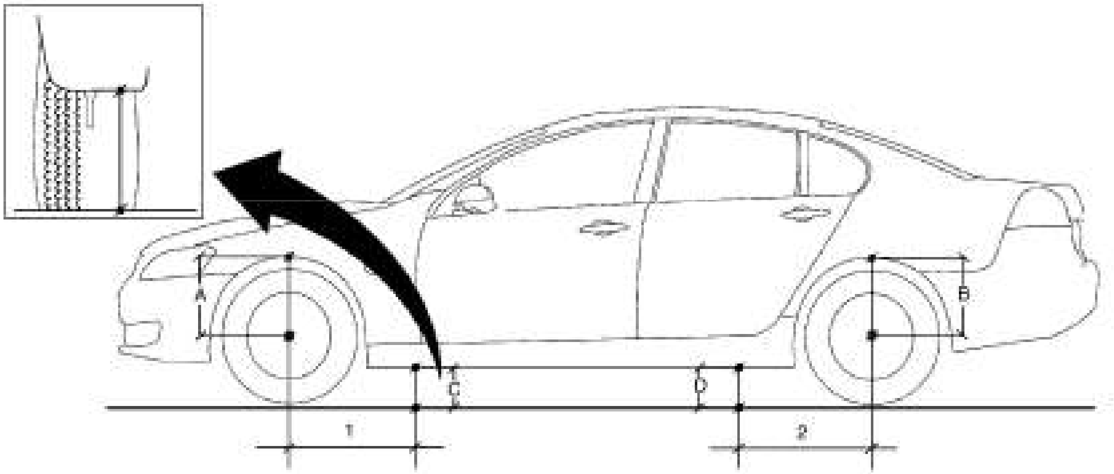
The vehicle must be on a flat level surface and all dimensions must be measured vertical from the ground. Trim heights should be within 13 mm (0.51 in) to be considered correct.

The suspension and trim height dimensions are for standard vehicles with base equipment only. The dimensions are for a new vehicle built to standard specification and are intended as a guide when checking trim height dimensions at normal kerb weight.

Perform the following before measuring the trim heights:

- Check the tyre pressures. Refer to Tire Inflation Pressure Specifications .
- Check the fuel level. Add additional weight if necessary to simulate a full tank.
- Make sure the passenger and rear compartments are empty, except for the spare tyre.
- Make sure the vehicle is on a flat and level surface, such as an alignment rack.
- Check that all the vehicle doors are securely closed.
- Check that the vehicle hood and trunk are securely closed.
- Check for installed after market accessories or modifications that could affect trim height measurement.

Measuring the trim height



Important: The vehicle must be on a flat level surface

1. Using your hands, lift the front bumper approximately 38 mm (1.49 in).
2. Gently remove your hands and allow the vehicle to lower.
3. Using your hands, bounce the front of the vehicle downward approximately 38 mm (1.49 in).
4. Gently remove your hands and allow the vehicle to rise.
5. Measure and note the C dimension for the left and right side of the vehicle, inboard of the pinch-weld flange at 544 mm (21.42 in) (1) from the centreline of the front wheel.
6. Measure and note the A dimension for the left and right side of the vehicle from the bottom of the front wheel rim to the wheel arc along the centreline of the front wheel.
7. Using your hands, lift the front bumper approximately 38 mm (1.49 in).
8. Gently remove your hands and allow the vehicle to lower.
9. Using your hands, bounce the front of the vehicle downward approximately 38 mm (1.49 in).
10. Gently remove your hands and allow the vehicle to rise.
11. Measure and note the D dimension for the left and right side of the vehicle, inboard of the pinch-weld flange at 544 mm (21.42 in) (1) from the centreline of the rear wheel.
12. Measure and note the B dimension for the left and right side of the vehicle from the bottom of the rear wheel rim to the wheel arc along the centreline of the rear wheel.
13. Compare the A, B, C and D dimension measurements to the trim height specifications. Refer to Trim Height Specifications .
14. Compare the right and left and front and rear dimension measurements to the trim height variation specifications. Refer to Trim Height Specifications .
15. If the measurements are not within the specified range, replace the coil springs as required. Refer to Coil Spring Replacement or Coil Spring Replacement .

Vehicle Leads/Pulls

Step	Action	Yes	No
DEFINITION: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle straight path.			
1	Did you review the General Description and perform the visual/physical inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	Road test the vehicle in order to verify the complaint. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect the tyre/wheel assemblies for: • Correct tyre pressure. Refer to Tire Placard. • Correct tyre size. Refer to Tire Placard. • Abnormal tyre wear or damage. Refer to Tire Diagnosis - Irregular or Premature Wear. Did you find and correct the condition?	Go to Step 8	Go to Step 4
4	Perform the Radial Tire Lead/Pull Correction. Did you find and correct the condition?	Go to Step 8	Go to Step 5
5	Inspect and correct/adjust the suspension and steering systems for: • Vehicle trim height. Refer to Trim Height Inspection. • Excessively worn, loose, or damaged components. Did you find and correct the condition?	Go to Step 8	Go to Step 6
6	Inspect/correct the brake system for brake drag. Refer to Brakes Drag. Did you find and correct the condition?	Go to Step 8	Go to Step 7
7	Inspect the wheel alignment and adjust as necessary. Refer to Wheel Alignment Measurement. Did you find and correct the condition?	Go to Step 8	Go to Strategy Based Diagnosis.
8	Operate the vehicle in order to verify the repair.	System	

	Did you correct the condition?	OK	Go to Step 3

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Suspension General Diagnosis | Diagnostic Information and Procedures | **Document ID: 2076154**

Wheel Bearings Diagnosis

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis.
2	1. Inspect the tyres and wheels for the following condition: - Correct tyre inflation. Refer to Tire Inflation Pressure Specifications. - Abnormal tyre wear or damage. Refer to Tire Diagnosis - Irregular or Premature Wear. - Inspect the wheel nuts for looseness. Refer to Fastener Tightening Specifications. 2. Repair as necessary. Did you find and correct the condition?	Go to Step 8	Go to Step 3
3	**Important:** A noise heard during left turns is a good indicator of a noisy right wheel bearing. A noise heard during right turns is a good indicator of a noisy left wheel bearing. A noise heard during acceleration is a good indicator of noisy rear wheel bearings. Road test the vehicle to identify the noisy bearing. Drive the vehicle on a smooth road at a moderate speed range. While driving, turn the wheel to the left and the right to apply loads to each wheel. Did you identify the noisy bearing.	Go to Step 7	Go to Step 4
4	Inspect the front and rear wheel bearings for wear and damage.. - Front Wheel Hub Assembly Inspection - Rear Wheel Hub Assembly Inspection Did you identify the noisy bearing.	Go to Step 8	Go to Step 5
5	Inspect for tyre and wheel assemblies for run out. Refer to Tire and Wheel Assembly Runout Measurement - On-Vehicle. Did you find and correct the condition?	Go to Step 8	Go to Step 6
6	Inspect the front and/or rear suspension. Refer to Noise Diagnosis - Front Suspension or Noise Diagnosis - Rear Suspension. Did you find and correct the condition?	Go to Step 8	Go to Strategy Based Diagnosis.

7	Replace the wheel bearing. Refer to Front Wheel Bearing and Hub Replacement or Rear Wheel Bearing and Hub Replacement. Did you complete the repair?	Go to Step 8	--
8	Road test the vehicle to verify the repair. Does the vehicle operate normally?	System OK	Go to Step 3

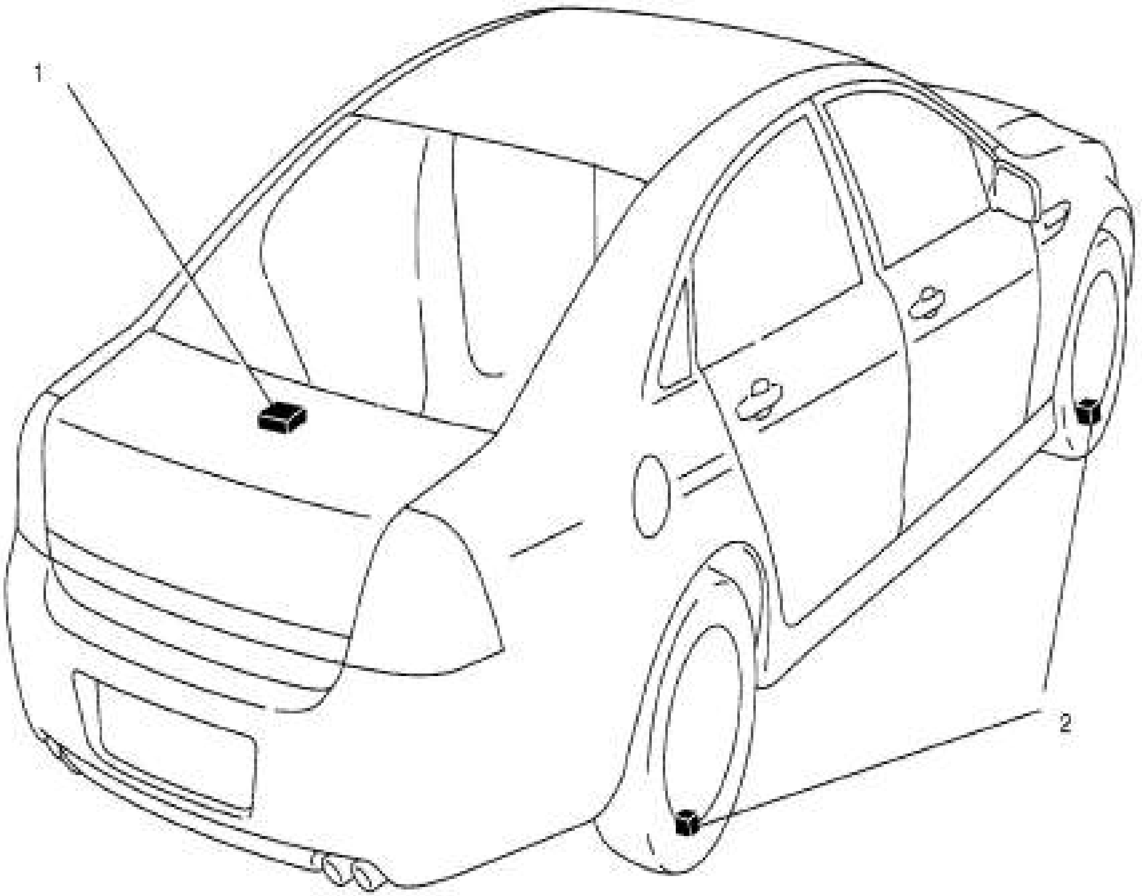
Tire Pressure Monitoring System Component Views (LWB)

Component Locator TPMS



(1) Remote Control Door Lock Receiver (RCDLR)/Tyre Pressure Monitor (TPM) Module
(2) Tyre Pressure Monitoring System (TPMS) Sensors

Diagnostic Starting Point - Tire Pressure Monitoring

Visual / Physical Inspection

- Inspect for after-market devices, such as tyres, wheels or radio frequency transmitting devices which could affect the operation of the tyre pressure monitor systems. Refer to Checking Aftermarket Accessories in Wiring Systems.
- Inspect the easily accessible or visible system components for obvious physical damage or missing components such as the valve stems which could also effect the operation of the system.
- Inspect the tyres for the correct inflation pressures.
- Inspect the tyres for any use of sealants. The use of tyre sealants can obstruct the sensor's pressure sensing port and cause inaccurate tyre pressure readings. If this condition is verified, replace the sensor. Refer to Tire Pressure Indicator Sensor Replacement .

System Diagnosis

After incorrect system operation has been verified and that aftermarket devices or tyre sealants are not the cause, begin the system diagnosis with the diagnostic system check. The diagnostic system check will provide the following information:

1. The identification of the control modules that control the tyre pressure monitoring system.
2. The ability of those control modules to communicate via the serial data circuit.
3. The presence of any stored diagnostic trouble codes (DTCs) in those control modules and there status.

The use of the diagnostic system check will identify the correct procedure for diagnosing the system and where the procedure is located. Refer to Diagnostic System Check - Vehicle .

Diagnostic System Check - Tire Pressure Monitoring

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Review the systems description and operation in order to familiarise yourself with the system functions. Refer to Tire Pressure Monitor Description and Operation .

The Remote Function Actuator supports two systems, keyless entry and tyre pressure monitoring, DTCs specific to these systems can be found within their relevant sections. For keyless entry diagnostic procedures, refer to Diagnostic Starting Point - Keyless Entry in Keyless Entry.

1. Inspect for aftermarket devices which could affect the operation of the tyre pressure monitoring system (TPMS) system to verify that none are installed. Refer to Checking Aftermarket Accessories .

   If such devices are installed, remove/disable them and re-test.
2. Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

   If damage or such conditions are found, repair as required.
3. Compare the scan tool tyre pressure parameters to the actual tyre pressures.

   If tyre pressure parameters are not correct, use scan tool special functions to adjust setting.
4. Using J-46079 Tyre Pressure Monitor Diagnostic Tool, verify that the scan tool pressure sensor ID parameters match the actual on-vehicle locations.

   If actual pressure sensor locations do not match scan tool readings, refer to Tire Pressure Indicator Sensor Programming .
5. Verify the scan tool TPM system enabled parameter is YES.

   If the TPM system enabled parameter is NO, use scan tool special functions to adjust setting.
6. Verify the tyres are inflated to the correct pressure.

DTC C0569

DTC Descriptor

DTC C0569 00: System Configuration Error

Diagnostic Fault Information

Perform the Diagnostic System Check - Tire Pressure Monitoring prior to using this diagnostic procedure.

Circuit/System Description

The remote function actuator (RFA) receives a radio frequency (RF) transmission from each tire pressure sensor. Each sensors RF transmission contains its own unique identification (ID) code that must be learned into the RFA memory. Once all four IDs have been learned and vehicle speed is 40 kph (25 mph) or greater the RFA continuously compares IDs in received transmission to its learned IDs to determine if all four sensors are present.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The RFA has not undergone the tire type and tire pressure selection setup procedure.

Action Taken When the DTC Sets

The instrument panel cluster (IPC) displays the SERVICE TIRE MONITOR warning message.

Conditions for Clearing the DTC

A current DTC will clear when the RFA has undergone the setup procedure.

Diagnostic Aids

A newly replaced RFA will set DTC C0569 on its initial ignition ON cycle. tire type and tire pressure selection setup must be performed. Refer to Tire Pressure Indicator Sensor Programming .

DTC C0750, C0755, C0760, or C0765

DTC Descriptor

DTC C0750: Left Front Tire Pressure Sensor/Transmitter Fault

DTC C0755: Right Front Tire Pressure Sensor/Transmitter Fault

DTC C0760: Left Rear Tire Pressure Sensor/Transmitter Fault

DTC C0765: Right Rear Tire Pressure Sensor/Transmitter Fault

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit/System Description

The tire pressure monitoring system (TPMS) has four radio frequency transmitting pressure sensors inside the wheel/tire assemblies. As vehicle speed increases to above 40 km/h (25 mph) the sensors internal roll switch closes, which puts the sensors into drive mode. The sensors begin to transmit once every 60 seconds to the driver side antenna module. The data within this radio frequency transmission contains sensor identification, sensor mode, sensor status and tire pressure. Once vehicle speed is greater than 40 km/h (25 mph) the antenna module waits for all sensors to go into drive mode. If one or more sensors do not go into drive mode or do not transmit at all the driver side antenna module will set DTC C0750, C0755, C0760, or C0765.

Conditions for Running the DTC

- The engine is running
- Vehicle speed is at least 40 km/h (25 mph).

Conditions for Setting the DTC

Any given sensor stops transmitting for ten minutes.

Action Taken When the DTC Sets

- A DTC is stored in memory
- The fault is displayed on the instrument panel cluster (IPC)
- A warning tone is activated.

Conditions for Clearing the DTC

- A history DTC will clear after 100 consecutive ignition cycles

- Use a scan tool to clear DTC.

Circuit/System Verification

1. DTC C0750, C0755, C0760 or C0765 if more than one of these DTCs are set. Refer to Remote Control Door Lock Receiver and Theft Deterrent Module Programming and Setup .
2. If the vehicle passes the Circuit/System Verification test, then operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records Data List.

Circuit/System Testing

1. If any other DTCs are set diagnosis these first, refer to Diagnostic Trouble Code (DTC) List - Vehicle .
2. Ignition ON, observing the tire pressure monitor parameter on the scan tool, activate the transponder at appropriate wheel. The parameter status should change on the scan tool.

   If the scan tool parameter does not change replace the appropriate tire pressure monitor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Remote Control Door Lock Receiver and Theft Deterrent Module Replacement .
- Control Module References for TPM module replacement, setup and programming.

Tire Pressure Indicator Sensor Programming

When replacing the Tire Pressure Monitor (TPM) the module will have to be programmed. Refer to Remote Control Door Lock Receiver and Theft Deterrent Module Programming and Setup .

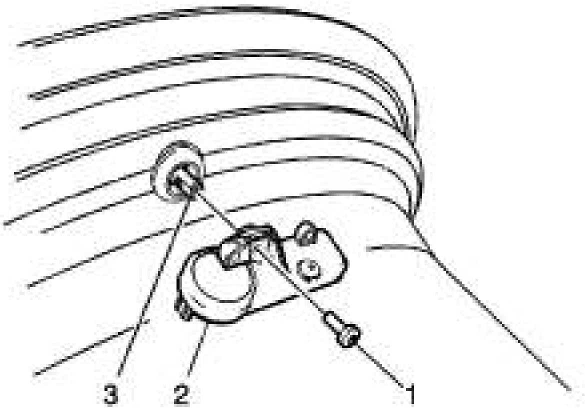
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Tire Pressure Monitoring | Repair Instructions | **Document ID: 1992754**

Tire Pressure Indicator Sensor Replacement

Removal Procedure

1. Raise the vehicle on a suitable support. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire/wheel assembly from the vehicle. Refer to Tire and Wheel Removal and Installation .
3. Remove the tire from the rim. Refer to Tire Dismounting and Mounting .

Important: When servicing the tire pressure sensor always use a new Schrader® tire pressure monitor (TPM) and a new TORX screw during installation.



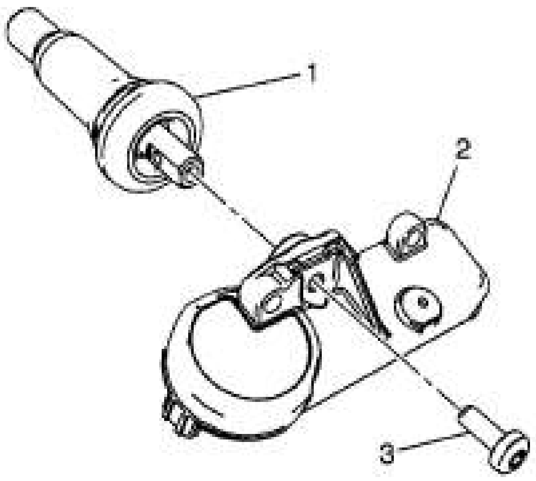
4. Remove the TORX screw (1) from the tire pressure sensor (2) and pull it straight off the tire pressure valve stem (3).

Notice: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

5. Remove the tire pressure valve stem by pulling it through the rim.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



Important:

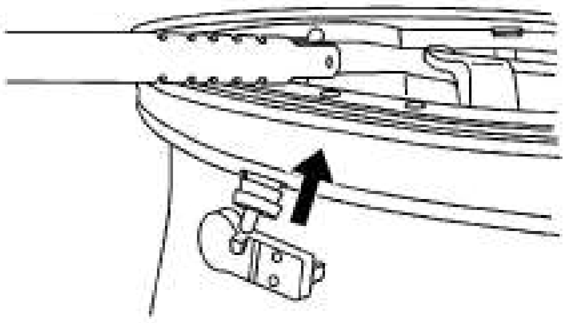
- Ensure the flat of the valve, lines up with the flats of the snap in the enclosure.
- TPM valves and TORX screws are one-time use only.

1. Assemble the tire pressure sensor (2) to the valve stem and install the new TORX screw (3).

   Tighten
   Tighten the TORX screw to 1.3 N·m (11.5 lb in).

   Important: Use and approved tire mounting lubricant. DO NOT use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A corrosive type compound can cause tire or rim deterioration.

2. Apply tire soap to the rubber portion of the valve stem (1).



3. Using a tire valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.

   Important: Snap Fit TPM sensors are still shipped in the OFF mode. However, the TPM no longer needs to be spun to remove it from the OFF mode. The sensor will exit its OFF state when the tire is inflated. The technician can then program the vehicle as normal.

4. Fit the tire to the rim. Refer to Tire Dismounting and Mounting .
5. Install the tire/wheel assembly on the vehicle. Refer to Tire and Wheel Removal and Installation .
6. Lower the vehicle.
7. Learn the tire pressure sensors. Refer to Tire Pressure Indicator Sensor Programming .

Tire Pressure Monitor Description and Operation (LWB)

Tyre Pressure Monitoring System (TPMS) Description and Operation Overview

The tyre pressure monitor system (TPMS) warns the driver when a significant loss of tyre pressure occurs in any of the four tyres and allows the driver to display the individual tyre pressures on the instrument panel cluster (IPC) while the vehicle is being driven. The system uses the remote control door lock receiver (RCDLR)/tyre pressure monitor (TPM) module, instrument panel cluster (IPC) and four radio frequency transmitting pressure sensors inside each wheel/tyre assembly (spare wheel is equipped but inactive) to perform the system functions. When vehicle speed is less than 32 km/h (20 mph), the sensors go into stationary mode. In this mode the sensors transmit to the RCDLR once every 60 minutes to minimize sensor battery consumption. As vehicle speed increases to 32 km/h (20 mph), centrifugal force closes the sensor's internal roll switch causing the sensors to go into drive mode. In this mode the sensor transmits once every 60 seconds to the RCDLR. The RCDLR translates the information within the sensors radio frequency transmission into sensor presence, sensor mode and tyre pressure. The RCDLR then sends this information to the IPC unit via the TPM module where the tyre pressures and there locations are displayed on the IPC. If the TPM module detects a significant loss of tyre pressure or if a tyre is over inflated the tyre pressure of the affected tyre is displayed on the IPC. The IPC will flash and the affected tyre pressure warning indicator is displayed on the IPC. The IPC indicator can be cleared by adjusting tyre pressures to the recommended kPa/psi.(refer to the tyre placard). The sensors pressure accuracy range is from -10°C to +70°C (+14°F to +158°F) is plus or minus seven kPa (one psi). The RCDLR has the ability to detect malfunctions within the TPMS. Any malfunctions detected will cause the IPC to display the relevant fault message.

Diagnostic Starting Point - Tires and Wheels

Tyre Wear

Analysis of tyre wear conditions varies according to the type, size and brand of the tyre fitted to the vehicle. Refer to the tyre manufacturer's literature relating to tyre wear when evaluating tyre wear conditions.

Tyre and Wheel Inspection

This visual inspection should be conducted for all vibration concerns unless the disturbance only occurs with the vehicle at a standstill.

- The tyres should be inspected for unusual wear. Unusual wear conditions can cause tyre growl, howl, slapping noises, and vibrations throughout the vehicle. Refer to Tire Diagnosis - Irregular or Premature Wear .
- Check for debris build-up, such as packed mud, undercoating, ice/snow buildup, road tar, etc. If debris build up is found it must be removed.
- Check for bulging in the tyre sidewalls. If bulging is found tyre must be replaced. Refer to Tire Dismounting and Mounting .
- Check the condition of all wheels. Refer to Replacement Wheels Description .
- Check that all tyres are inflated to the correct pressures prior to any road test. Refer to Tire Inflation Pressure Specifications .

Road Testing

Caution: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

There are many potential causes for a vibration condition to be present in a vehicle. It is vital that a thorough road test be conducted to identify the causes for a vibration condition.

Slow Acceleration Test

This test is to identify engine or vehicle speed related conditions. It will be necessary to perform additional tests in order to determine in which category the vibration belongs.

1. Slowly accelerate on a smooth level road up to allowable speed.
2. Identify a vibration condition that matches the customer's description.
3. Note the vehicle speed (km/h) and engine speed (RPM) where the vibration condition occurs.

Follow this test with the neutral coast down test, and the downshift test.

Neutral Coast Down Test

1. Accelerate on a smooth level road, to a speed slightly higher than the speed at which the

vibration occurs.

2. Shift the vehicle into NEUTRAL and coast down through the vibration range. Note if the vibration occurs in NEUTRAL.

If the vibration occurs in NEUTRAL, the vibration is vehicle-speed sensitive eliminating the engine and torque converter as a cause. Depending on the symptoms or frequency, the repair will concentrate on either the tyres and wheels, the propeller shaft or the rear axle.

Downshift Test

1. Accelerate on a smooth level road, to the speed at which the vibration condition occurs. Note the engine RPM.
2. Decelerate and safely downshift to the next lower gear.
3. Operate the vehicle at the previously noted engine RPM.

If the vibration returns at the noted engine RPM, the engine or torque converter is the most probable cause. To confirm these results, repeat this test in lower gears and NEUTRAL.

Steering Input Test

This test is intended to determine how much wheel bearings and other suspension components contribute to a vibration, especially those relating to noises, howl, growl, grinding and roaring.

With the vehicle at the vibration speed drive through slow sweeping turns in both directions.

If the vibration gets worse or goes away, the wheel hubs and tyre tread wear are possible causes.

Standing Start Acceleration

The purpose of this test is to duplicate a vibration known as Take-off-Shudder. A powertrain mount or the exhaust contacting the body may also be a potential cause depending on the symptoms.

1. With the vehicle at a complete stop and in gear, remove your foot from the brake.
2. Accelerate while checking for vibrations that match the customer's description.

Shudder in the seat or steering wheel under these conditions usually results from incorrect driveline angles. Worn, tight or failed universal joint may also be a cause, and should be inspected first.

Grunting or groaning noises along with a buzzing or roughness in the floor usually points to the vibration being conducted through the engine or transmission mounts, or through exhaust mounts and hangers that have grounded.

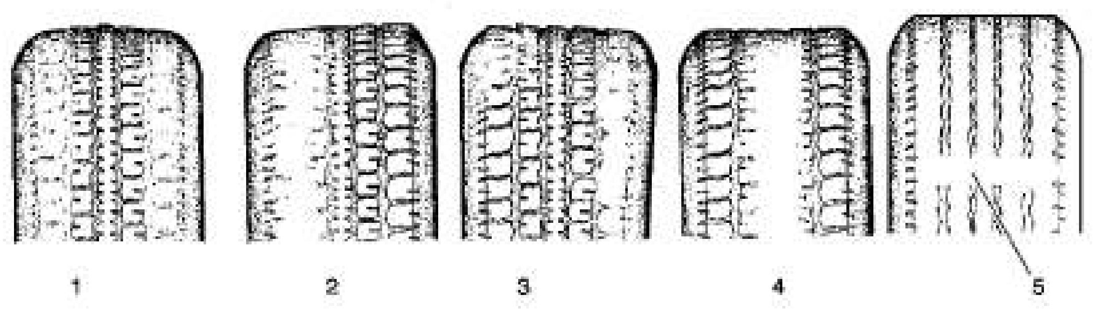
Radial Tire Lead / Pull Correction

Step	Action	Yes	No
DEFINITION: Lead/pull is the deviation of the vehicle from a straight path on a level road with no pressure on the steering wheel.			
1	Road test the vehicle to verify the complaint. Select a smooth level surface to perform the test. Does the condition exist?	Go to Step 2	System OK
2	1. Switch the front tyre and wheel assemblies from side to side. Refer to Tire and Wheel Removal and Installation in Tires and Wheels. 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to Step 3	System OK
3	Does the vehicle lead/pull in the opposite direction?	Go to Step 4	Go to Wheel Alignment Measurement in Wheel Alignment
4	1. Switch the left front tyre and wheel assembly with the left rear tyre and wheel assembly. Refer to Tire and Wheel Removal and Installation in Tires and Wheels. 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to Step 5	Go to Step 6
5	1. Switch the right front tyre and wheel assembly with the right rear tyre and wheel assembly. Refer to Tire and Wheel Removal and Installation in Tires and Wheels. 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to Wheel Alignment Measurement in Wheel Alignment	Go to Step 7
6	Replace the left rear tyre. Refer to Tire Dismounting and Mounting in Tires and Wheels. Is the repair complete?	Go to Step 8	--
7	Replace the right rear tyre. Refer to Tire Dismounting and Mounting in Tires and Wheels.		

	Is the repair complete?	Go to Step 8	--
8	Verify correct vehicle operation. Does the condition still exist?	Go to Step 1	System OK

Tire Diagnosis - Irregular or Premature Wear

Tyre Wear



(1) Under-Inflation, Hard Cornering, Lack of Regular Rotation

(2) Incorrect Wheel Alignment, Hard Cornering, Lack of Regular Rotation

(3) Incorrect Wheel Alignment, Shock Absorber Failure

(4) Over-Inflation, Heavy Acceleration, Lack of Regular Rotation

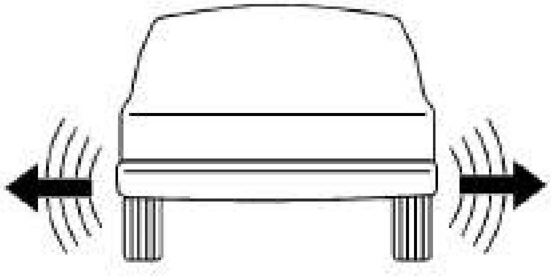
(5) Normal Wear to wear indicator

Inspection Procedure

1. Inspect front tyres for wear and damage.
2. Inspect rear tyres for wear and damage.
3. Rotate the tyre and wheel assembly if any of the following conditions exist:
   - The amount of time or distance since the last tyre rotation matches the maintenance schedule.
   - The outer tread blocks are worn more than the middle tread blocks (1).
   - The outer tread blocks are worn more than the inner tread blocks (2).
   - The middle tread blocks are worn more than the outer tread blocks (4).
4. Measure the wheel alignment. Refer to Wheel Alignment Measurement . If any of the following conditions exist:
   - The tread blocks have feather edges (3).
   - The outer tread blocks are worn more than the inner tread blocks (2).
   - The inner tread blocks are worn more than the outer tread blocks (4).
5. Inspect the struts or the shock absorbers if the tyre tread exhibits a cupped appearance (3).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Tires and Wheels | Diagnostic Information and Procedures | **Document ID: 2076155**

Tire Diagnosis - Waddle Complaint



Tyre waddle is a side to side movement at the front of the vehicle and/or the rear of the vehicle. Tyre waddle can be caused by the following conditions:

- A steel belt not being straight within the tyre.
- Excessive lateral runout of the tyre.
- Excessive lateral runout of the wheel.

Tyre waddle is most noticeable at an approximate speed of about 8-48 km/h (5-30 mph). Tyre waddle may appear as ride roughness at 80-113 km/h (50-70 mph). Tyre waddle may appear as a vibration at 80-113 km/h (50-70 mph).

Inspection Procedure

Step	Action	Yes	No
1	Has a vehicle road test been completed?	Go to Step 2	Go to Diagnostic Starting Point - Tires and Wheels
	Caution: Wear gloves when inspecting the tires in order to prevent personal injury from steel belts sticking through the tire. 1. Raise and support the vehicle with safety stands. Refer to Lifting and Jacking the Vehicle. 2. Mark the tyre in order to note the start and the		

2	stop position. 3. Rotate each tyre and wheel assembly by hand. 4. Visually inspect the tyre and wheel assemblies for the following: - Debris build-up, such as packed mud, undercoating, ice/snow buildup, road tar, etc. - Damage, abnormal or excessive wear Do any of the tyre and wheel assemblies exhibit any of the conditions listed?	Go to Step 3	Go to Step 4
3	1. Remove the debris from the tyre and wheel assemblies. 2. Replace the damaged, abnormally or excessively worn wheels or tyres as necessary. Refer to Tire Dismounting and Mounting. Did you complete the repair or replacement?	Go to Step 8	--
4	Measure the on-vehicle runout of the tyre and wheel assemblies. Refer to Tire and Wheel Assembly Runout Measurement - On-Vehicle. Does the runout measurement indicate a runout concern?	Go to Step 5	Go to Step 9
5	Measure the off-vehicle runout of the tyre and wheel assemblies. Refer to Tire and Wheel Assembly Runout Measurement - Off Vehicle. Does the runout measurement indicate a runout concern?	Go to Step 15	Go to Step 6
6	Are any of the tyre and wheel assembly runout measurements marginal; within acceptable limits, but close to the maximum?	Go to Step 7	Go to Step 12
7	**Important:** Ensure that each tyre and wheel assembly is match-mounted and balanced before reinstalling to the vehicle. 1. Match-mount the tyre to the wheel for each tyre and wheel assembly with marginal runout. Refer to Tire-to-Wheel Match-Mounting (Vectoring). 2. Measure the runout of each match-mounted tyre and wheel assembly. Refer to Tire and Wheel Assembly Runout Measurement - Off Vehicle. Were you able to significantly reduce the amount of tyre and wheel assembly runout?	Go to Step 8	Go to Step 15
8	Remeasure the on-vehicle runout of the tyre and wheel assemblies. Refer to Tire and Wheel Assembly Runout Measurement - On-Vehicle. Does the measurement indicate a runout concern?	Go to Step 12	Go to Step 17
	Inspect the balance of the tyre and wheel assemblies.		

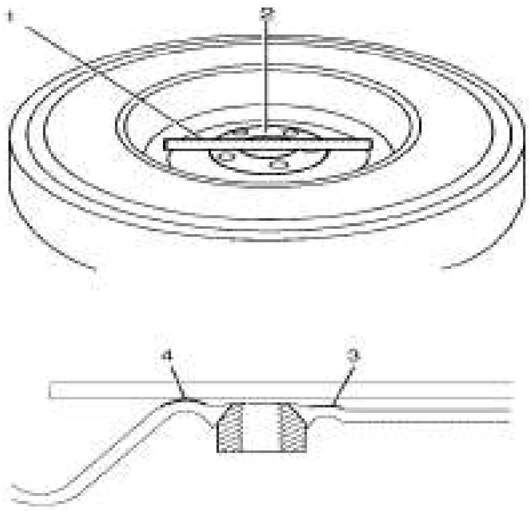
9	Refer to Tire and Wheel Balancing . Are any or the tyre and wheel assemblies out of balance?	Go to Step 10	Go to Step 11
10	Balance the tyre and wheel assemblies as necessary. Refer to Tire and Wheel Balancing . Did you complete the repair or replacement?	Go to Step 17	--
11	1. Inspect the brake discs for damage. 2. Inspect the brake disc assembled lateral runout. Refer to Brake Rotor Assembled Lateral Runout Correction. Are any of the brake discs damaged and/or indicate a runout concern?	Go to Step 14	Go to Step 16
12	Measure the runout of the hub/axle flanges. Refer to Front Wheel Hub Assembly Inspection Does the runout measurement indicate a runout concern?	Go to Step 13	Verify customer concern, go to Strategy Based Diagnosis.
13	Replace components as required. Refer to the following procedures as necessary: • Front Wheel Bearing and Hub Replacement. • Rear Wheel Bearing and Hub Replacement. Did you complete the replacement?	Go to Step 17	--
14	Replace the brake discs as necessary. Refer to the appropriate procedure: • Front Brake Rotor Replacement • Rear Brake Rotor Replacement Did you complete the replacement?	Go to Step 17	--
15	Replace any tyres and/or wheels that were isolated as the cause of the disturbance, as necessary. Refer to Tire Dismounting and Mounting in Tires and Wheels. Did you complete the replacement?	Go to Step 17	--
16	Finish-balance the tyre and wheel assemblies on-vehicle. Refer to Tire and Wheel Balancing in Tires and Wheels. Did you complete the on-vehicle finish balancing?	Go to Step 17	--
17	1. Install or connect any components that were removed or disconnected during diagnosis. 2. Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 4

Wheel Mounting Surface Check

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the wheels. Refer to Tire and Wheel Removal and Installation .
3. Inspect the wheel stud holes for damage. If damage is found the wheel must be replaced. Refer to Replacement Wheels Description .
4. Thoroughly clean the wheel mounting surface.



Important: Use a straight edge (1) 150 to 165 mm (6 to 6.5 in) long.

Important: If you can rock the straight edge (1) the mounting surface (2) is bent and the wheel must be replaced.

Important: For steel wheels the outer mounting ring (4) is designed to be raised slightly above the inner mounting ring (3).

5. Place a straight edge (1) across the wheel inboard mounting surface (2) over a wheel stud hole. Attempt to rock the straight edge up and down on the mounting surface.
6. Repeat Step 5 over every wheel stud hole.
7. Replace wheels as required. Refer to Replacement Wheels Description and Tire Dismounting and Mounting .
8. Remove the safety stands.
9. Lower the vehicle to the ground.

Tire and Wheel Balancing (Off Vehicle LWB SWB)

Important: The tyre and wheel assembly must be balanced off vehicle before attempting to balance the tyre and wheel assembly on vehicle. Refer to Tire and Wheel Balancing .

If after following the tyre and wheel vibration diagnostic process, some amount of tyre and wheel vibration is still evident, an on-vehicle high-speed spin balancer may be used to perform an on-vehicle balance in an attempt to finish balance the tyre and wheel assemblies, wheel hubs, brake rotors and wheel trim, if equipped, simultaneously. On-vehicle balancing can also compensate for minor amounts of residual runout encountered as a result of mounting the tyre and wheel assembly on the vehicle, as opposed to the balance which was achieved with the off-vehicle balancing procedure.

Important: Note the following information before performing the on-vehicle tyre and wheel balance:

- Vehicles equipped with low profile, wide tread path, high performance tyres and wheels are susceptible to small amounts of dynamic imbalance.
- When performing an on-vehicle balance, care must be taken when placing the wheel balance weights on the wheels. If the wheel balance weights are not placed accurately, they can induce dynamic imbalance and increase the severity of the vibration.
- Inspect the wheel bearings to ensure that they are in good condition. Refer to Front Wheel Bearing and Hub Replacement or Rear Wheel Bearing and Hub Replacement .
- Thoroughly inspect all on-vehicle balancing equipment and make sure that it is within the manufacturer's recommended specifications.
- Do not remove the off-vehicle balance weights. The purpose of on-vehicle balance is to fine tune the assembly balance already achieved off-vehicle, not to start over.
- Leave all wheel trims installed whenever possible.
- If the on-vehicle balancer calls for more than 56 g (2 oz) of additional weight, split the weight between the inboard and outboard flanges of the wheel, so as not to upset the dynamic balance of the assembly achieved in the off-vehicle balance.

  Perform the on-vehicle balancing procedure in accordance with the on-vehicle balancer manufacturer's instructions.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Tires and Wheels | Repair Instructions | Document ID: 1997040

Tire and Wheel Removal and Installation

Tools Required

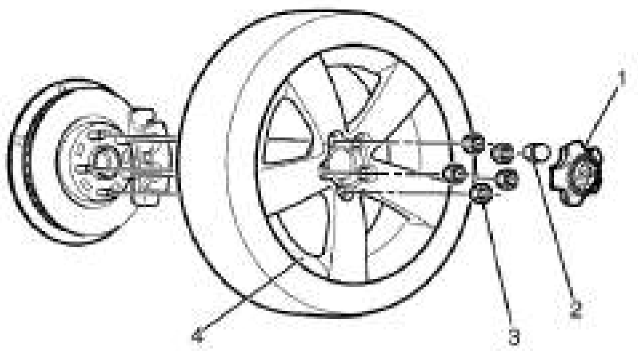
J-39544-18A Torque Limiting Bar

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



2. Remove the wheel centre cap (1) (alloy wheels).
3. Remove the wheel nut caps (2), if equipped.
4. Mark the wheel in relation to the wheel hub flange.
5. Remove the wheel nuts (3).

Caution: If penetrating oil gets on the vertical surfaces between the wheel and the rotor or drum it could cause the wheel to work loose as the vehicle is driven, resulting in loss of control and an injury accident.

Notice: Never use heat to loosen a tight wheel. It can shorten the life of the wheel, studs, or hub and bearing assemblies. Wheel nuts must be tightened in sequence and to the specified torque to avoid bending the wheel or rotor.

6. Remove the tire and wheel assembly (4).

If the tire and wheel assembly is difficult to remove, perform the following steps:

6.1. Install and tighten all wheel nuts on the affected wheel.
6.2. Loosen each wheel nut 2 turns.
6.3. Lower the vehicle to the ground.
6.4. Rock the vehicle from side to side.
6.5. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
6.6. Remove the wheel nuts.
6.7. Remove the tire and wheel assembly.

Installation Procedure

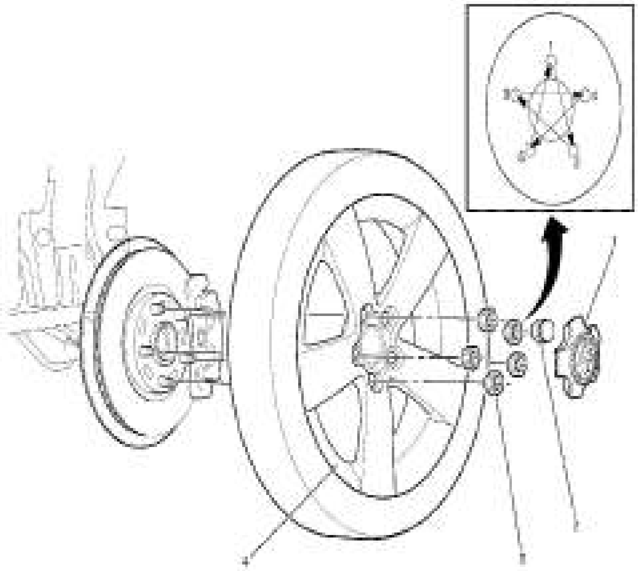
Caution: Before installing the wheels, remove any buildup of corrosion on the wheel mounting surface and brake drum or disc mounting surface by scraping and wire brushing. Installing wheels with poor metal-to-metal contact at the mounting surfaces can cause wheel nuts to loosen. This can cause a wheel to come off when the vehicle is moving, causing loss of control and possibly personal injury.

1. Remove any corrosion or foreign material from the wheel and the hub mounting surfaces.

Important: Do not apply any lubricant to the wheel stud or wheel nut threads.

2. Clean the threads on the wheel studs and wheel nuts.

Notice: Refer to Fastener Notice in the Preface section.



Notice: A torque wrench or J 39544 must be used to ensure that wheel nuts are tightened to specification. Never use lubricants or penetrating fluids on wheel stud, nuts, or mounting surfaces, as this can raise the actual torque on the nut without a corresponding torque reading on the torque wrench. Wheel nuts, studs, and mounting surfaces must be clean and dry. Failure to follow these instructions could result in wheel, nut, and/or stud damage.

Important: Tighten the nuts evenly and alternately in the sequence shown.

Important: An pneumatic/electric impact tool can only be used to tighten wheels nuts if used in conjunction with the correct specification torque limiting bar. Use special tool J-39544-18A.

3. Install the tire and wheel assembly (4).

   Install the wheel nuts (3).

   Tighten
   Tighten the wheel nuts in sequence to 170 N·m (125 lb ft)

4. Install the wheel nut caps (2), if equipped.
5. Install the wheel centre cap (1) (alloy wheels).
6. Lower the vehicle to the ground.

Tire Dismounting and Mounting (LWB SWB)

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tyre and wheel assemblies from the vehicle. Refer to Tire and Wheel Removal and Installation .

Notice: Damage to either the tire bead or the wheel mounting holes can result from the use of improper wheel attachment or tire mounting procedures. It takes up to 70 seconds for all of the air to completely exhaust from a large tire. Failure to follow the proper procedures could cause the tire changer to put enough force on the tire to bend the wheel at the mounting surface. Such damage may result in vibration and/or shimmy, and under severe usage lead to wheel cracking.

3. Deflate the tyre completely.

Notice: Use a tire changing machine in order to dismount tires. Do not use hand tools or tire irons alone in order to remove the tire from the wheel. Damage to the tire beads or the wheel rim could result.

Notice: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

Important: If the tyre is to be refitted note and record the relationship and orientation of the tyre to the wheel.

4. Remove the tyre from the wheel, using a tyre changing machine.
5. Remove any rubber, light rust or corrosion from the wheel bead seats.

Notice: When mounting the tires, use an approved tire mounting lubricant. DO NOT use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A silicon base compound can cause the tire to slip on the rim. A corrosive type compound can cause tire or rim deterioration.

6. Apply an approved Lubricant to the tyre bead and the wheel rim.

Important: Rim-clamp tyre changes are recommended.

Important: If fitting the original tyre maintain the original relationship and orientation of the tyre to the wheel.

Important: If fitting an Australian manufactured tyre align the RED dot on tyre to the mark on outer flange of wheel, or if there is no mark on the wheel, align RED dot to low point of wheel as measured with dial indicator.

Important: If fitting an European manufactured tyre align the WHITE dot on the tyre

180 degrees from the mark on outer flange of wheel, or if there is no mark on the wheel, align WHITE dot 180 degrees from the low point of the wheel as measured with the dial indicator.

Important: If fitting a Japanese manufactured tyre and there is a YELLOW dot but not a RED dot use the rule for Australian tyres. If there is a YELLOW and a RED dot, ignore the YELLOW dot and use the RED dot as per the rule for Australian tyres.

7. Install the tyre to the wheel using a tyre changer.

Caution: To avoid serious personal injury, do not stand over tire when inflating. The bead may break when the bead snaps over the safety hump. Do not exceed 275 kPa (40 psi) pressure when inflating any tire if beads are not seated. If 275 kPa (40 psi) pressure will not seat the beads, deflate, relubricate the beads and reinflate. Overinflation may cause the bead to break and cause serious personal injury.

8. Inflate the tyre to the specified pressure. Refer to Tire Inflation Pressure Specifications .
9. Make sure that the locating rings are visible on both sides of the tyre in order to verify that the tyre bead is fully seated on the wheel.
10. Balance the tyre and wheel. Refer to Tire and Wheel Balancing off vehicle.
11. Install the tyre and wheel. Refer to Tire and Wheel Removal and Installation .
12. Remove the safety stands.
13. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Tires and Wheels | Repair Instructions | **Document ID: 2013665**

Tire Dismounting and Mounting (LWB)

Removal Procedure

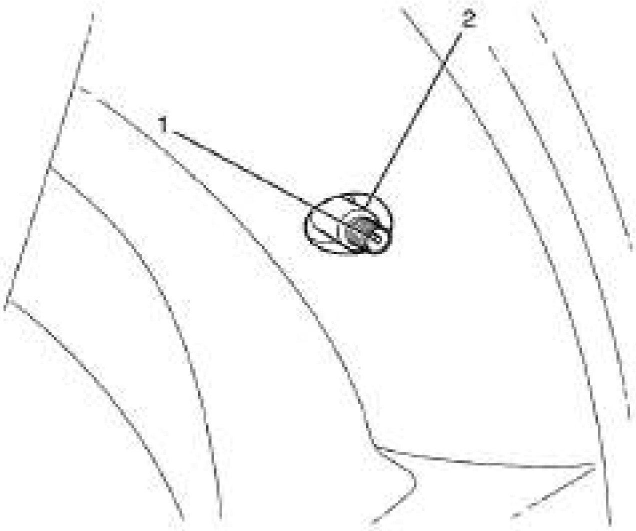
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the tyre and wheel assemblies from the vehicle. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.

Notice: Refer to General Repair Instructions in the Preface section.

3. Remove the valve cap.



Important: The valve core (1) is a single use part. It must be discarded after removal.

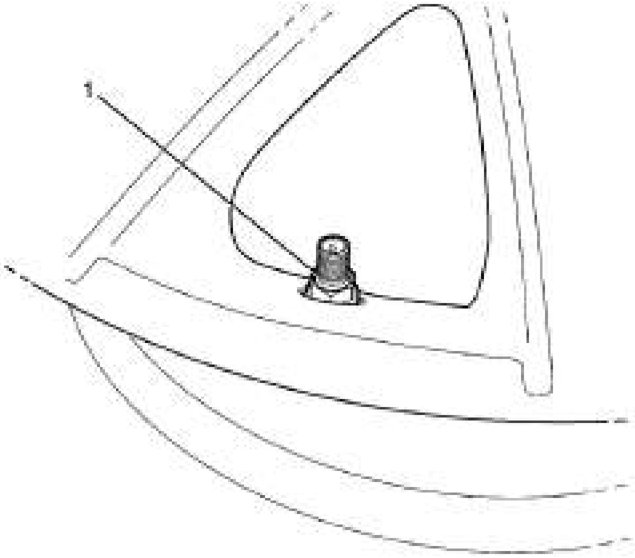
Important: If the tyre is to be refitted note and record the relationship and orientation of the tyre to the wheel.

4. Using a suitable tool remove the valve core (1) from the valve stem (2).

   Discard the valve core.

5. Deflate the tyre completely.
6. Remove the tyre from the wheel, using a tyre changing machine.
7. Remove any rubber, light rust or corrosion from the wheel bead seats.

Disassembly Procedure

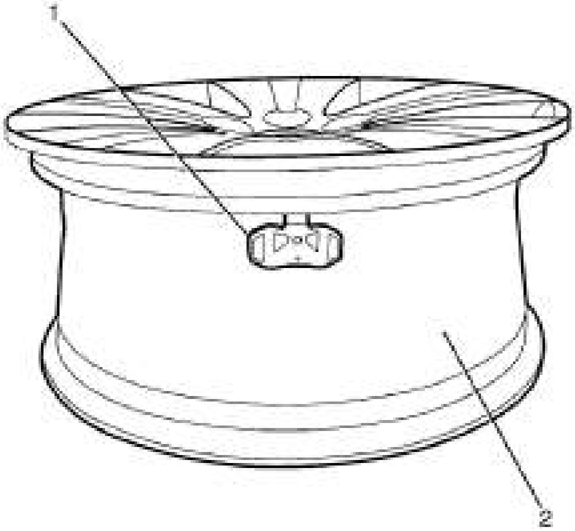


Important: The tyre pressure transmitter to wheel retaining nut (1) is a single use part. It must be discarded after removal.

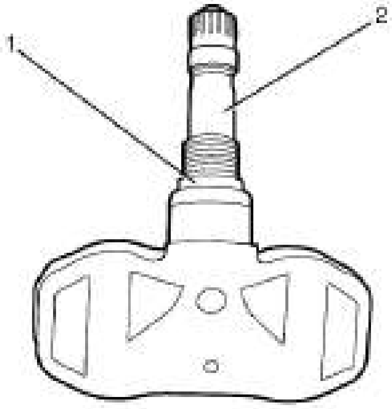
1. Remove the tyre pressure transmitter to wheel retaining nut (1).

   Discard the nut.

2. Remove the tyre pressure transmitter from the wheel.



3. Remove the tyre pressure transmitter (1) from the wheel (2).

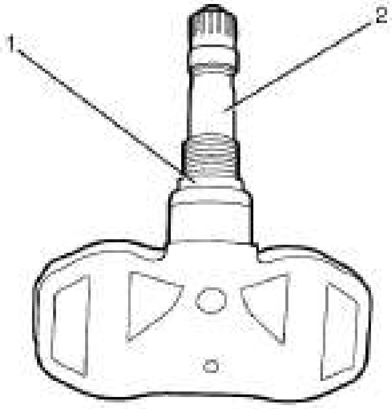


Important: The tyre pressure transmitter seal (1) is a single use part. It must be discarded after removal.

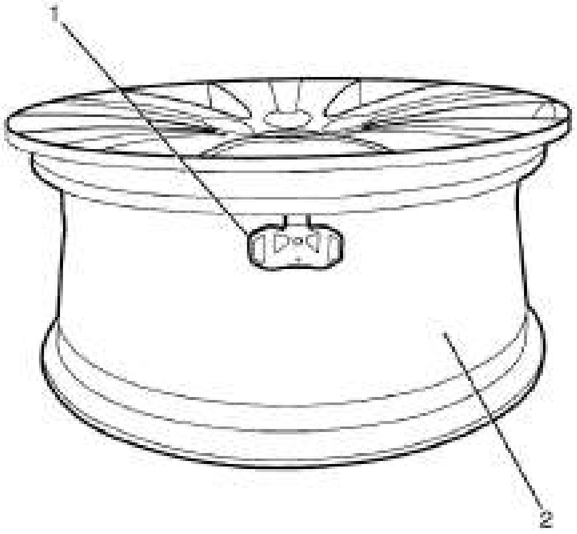
4. Remove the tyre pressure transmitter seal (1) from the tyre pressure transmitter (2).

   Discard the seal.

Assembly Procedure

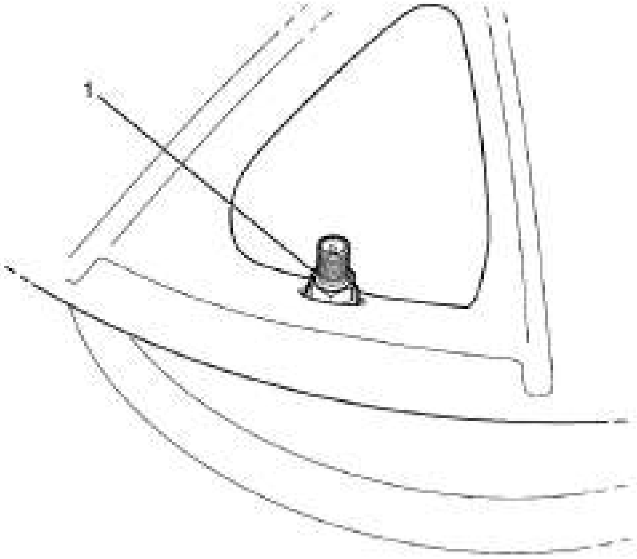


1. Install a NEW tyre pressure transmitter seal (1) to the tyre pressure transmitter (2).



2. Position tyre pressure transmitter (1) to the wheel (2).

   Notice: Refer to Fastener Notice in the Preface section.



Important: Secure the tyre pressure transmitter in the valve hole while tightening.

3. Install a NEW tyre pressure transmitter to wheel retaining nut (1).

   Tighten
   Tighten the nut to 2 N·m (18 lb in).

Installation Procedure

Notice: Refer to General Repair Instructions in the Preface section.

Important: Rim-clamp tyre changers are recommended.

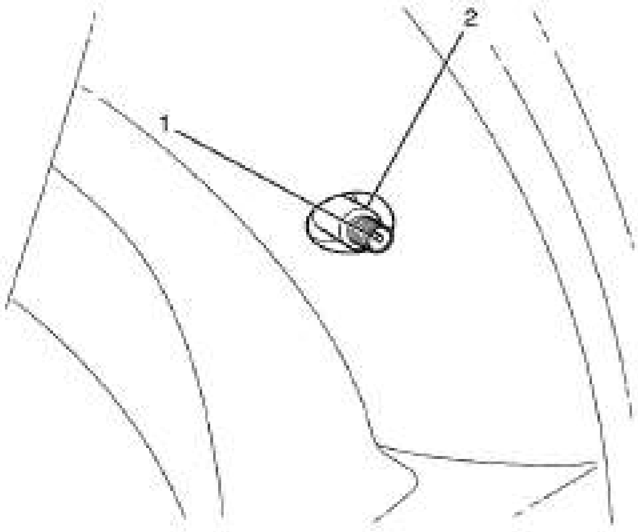
Important: If fitting the original tyre maintain the original relationship and orientation of the tyre to the wheel.

Important: If fitting an Australian manufactured tyre align the RED dot on tyre to the mark on outer flange of wheel, or if there is no mark on the wheel, align RED dot to low point of wheel as measured with dial indicator.

Important: If fitting an European manufactured tyre align the WHITE dot on the tyre 180 degrees from the mark on outer flange of wheel, or if there is no mark on the wheel, align WHITE dot 180 degrees from the low point of the wheel as measured with the dial indicator.

Important: If fitting a Japanese manufactured tyre and there is a YELLOW dot but not a RED dot use the rule for Australian tyres. If there is a YELLOW and a RED dot, ignore the YELLOW dot and use the RED dot as per the rule for Australian tyres.

1. Apply an approved lubricant to the tyre bead and the wheel rim.
2. Install the tyre using a tyre changing machine.



3. Install a NEW valve core (1) to the valve stem (2).

Caution: Refer to General Repair Instructions in the Preface section.

4. Inflate the tyre until the bead snaps over the safety hump then inflate to the specified pressure. Refer to Tire Inflation Pressure SpecificationsTire Inflation Pressure Specifications.
5. Install a valve cap to the valve stem.
6. Make sure that the locating rings are visible on both sides of the tyre in order to verify that the tyre bead is fully seated on the wheel.

7. Balance the tyre and wheel assemblies. Refer to Tire and Wheel BalancingTire and Wheel Balancing (Off Vehicle).
8. Install the tyre and wheel assemblies. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
9. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Tires and Wheels | Repair Instructions | **Document ID: 1987982**

Tire Rotation (LWB SWB)

Important: If uneven tyre wear is evident, the reason for the wear should be corrected.

Important: If the tyres are rotated, it is recommended that the tyre and wheel assembly balance be checked at the same time.

1. It is recommended that tyre rotation be carried out when brake inspections are performed, as per the service schedule outlined in the Owner's Handbook, or when:

   Difference in tread depth between front and rear tires exceed 1.55 mm.

   When any unusual tyre wear pattern develops.

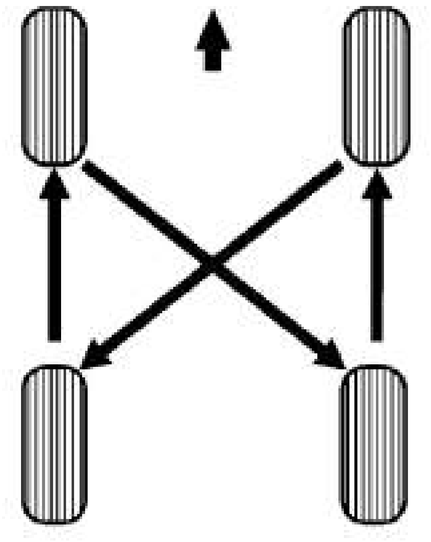
   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

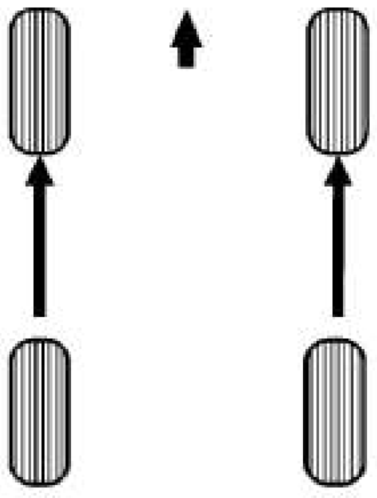
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

   Important: Note the location of each tyre and wheel assembly in relation to the original position on the vehicle.

3. Remove the tyre and wheel assembly. Refer to Tire and Wheel Removal and Installation.
4. Rotate the tyre and wheel assemblies as shown in the following diagrams.



Important: For 'Non Directional' tyres carry out rotation as shown Above.



Important: For 'Directional' tyres carry out rotation as shown Above.

5. Install the tyre and wheel assemblies. Refer to Tire and Wheel Removal and Installation.
6. Remove the safety stands.
7. Lower the vehicle.
8. Check and adjust the tyre inflation pressure. Refer to Tire Inflation Pressure Specifications.

Tire Repair

Many different materials and techniques are available on the market in order to repair tyres. Not all of the materials and techniques work on some types of tyres. Tyre manufacturers have published detailed instructions on how and when to repair tyres. Obtain the instructions from the manufacturer. If the vehicle is equipped with a compact spare tyre, do not repair the compact spare tyre.

General Description

The factory installed tires are designed to operate satisfactorily with loads up to and including the full rated load capacity when these tires are inflated to the recommended pressures.

The following factors have an important influence on tire life:

- Correct tire pressures
- Correct wheel alignment
- Proper driving techniques
- Tire rotation

The following factors increase tire wear:

- Heavy cornering
- Excessively rapid acceleration
- Heavy braking

P-Metric Sized Tires Description

The tyre sidewall has a coded marking system, which provides information about the tyre.

50	Aspect Ratio % (Section Height to Section Width) (50 = 50%)
R	Tyre Construction

	(R = Radial)	
16	Rim Diameter in inches (16 = 16")	
C	Service Application Code (C or LT = Light Truck or Multi-purpose Passenger Vehicle) **NOTE:** Some European and Japanese light truck tyres use C instead of LT for the same purpose.	
95	Max Load Index	91 = 615 kg
		92 = 630 kg
		93 = 650 kg
		94 = 670 kg
		95 = 690 kg
		96 = 710 kg
		97 = 730 kg
		99 = 775 kg
		104 = 900 kg
		106 = 950 kg
S	Speed Rating	R = 170 km/h
		S = 180 km/h
		H = 210 km/h
		V = 240 km/h
		W = 270 km/h

Metric Wheel Nuts and Bolts Description

All models use metric (M14 x 1.5) wheel attaching studs and nuts. There is only 1 type of wheel nut that is used to attach both alloy and steel wheels. Each wheel is attached to the wheel hub by 5 wheel hub studs and 5 wheel nuts.

For removal and installation instructions for the wheel attaching studs, refer to Wheel Stud Replacement for Front, or Wheel Stud Replacement for Rear.

Metric wheel/nuts and bolts are identified in the following way:

The wheel/nut has the word Metric stamped on the face.

The thread sizes of metric wheel/nuts and the bolts are indicated by the following example: M14 x 1.5.

- M = Metric
- 14 = Diameter in millimeters
- 1.5 = Thread pitch in Millimeters

Replacement Wheels Description

Replace the wheel if any of the following conditions exist:

- The wheel exhibits excessive runout.
- The wheel is bent.
- The wheel mounting surface is bent.
- The wheel is cracked.
- The wheel is severely rusted.
- The wheel is severely corroded.

Replace the wheel, the wheel hub studs and the wheel nuts, if any of the following conditions exist:

- The wheel has elongated wheel stud holes.
- The wheel nuts loosen repeatedly.

Caution: Refer to General Repair Instructions in the Preface section.

Notice: Refer to General Repair Instructions in the Preface section.

Important:

- Replacement wheels must be equivalent to the original equipment wheels in the following ways:
  - The load capacity.
  - The wheel diameter.
  - The rim width.
  - The wheel offset.
  - The mounting configuration.
- A wheel of the incorrect size or type may affect the following conditions:
  - Wheel and hub-bearing life.
  - Brake cooling.
  - Speedometer/odometer calibration.
  - Vehicle ground clearance.
  - Tire clearance to the body and the chassis.

Steel wheel identification is stamped into the wheel rim.

Aluminium wheel identification is cast into the inboard side of the wheel.

Tire Inflation Description

This vehicle has been engineered to operate up to the stated load capacity with wheel and tyre assemblies of the type, size, construction, and configuration as originally installed. Maintenance of the tyre inflation pressures is critical to the continued satisfactory performance, handling, and operating economy of the vehicle.

Operating the vehicle with incorrectly inflated tyres can adversely affect vehicle performance and may contribute to the following:

- Reduced fuel economy
- Tyre overloading
- Reduced tyre life
- Excessive tyre wear
- Uneven tyre wear
- Vehicle handling concerns

Inspect the tyre pressures when the vehicle has not been driven for at least 3 hours or not more than 1.6 km (1 mi) and when the tyres are cool to the touch.

Replace any missing or damaged tyre valve stem extensions and/or caps to prevent the intrusion of water and contaminates.

One pound per square inch (psi) equals 6.9 kilopascals (kPa). The following table illustrates the conversion of kilopascals to pounds per square inch:

Inflation Pressure Conversion (Kilopascals to PSI)

kPa	psi	kPa	psi
140	20	215	31
145	21	220	32
155	22	230	33
160	23	235	34
165	24	240	35
170	25	250	36
180	26	275	40
185	27	310	45
190	28	345	50
200	29	380	55
205	30	415	60
Conversion: 6.9 kPa = 1 psi			

For the correct inflation pressures refer to the vehicle's tyre placard.

Tyres inflated to a higher than recommended pressure can contribute to the following conditions:

- A hard ride
- Tyre bruising
- Rapid tread wear at the center of the tyre

Tyres inflated to a lower than recommended pressure can contribute to the following conditions:

- Tyre squeal on turns
- Hard steering
- Rapid and/or uneven wear on the outer edges of the tread
- Tyre rim bruises and tyre rim rupture
- Tyre cord breakage
- High tyre temperatures
- Sluggish vehicle handling
- Higher fuel consumption

Unequal pressure on the same axle can cause the following conditions:

- Uneven braking action
- Steering lead
- Imprecise vehicle handling

Wheel Alignment Measurement

Important: Steering and vibration concerns are not always the result of incorrect alignment. Other causes could include:

- Wheel and Tyre imbalance. Refer to Tire and Wheel Assembly Balancing - Off Vehicle or Tire and Wheel Assembly Balancing - On-Vehicle
- Tyre lead due to wear, incorrectly manufactured or incorrectly mounted tyres. Refer to Radial Tire Lead/Pull Correction .
- Before performing any adjustments affecting wheel alignment, perform the following inspections and adjustments in order to ensure correct alignment readings.
- Inspect tyres for correct inflation. Refer to Tire Inflation Pressure Specifications .
- Inspect tyres for irregular wear. Refer to Tire Diagnosis - Irregular or Premature Wear .
- Inspect the run out of the wheels and tyres. Refer to Tire and Wheel Assembly Runout Measurement - On-Vehicle .
- Inspect the wheel hub end float.
  - For front wheel hub Refer to Front Wheel Hub Assembly Inspection
  - For rear wheel hub Refer to Rear Wheel Hub Assembly Inspection
- Inspect the front suspension and steering ball joints for wear and damage. Refer to Ball Joint Inspection .
- Inspect the suspension control arms and stabiliser bar for wear and damage.
- Inspect the steering gear for looseness.
- Inspect the struts/shock absorbers for wear and damage. Refer to Suspension Strut and Shock Absorber Testing - On Vehicle .
- Inspect the vehicle trim height. Refer to Trim Height Inspection .
- Inspect the steering wheel for excessive drag or poor return due to stiff or binding suspension components.
- Inspect the fuel level. The fuel tank should be full or the vehicle should have compensating load added.

Important: Give consideration to excess loads such as tool boxes, sample cases, etc. If normally carried in the vehicle, these items should remain in the vehicle during the alignment adjustments. Give consideration also to the condition of the equipment being used for the alignment. Follow the equipment manufacturer's instructions.

Perform the following steps to measure the front and rear alignment angles:

Important: Satisfactory vehicle operation may occur over a wide range of alignment settings. However, if the settings are not within the allowable specifications, correct the alignment to the correct specifications. Refer to Wheel Alignment Specifications .

1. Install the alignment equipment according to the manufacturer's instructions.
2. Bounce the front and rear bumpers 3 times prior to checking the wheel alignment.
3. Measure the alignment angles and record the readings.

Important: When performing adjustments to vehicles requiring a four wheel alignment, set the rear wheel alignment angles first in order to obtain the correct front alignment angles.

4. Adjust alignment angles to vehicle specifications, if necessary. Refer to Wheel Alignment Specifications .

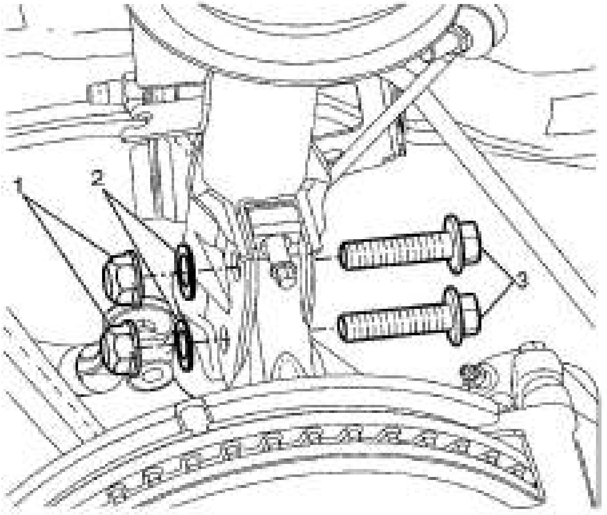
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Wheel Alignment | Repair Instructions | Document ID: 1992494

Front Caster and Camber Adjustment

Front Caster and Camber Adjustment - Up to xx/xx

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation .



Important: The strut assembly to steering knuckle retaining bolts (3), nuts (1) and washers (2) are single use parts. They must be discarded after removal.

3. Remove the strut assembly to steering knuckle retaining bolts (3), nuts (1) and washers (2).

   Discard the bolts, nuts and washers.

   Important: The strut assembly to steering knuckle retaining bolts (2) and nuts (1) are not to be fully tightened until after the front camber has been adjusted.

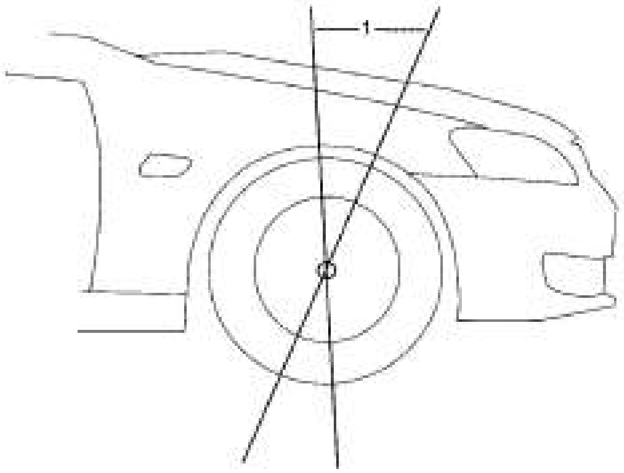
4. Install NEW strut assembly to steering knuckle retaining bolts (3), washers (2) and nuts (1).

   Do not fully tighten at this stage.

5. Install the front wheel. Refer to Tire and Wheel Removal and Installation .
6. Remove the safety stands.
7. Lower the vehicle to the ground.

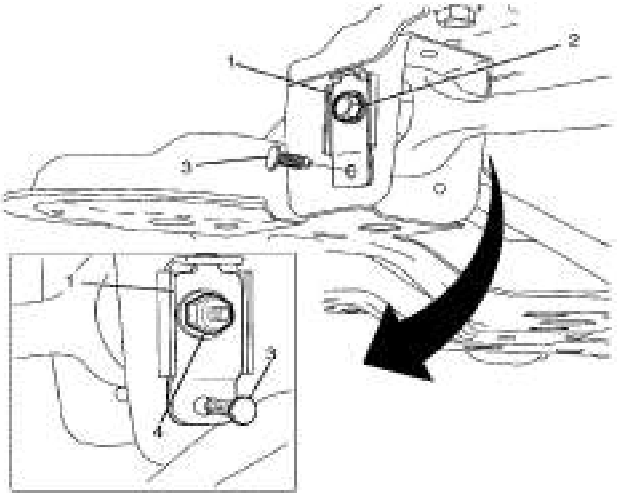
Important: Before checking and adjusting any wheel alignment angles bounce the vehicle to settle the suspension to normal ride height.

8. Bounce the vehicle several times to settle the suspension.



Important: For accurate readings do not push or pull on the tyre and wheel assembly during the alignment process.

9. Determine the actual caster angle (1).



10. Remove the front caster arm to subframe retaining nut (4) and bolt (2).

Discard the bolts and nuts.

Important: The front caster arm to subframe offset washers (1) are used to adjust the caster of the front suspension.

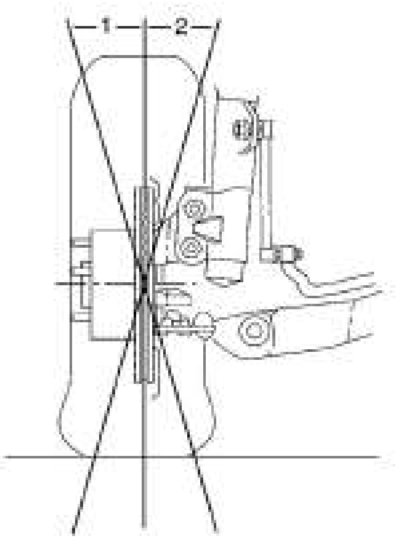
11. Adjust the caster to specification by selecting and installing the correct front caster arm to subframe offset washer (1). For caster specifications, Refer to Wheel Alignment Specifications .
12. Install the subframe offset washer to subframe retaining clips (3).
13. Install the NEW lower caster arm to the subframe retaining bolt (2).
14. Install the NEW lower caster arm to the subframe retaining nut (4).

    Do not fully tighten at this stage.

    Notice: Refer to Fastener Notice in the Preface section.

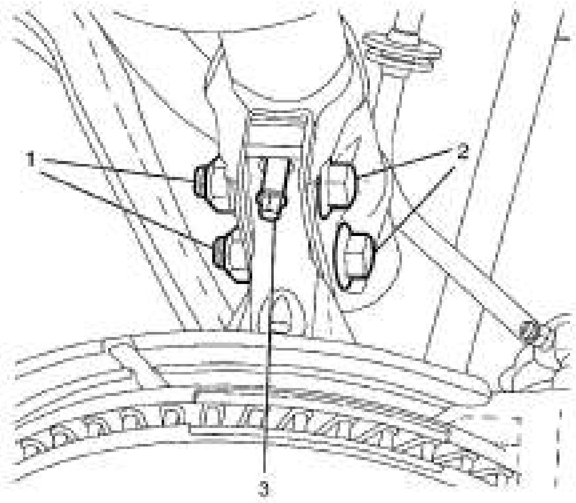
15. Tighten the front caster arm to subframe retaining nut (4).

    Tighten
    Tighten the nut to 50 N·m+ 120° (30 lb ft + 120°).



Important: For accurate readings do not push or pull on the tyre and wheel assembly during the alignment process.

16. Determine the actual camber, Positive (1) or Negative (2).



17. Adjust the camber to specification using the camber adjusting bolt (3). Turning clockwise will reduce negative camber. For camber specifications, Refer to Wheel Alignment Specifications .
18. Tighten the strut assembly to steering knuckle retaining bolts (2) and nuts (1).

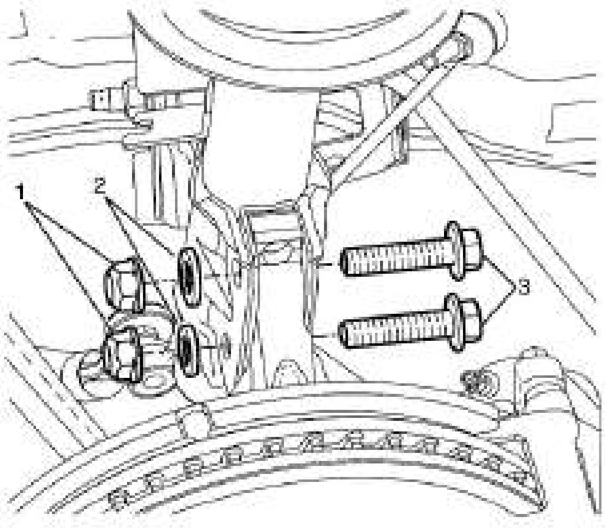
    Tighten

    - Tighten the bolts a first pass to 85 N·m (63 lb ft).
    - Tighten the bolts a second pass to 100 N·m (74 lb ft).
    - Tighten the bolts an additional 90 degrees.
19. Verify that the caster and camber are still within specifications. Refer to Wheel Alignment Specifications .
20. If further adjustment is required, adjust as necessary.

Front Caster and Camber Adjustment - From xx/xx

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation .



Important: The strut assembly to steering knuckle retaining bolts (3), nuts (1) and washers (2) are single use parts. They must be discarded after removal.

3. Remove the strut assembly to steering knuckle retaining bolts (3), nuts (1) and washers (2).

   Discard the bolts, nuts and washers.

   Important: The strut assembly to steering knuckle retaining bolts (2) and nuts (1) are not to be fully tightened until after the front camber has been adjusted.

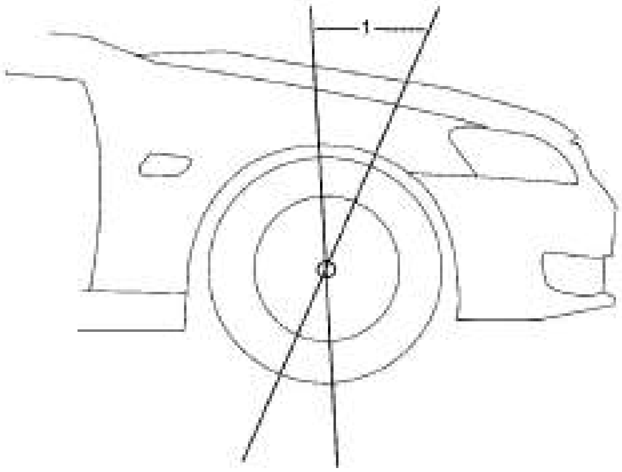
4. Install NEW strut assembly to steering knuckle retaining bolts (3), washers (2) and nuts (1).

   Do not fully tighten at this stage.

5. Install the front wheel. Refer to Tire and Wheel Removal and Installation .
6. Remove the safety stands.
7. Lower the vehicle to the ground.

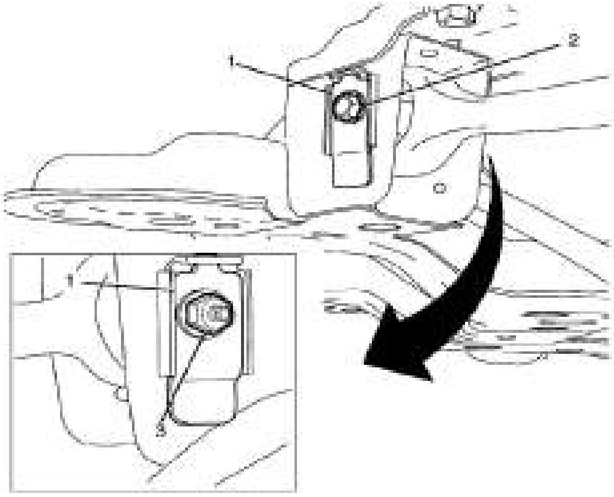
   Important: Before checking and adjusting any wheel alignment angles bounce the vehicle to settle the suspension to normal ride height.

8. Bounce the vehicle several times to settle the suspension.



Important: For accurate readings do not push or pull on the tyre and wheel assembly during the alignment process.

9. Determine the actual caster angle (1).



10. Remove the front caster arm to subframe retaining nut (3) and bolt (2).

    Discard the bolts and nuts.

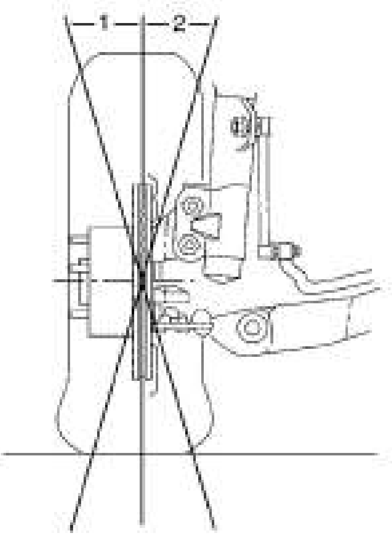
11. For caster specifications, Refer to Wheel Alignment Specifications .
12. Install the NEW lower caster arm to the subframe retaining bolt (2).
13. Install the NEW lower caster arm to the subframe retaining nut (4).

Do not fully tighten at this stage.

Notice: Refer to Fastener Notice in the Preface section.

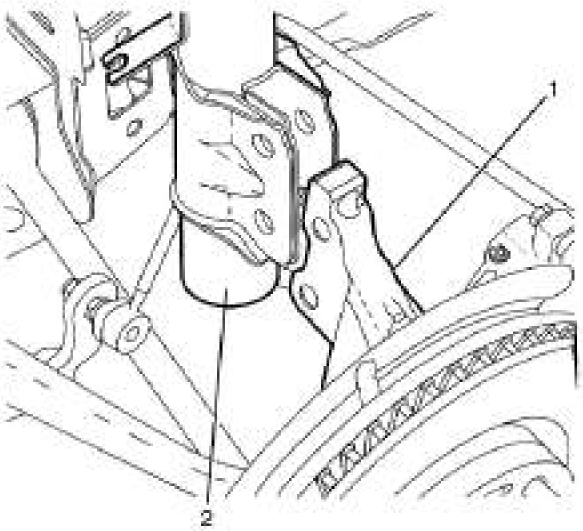
14. Tighten the front caster arm to subframe retaining nut (4).

    Tighten
    Tighten the nut to 50 N·m+ 120° (30 lb ft + 120°).



Important: For accurate readings do not push or pull on the tyre and wheel assembly during the alignment process.

15. Determine the actual camber, Positive (1) or Negative (2).



16. For camber specifications, Refer to Wheel Alignment Specifications .
17. Tighten the strut assembly to steering knuckle retaining bolts (2) and nuts (1).

    Tighten

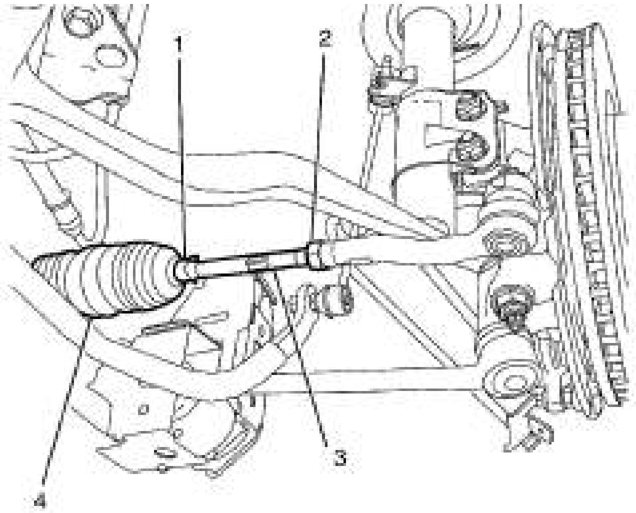
    - Tighten the bolts a first pass to 85 N·m (63 lb ft).
    - Tighten the bolts a second pass to 100 N·m (74 lb ft).
    - Tighten the bolts an additional 90 degrees.
18. Verify that the caster and camber are still within specifications. Refer to Wheel Alignment Specifications .
19. If further adjustment is required, adjust as necessary.

Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment

1. Bounce the vehicle several times to settle the suspension.

   Important: The toe of the front wheels must be checked with the wheels in the straight ahead position.

2. Set the wheels and steering gear to the straight ahead position.



3. Disconnect the outer steering gear boot to tie rod retaining clip (1).
4. Loosen the tie rod end to tie rod locking nut (2).
5. Determine the actual front wheel toe setting.
6. Adjust the front wheel toe to specification by turning the tie rod (3). For front wheel toe specifications, Refer to Wheel Alignment Specifications .

   Notice: Refer to Fastener Notice in the Preface section.

   Important: Do not allow the tie rod (3) to turn while tightening the tie rod end to tie rod locking nut (2).

7. Tighten the tie rod end to tie rod lock nut (2)

   Tighten
   Tighten the nut to 50 N·m (37 lb ft).

8. Verify that the toe is still within specifications. Refer to Wheel Alignment Specifications .
9. If further adjustment is required, adjust as necessary.

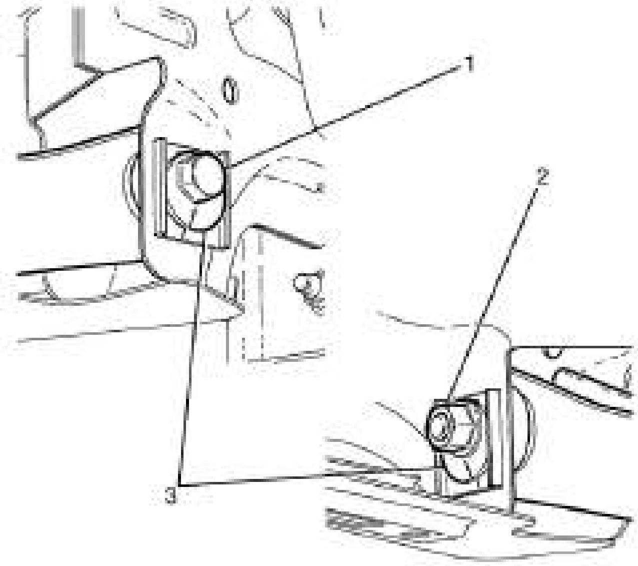
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Wheel Alignment | Repair Instructions | **Document ID: 1992522**

Rear Camber Adjustment

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



Important: The lower control arm to the subframe retaining bolt (1) and nut (2) eccentric washers (3) are used to adjust rear suspension camber.

Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

2. Remove the lower control arm to the subframe retaining nut (2).

   Discard the nut.

   Important: The lower control arm to the subframe retaining nut (2) is not to be fully tightened until after the rear suspension camber has been adjusted.

3. Install NEW lower control arm to the subframe retaining nut (2).

   Do not fully tighten at this stage.

4. Remove the safety stands.
5. Lower the vehicle to the ground.

Important: Before checking and adjusting any wheel alignment angles bounce the vehicle to settle the suspension at normal ride height.

6. Bounce the vehicle several times to settle the suspension.
7. Determine the actual rear suspension camber angle.
8. Adjust the rear suspension camber to specification by turning the lower control arm to subframe retaining bolt (1). For rear suspension camber specifications, refer to Wheel Alignment Specifications .

   Notice: Refer to Fastener Notice in the Preface section.

   Important: The weight of the vehicle must be on a level surface such as an alignment rack and on all four wheels before fully tightening the bolts and nuts that have been partially tightened. Failure to comply with this requirement may adversely affect the ride and handling characteristics of the vehicle.

   Important: Do not allow the lower control arm to subframe retaining bolt (1) to turn while tightening.

9. Tighten the lower control arm to subframe retaining bolt (1) and nut (2).

   Tighten
   Tighten the bolt and nut to 175 N·m (129 lb ft).

10. Verify that camber is still within specifications. Refer to Wheel Alignment Specifications .
11. If further adjustment is required, adjust as necessary.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Wheel Alignment | Repair Instructions | Document ID: 1992529

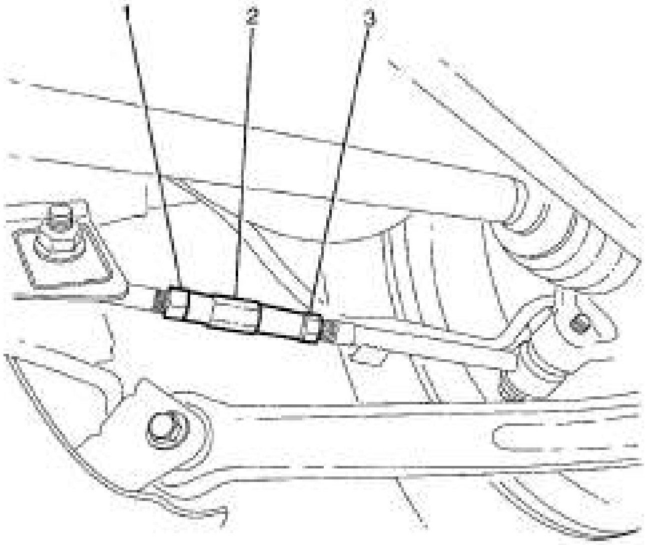
Rear Toe Adjustment

Adjustment Procedure -- Up to 09 Oct 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Loosen the I-Link adjuster lock nuts (1 and 3) from the I-Link adjuster (2).
3. Remove the safety stands.
4. Lower the vehicle to the ground.

Important: Before checking and adjusting any wheel alignment angles bounce the vehicle to settle the suspension to normal ride height.

5. Bounce the vehicle several times to settle the suspension.
6. Determine the actual rear suspension toe setting.
7. Adjust the rear suspension toe to specification by turning the I-Link adjuster (2). For rear suspension toe specifications, Refer to Wheel Alignment Specifications.

Notice: Refer to Fastener Notice in the Preface section.

Important: The weight of the vehicle must be on a level surface such as an alignment rack and on all four wheels before fully tightening the bolts and nuts that have been partially tightened. Failure to comply with this requirement may adversely affect the ride and handling characteristics of the vehicle.

Important: Do not allow the I-Link adjuster (2) to turn while tightening the I-Link adjuster lock nuts (1 and 3).

8. Tighten the I-Link lock nuts (1 and 3).

   Tighten
   Tighten the nut to 50 N·m (37 lb ft).

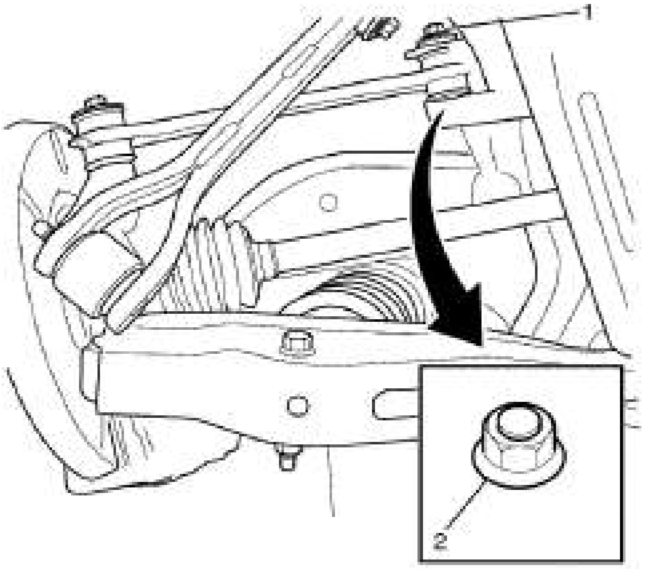
9. Verify that the toe is still within specifications. Refer to Wheel Alignment Specifications.
10. Readjust if necessary.

Adjustment Procedure -- After 09 Oct 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Remove and discard the lock nut (2).

   Important: Do not fully tighten the NEW lock nut (2) at this time.

3. Fit a NEW lock nut (2).
4. Lower the vehicle to the ground.

   Important: The weight of the vehicle must be on a level surface and on all four wheels before fully tightening the nut.

   Important: The suggested method to settle the rear suspension is with the wheels on the ground, open rear compartment lid and support the lid with a suitable brace. Using your hands press down hard on the rear compartment floor and release a number of times.

5. Settle the suspension.
6. Determine the actual rear suspension toe setting.
7. Adjust the rear suspension toe to specification by turning the bolt adjuster (1). For rear

suspension toe specifications, Refer to Wheel Alignment Specifications.

Notice: Refer to Fastener Notice in the Preface section.

Important: The weight of the vehicle must be on a level surface such as an alignment rack and on all four wheels before fully tightening the bolts and nuts that have been partially tightened. Failure to comply with this requirement may adversely affect the ride and handling characteristics of the vehicle.

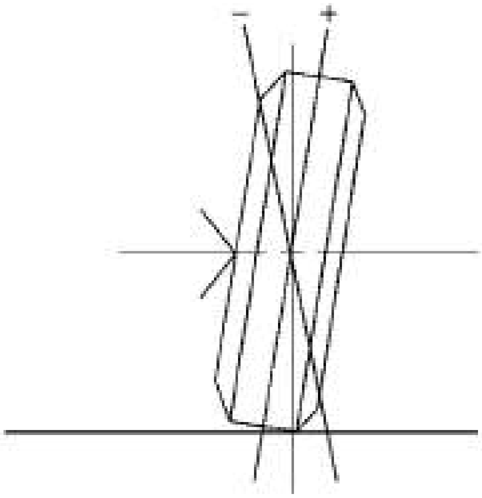
Important: Do not allow the bolt adjuster (1) to turn while tightening the lock nut (2).

8. Tighten the lock nut (2).

   Tighten
   Tighten the nut to 175 N·m (129 lb ft).

9. Verify that the toe is still within specifications. Refer to Wheel Alignment Specifications.
10. Readjust if necessary.

Camber Description



Camber is the tilting of the wheels from the vertical when viewed from the front of the vehicle. When The wheel tilts outward at the top, The camber is positive (+). When the wheel tilts inward at the top the camber is negative (-). The amount of tilt is measured in degrees from the vertical. The camber setting influences the directional control of the vehicle and tyre wear.

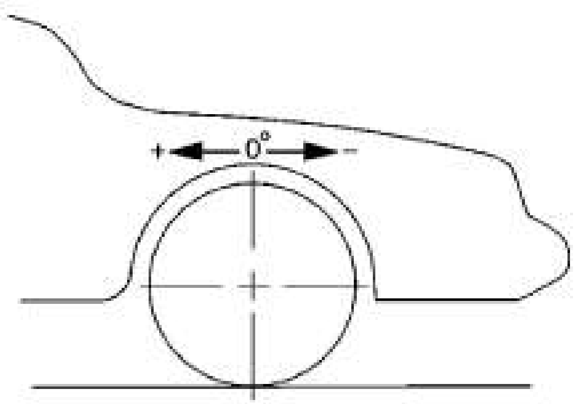
Too much positive camber will result in premature wear on the outside of the tyre and cause excessive wear on the suspension parts.

Too much negative camber will result in premature wear on the inside of the tyre and cause excessive wear on the suspension parts.

Unequal side-to-side camber of 1 degree or more will cause the vehicle to pull or lead to the side with the most positive camber.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Wheel Alignment | Description and Operation | **Document ID: 1987828**

Caster Description



Caster is the tilting of the upper most point of the steering axis either forward (-) or backward (+) from vertical when viewed from the side of the vehicle. A backward tilt at the top steering axis point is positive (+) and a forward tilt is negative (-). Measurement is usually expressed as an angle in degrees and minutes. Caster influences directional control of the steering but does not affect tyre wear. Caster is affected by the vehicle ride height, therefore it is important to keep the body at its designed height. Overloading the vehicle or weak or sagging springs will affect caster. When the rear of the vehicle is lower than its designated trim height, the front suspension moves to a more positive caster. If the rear suspension is higher than its designated trim height, the front suspension moves to a less positive caster.

With too little positive caster, steering may be unstable at high speed and wheel returnability may be diminished when coming out of a turn. Too much positive caster can result in excessive steering effort and associated 'wheel fight' and 'kickback'. If one wheel has more positive caster than the other, that wheel will pull toward the center of the vehicle. This condition will cause the vehicle to pull or lead towards the side with the least amount of positive caster.

Lead/Pull Description

At a constant speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicles straight path.

Lead/pull is usually caused by the following factors.

- Tyre Construction
- Wheel Alignment
- Unbalanced Steering Gear

The way in which a tyre is built may produce lead/pull.

The rear tyres will not cause lead.

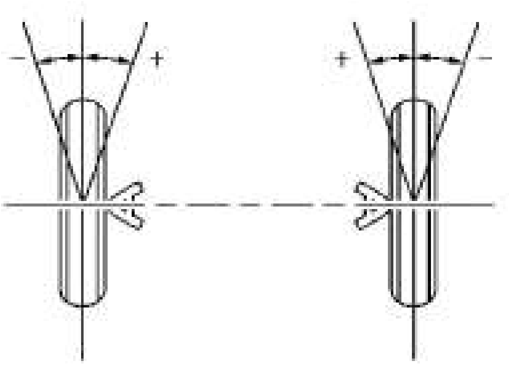
Scrub Radius Description

Ideally the scrub radius is as small as possible normally, the steering axis inclination (SAI) angle and the centerline of the tyre and wheel intersect below the road surface, causing a positive scrub radius. With struts, the SAI angle is much larger than the long arm/short arm type of suspension. This allows the SAI angle to intersect the camber angle above the road surface, forming a negative scrub radius. The smaller the scrub radius, the better the directional stability. Installing aftermarket wheels that have additional offset will dramatically increase scrub radius. The newly installed wheels may cause the centerline of the tyres to move further away from the spindle. This will increase the scrub radius.

A large amount of scrub radius can cause severe shimmy after hitting a bump. Four-Wheel drive vehicles with large tyres use a steering damper to compensate for an increased scrub radius. Scrub radius is not directly measurable by conventional methods. Scrub radius is projected geometrically by engineers during the design phase of the suspension.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Suspension | Wheel Alignment | Description and Operation | **Document ID: 1987832**

Toe Description



Toe is a measurement of how much the front and or rear wheels are turned in or out from a straight ahead position. When the wheels are turned in, toe is positive (+). When the wheels are turned out, toe is negative (-). The actual amount of toe is normally only a fraction of a degree. Toe offsets the small deflections of the wheel support system that occur when the vehicle is rolling forward. In other words, with the vehicle standing still and the wheels set with toe-in, the wheels tend to roll parallel on the road when the vehicle is moving.

Incorrect toe adjustment will cause premature tyre wear and cause steering instability.

Wander Description

Wander is the undesired drifting or deviation of a vehicle to either side from a straight path with hand pressure on the steering wheel. Wander is a symptom of the vehicles sensitivity to external disturbances, such as road camber and cross wind, and accentuated by poor on-centre steering feel.

Transmission Fluid Temperature Sensor Specifications

* Reference Number refers to the callout number on the disassembled view.

Transmission General Specifications

Transmission General Specifications

Description	Hydra-Matic 4L60-E	Hydra-Matic 4L65-E
RPO Codes	M30	M32
Vehicle Platform (Engine/Transmission) Usage	LE0, LW2/M30	L98/M32
Transmission Drive	Longitudinally-Mounted Rear Wheel Drive	
1st Gear Ratio	3.059:1	
2nd Gear Ratio	1.625:1	
3rd Gear Ratio	1.000:1	
4th Gear Ratio	0.696:1	
Reverse	2.294:1	
Torque Converter Size (Diameter of Torque Converter Turbine)	258 mm (10.6 inch)	300 mm (11.81 inch)
Pressure Taps	Line Pressure	
Transmission Fluid Type	DEXRON® VI	
Transmission Type: 4	Four Forward Gears	
Transmission Type: L	Longitudinal Mount	
Transmission Type: 60/ 65	Product Series	
Transmission Type: E	Electronic Controls	
Position Quadrant	P, R, N, D ,3, 2, 1	
Case Material	Die Cast Aluminum	
Transmission Weight Dry (Approximate)	258 mm Converter 71.6 kg (157.9 lb)	300 mm Converter 79.0 kg (174.2 lb)
Transmission Weight Wet (Approximate)	258 mm Converter 78.8 kg (173.7 lb)	300 mm Converter 88.3 kg (194.7 lb)

Fluid Capacity Specifications

Fluid Capacity

Application	Specification	
	4L60-E	4L65-E
Overhaul	8.4 litres (1.8 Gallons)	10.8 litres(2.4 Gallons)
Pan Removal	4.8 litres (1.05 Gallons)	5.0 litres (1.09 Gallons)

- A = Applied
- H = Holding
- ON = The solenoid is energised.
- OFF = The solenoid is de-energised.
- *Shift Solenoid state is a function of vehicle speed and may change if the vehicle speed increases sufficiently in Park, Reverse or Neutral. However, this does not affect the operation of the transmission.
- **Manual Second-First gear is electronically prevented under normal operating conditions.
- ***Manual First-Second gear is only available above approximately 48-56 km/h (30-35 mph).

Shift Solenoid Valve State and Gear Ratio

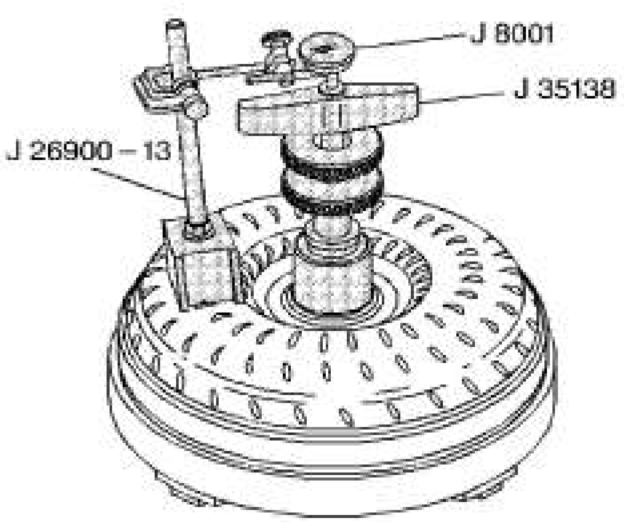
Torque Converter End Play Inspection

Tools Required

- J 8001 Dial Indicator Set
- J 26900-13 Magnetic Indicator Base
- J 35138 Converter End Play Checker
- J 39195 Converter End Play Check Tool



1. Inspect the torque converter and replace if any of the following conditions exist:
   - Evidence of damage to the pump assembly.
   - Metal particles are found after flushing the cooler and cooler lines.
   - External leaks in the hub area.
   - Converter pilot is broken, damaged or poor fit into the crankshaft.
   - Converter hub is scored or damaged.
   - Internal damage to the stator.
   - Contamination from engine coolant.
   - Excessive end play.

   Important: The torque converter should not be replaced if the fluid has an odour, discoloration or no evidence of metal or clutch plate material.

   Flushing the torque converter is not recommended.

2. Install the J 35138 , the J 26900-13 and the J 8001 or J 39195 to be used with the 300 mm

torque converter.

Specification

- The end play for a 245 mm torque converter should be 0-0.38 mm (0-0.015 in).
- The end play for a 298 mm torque converter should be 0.1-0.48 mm (0.004-0.019 in).
- The end play for a 258 mm and 300 mm torque converter should be 0.1-0.5 mm (0.004-0.020 in).

3. Remove the tools.

Torque Converter End Play Specifications

Torque Converter End Play Check

Torque Converter Size	Specification
258 mm (10.16 in)	0.1-0.5 mm (0.004-0.020 in)
300 mm (11.81 in)	0.1-0.5 mm (0.004-0.020 in)

Transmission Fluid Pressure Manual Valve Position Switch Logic

TFP Manual Valve Position Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C
Park/Neutral (P or N)	HI	LOW	HI
Reverse (R)	LOW	LOW	HI
Drive 4 (D)	HI	LOW	LOW
Drive 3 (3)	HI	HI	LOW
Drive 2 (2)	HI	HI	HI
Drive 1 (1)	LOW	HI	HI
Invalid	LOW	HI	LOW
	LOW	LOW	LOW

- HI = Ignition voltage
- LOW = 0 voltage

Transmission Range Switch Logic

Transmission Range Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C	Signal P
Park (P)	LOW	HI	HI	LOW
Reverse (R)	LOW	LOW	HI	HI
Neutral (N)	HI	LOW	HI	LOW
Drive 4 (OD)	HI	LOW	LOW	HI
Drive 3 (3)	LOW	LOW	LOW	LOW
Drive 2 (2)	LOW	HI	LOW	HI
Drive 1 (1)	HI	HI	LOW	LOW
HI = Ignition voltage LOW = 0 volts				

Transmission Internal Mode Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C	Signal P
Park (P)	LOW	HI	HI	LOW
Reverse (R)	LOW	LOW	HI	HI
Neutral (N)	HI	LOW	HI	LOW
Drive 4 (D)	HI	LOW	LOW	HI
Drive 3 (3)	LOW	LOW	LOW	LOW
Drive 2 (2)	LOW	HI	LOW	HI
Drive 1 (1)	HI	HI	LOW	LOW
HI = Ignition voltage LOW = 0 volts				

Component Resistance

Component Resistance

Component	Pass/Thru Pins	Resistance at 20°C (68°F)	Resistance at 100°C (212°F)	Resistance to Ground (Case)
1-2 Shift Solenoid Valve	A, E	19-24 Ω	24-31 Ω	Greater than 250 K Ω
2-3 Shift Solenoid Valve	B, E	19-24 Ω	24-31 Ω	Greater than 250 K Ω
TCC Solenoid Valve	T, E	21-26 Ω	26-33 Ω	Greater than 250 K Ω
TCC PWM Solenoid Valve	U, E	10-11 Ω	13-15 Ω	Greater than 250 K Ω
3-2 Shift Solenoid Valve	S, E	20-24 Ω	29-32 Ω	Greater than 250 K Ω
Pressure Control Solenoid Valve	C, D	3-5 Ω	4-7 Ω	Greater than 250 K Ω
*Transmission Fluid Temperature (TFT) Sensor	M, L	3088-3942 Ω	159.3-198.0 Ω	Greater than 10 M Ω
Output Speed Sensor	A, B OSS CONN	1420 Ω @ 25°C	2140 Ω @ 150°C	Greater than 10 M Ω
***Important:** The resistance of this device is necessarily temperature dependent and will therefore vary far more than any other device. Refer to Transmission Fluid Temperature Sensor Specifications.

(600) 3-4 Clutch Boost (5) Spring Assembly
(601) Thrust Washer - Pump to Drum
(602) 2-4 Band Assembly - Model Dependent
(603) Reverse Input Clutch Bushing - Front
(605) Reverse Input Clutch Housing and Drum Assembly
(606) Reverse Input Clutch Bushing - Rear
(607) Reverse Input Clutch Piston Assembly
(608a) Reverse Input Clutch Seal - Inner
(608b) Reverse Input Clutch Seal - Outer
(609) Reverse Input Clutch Spring Assembly
(610) Reverse Input Clutch Spring Retainer Ring

(611) Reverse Input Clutch Plate - Belleville
(612a) Reverse Input Clutch Turbulator Plate - Steel
(612b) Reverse Input Clutch Plate Assembly - Fiber
(613) Reverse Input Clutch Backing Plate - Selective
(614) Reverse Input Clutch Retaining Ring
(615) Stator Shaft/Selective Washer Bearing Assembly
(616) Thrust Washer - Selective
(617) Check Valve Retainer and Ball Assembly
(618) O-Ring Seal - Location Model Dependent
(619) Oil Seal Ring - Solid
(620) Retainer and Checkball Assembly
(621) Input Housing and Shaft Assembly - Model Dependent
(622) O-Ring Input to Forward Clutch Housing Seal
(623) 3rd and 4th Clutch Piston
(625) 3rd and 4th Clutch Ring - Apply
(626) 3rd and 4th Clutch Spring Assembly
(627) Forward Clutch Housing Retainer and Ball Assembly
(628) Forward Clutch Housing
(630) Forward Clutch Piston
(632) Overrun Clutch Piston
(633) Overrun Clutch Ball
(634) Overrun Clutch Spring Assembly
(635) Overrun Clutch Spring Retainer Snap Ring
(636) Input Housing to Output Shaft Seal
(637) Input Sun Gear Bearing Assembly
(638) Overrun Clutch Hub Retaining Snap Ring
(639) Overrun Clutch Hub
(640) Forward Sprag Clutch Inner Race and Input Sun Gear Assembly
(642) Forward Sprag Assembly
(643) Sprag Assembly Retainer Ring

Diagnostic Starting Point - Automatic Transmission

Begin the system diagnosis with Diagnostic System Check - Vehicle . The Diagnostic System Check provides the following information:

- The identification of the control modules which commands the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification and status of stored diagnostic trouble codes (DTCs).

The use of Diagnostic System Check - Vehicle , identifies the correct procedure for diagnosing the system and where the procedure is located.

Symptoms

When it has been determined through Diagnostic System Check - Vehicle , that no DTCs are present, begin symptom diagnosis by reviewing the Transmission Component and System Description . Reviewing Transmission Component and System Description . information enables you to understand the operation of the system. This helps you determine if the condition described by the customer is normal or if a malfunction exists. If it is determined that a malfunction exists, identify the concern by referring to the Symptoms - Automatic Transmission . The Symptoms - Automatic Transmission provides common diagnostic categories which relate directly to diagnostic information or procedures.

Scan Tool Data Definitions

1-2 Shift Error: This parameter displays the difference between the desired 1-2 shift time and the actual 1-2 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

1-2 Shift Time: This parameter displays the actual time of the last 1-2 shift. The shift time is based on the engine RPM drop after the commanded 1-2 shift. This value is only accurate if the shift was adaptable.

1-2 Sol.: This parameter displays the commanded state of the 1-2 shift solenoid valve. When the transmission is in FIRST and FOURTH gear, the display should indicate ON, current is flowing through the solenoid. When the transmission is in SECOND and THIRD gear, the display should indicate OFF, current is not flowing through the solenoid.

1-2 Sol. Open/Short to GND: This parameter displays whether an open or a short to ground exists in the 1-2 shift solenoid valve feedback signal and displays Yes or No. The 1-2 shift solenoid valve must be commanded OFF for this parameter to be valid.

1-2 Sol. Short to Volts: This parameter displays if a short to voltage exists in the 1-2 shift solenoid valve feedback signal. This parameter is valid only when the 1-2 shift solenoid valve is commanded ON. The scan tool will display YES or NO.

1-2 Tap Cell (4-16): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 N·m (12.5 lb ft) of engine torque increment per cell, added to or subtracted from shift pressure during a 1-2 up shift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added in order to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted in order to increase shift time.

2-3 Shift Error: This parameter displays the difference between the desired 2-3 shift time and the actual 2-3 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

2-3 Shift Time: This parameter displays the actual time of the last 2-3 shift. The shift time is based on the engine RPM drop after the commanded 2-3 shift. This value is only accurate if the shift was adaptable.

2-3 Sol.: This parameter displays the commanded state of the 2-3 shift solenoid valve. When the transmission is in FIRST and SECOND gear the display should indicate ON, current is not flowing through the solenoid. When the transmission is in THIRD and FOURTH gear, the display should indicate OFF, current is flowing through the solenoid.

2-3 Sol. Open/Short to GND: This parameter displays whether an open or a short to ground exists in the 2-3 shift solenoid valve feedback signal and displays Yes or No. The 2-3 shift solenoid valve must be commanded OFF for this parameter to be valid.

2-3 Sol. Short to Volts: This parameter displays if a short to voltage exists in the 2-3 shift solenoid valve feedback signal. This parameter is valid only when the 2-3 shift solenoid valve is commanded ON. The scan tool will display YES or NO.

2-3 Tap Cell (4-16): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 N·m (12.5 lb ft) of engine torque increment per cell, added to or subtracted from shift pressure during a 2-3 up shift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added in order to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted in order to increase shift time.

3-2 Downshift Sol.: This parameter displays if the 3-2 shift solenoid valve assembly is currently commanded ON or OFF. The solenoid commanded state is based on the transmission temperature. The solenoid will change states during a 3-2 downshift to regulate the appropriate pressure. The commanded state of the solenoid occurs at approximately 30 mph with a throttle increase. The scan tool displays ON or OFF.

3-2 Sol. Open/Short to GND: This parameter displays whether an open or a short to ground exists in the 3-2 shift solenoid valve feedback signal and displays Yes or No. The 3-2 shift solenoid valve must be commanded OFF for this parameter to be valid.

3-2 Sol. Short to Volts: This parameter displays if a short to voltage exists in the 3-2 shift solenoid valve feedback signal. This parameter is valid only when the 3-2 shift solenoid valve is commanded ON. The scan tool will display YES or NO.

3-4 Shift Error: This parameter displays the difference between the desired 3-4 shift time and the actual 3-4 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

3-4 Shift Time: This parameter displays the actual time of the last 3-4 shift. The shift time is based on the engine RPM drop after the commanded 3-4 shift. This value is only accurate if the shift was adaptable.

Calc. Throttle Position: This parameter displays a calculated value, which is determined by the accelerator pedal position and the actual throttle position, used to optimize transmission controls. It represents the driver's intended request for torque or acceleration. The range is 0-100 percent, where 0 percent represents an idle or coast request and 100 percent represents a request for wide open throttle (WOT).

Commanded Gear: This parameter displays the current commanded state of the shift solenoid valves. The scan tool displays 1, 2, 3, 4 or 5.

Current TAP Cell: This parameter displays the current transmission adaptive pressure (TAP) cell in use for transmission line pressure adaptation. The cells are based on 17 N·m (12.5 lb ft) of engine torque. The higher the engine torque, the higher the current TAP cell. The last cell used will remain displayed until the next adaptable up shift occurs.

ECT: This parameter displays the input signal from the ECT sensor. Engine coolant temperature is high at 151°C (304°F) when the signal voltage is low (0 volts). Engine coolant temperature is low at -40°C (-40°F) when the signal voltage is high (5 volts).

Engine Speed: This parameter displays the rotational speed of the engine expressed as revolutions per minute.

Engine Torque: This parameter displays a calculated value based on engine load, throttle position, mass air flow, and other engine inputs. This parameter is accurate to within 15 ft/lb of actual measured engine torque.

Estimated Gear Ratio: This parameter displays the estimated turbine speed divided by the transmission output speed. Estimated turbine speed is calculated from engine speed and engine torque.

Ignition Voltage: This parameter displays the system voltage measured at the ignition feed.

Last Shift Time: This parameter displays the actual time of the last up shift. This value is only accurate if the shift was adaptable.

PC Sol. Actual Current: This parameter displays the actual current flow through the pressure control solenoid circuit which is measured by the control module. High current flow results in low line pressure. Low current flow results in high line pressure.

PC Solenoid Duty Cycle: This parameter displays the commanded state of the pressure control solenoid expressed as a percentage of energised ON time. A reading of low percent indicates zero ON time, non energised, or no current flow. A high percent at idle indicates maximum ON time, energised, or high current flow.

PC Sol. Ref. Current: This parameter displays the commanded current of the pressure control solenoid circuit. High current results in low line pressure. Low current results in high line pressure.

Speed Ratio: This parameter displays the calculated speed ratio of the transmission. The ratio is calculated by dividing the output speed sensor signal by the input speed sensor signal. Gear ratio in a step-gear transmission is calculated in the opposite manner.

TCC Brake Switch: This parameter displays the status of the TCC brake switch circuit input. OPEN indicates a zero voltage input, brake pedal applied. CLOSED indicates a voltage input, brake pedal released. The scan tool display OPEN or CLOSED.

TCC Duty Cycle: This parameter displays the commanded percentage of ON time of the TCC PWM solenoid. A high percentage represents an ON, energised, commanded state. Zero percent represents an OFF, non-energised, commanded state.

TCC Duty Cycle Open/Short to GND: This parameter displays whether an open or a short to ground exists in the torque converter clutch (TCC) pulse width modulation (PWM) solenoid valve feedback signal and displays Yes or No. The TCC PWM solenoid valve must be commanded OFF for this parameter to be valid. The scan tool will display Yes only while the TCC PWM solenoid valve is OFF. The display will pulsate.

TCC Duty Cycle Short to Volts: This parameter displays whether a short to voltage, exists in the TCC PWM solenoid valve feedback signal and displays Yes or No. The TCC PWM solenoid valve must be commanded ON for this parameter to be valid. The scan tool will display Yes only while the TCC PWM solenoid valve is ON. The display will pulsate.

TCC Enable Sol.: This parameter displays the commanded state of the TCC solenoid. Yes indicates a commanded energised state, current is flowing through the solenoid. No indicates a commanded non-energised state, current is not flowing through the solenoid. This commanded state occurs at various vehicle speeds between applications. The scan tool displays Yes or No.

TCC Enable Open/Short to GND: This parameter displays whether an open or a short to ground exists in the TCC solenoid valve feedback signal. This parameter is valid only when the TCC solenoid is commanded OFF. The scan tool displays Yes or No.

TCC Enable Short to Volts: This parameter displays whether a short to voltage exists in the TCC solenoid valve feedback signal. This parameter is valid only when the TCC solenoid is commanded ON. The scan tool displays Yes or No.

TCC Slip Speed: This parameter displays the difference between transmission output speed and engine speed. A negative value indicates that the engine speed is less than the output speed, deceleration. A positive value indicates that the engine speed is greater than the output speed, acceleration. A value of zero indicates that the engine speed is equal to the output speed, TCC applied.

TFP Sw.: This parameter displays Park/Neutral, Reverse, Drive4, Drive3, Drive2, Drive1 or Invalid. This parameter is the decoded status of the three A/B/C inputs from the automatic transmission fluid pressure manual valve position switch. If a valid combination of inputs is not detected, invalid will be displayed.

TFP Sw. A/B/C: This parameter displays HI/LOW, HI/LOW, HI/LOW. This parameter indicates the status of the three inputs from the Automatic Transmission Fluid Pressure Manual Valve Position Switch Assembly. LOW represents a zero voltage signal. HI represents an ignition voltage signal.

Torque Converter Efficiency: This parameter displays a ratio of 0.00:1 to 2:1. The ratio is calculated by multiplying the speed ratio by a value related to the "K factor" of the torque converter. The "K factor" is the looseness or tightness of the torque converter for a given torque. The nearer the torque converter is to full coupling, i.e. 1:1, the closer the torque converter efficiency number will be to 1.

TP Indicated Angle: This parameter displays the desired throttle angle for operating conditions present at the time.

TR Sw.: This parameter displays the decoded status of the four A/B/C/P inputs from the transmission range switch. The scan tool displays Park, Reverse, Neutral Drive, Intermediate, Low, and Invalid. If a valid combination of inputs is not detected, invalid will be displayed.

TR Sw. A/B/C/P: This parameter displays the status of the four inputs from the transmission range switch. The scan tool displays HI/LOW. HI indicates an ignition voltage input to the control module. LOW indicates a zero voltage input to the control module.

Trans. Fluid Temp.: This parameter displays the input signal of the transmission fluid temperature sensor. Transmission fluid temperature is high 151°C (304°F) when signal voltage is low, 0 volts, and transmission fluid temperature is low -40°C (-40°F) when signal voltage is high, 5 volts.

Trans. Slip Counter: This parameter displays the number of times the P0894 Diagnostic test has identified a slipping condition. This diagnostic test is required to identify a slipping condition three times in a row in order to set the DTC P0894 Transmission Component Slipping Diagnostic code. The scan tool displays 0, 1 or 2.

Transmission Hot Mode: This parameter displays the automatic transmission fluid temperature (TFT) and displays ON or OFF. OFF indicates that the TFT has not exceeded 130°C (266°F). ON indicates that the TFT has exceeded 130°C (266°F) and has not cooled to 120°C (248°F) for more that 5 seconds. Note: these numbers are approximate. They differ with transmissions.

Transmission OSS: This parameter displays the rotational speed of the transmission output shaft expressed as revolutions per minute.

Vehicle Speed: This parameter displays the speed at which the vehicle is traveling. The scan tool displays vehicle speed as kilometers per hour (km/h), (miles per hour (MPH)). The vehicle speed is calculated based on the input signal from the vehicle speed sensor.

Diagnostic Trouble Code (DTC) Type Definitions

Diagnostic trouble codes (DTCs) are grouped into several types. Each type has a unique set of characteristics for MIL operation, DTC storage, and DTC clearing. The following list contains a brief summary of the DTC types and the associated properties of each.

Type A

This DTC is emissions related. The malfunction indicator lamp (MIL) illuminates and default actions, if any, are activated immediately after a failure is detected. The DTC is then stored in history and the Freeze Frame data is captured.

Type B

This DTC is emissions related. Default actions, if any, are activated and a Failure Record is stored after the first failure is detected. At the time of the first fail, the DTC will appear in memory as pending. If the next trip reports a pass, the pending DTC is deleted. If the failure recurs on the next consecutive drive cycle, the MIL illuminates, the DTC is stored in history, and the Freeze Frame data is captured at the time of failure.

Type C

This DTC is non emission related and does not turn on the MIL. When a Type C DTC sets, a message may be displayed on the driver information center. Type C DTCs that do not display a message were formerly referred to as type D DTCs.

DTC P0218

Circuit Description

The flow of transmission fluid starts in the bottom pan and is drawn through the filter, control valve body assembly, transmission case and into the oil pump assembly. The oil pump assembly pressurizes the fluid and directs it to the pressure regulator valve where it becomes the main supply of fluid to the various components and hydraulic circuits in the transmission. Hot fluid exiting the torque converter flows through the converter clutch apply valve and into the transmission cooler lines to the oil cooler located in the vehicle radiator, and auxiliary cooler if equipped. From the cooler, fluid returns to cool and lubricate the front of the transmission. In forward drive ranges, D4 fluid from the manual valve is routed through an orificed cup plug in the rear of the transmission case to feed the rear lube fluid circuit.

When the transmission control module (TCM) detects a high transmission fluid temperature (TFT) for a long period of time, then DTC P0218 sets. DTC P0218 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0218 Transmission Fluid Overtemperature

Conditions for Running the DTC

- No TFT sensor DTCs P0711, P0712 or P0713.
- The ignition switch is ON for 5 seconds.

Conditions for Setting the DTC

The TFT is greater than 130°C (266°F) for 600 seconds (10 minutes).

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM freezes transmission adapt functions.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as Failure Records.
- The TCM stores DTC P0218 in TCM history.

Conditions for Clearing the DIC/DTC

- The TCM clears the DIC message when the condition no longer exists.
- A scan tool can clear the DTC.

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Diagnostic Aids

- The scan tool Trans. Fluid Temp. should rise steadily to a normal operating temperature, then stabilize.
- Ask about the customer's driving habits, trailer towing, etc. Trailer towing should occur in D3.
- Refer to Symptoms - Automatic Transmission .

Test Description

The number below refers to the step number on the diagnostic table.

3. This step inspects for air flow restrictions or damage which may result in the transmission overheating.

DTC P0218

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Failure Records. Using the Clear Info function erases the Failure Records from the TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Inspect for correct transmission fluid level. Refer to Transmission Fluid Check . Did you perform the fluid checking procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Inspect the engine cooling system and transmission cooling system for the following conditions: • Air flow restrictions • Air flow blockage • Debris 2. Inspect the transmission cooling system for damaged cooler lines.	--		

	3. Test the oil cooler flow. Refer to Transmission Fluid Cooler Flushing and Flow Test . Did you find and correct the condition?		Go to Step 6	Go to Step 4
4	Test for correct line pressure. Refer to Line Pressure Check . Did you find and correct the condition?	--	Go to Step 6	Go to Step 5
5	Test the torque converter stator. Refer to Torque Converter Diagnosis . Did you find and correct the condition?	--	Go to Step 6	Go to Testing for Intermittent Conditions and Poor Connections
6	Perform the following procedure in order to verify the repair: 1. Install a scan tool. 2. Select DTC. 3. Select Clear Info. 4. Start and idle the engine until it reaches normal operating temperature. 5. Monitor Trans. Fluid Temp. on the scan tool. 6. Drive the vehicle for 10 minutes. 7. Ensure that the transmission fluid temperature has stabilized and is less than 129°C (264°F). 8. Select Specific DTC. 9. Enter DTC P0218. Has the test run and passed?	--	Go to Step 7	Go to Step 2
7	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0562

Circuit Description

The transmission control module (TCM) continuously monitors the system voltage on the Ignition 1 and the battery circuits. Lower than normal voltage may be inadequate to operate the transmission control solenoids properly. Improper solenoid operation may cause erratic transmission operation and tie-up conditions, which may result in internal damage.

When the TCM detects low voltage, DTC P0562 sets. DTC P0562 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0562 System Voltage Low

Conditions for Running The DTC

The engine speed is greater than 1,200 RPM.

Conditions for Setting The DTC

The TCM detects system voltage less than 11 volts for 10 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0562 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

- Observe the driver information centre (DIC) messaging that indicates the electrical system requires service.
- Inspect for the following conditions:

- Loose or damaged terminals at the generator
- Loose or worn generator drive belt

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests the charging system voltage with a nominal load.

5. This step obtains the ignition voltage measurement reported by the TCM.

6. This step tests the voltage drop from the battery and ignition voltage input at the TCM.

10. This step tests the voltage drop from the ground terminals of the TCM to the ground terminal of the battery.

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and TCM. • Using the Clear Info function erases stored DTCs in both the engine control module (ECM) and transmission control module (TCM). 3. Record the Failure Records. 4. Clear the DTC. 5. Using the DMM, measure and record the battery voltage across the battery terminals. Is the voltage higher than the specified value?	11 V	Go to Step 3	Go to Battery Inspection/Test
3	1. Start the engine. 2. Allow the engine to warm up to normal operating temperature.	--	Go to Charging	

	Is the charge indicator light ON?		System Test	Go to Step 4
4	1. Turn ON the high beam headlamps. 2. Turn the HVAC blower control to the highest speed setting. 3. Turn ON the rear window defroster. 4. Increase the engine speed to 1,500 RPM. 5. Observe the DMM battery voltage and record your voltage reading for reference. Is the voltage within the specified range?	12.5-14.5 V	Go to Step 5	Go to Charging System Test
5	1. Increase the engine speed to 1,500 RPM. 2. Observe the Ignition Voltage with the scan tool. Is the scan tool Ignition Voltage within the specified range?	12.5-14.5 V	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the TCM connector. 3. Probe the ignition voltage circuit and the battery positive voltage circuit of the TCM connector with the ground probe of the DMM. Refer to Measuring Voltage . 4. Connect the positive lead of the DMM to the battery positive terminal. 5. Turn ON the ignition, with the engine OFF. Are the voltage drop measurements less than the specified value?	0.5 V	Go to Step 10	Go to Step 7
7	Inspect the ECM/TCM fuse and the ACC/TCM fuse for an open. Refer to Circuit Protection - Fuses . Did you find an open fuse?	--	Go to Step 8	Go to Step 9
8	Repair the short to ground in the battery positive voltage circuit or the ignition voltage circuit. Refer to Wiring Repairs . Is the repair complete?	--	Go to Step 13	--
9	Test the battery positive voltage circuit and the ignition voltage circuit for an open or high resistance condition. Refer to Testing for Continuity and Wiring Repairs .	--		

	Did you find and correct a condition?		Go to Step 13	Go to Step 10
10	1. Turn ON the ignition, with the engine OFF. 2. Connect the negative lead of the DMM to the battery ground terminal. Observe and record the voltage measurement. 3. Using the positive probe of the DMM, probe each of the TCM ground circuits of the TCM connector. Observe and record the voltage measurement. Refer to Measuring Voltage Drop . Are both of the voltage drop measurements less than the specified value?	0.2 V	Go to Step 12	Go to Step 11
11	Repair the open or high resistance condition in the TCM ground circuits. Refer to Wiring Repairs . Is the repair complete?	--	Go to Step 13	--
12	Replace the TCM. Refer to Control Module References . Is the action complete?	--	Go to Step 13	--
13	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: - Start the engine. - Allow the engine to warm up to normal operating temperature. - Raise the engine speed to at least 1,200 RPM. - TCM voltage must be greater than 11 volts for 12 seconds. 4. Select Specific DTC. 5. Enter DTC P0562. Has the test run and passed?	--	Go to Step 14	Go to Step 2
14	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0563

Circuit Description

The transmission control module (TCM) continuously monitors the system voltage on the ignition 1 and the battery voltage circuits. Higher than normal voltage may cause the solenoids inside the transmission to operate improperly or damage solid-state components inside the TCM.

When the TCM detects high voltage, DTC P0563 sets. DTC P0563 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0563 System Voltage High.

Conditions for Running The DTC

The ignition is ON.

Conditions for Setting The DTC

The TCM detects system voltage greater than 18 volts for 10 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0563 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

- Observe the driver information center (DIC) messaging that indicates the electrical system requires service.
- Use the scan tool in order to inspect all other modules for voltage related DTCs.
- Running the engine with a battery charger attached may cause DTC P0563 to set.

- Inspect the charging circuit for high resistance.
- Inspect the vehicle battery for open or sulfated cells.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests the charging system voltage with a minimal load.

5. This step obtains the ignition voltage measurement reported by the TCM.

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the engine control module (ECM) and transmission control module (TCM). • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the Failure Records. Did you record a Failure Record for ECM DTC P0562?	--	Go to DTC P0562 .	Go to Step 3
3	1. Clear the DTC. 2. Start the engine. 3. Allow the engine to warm up to normal operating temperature. Is the charge indicator light ON?	--	Go to Charging System Test	Go to Step 4
4	1. Turn OFF all electrical accessories. 2. Increase the engine speed to 2,000 RPM. 3. Using the DMM, measure the voltage between the battery terminals. Record the measurement for reference. Is the voltage within the specified range?	12.5-14.5 V	Go to Step 5	Go to Charging System Test

5	1. Leave the engine running. 2. Observe the Ignition Voltage on the scan tool. 3. Increase the engine speed to 2,000 RPM. Is the difference between the voltage displayed on the scan tool and the voltage measurement in Step 4 greater than the specified value?	1.0 V	Go to Step 7	Go to Step 6
6	Did P0563 reset?	--	Go to Step 7	Go to Testing for Intermittent Conditions and Poor Connections
7	Replace the TCM. Refer to Control Module References . Is the action complete?	--	Go to Step 8	--
8	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Start the engine. • Allow the engine to warm up to normal operating temperature. • Observe the Ignition Voltage on the scan tool. • TCM voltage must remain below 18 volts for 12 seconds. 4. Select Specific DTC. 5. Enter DTC P0563. Has the test run and passed?	--	Go to Step 9	Go to Step 2
9	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0711

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The automatic transmission fluid temperature (TFT) sensor is part of the automatic transmission fluid pressure (TFP) manual valve position switch. The automatic TFT sensor is a negative coefficient thermistor. When the transmission fluid is cold, the sensor resistance is high. As the transmission fluid warms up, the sensor resistance decreases. This diagnostic monitors the TFT circuit. The circuit may be functional, but not in the normal operating range. This diagnostic indicates stuck, erratic, intermittent, skewed, or inaccurate values, indicating poor system performance. The TFT range is -40 to +151°C (-40 to +305°F).

If the TCM detects rapid or no voltage changes in the TFT sensor circuit, then DTC P0711 sets. DTC P0711 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance.

Conditions for Running the DTC

- No engine coolant temperature (ECT) DTC P0115.
- No output speed sensor (OSS) DTCs P0722 or P0723.
- DTC P0711 has not passed in the current ignition cycle.
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is -39 to +149°C (-38 to +300°F).
- For conditions 1 and 2 below, the engine coolant temperature is greater than 70°C (158°F) and has changed by at least 50°C (90°F) since start-up.
- For conditions 1 and 2 below, the torque converter clutch (TCC) slip speed is 120 RPM or greater for 600 seconds (10 minutes) cumulatively.

Conditions for Setting the DTC

One of the following conditions occurs:

Condition 1

- The transmission fluid temperature at start-up is -40 to +21°C (-40 to +70°F).
- The vehicle speed is greater than 8 km/h (5 mph) for 900 seconds (15 minutes) cumulatively.
- The transmission fluid temperature has not changed by more than 2°C (4°F) since start-up for 100 seconds (1 minute and 40 seconds).

Condition 2

- The transmission fluid temperature at start-up is 129-150°C (264-302°F).
- The vehicle speed is greater than 8 km/h (5 mph) for 600 seconds (10 minutes) cumulatively.
- The transmission fluid temperature has not changed by more than 2°C (4°F) since start-up for 100 seconds (1 minute and 40 seconds).

Condition 3

The transmission fluid temperature has changed by 20°C (36°F) or greater within 250 milliseconds; 14 times within 7 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM freezes transmission adaptive functions.
- The TCM calculates a default transmission fluid temperature based on engine coolant temperature, intake air temperature and engine run time.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P0711 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission-related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5. This step tests for an intermittent short or open condition in the engine wiring harness. The test lamp is used as a resistor in the circuit.

6. This step determines if the TCM or the TFT sensor is causing a steady, unchanging TFT reading.

DTC P0711

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Inspect for correct transmission fluid level. Refer to Transmission Fluid Check . Did you perform the fluid checking procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Failure Records. Using the Clear Info function erases the Failure Records from the transmission control module (TCM). 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Select Trans. Fluid Temp. on the scan tool. 6. Drive the vehicle and observe the scan tool for either of the following conditions: • The Trans. Fluid Temp. does not change more than 2.25°C (4°F) in 409 seconds since start-up. • The Trans. Fluid Temp. changes more than 20°C (36°F) in 200 milliseconds 14 times within 7 seconds. Did either of the conditions occur?	--	Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	Did the scan tool display a condition in which the Trans. Fluid Temp. does not change by more than the specified value in 409 seconds since start-up?	2.25°C (4°F)	Go to Step 6	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the A/T inline 20-way connector, additional DTCs may set. 3. Install the J 44152 Jumper Harness (20 pins) on the engine side of the A/T inline 20-way connector. 4. Using the J 35616 , connect a test lamp from the transmission fluid temperature (TFT) sensor signal and low reference circuits of the J 44152 . Refer to Component Connector End	20°C		

	Views . 5. Turn ON the ignition, with the engine OFF. 6. While observing the scan tool display, move or wiggle the engine wiring harness from TCM to the A/T inline 20-way connector. Does the scan tool Trans. Fluid Temp. change by more than the specified value?	(36°F)	Go to Step 7	Go to Step 8
6	1. Turn OFF the ignition. 2. Disconnect the A/T inline 20-way connector. 3. Turn ON the ignition, with the engine OFF. Does the scan tool display the same condition as in step 4?	--	Go to Step 11	Go to Step 10
7	1. Test the TFT sensor signal circuit of the TFT sensor for an intermittent open or short condition between the TCM and the A/T inline 20-way connector. 2. Test the low reference circuit of the TFT sensor for an intermittent open or short condition. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 12	Go to Step 11
8	1. Test the TFT sensor signal circuit of the TFT sensor for an intermittent open or short condition between the AT inline 20-way connector and the TFT sensor. 2. Test the low reference circuit of the TFT sensor for an intermittent open or short condition. Refer to Circuit Testing . Did you find an intermittent open or short condition?	--	Go to Step 9	Go to Step 10
9	Replace the A/T wiring harness. Refer to Torque Converter Clutch Pulse Width Modulation Solenoid, Torque Converter Clutch Solenoid, and Wiring Harness . Did you complete the replacement?	--	Go to Step 12	--
10	Replace the TFT sensor, this sensor is part of the TFP manual valve position switch. Refer to Valve Body and Pressure Switch Replacement .	--		--

	Did you complete the replacement?		Go to Step 12	
11	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 12	--
12	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle and make sure the following conditions are met: • The Trans. Fluid Temp. changes by more than 3°C (5.4°F) for 11 seconds since start-up. • The Trans. Fluid Temp. does not change by more than 20°C (36°F) within 200 milliseconds for a period of at least 11 seconds 4. Select Specific DTC. 5. Enter DTC P0711. Has the test run and passed?	--	Go to Step 13	Go to Step 2
13	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0712

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The automatic transmission fluid temperature (TFT) sensor is part of the automatic transmission fluid pressure (TFP) manual valve position switch. The TFT sensor is a thermistor, or a resistor that changes value when the temperature changes. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases, and as the temperature decreases, the resistance increases. The transmission control module (TCM) supplies a 5-volt reference signal to the sensor and measures the voltage drop in the circuit. When the transmission fluid is cold, the sensor resistance is high and the TCM detects high signal voltage. As the fluid temperature increases, the resistance of the sensor decreases, which lowers the signal voltage.

If the TCM detects a short to ground in the TFT sensor or signal circuit, then DTC P0712 sets. DTC P0712 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage.

Conditions for Running the DTC

The engine run time is greater than 5 seconds.

Conditions for Setting the DTC

The TCM detects a transmission fluid temperature of 150°C (302°F) or more for 2 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM freezes transmission adaptive functions.
- The TCM calculates a default transmission fluid temperature based on engine coolant temperature, intake air temperature and engine run time.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.

- The TCM stores DTC P0712 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission-related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Diagnostic Aids

- The scan tool displays the transmission fluid temperature in degrees. After the transmission is operating, the fluid temperature should rise steadily to a normal operating temperature, then stabilize.
- Verify the customer's driving habits, trailer towing, etc. Trailer towing should occur in D3.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step tests for a short to ground condition.

4. This step tests for an internal fault within the transmission by creating an open.

DTC P0712

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Inspect for correct transmission fluid level. Refer to Transmission Fluid Check . Did you perform the fluid checking procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Failure Records. Using the Clear Info function erases the Failure Records from the transmission control module (TCM). 3. Record the DTC Failure Records. 4. Clear the DTC.	0.2 V	Go to Testing for	

	Does the scan tool displays a TFT Sensor signal voltage greater than the specified value?		Intermittent Conditions and Poor Connections	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the A/T inline 20-way connector, additional DTCs may set. 3. Turn ON the ignition, with the engine OFF. Does the scan tool display a TFT Sensor signal voltage greater than the specified value?	4.92 V	Go to Step 5	Go to Step 7
5	1. Install the J 44152 Jumper Harness (20 pins) on the transmission side of the A/T inline 20-way connector. 2. Using the DMM and the J 35616 , measure the resistance the transmission fluid temperature (TFT) sensor signal and low reference circuits of the J 44152 . Refer to Testing for Continuity . Refer to Component Connector End Views . Does the resistance measure within the specified range?	3088-3942 Ω at 20°C (68°F) 159-198 Ω at 100°C (212°F)	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 6
6	Test the signal circuit of the TFT sensor for a short to ground between the A/T inline 20-way connector and the TFT sensor. Refer to Testing for Short to Ground . Did you find a short to ground condition?	--	Go to Step 9	Go to Step 8
7	Test the signal circuit of the TFT sensor for a short to ground between the TCM and the A/T inline 20-way connector. Refer to Testing for Short to Ground and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 11	Go to Step 10
8	Replace the TFT sensor, this sensor is part of the TFP manual valve position switch. Refer to Valve Body and Pressure Switch Replacement . Did you complete the replacement?	--	Go to Step 11	--
9	Replace the A/T wiring harness. Refer to Valve Body and Pressure Switch Replacement .	--		--

	Did you complete the replacement?		Go to Step 11	
10	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 11	--
11	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn ON the ignition, with the engine OFF. 4. Verify that the scan tool indicates a TFT Sensor signal voltage greater than 0.2 volts for 10 seconds. 5. Select Specific DTC. 6. Enter DTC P0712. Has the test run and passed?	--	Go to Step 12	Go to Step 2
12	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0713

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The automatic transmission fluid temperature (TFT) sensor is part of the automatic transmission fluid pressure (TFP) manual valve position switch. The TFT sensor is a thermistor, or a resistor that changes value when the temperature changes. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases, and as the temperature decreases, the resistance increases. The transmission control module (TCM) supplies a 5-volt reference signal to the sensor and measures the voltage drop in the circuit. When the transmission fluid is cold, the sensor resistance is high and the TCM detects high signal voltage. As the fluid temperature increases, the resistance of the sensor decreases, which lowers the signal voltage.

If the TCM detects an open in the TFT sensor or signal circuit, then DTC P0713 sets. DTC P0713 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage.

Conditions for Running the DTC

- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722, P0723.
- The output shaft speed is greater than 200 RPM for 200 seconds (3 minutes and 20 seconds) cumulative.
- The TCC slip speed is greater than 120 RPM for 200 seconds (3 minutes and 20 seconds) cumulative.
- The engine run time is greater than 5 seconds.

Conditions for Setting the DTC

The TCM detects a transmission fluid temperature of -39° C (-38° F) or less for 25 seconds.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM freezes transmission adaptive functions.
- The TCM calculates a default transmission fluid temperature based on engine coolant temperature, intake air temperature and engine run time.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P0713 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission-related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5. This step tests the TFT sensor signal circuit for being shorted to another circuit within the transmission. If the TFT sensor signal circuit shorts to another circuit, which is carrying voltage greater than 5-volts, the TFT sensor will become open.

6. This step tests the TFT sensor signal circuit for being shorted to voltage, which will be the cause for the open in the TFT sensor.

DTC P0713

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the DTC Failure Records. Using the Clear Info function erases the Failure Records from the transmission control module (TCM). 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Select Trans. Fluid Temp. on the scan tool. Does the scan tool display a Trans. Fluid Temp. less than the specified value?	-39°C (-38°F)	Go to Step 3	Go to Testing for Intermittent Conditions and Poor Connections

3	1. Turn OFF the ignition. 2. Disconnect the A/T inline 20-way connector. Additional DTCs may set. 3. Install the J 44152 Jumper Harness (20 pins) on the transmission side of the A/T inline 20-way connector. 4. Using the DMM and the J 35616 , measure the resistance between the transmission fluid temperature (TFT) sensor signal and low reference circuits of the J 44152 . Refer to Testing for Continuity . Refer to Component Connector End Views . Does the resistance measure less than the specified value?	100 K Ω	Go to Step 7	Go to Step 4
4	1. Test the signal circuit of the TFT sensor for an open between the A/T inline 20-way connector and the TFT sensor. 2. Test the low reference circuit of the TFT sensor for an open between the A/T inline 20-way connector and the TFT sensor. Refer to Testing for Continuity . Did you find an open condition?	--	Go to Step 8	Go to Step 5
5	Measure the resistance between the TFT sensor signal circuit and all other terminals of the J 44152 . Refer to Testing for Continuity . Does the resistance measure less than the specified value?	1,000 Ω	Go to Step 10	Go to Step 6
6	Test the signal circuit of the TFT sensor for a short to voltage between the TCM and the A/T inline 20-way connector. Refer to Testing for a Short to Voltage and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 9	Go to Step 9
7	1. Test the signal circuit of the TFT sensor for an open between the TCM and the A/T inline 20-way connector. 2. Test the low reference circuit of the TFT sensor for an open between the TCM and the A/T inline 20-way connector. Refer to Testing for Continuity and Wiring	--		

	Repairs . Did you find and correct an open condition?		Go to Step 12	Go to Step 11
8	Replace the automatic transmission wiring harness. Refer to Valve Body and Pressure Switch Replacement . Did you complete the replacement?	--	Go to Step 12	--
9	Replace the TFT sensor. Refer to Valve Body and Pressure Switch Replacement . Did you complete the replacement?	--	Go to Step 12	--
10	1. Replace the automatic transmission wiring harness. 2. Replace the TFT sensor. Refer to Valve Body and Pressure Switch Replacement . Did you complete the replacements?	--	Go to Step 12	--
11	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 12	--
12	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Turn ON the ignition, with the engine OFF. • The Trans. Fluid Temp. must be greater than -40°C (-40°F) for 6 seconds. 4. Select Specific DTC. 5. Enter DTC P0713. Has the test run and passed?	--	Go to Step 13	Go to Step 2
13	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0716

Circuit Description

The automatic transmission input shaft speed (AT ISS) sensor assembly is a three-wire hall-effect sensor that is mounted internally to the transmission on the oil pump assembly. The AT ISS utilizes the gear teeth, located on the turbine shaft, to generate a voltage signal of varying frequency that corresponds to the rotational speed of the turbine shaft. The AT ISS signal is an input to the transmission control module (TCM) and is used to determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio.

If the TCM detects an unrealistically large change in the AT ISS speed, DTC P0716 sets. DTC P0716 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0716 Input Speed Sensor Performance.

Conditions for Running the DTC

- No output speed sensor (OSS) DTCs P0722 or P0723.
- No AT ISS DTC P0717.
- No shift solenoid (SS) DTCs P0757, P0973 or P0974.
- The AT ISS speed is 300-1000 RPM for 2 seconds.
- The vehicle speed is greater than 16 km/h (10 mph).
- The engine torque is greater than 90 N·m (66 lb ft).
- The throttle position is greater than 10 percent.

Conditions for Setting the DTC

The AT ISS RPM changes abruptly by greater than 1300 RPM for 5 seconds.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adapts.
- The TCM calculates a default AT ISS RPM.
- The ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as Freeze Frame and Failure Records.

- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as Failure Records.
- The TCM stores DTC P0716 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the third consecutive drive trip in which the TCM does not send an MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission-related diagnostic fault occurring.

Diagnostic Aids

- Inspect the connectors at the TCM, the AT ISS, and all other circuit connecting points for an intermittent condition. Refer to Testing for Intermittent Conditions and Poor Connections .
- Inspect the circuit wiring for an intermittent condition. Refer to Testing for Electrical Intermittents .
- Road test the vehicle while monitoring the Transmission ISS parameter on the scan tool. The Transmission ISS parameter should vary with engine speed changes and not abruptly drop out.
- Inspect for an open or shorted AT ISS wire.
- Inspect for a disconnected AT ISS connector.
- Inspect for a faulty AT ISS.

DTC P0716

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTCs. 5. Road test the vehicle. 6. Observe the Transmission AT ISS parameter on the scan tool.	1300 RPM		

	Does the scan tool indicate a Transmission AT ISS parameter fluctuate or drop greater than the specified value?		Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the AT 20-way connector. 3. Turn the ignition ON, with the engine OFF. 4. Using the DMM, measure the TCM harness side voltage of the AT ISS 12-volt reference circuit to ground, at the AT 20-way connector, engine harness side. 5. Wiggle the engine harness between the TCM and the AT 20-way connector. Does the voltage measure near the specified value and not fluctuate?	12 V	Go to Step 4	Go to Step 7
4	Measure the voltage from the AT ISS 12-volt reference circuit to the AT ISS low reference circuit, at the AT 20-way connector, engine harness side. Does the voltage measure near the specified value and not fluctuate?	12 V	Go to Step 5	Go to Step 8
5	1. Turn OFF the ignition. 2. Connect the J 38522 , to the AT ISS signal circuit at the AT 20-way connector, engine harness side. 3. Adjust the signal to 12 V. 4. Adjust the frequency to 300Hz. 5. Adjust the duty cycle to 50 percent. 6. Turn the ignition ON, with the engine OFF. 7. Observe the Transmission AT ISS parameter on the scan tool. Is the Transmission AT ISS RPM near the specified value and does not fluctuate?	602 RPM	Go to Step 9	Go to Step 6
6	Test the AT ISS signal circuit for the following conditions: • An open. • A short to ground. • A short to voltage. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 14	Go to Step 13
	Test the AT ISS 12-volt reference circuit for the following conditions:			

7	• An open. • A short to ground. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 14	Go to Step 13
8	Test the AT ISS low reference circuit for an open or a short to voltage. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 14	Go to Step 13
9	Test the AT ISS internal transmission harness for the following conditions: • An open. • A short to ground. • A short to voltage. Refer to Circuit Testing . Did you find a condition?	--	Go to Step 11	Go to Step 10
10	1. Remove the AT ISS sensor. Refer to Oil Pump Disassemble . 2. Inspect the AT ISS and the transmission for the following conditions: • An incorrect AT ISS. • A loose AT ISS. • A damaged AT ISS. • Incorrect AT ISS installation. • Turbine shaft damage. 3. Repair any of the above conditions as necessary. Did you find and correct the condition?	--	Go to Step 14	Go to Step 12
11	Replace the internal transmission harness. Refer to Valve Body and Pressure Switch Replacement . Did you complete the action?	--	Go to Step 14	--
12	Replace the AT ISS. Refer to Oil Pump Disassemble . Did you complete the replacement?	--	Go to Step 14	--
13	Replace the TCM. Refer to Control Module References .	--		--

	Did you complete the replacement?		Go to Step 14	
14	Perform the following procedure In order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle. 4. Ensure the vehicle speed is greater than 20 km/h (13 mph) for at least 10 seconds. 5. Select specific DTC. 6. Enter DTC P0716. Has the test run and passed?	--	Go to Step 15	Go to Step 2
15	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0717

Circuit Description

The automatic transmission input shaft speed (AT ISS) sensor assembly is a three-wire hall-effect sensor that is mounted internally to the transmission on the oil pump assembly. The AT ISS utilizes the gear teeth, located on the turbine shaft, to generate a voltage signal of varying frequency that corresponds to the rotational speed of the turbine shaft. The AT ISS signal is an input to the transmission control module (TCM) and is used to determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio.

If the TCM detects AT ISS input less than 100 RPM with the engine running, DTC P0717 sets. DTC P0717 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0717 Input Speed Sensor Circuit Low Voltage.

Conditions for Running the DTC

- No output speed sensor (OSS) DTCs P0722 or P0723.
- No AT ISS DTC P0716.
- No TFP DTC P1810.
- The vehicle speed is greater than 16 km/h (10 mph).
- The engine torque is greater than 90 N·m (66 lb ft).

Conditions for Setting the DTC

The AT ISS RPM is less than 100 RPM for 5 seconds.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adapts.
- The TCM calculates a default AT ISS RPM.
- The ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as Freeze Frame and Failure Records.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as Failure Records.

- The TCM stores DTC P0717 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the third consecutive drive trip in which the TCM does not send an MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission-related diagnostic fault occurring.

Diagnostic Aids

- Inspect the connectors at the TCM, the AT ISS, and all other circuit connecting points for an intermittent condition. Refer to Testing for Intermittent Conditions and Poor Connections .
- Inspect the circuit wiring for an intermittent condition. Refer to Testing for Electrical Intermittents .
- Road test the vehicle while monitoring the Transmission ISS parameter on the scan tool. The Transmission ISS parameter should vary with engine speed changes and not abruptly drop out.
- Inspect for an open or shorted AT ISS wire.
- Inspect for a disconnected AT ISS connector.
- Inspect for a faulty AT ISS.

DTC P0717

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTCs. 5. Start the engine and vary the RPMs. 6. Observe the Transmission AT ISS parameter on the scan tool. Is the scan tool Transmission AT ISS parameter greater than the specified value?	400 RPM	Go to Diagnostic Aids	Go to Step 3

3	1. Turn OFF the ignition. 2. Disconnect the AT 20-way connector. 3. Turn the ignition ON, with the engine OFF. 4. Using the DMM, measure the voltage of the AT ISS 12-volt reference circuit to ground, at the AT 20-way connector, engine harness side. Does the voltage measure near the specified value?	12 V	Go to Step 4	Go to Step 7
4	Measure the voltage from the AT ISS 12-volt reference circuit to the AT ISS low reference circuit, at the AT 20-way connector, engine harness side. Does the voltage measure near the specified value?	12 V	Go to Step 5	Go to Step 8
5	1. Turn OFF the ignition. 2. Connect the J 38522 , to the AT ISS signal circuit at the AT 20-way connector, engine harness side. 3. Adjust the signal to 12 V. 4. Adjust the frequency to 300Hz. 5. Adjust the duty cycle to 50 percent. 6. Turn the ignition ON, with the engine OFF. 7. Observe the Transmission AT ISS parameter on the scan tool. Is the Transmission AT ISS RPM near the specified value and steady?	602 RPM	Go to Step 9	Go to Step 6
6	Test the AT ISS signal circuit for the following conditions: • An open. • A short to ground. • A short to voltage. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 14	Go to Step 13
7	Test the AT ISS 12-volt reference circuit for the following conditions: • An open. • A short to ground. Refer to Circuit Testing and Wiring Repairs .	--		

	Did you find and correct the condition?		Go to Step 14	Go to Step 13
8	Test the AT ISS low reference circuit for an open or a short to voltage. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 14	Go to Step 13
9	Test the AT ISS internal transmission harness for the following conditions: • An open. • A short to ground. • A short to voltage. Refer to Circuit Testing and Wiring Repairs . Did you find a condition?	--	Go to Step 11	Go to Step 10
10	1. Remove the AT ISS sensor. Refer to Oil Pump Disassemble . 2. Inspect the AT ISS and the transmission for the following conditions: • An incorrect AT ISS • A loose AT ISS • A damaged AT ISS • Incorrect AT ISS installation • Turbine shaft damage. 3. Repair any of the above conditions as necessary. Did you find and correct the condition?	--	Go to Step 14	Go to Step 12
11	Replace the internal transmission harness. Refer to Valve Body and Pressure Switch Replacement . Did you complete the action?	--	Go to Step 14	--
12	Replace the AT ISS. Refer to Valve Body and Pressure Switch Replacement . Did you complete the replacement?	--	Go to Step 14	--
13	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 14	--
	Perform the following procedure In order to verify the repair: 1. Select DTC. 2. Select Clear Info.			

14	3. Drive the vehicle. 4. Ensure the vehicle speed is greater than 20 km/h (13 mph) for at least 10 seconds. 5. Select specific DTC. 6. Enter DTC P0717. Has the test run and passed?	--	Go to Step 15	Go to Step 2
15	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0719

Circuit Description

The body control module (BCM) receives a signal from the brake pedal position sensor through the brake pedal position switch signal circuit. The BCM then applies a signal through the stop lamp switch signal circuit to the transmission control module (TCM) and engine control module (ECM).

When the TCM detects an open or short to ground on the stop lamp switch signal circuit during stopping, then DTC P0719 sets. DTC P0719 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0719 Brake Switch Circuit Low Voltage.

Conditions for Running the DTC

- No OSS DTCs P0722 or P0723.
- No Brake Switch DTC P0724.
- The vehicle speed is greater than 40 km/h (25 mph) for 7 seconds, then 8-40 km/h (5-25 mph) for 5 seconds, then less than 8 km/h (5 mph).
- Continuously 8 times once the previous criteria have been met.

Conditions for Setting the DTC

The TCM detects an open or short to ground on the stop lamp switch signal circuit when the circuit should be high, B+.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0719 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

Important:

- Verify that the brake pedal position sensor is adjusted properly. Refer toBrake Pedal Position Sensor Calibration in Lighting Systems.
- Test drive the vehicle if a switch or circuit condition cannot be located. An intermittent condition may be duplicated during a test drive.

Test Description

The number below refers to the step number on the diagnostic table.

2. This step determines if the fault is present.

DTC P0719

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Connect a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. With a scan tool, observe the TCC Brake Switch parameter in the TCC Data Display. 4. Depress the brake pedal. Does the Stop Lamp Pedal Switch parameter indicate Closed?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	1. Disconnect the transmission control module (TCM). 2. Using J 35616 , with the test lamp connected to ground, probe the harness side of the stop lamp switch signal circuit. 3. Depress the brake pedal. Does the test lamp illuminate?	--	Go to Step 5	Go to Step 4
4	Test for the stop lamp switch signal circuit an open or short to ground. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 7	Go to Step 6
5	Replace the TCM. Refer to Control Module References	--		--

	Did you complete the replacement?		Go to Step 7	
6	Replace the BCM. Refer to Control Module References Did you complete the replacement?	--	Go to Step 7	--
7	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Turn ON the ignition, with the engine OFF for at least 2 seconds. • Start the vehicle and idle for 5 seconds. • Drive in D4 from 0-60 km/h (0-37 mph) 8 times in 1 ignition cycle. 4. Select Specific DTC. 5. Enter DTC P0719. Has the test run and passed?	--	Go to Step 8	Go to Step 2
8	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0722

Circuit Description

The output speed sensor (OSS), provides vehicle speed information to the transmission control module (TCM). The OSS is a permanent magnet generator. The sensor is mounted in the transmission case facing the rear internal gear which is splined to the output shaft assembly. As the output shaft and internal gear rotate, the toothed rotor of the internal gear produces AC voltage as the rotor teeth pass through the magnetic field of the sensor. The AC voltage level and the number of pulses increase as the speed of the vehicle increases. The TCM converts the voltage to vehicle speed. The TCM uses the output shaft speed signal to determine shift timing and torque converter clutch (TCC) scheduling.

If the TCM detects no vehicle speed when there is engine speed in a drive gear range, then DTC P0722 sets. DTC P0722 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0722 Output Speed Sensor Circuit Low Voltage.

Conditions for Running the DTC

- No OSS DTC P0723.
- No transmission fluid pressure (TFP) DTCs P1810, P1815, P1816.
- Ignition voltage between 8-18 volts.
- TFT is between -40°C (-40°F) and 150°C (302°F).
- The engine run time is greater than 5 seconds.
- The throttle position is greater than 12 percent.
- The engine torque is between 108 N·m (80 lb ft) and 882 N·m (651 lb ft).

Conditions for Setting the DTC

The transmission OSS is less than 50 RPM for 3 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM calculates vehicle speed from the automatic transmission engine RPM and commanded gear.

- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the engine control module (ECM) records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0722 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Inspect the rear internal gear teeth for damage.
- Visually inspect the OSS for cracks or damage.
- Ensure the OSS is properly torqued to the transmission housing.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. Disable the traction control system when performing this step. When the ignition key is cycled to the OFF position and then cycled back ON, the traction control system defaults to ON.

3. This step tests the OSS.

5. This step tests the integrity of the OSS.

Operate the vehicle so that the transmission output speed is greater than 500 RPM for 3 seconds. 4. Select Specific DTC. 5. Enter DTC P0722. Has the test run and passed?	--	Go to Step 16	Go to Step 2
16	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0723

Circuit Description

The output shaft speed (OSS) sensor provides vehicle speed information to the transmission control module (TCM). The OSS is a permanent magnet generator. The sensor is mounted in the transmission case facing the rear internal gear which is splined to the output shaft assembly. As the output shaft and internal gear rotate, the toothed rotor of the internal gear produces AC voltage as the rotor teeth pass through the magnetic field of the sensor. The AC voltage level and the number of pulses increase as the speed of the vehicle increases. The TCM converts the voltage to vehicle speed. The TCM uses the output shaft speed signal to determine shift timing and torque converter clutch (TCC) scheduling.

If the TCM detects an unrealistic drop in output shaft speed, DTC P0723 sets. DTC P0723 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0723 Output Speed Sensor Circuit Intermittent.

Conditions for Running the DTC

- No OSS DTC P0722.
- No transmission fluid pressure (TFP) DTCs P1810, P1815, P1816.
- Ignition voltage between 8-18 volts.
- TFT is between -40°C (-40°F) and 150°C (302°F).
- The engine run time is greater than 5 seconds.
- The throttle position is greater than 12 percent.
- The engine torque is between 108 N·m (80 lb ft) and 882 N·m (651 lb ft).

Conditions for Setting the DTC

The transmission output shaft speed drops greater than 1,000 RPM, for at least 3.4 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM calculates vehicle speed from the automatic transmission input shaft speed sensor and commanded gear.

- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the engine control module (ECM) records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0723 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Inspect the rear internal gear teeth for damage.
- Visually inspect the OSS for cracks or damage.
- Ensure the OSS is properly torqued to the transmission housing.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. Disable the traction control system when performing this step. When the ignition switch is cycled OFF and then back ON, the traction control system defaults to ON.

3. This step tests the OSS.

5. This step tests the integrity of the OSS.

16	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0724

Circuit Description

The body control module (BCM) receives a signal from the brake pedal position (BPP) sensor through the brake pedal position switch signal circuit. The BCM then applies a signal through the stop lamp switch signal circuit to the transmission control module (TCM) and engine control module (ECM).

When the TCM detects voltage on the stop lamp switch signal circuit during acceleration then DTC P0724 sets. DTC P0724 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0724 Brake Switch Circuit High Voltage.

Conditions for Running the DTC

- No output speed sensor (OSS) DTCs P0722 or P0723.
- No brake switch DTC P0719.
- The vehicle speed is 8-40 km/h (5-25 mph) for 6 seconds, then greater than 40 km/h (25 mph) for 7 seconds.

Conditions for Setting the DTC

The TCM detects voltage on the stop lamp switch signal circuit during acceleration.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0724 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

Important:

- Verify that the BPP sensor is adjusted properly. Refer to Brake Pedal Position Sensor Calibration in Lighting Systems.
- Test drive the vehicle if a switch or circuit condition cannot be located. An intermittent condition may be duplicated during a test drive.
- Application of the brake pedal while accelerating may cause this DTC to set.

Test Description

The number below refers to the step number on the diagnostic table.

2. This step determines if the fault is present.

DTC P0724

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle

DTC P0741

Circuit Description

The torque converter clutch (TCC) solenoid valve is a normally-open exhaust valve that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve in order to control fluid acting on the converter clutch apply valve. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. When grounded, energised, by the transmission control module (TCM), the TCC solenoid valve stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and move the converter clutch apply valve against spring force and into the apply position. In this position, release fluid is open to an exhaust port and converter feed fluid fills the apply fluid circuit. The converter feed fluid applies the TCC. When the TCM no longer provides a ground path, the TCC solenoid valve de-energises and apply fluid exhausts, releasing the TCC.

When the TCM detects high torque converter slip when the TCC is commanded OFF, then DTC P0741 sets. DTC P0741 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0741 Torque Converter Clutch (TCC) System - Stuck Off.

Conditions for Running the DTC

- No output shaft speed (OSS) DTCs P0722 or P0723.
- No TCC system stuck-on DTC P0742.
- No TCC solenoid electrical DTCs P2763 or P2764.
- The IMS range is D2, D3, D4, or D5.
- Ignition voltage between 8-18 volts.
- The transmission fluid temperature is greater than 20°C (68°F).
- The engine torque is between 108 N·m (80 lb ft) and 881 N·m (650 lb ft).
- The throttle position is greater than 10 percent.
- The gear ratio is within the following ranges:
  - 1.41:1-1.56:1 - 2nd gear
  - 0.95:1-1.05:1 - 3rd gear
- The TCC is commanded ON .1 seconds.
- The TCC duty cycle is greater than 60 percent for more than 3 seconds.

Conditions for Setting the DTC

The TCM commands the TCC ON, and the TCC slip is greater than 250 RPM for 3 seconds.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM inhibits TCC.
- The TCM inhibits 4th gear if the transmission is in Hot Mode.
- The TCM commands elevated line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0741 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Inspect the transmission fluid lines to the radiator. The lines may be pinched, plugged or twisted.
- Contamination may cause the TCC apply valve to stick in the valve body.
- Internal damage to the torque converter may prevent TCC application.

Test Description

The number below refers to the step number on the diagnostic table.

2. This step tests the hydraulic state of the TCC. When the TCM commands the TCC solenoid valve OFF, the slip speed should increase.

DTC P0741

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle

2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info. function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Drive the vehicle in the D4 drive range in second, third, or fourth gear under steady acceleration, with a TP angle at 20 percent. While the scan tool TCC Enable status is ON, does the scan tool display a TCC Slip Speed within the specified range?	-20 to +20 RPM	Go to Diagnostic Aids	Go to Step 3
3	The torque converter clutch (TCC) system is hydraulically stuck OFF. Inspect for the following conditions: • Torque converter clutch/pulse width modulation (TCC PWM) solenoid valve mechanically stuck OFF or leaking. • TCC regulator apply valve stuck in the OFF position. • TCC Sol valve stuck in the OFF position or leaking. • TCC enable valve stuck in the OFF position. • Misaligned damaged or leaking valve body gasket. • Inspect the forward clutch input housing assembly for the input shaft fluid seal ring leaking or worn. Did you find and correct any of the above conditions?	--	Go to Step 4	--

DTC P0742

Circuit Description

The torque converter clutch (TCC) solenoid valve is a normally-open exhaust valve that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve in order to control fluid acting on the converter clutch apply valve. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. When grounded, energised, by the transmission control module (TCM), the TCC solenoid valve stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and move the converter clutch apply valve against spring force and into the apply position. In this position, release fluid is open to an exhaust port and converter feed fluid fills the apply fluid circuit. The converter feed fluid applies the TCC. When the TCM no longer provides a ground path, the TCC solenoid valve de-energises and apply fluid exhausts, releasing the TCC.

When the TCM detects low torque converter slip when the TCC is commanded OFF, then DTC P0742 sets. DTC P0742 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0742 Torque Converter Clutch (TCC) System - Stuck On.

Conditions for Running the DTC

- No TCC electrical DTCs P02763, P02764, P02769, P02770.
- No TCC performance DTC P0741.
- No output shaft speed (OSS) sensor DTCs P0722 or P0723.
- Ignition voltage is between 8-18 volts.
- The engine run time is greater than 5 seconds.
- The information management system (IMS) range is D5.
- The transmission fluid temperature is 10-130°C (50-266°F).
- The engine speed is 500-6,500 RPM for 5 seconds, then 800-4,400 RPM.
- The engine torque is between 156 N·m (115 lb ft) and 881 N·m (650 lb ft).
- The throttle position is greater than 10 percent.
- The transmission is not in 1st gear and the gear ratio is 0.95:1-1.56:1.
- The vehicle speed is greater than 15 km/h (9 mph).
- TCC is commanded OFF.

Conditions for Setting the DTC

The following conditions occur 4 times in 1 ignition cycle:

- The TCM commands the TCC OFF.
- The TCC slip is between -15 to +15 RPM for greater than 3 seconds.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0742 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

The TCC fluid hydraulically applies the TCC, possibly causing an engine stall, under the following conditions:

- The TCC is hydraulically stuck ON.
- The parking brake is applied.
- Any gear range is selected.
- Contamination may cause the TCC apply valve to intermittently stick in the valve body.
- Internal damage in the torque converter may cause no TCC apply.

Test Description

The number below refers to the step number on the diagnostic table.

2. This step tests the hydraulic state of the TCC. When the TCM commands the TCC solenoid valve OFF, the slip speed should increase.

DTC P0742

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info. function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Drive the vehicle in the D4 drive range in second, third, or fourth gear under steady acceleration, with a TP angle at 10 percent. While the scan tool TCC Enable status is NO, does the scan tool display a TCC Slip Speed within the specified range?	-20 to +20 RPM	Go to Step 3	Go to Diagnostic Aids
3	The TCC is hydraulically stuck ON. Inspect for the following: - Clogged exhaust orifice in the torque converter clutch (TCC) solenoid valve. - Converter clutch apply valve stuck in the apply position. - Misaligned or damaged valve body gasket. - Restricted release passage. - Restricted transmission cooler line. Did you find and correct the condition?	--	Go to Step 4	--
4	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D4 with the TCC OFF and the throttle above 10 percent. Ensure that the scan tool TCC Slip Speed is 100-2,500 RPM for 3 seconds. 4. Select Specific DTC.	--		

	5. Enter DTC P0742. Has the test run and passed?		Go to Step 5	Go to Step 2
5	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

Document ID: 1984496

DTC P0751

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The 1-2 SS valve is a normally-open exhaust valve that is used with the 2-3 SS valve, in order to allow 4 different shifting combinations.

If the transmission control module (TCM) detects a 2-2-3-3 shift pattern, then DTC P0751 sets. DTC P0751 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0751 1-2 Shift Solenoid (SS) Valve Performance - No First or Fourth Gear.

Conditions for Running the DTC

- No output shaft speed (OSS) DTCs P0722 or P0723.
- No TCC performance DTC P0742, P0894.
- No shift solenoid electrical DTCs P0973, P0974, P0976, or P0977.
- No information management system (IMS) DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- The ignition voltage is 8-18 volts.
- The engine RPM is 500-6,500 RPM for greater than 5 seconds.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is greater than 10 percent.
- The input shaft speed is 200-6,800 RPM.
- The output shaft speed is greater than 100 RPM.

Conditions for Setting the DTC

Both of the following conditions must occur twice during the same trip:

- Fail Case 1: The TCM commands 1st gear and the resulting gear ratio is 1.44:1-1.50:1 for 2 seconds.
- Fail Case 2: The TCM commands 4th gear and the resulting gear ratio is 0.98:1-1.03:1 for 4 seconds.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.

- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0751 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0751, and then cannot reset DTC P0751, the following conditions may exist:
  - Fluid contamination.
  - Plugged fluid circuits.
  - Restricted fluid circuits.
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The number below refers to the step number on the diagnostic table.

2. This step tests that the TCM commanded all shifts, that all shift solenoid valves responded correctly, but that all the shifts did not occur.

DTC P0751

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF.			

2	**Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Drive the vehicle in D4 range under the following conditions: Accelerate the vehicle, ensuring that the TCM commands 1st, 2nd, 3rd and 4th gears. Did you detect a 2-2-3-3 shift pattern?	--	Go to Step 3	Go to Diagnostic Aids
3	Inspect the shift solenoid/hydraulic circuit for the following conditions: - An internal malfunction - Damaged seals on the shift solenoid valve--Refer to Shift Solenoid Leak Test . Did you find and correct the condition?	--	Go to Step 4	--
4	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D4 range under the following conditions, only if traffic and road conditions permit: Hold the throttle at 20 percent and accelerate to 88 km/h (55 mph). 4. Select Specific DTC. 5. Enter DTC P0751. Has the test run and passed?	--	Go to Step 5	Go to Step 2
5	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0752

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The 1-2 SS valve is a normally-open exhaust valve that is used with the 2-3 SS valve, in order to allow 4 different shifting combinations.

When the transmission control module (TCM) detects a 1-1-4-4 shift pattern, then DTC P0752 sets. DTC P0752 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0752 1-2 Shift Solenoid (SS) Valve Performance - No Second or Third Gear.

Conditions for Running the DTC

- No output shaft speed (OSS) DTCs P0722 or P0723.
- No torque converter clutch (TCC) performance DTC P0742 or P0894.
- No shift solenoid electrical DTCs P0973, P0974, P0976, or P0977.
- Ignition voltage between 8-18 volts.
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is greater than 10 percent.
- The output shaft speed is greater than 150 RPM.
- The engine torque is between 108 N·m (80 lb ft) and 882 N·m (651 lb ft).

Conditions for Setting the DTC

The TCM commands 2nd gear and the resulting gear ratio is 2.42:1-2.52:1, 1st gear ratio for 2 seconds twice during the same trip.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits 3-2 downshifts if the vehicle speed is greater than 40 km/h (25 mph).
- At the time of the first failure, the TCM records the operating conditions when the Conditions

for Setting the DTC are met. The TCM stores this information as a Failure Record.

- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0752 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0752, and then cannot reset DTC P0752, the following conditions may exist:
  - Fluid contamination.
  - Plugged fluid circuits.
  - Restricted fluid circuits.
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The number below refers to the step number on the diagnostic table.

2. This step tests that the TCM commanded all shifts, that all shift solenoid valves responded correctly, but that all the shifts did not occur.

DTC P0752

DTC P0756

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The 2-3 SS valve is a normally-open exhaust valve that is used with the 1-2 SS valve, in order to allow 4 different shifting combinations.

When the transmission control module (TCM) detects a 4-3-3-4 shift pattern, then DTC P0756 sets. DTC P0756 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0756 2-3 Shift Solenoid (SS) Valve Performance - No First or Second Gear.

Conditions for Running the DTC

- No throttle position (TP) sensor DTC P0120.
- No output shaft speed (OSS) DTCs P0722 or P0723.
- No torque converter clutch (TCC) performance DTC P0742.
- No shift solenoid electrical DTCs P0973, P0974, P0976, or P0977.
- No IMS DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- The engine torque is between 108 N·m (80 lb ft) and 882 N·m (651 lb ft).
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is greater than 10 percent.
- The output shaft speed is greater than 150 RPM.

Conditions for Setting the DTC

Both of the following conditions must occur twice during the same trip:

- Fail Case 1: The TCM commands 1st gear when the output shaft speed is 200 RPM or greater, the engine torque is 40-350 N·m (30-258 lb ft), and the resulting gear ratio is 0.73:1-0.77:1 for 2.8 seconds.
- Fail Case 2: The TCM commands 2nd gear when the engine torque is 36-350 N·m (27-258 lb ft) and the resulting gear ratio is 1.56:1-1.64:1 for 1 second.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.

- The TCM inhibits 1st gear.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0756 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0756, and then cannot reset DTC P0756, the following conditions may exist:
  - Fluid contamination.
  - Plugged fluid circuits.
  - Restricted fluid circuits.
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The number below refers to the step number on the diagnostic table.

2. This step tests that the TCM commanded all shifts, that all shift solenoid valves responded correctly, but that all the shifts did not occur.

DTC P0756

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF.			

2	**Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Drive the vehicle in D4 range under the following conditions: Accelerate the vehicle, ensuring that the TCM commands 1st, 2nd, 3rd and 4th gears. Did you detect a 4-3-3-4 shift pattern?	--	Go to Step 3	Go to Diagnostic Aids
3	1. Inspect the shift solenoid/hydraulic circuit for the following conditions: - Debris or chips in the AFL oil passage. - Debris or chips restricting oil flow in passage #29 of the case or through the spacer plate gasket into the valve body. - A cracked 2-3 shift solenoid. - A 2-3 shift valve which is stuck or hung up in the valve body bore. - A 2-3 shuttle valve which is stuck or hung up in its bore. - Damaged seals on the shift solenoid valves--Refer to Shift Solenoid Leak Test . 2. Clean and inspect the related valves, bores and the valve body for debris or contamination. Did you find and correct the condition?	--	Go to Step 4	--
4	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D4 range under the following conditions, only if traffic and road conditions permit: Hold the throttle at 40 percent and accelerate to 64 km/h (40 mph). 4. Select Specific DTC.	--		

	5. Enter DTC P0756. Has the test run and passed?		Go to Step 5	Go to Step 2
5	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0757

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The 2-3 SS valve is a normally-open exhaust valve that is used with the 1-2 SS valve in order to allow four different shifting combinations.

When the transmission control module (TCM) detects a 1-2-2-1 shift pattern, then DTC P0757 sets. DTC P0757 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0757 2-3 Shift Solenoid (SS) Valve Performance - No Third or Fourth Gear.

Conditions for Running the DTC

- No throttle position (TP) sensor DTC P0120.
- No output shaft speed (OSS) DTCs P0722 or P0723.
- No torque converter clutch (TCC) performance DTC P0742.
- No shift solenoid electrical DTCs P0973, P0974, P0976, or P0977.
- No IMS DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- The engine torque is between 108 N·m (80 lb ft) and 882 N·m (651 lb ft).
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is greater than 10 percent.
- The output shaft speed is greater than 150 RPM.

Conditions for Setting the DTC

The TCM commands 3rd gear and the resulting gear ratio is a 1.44:1-1.52:1, 1st gear, for 2.25 seconds.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits 4th gear.

- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0757 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0757, and then cannot reset DTC P0757, the following conditions may exist:
  - Fluid contamination.
  - Plugged fluid circuits.
  - Restricted fluid circuits.
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The number below refers to the step number on the diagnostic table.

2. This step tests that the TCM commanded all shifts, that all shift solenoid valves responded correctly, but that all the shifts did not occur.

DTC P0757

DTC P0787

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The 3-2 shift solenoid (SS) valve is a normally-closed, 3-port, on/off device that controls the 3-2 downshift. The solenoid attaches to the control valve body within the transmission. The solenoid receives ignition voltage through the ignition 1 circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the 3-2 shift solenoid valve control circuit. During a 3-2 downshift, the 2-4 band applies as the 3-4 clutch releases. The TCM varies the timing between the 3-4 clutch release and the 2-4 band apply depending on the vehicle speed and the throttle position.

When the TCM detects a continuous open, short to ground or short to voltage in the 3-2 SS valve circuit, then DTC P0787 sets. DTC P0787 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0787 3-2 Shift Solenoid (SS) Control Circuit Low Voltage.

Conditions for Running the DTC

- The system voltage is 10-18 volts.
- The engine speed is greater than 450 RPM for 5 seconds.
- Vehicle speed is less than 200 km/h (124 mph).

Conditions for Setting the DTC

DTC P0787 sets if one of the following conditions occurs for 5 seconds:

Condition 1

The TCM commands the solenoid ON and the voltage feedback remains high, B+.

Condition 2

The TCM commands the solenoid OFF and the voltage feedback remains low, 0 volts.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM commands 3rd gear.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0787 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests the ability of the TCM to control the solenoid.
5. This step tests for voltage to the 3-2 SS valve.
6. This step tests the ability of the TCM and wiring to control the ground circuit.
8. This step measures resistance of the automatic transmission (A/T) wiring harness and the 3-2 SS valve.

DTC P0787

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool.			

2	2. Turn ON the ignition, with the engine OFF. **Important::** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. Are any of the following DTCs also set? - P0961 - P0973 - P0976 - P2764 - P2769	--	Go to Step 3	Go to Step 4
3	Inspect the ACC/TCM fuse for an open. Refer to Circuit Protection - Fuses . Is the fuse open?	--	Go to Step 12	Go to Step 5
4	With a scan tool, command the 3-2 Downshift Solenoid ON. Does the 3-2 Sol. CKT status parameter display OK when commanded ON?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the A/T inline 20-way connector, additional DTCs may set. 3. Install the J 44152 Jumper Harness (20 pins) on the engine side of the A/T inline 20-way connector. 4. Turn ON the ignition, with the engine OFF. 5. Using the J 35616 , connect a test lamp from 3-2 SS valve ignition 1 voltage circuit of the J 44152 to ground. Refer to Component Connector End Views . Does the test lamp illuminate?	--	Go to Step 6	Go to Step 15
	1. Connect a test lamp between the 3-2 SS valve IGN 1 voltage and control circuits of the J 44152 . Refer to Component Connector End			

6	Views and Testing for Continuity . 2. Use the scan tool in order to command the 3-2 SS valve ON and OFF 3 times. Does the test lamp turn ON and OFF with each command?	--	Go to Step 8	Go to Step 7
7	Is the test lamp always ON?	--	Go to Step 16	Go to Step 17
8	1. Install the J 44152 on the transmission side of the A/T inline 20-way connector. 2. Using the DMM and the J 35616 , measure the resistance between the 3-2 SS valve IGN 1 voltage and control circuits of the J 44152 . Refer to Testing for Continuity . Refer to Component Connector End Views . Does the resistance measure within the specified range?	20-32 Ω	Go to Step 9	Go to Step 10
9	Measure the resistance from the 3-2 SS valve IGN voltage and control circuits to ground. Refer to Testing for Continuity . Do both readings measure greater than the specified value?	250 K Ω	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 11
10	1. Disconnect the A/T wiring harness from the 3-2 SS valve. 2. Measure the resistance of the 3-2 SS valve. Refer to Testing for Intermittent Conditions and Poor Connections . Does the resistance measure within the specified range?	20-32 Ω	Go to Step 18	Go to Step 19
11	1. Disconnect the A/T wiring harness from the 3-2 SS valve. 2. Measure the resistance from the component's terminals to ground. Refer to Testing for Intermittent Conditions and Poor Connections . Do both readings measure greater than the specified value?	250 K Ω	Go to Step 18	Go to Step 19
	Important: The condition that affects this circuit may exist in other connecting branches of the circuit. Refer to Power Distribution			

12	Schematics , for complete circuit distribution. Test the ignition circuit of the 3-2 SS valve for a short to ground between the fuse block-underhood and the A/T inline 20-way connector. Refer to Testing for Short to Ground and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 21	Go to Step 13
13	**Important:** The condition that affects this circuit may exist in other connecting branches of the circuit. Refer to Power Distribution Schematics , for complete circuit distribution. Test the ignition voltage circuit of the 3-2 SS valve for a short to ground between the A/T inline 20-way connector and the 3-2 SS valve assembly. Refer to Testing for Short to Ground . Did you find a short to ground condition?	--	Go to Step 18	Go to Step 14
14	1. Test each solenoid for a short to ground. Refer to Testing for Short to Ground . 2. Replace the faulty solenoid as necessary. Did you complete the replacement?	--	Go to Step 21	--
15	**Important:** The condition that affects this circuit may exist in other connecting branches of the circuit. Refer to Power Distribution Schematics , for complete circuit distribution. Test the ignition circuit of the 3-2 SS valve for an open. Refer to Testing for Continuity and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 21	--
16	Test the control circuit of the 3-2 SS valve for a short to ground between the TCM and the A/T inline 20-way connector. Refer to Testing for Short to Ground and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 21	Go to Step 20
17	Test the control circuit of the 3-2 SS valve for an open between the TCM and the A/T inline 20-way connector. Refer to Testing for a Short to Voltage and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 21	Go to Step 20
	Replace the A/T wiring harness. Refer to			

18	Torque Converter Clutch Pulse Width Modulation Solenoid, Torque Converter Clutch Solenoid, and Wiring Harness . Did you complete the replacement?	--	Go to Step 21	--
19	Replace the 3-2 SS valve. Refer to Control and Shift Solenoids Replacement . Did you complete the replacement?	--	Go to Step 21	--
20	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 21	--
21	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D3 or D4 and perform a 3-2 downshift. Ensure the 3-2 Sol. CKT status parameter displays OK. 4. Select specific DTC. 5. Enter DTC P0787. Has the test run and passed?	--	Go to Step 22	Go to Step 2
22	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0788

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The 3-2 shift solenoid (SS) valve is a normally-closed, 3-port, ON/OFF device that controls the 3-2 downshift. The solenoid attaches to the control valve body within the transmission. The solenoid receives voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the 3-2 shift solenoid valve control circuit. During a 3-2 downshift, the 2-4 band applies as the 3-4 clutch releases. The TCM varies the timing between the 3-4 clutch release and the 2-4 band apply depending on the vehicle speed and throttle position.

When the TCM detects a continuous short to voltage in the 3-2 shift solenoid valve control circuit, then DTC P0788 sets. DTC P0788 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0788 3-2 Shift Solenoid (SS) Control Circuit High Voltage.

Conditions for Running the DTC

- The system voltage is 10-18 volts.
- The engine speed is 450 RPM for 5 seconds.
- The engine is not in fuel cutoff.

Conditions for Setting the DTC

DTC P0788 sets if the TCM commands the solenoid ON and the voltage feedback remains high, B+.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.

- The TCM commands 3rd gear.
- The TCM inhibits torque converter clutch (TCC) engaugement.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0788 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

DTC P0788

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. With a scan tool, command the 3-2 Sol. ON. Does the 3-2 Sol. CKT status parameter display OK?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
	1. Turn OFF the ignition. 2. Disconnect the A/T inline 20-way connector, additional DTCs may set. 3. Install the J 44152 on the engine side of the A/T inline 20-way connector. 4. Turn ON the ignition, with the engine			

3	OFF. 5. Using the J 35616 , connect a test lamp from 3-2 shift solenoid valve control circuit of the J 44152 to ground. Refer to Component Connector End Views . Does the test lamp illuminate?	--	Go to Step 6	Go to Step 4
4	1. Install the J 44152 on the transmission side of the A/T inline 20-way connector. 2. Using the DMM and J 35616 , measure the resistance between the ignition voltage and 3-2 shift solenoid valve control circuits of the J 44152 . Refer to Component Connector End Views . Does the resistance measure less than the specified value?	20 Ω	Go to Step 5	Go to Step 7
5	1. Disconnect the A/T internal wiring harness assembly from the 3-2 SS valve. 2. Measure the resistance of the 3-2 SS valve. Does the resistance measure less than the specified value?	20 Ω	Go to Step 8	Go to Step 7
6	Test the control circuit of the 3-2 SS valve for a short to voltage between the TCM and the A/T inline 20-way connector. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 10	Go to Step 9
7	Replace the A/T internal wiring harness. Refer to Torque Converter Clutch Pulse Width Modulation Solenoid, Torque Converter Clutch Solenoid, and Wiring Harness . Did you complete the replacement?	--	Go to Step 10	--
8	Replace the 3-2 SS valve. Refer to Control and Shift Solenoids Replacement . Did you complete the replacement?	--	Go to Step 10	--
9	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 10	--
	Perform the following procedure in order to verify the repair: 1. Select DTC.			

10	2. Select Clear Info. 3. Drive the vehicle in D4 and make sure the following conditions are met: - The TCM commands the 3-2 SS valve ON and the 3-2 Sol. CKT status parameter displays OK. - The TCM commands the 3-2 SS valve OFF and the 3-2 Sol. CKT status parameter displays OK. - All conditions are met for 5 seconds. 4. Select Specific DTC. 5. Enter DTC P0788. Has the test run and passed?	--	Go to Step 11	Go to Step 2
11	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0815, P0816, or P0826

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0815 00: Upshift Switch Circuit.

DTC P0816 00: Downshift Switch Circuit.

DTC P0826 00: Up and Down Shift Switch Circuit.

Circuit / System Description

The driver shift control (DSC), also known as the tap shift, allows the driver to manually shift gears by placing the shift control lever in the DSC position and pushing the lever upwards or downwards to select the desired gear. The DSC receives a 12 volt supply voltage from the BCM, and when pushing the shift lever in either direction a momentary switch is activated and a signal is sent to the cruise control module and body control module (BCM). The DSC shift system is only activate when the gear selector is in the Manual (M) position. The DSC system is deactivated in all other range positions.

Conditions for Running the DTC

DTCs P0815, P0816 or P0826

- The engine speed is between 500-6,500 RPM for at least 5 seconds.
- The time since the last gear selector range change is greater than 6 seconds.

Conditions for Setting the DTC

DTC P0815

The BCM detects an upshift request for 3 seconds in PARK, REVERSE, NEUTRAL, or D6- and for 600 seconds in PARK, REVERSE, NEUTRAL, D2, D4, OR D6.

DTC P0816

The BCM detects a downshift request for 3 seconds in PARK, REVERSE, NEUTRAL, or D6- and for 600 seconds in PARK, REVERSE, NEUTRAL, D2, D4, or D6.

DTC P0826

The BCM detects an invalid voltage on the TAP up/down signal circuit for 5 seconds.

Action Taken When the DTC Sets

The multi function display (MFD) displays the ESP Off message.

- DTCs P0815, P0816, and P0826 are Type C DTCs.
- The BCM disables TAP shift operation.

Conditions for Clearing the DTC

DTCs P0815, P0816, and P0826 are Type C DTCs.

Circuit/System Verification

With the engine ON, engage the DSC switch positions. using a scan too while observe the Driver Shift Request parameter. The parameter should change to reflect the selected up or downshift switch position and with no up or downshift switch position selected the parameter should display None.

Circuit/System Testing

DTC P0815

1. Select the Driver Shift Request parameter.
2. Disconnect the automatic transmission DSC shift switch connector.

   If the parameter status changes from upshift to invalid, replace the DSC shift switch.

   If the parameter status does not change, replace the BCM.

DTC P0816

1. Select the Driver Shift Request parameter.
2. Disconnect the DSC shift switch connector.

   If the parameter status changes from downshift to invalid, replace the DSC shift switch.

   If the parameter status does not change, replace the BCM.

DTC P0826

1. If any other DTC are set diagnose those DTCs first.
2. Ignition OFF, disconnect the DSC shift switch connector.
3. Connect a test lamp between the 12 V reference and a known ground.

   If the test lamp does not illuminate, test the 12 V reference circuit for an short to ground or open/high resistance. If circuit test normal replace the BCM.
4. If all circuits test normal replace the electronic range selector switch.

Component Testing

1. Test the DSC shift switch for correct resistance value, 8.11-8.39 ohms.

   If the resistance is not within specifications, replace the DSC switch.

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The pressure control (PC) solenoid valve is an electronic device that regulates transmission line pressure based on the current flow through its coil winding. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the pressure regulator valve. The transmission control module (TCM) controls the PC solenoid valve by applying a varying amount of amperage to the solenoid. The applied amperage can vary from 0.1-1.1 amps. Low amperage, 0.1 amp, indicates high line pressure. High amperage, 1.1 amps, indicates low line pressure. The duty cycle of the PC solenoid valve is expressed as a percentage of energised ON time.
Zero percent indicates zero ON time, non-energised, or no current flow. Approximately 60 percent at idle indicates maximum ON time, energised, or high current flow. The TCM determines the appropriate line pressure for a given load by comparing the throttle position sensor voltage, the engine speed and other inputs.

When the TCM detects a continuous open or short to ground in the PC solenoid valve circuit, then DTC P0961 sets. DTC P0961 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0961 Line Pressure Control (PC) Solenoid System Performance.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine is running.

Conditions for Setting the DTC

The PC solenoid valve duty cycle reaches its high limit, approximately 95 percent, or low limit, approximately 2 percent.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).

- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM freezes transmission adaptive functions.
- The TCM commands maximum line pressure.
- The TCM stores DTC P0961 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

DTC P0961 may set under low voltage conditions caused by high electrical system demands.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step tests the ability of the TCM to command the PC solenoid valve.

3. This step tests the PC solenoid valve and automatic transmission (A/T) wiring harness assembly for incorrect resistance.

DTC P0961

19	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Start the engine and make sure the following condition is met: The difference between the scan tool PC Sol. Actual Current and the PC Sol. Ref. Current is less than 0.16 amp. 4. Select Specific DTC. 5. Enter DTC P0961. Has the test run and passed?	--	Go to Step 20	Go to Step 2
20	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0973

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The solenoid is a normally-open exhaust valve. With the 2-3 SS valve, the 1-2 SS valve allows 4 different shifting combinations. The solenoid attaches to the control valve body within the transmission. The 1-2 SS valve receives ignition voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 1-2 SS valve control circuit.

When the TCM detects a continuous open, short to ground in the 1-2 SS valve circuit, then DTC P0973 sets. DTC P0973 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0973 1-2 Shift Solenoid (SS) Control Circuit Low Voltage.

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- The 1-2 SS is commanded ON.

Conditions for Setting the DTC

DTC P0973 sets when either of the following conditions occurs for 4.3 seconds:

- The TCM detects an open in the 1-2 shift solenoid valve circuit when the 1-2 SS is commanded ON.
- The TCM detects a short to ground in the 1-2 shift solenoid valve circuit when the 1-2 SS is commanded ON.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.

- The TCC commands maximum line pressure.
- The TCM inhibits 3-2 shift if vehicle speed is less than 40 km/h (25 mph).
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0973 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests the function of the 1-2 SS valve and the automatic transmission (AT) wiring harness.
5. This step tests for voltage to the 1-2 SS valve from the ignition through the fuse.
6. This step tests the ability of the TCM and the wiring to control the ground circuit.
8. This step measures the resistance of the AT wiring harness and the 1-2 SS valve.

DTC P0973

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from			

2	the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. Are any of the following DTCs also set? - P0787 - P0976 - P2764 - P2769	--	Go to Step 3	Go to Step 4

DTC P0974

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The solenoid is a normally-open exhaust valve. With the 2-3 SS valve, the 1-2 SS valve allows 4 different shifting combinations. The solenoid attaches to the control valve body within the transmission. The 1-2 SS valve receives ignition voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 1-2 SS valve control circuit.

When the TCM detects a continuous short to voltage in the 1-2 shift solenoid valve control circuit, then DTC P0974 sets. DTC P0974 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0974 1-2 Shift Solenoid (SS) Control Circuit High Voltage.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine speed is 500 RPM for 5 seconds.

Conditions for Setting the DTC

DTC P0974 sets if the TCM commands the solenoid ON and the voltage feedback remains high B+.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.

- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0974 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

DTC P0974

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. With a scan tool, command the 1-2 Sol. ON. Does the 1-2 Sol. CKT status parameter display OK?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the automatic transmission (A/T) inline 20-way connector, additional DTCs may set. 3. Install the J 44152 Jumper Harness (20 pins) on the engine side of the AT inline 20-way connector. 4. Turn ON the ignition, with the engine OFF. 5. Using the J 35616 , connect a test lamp from 1-2 shift solenoid valve control	--		

	circuit of the J 44152 to ground. Refer to Component Connector End Views . Does the test lamp illuminate?		Go to Step 6	Go to Step 4
4	1. Install the J 44152 on the transmission side of the A/T inline 20-way connector. 2. Using the DMM and J 35616 , measure the resistance between the ignition voltage and 1-2 shift solenoid valve control circuits of the J 44152 . Refer to Component Connector End Views . Does the resistance measure less than the specified value?	20 Ω	Go to Step 5	Go to Step 7
5	1. Disconnect the A/T internal wiring harness assembly from the 1-2 SS valve. 2. Measure the resistance of the 1-2 SS valve. Does the resistance measure less than the specified value?	20 Ω	Go to Step 8	Go to Step 7
6	Test the control circuit of the 1-2 SS valve for a short to voltage between the TCM and the A/T inline 20-way connector. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 10	Go to Step 9
7	Replace the A/T internal wiring harness. Refer to Torque Converter Clutch Pulse Width Modulation Solenoid, Torque Converter Clutch Solenoid, and Wiring Harness . Did you complete the replacement?	--	Go to Step 10	--

9	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 10	--
	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D4 and make sure the following conditions are met: • The TCM commands the 1-2 SS valve ON and the 1-2 Sol. CKT status			

10	parameter displays OK. - The TCM commands the 1-2 SS valve OFF and the 1-2 Sol. CKT status parameter displays OK. - All conditions are met for 5 seconds. 4. Select Specific DTC. 5. Enter DTC P0974. Has the test run and passed?	--	Go to Step 11	Go to Step 2
11	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0976

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The solenoid is a normally-open exhaust valve. With the 1-2 SS valve, the 2-3 SS valve allows 4 different shifting combinations. The solenoid attaches to the control valve body within the transmission. The 2-3 SS valve receives voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 2-3 SS valve control circuit.

When the TCM detects a continuous open, short to ground in the 2-3 SS valve control circuit, then DTC P0976 sets. DTC P0976 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0976 2-3 Shift Solenoid (SS) Control Circuit Low Voltage.

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- The 1-2 SS is commanded ON.

Conditions for Setting the DTC

DTC P0973 sets when either of the following conditions occurs for 4.3 seconds:

- The TCM detects an open in the 1-2 shift solenoid valve circuit when the 1-2 SS is commanded ON.
- The TCM detects a short to ground in the 1-2 shift solenoid valve circuit when the 1-2 SS is commanded ON.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCC commands maximum line pressure.

- The TCM inhibits 3-2 shift if vehicle speed is less than 40 km/h (25 mph).
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0973 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests the function of the 2-3 SS valve and the automatic transmission (AT) wiring harness.

5. This step tests for voltage to the 2-3 SS valve from the ignition through the fuse.

6. This step tests the ability of the TCM and the wiring to control the ground circuit.

8. This step measures the resistance of the AT wiring harness and the 2-3 SS valve.

DTC P0976

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the TCM.			

2	3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. Are any of the following DTCs also set? • P0787 • P0973 • P2764 • P2769	--	Go to Step 3	Go to Step 4
3	Inspect the ACC/TCM fuse for an open. Refer to Circuit Protection - Fuses . Is the fuse open?	--	Go to Step 12	Go to Step 5
4	With a scan tool, command the 2-3 Solenoid ON. Does the 2-3 Sol. CKT status parameter display OK when commanded ON?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the AT inline 20-way connector, additional DTCs may set. 3. Install the J 44152 Jumper Harness (20 pins) on the engine side of the AT inline 20-way connector. 4. Turn ON the ignition, with the engine OFF. 5. Using the J 35616 , connect a test lamp from the 2-3 SS valve ignition voltage circuit of the J 44152 to ground. Refer to Component Connector End Views . Does the test lamp illuminate?	--	Go to Step 6	Go to Step 15
6	1. Connect a test lamp between the 2-3 SS valve ignition voltage and control circuits of the J 44152 . Refer to Component Connector End Views . 2. Use the scan tool in order to command the 2-3 SS valve ON and OFF three times. Does the test lamp turn ON and OFF with each command?	--	Go to Step 8	Go to Step 7
7	Is the test lamp always ON?	--		Go to Step

			Go to Step 16	17
8	1. Install the J 44152 on the transmission side of the AT inline 20-way connector. 2. Using the DMM and J 35616 , measure the resistance between the 2-3 SS valve ignition voltage and control circuits of the J 44152 . Refer to Component Connector End Views . Does the resistance measure within the specified range?	19-31 Ω	Go to Step 9	Go to Step 10
9	Measure the resistance from the 2-3 SS valve ignition voltage and control circuits to ground. Refer to Testing for Continuity . Do both readings measure greater than the specified value?	250 K Ω	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 11
10	1. Disconnect the AT wiring harness assembly from the 2-3 SS valve. 2. Measure the resistance of the 2-3 SS valve. Refer to Testing for Continuity . Does the resistance measure within the specified range?	19-31 Ω	Go to Step 18	Go to Step 19
11	1. Disconnect the AT wiring harness assembly from the 2-3 SS valve. 2. Measure the resistance from the component's terminals to ground. Refer to Testing for Continuity . Do both readings measure greater than the specified value?	250 K Ω	Go to Step 18	Go to Step 19
12	**Important:** The condition that affects this circuit may exist in other connecting branches of the circuit. Refer to Power Distribution Schematics . Test the ignition circuit of the 2-3 SS valve for a short to ground between the fuse block-underhood and the AT inline 20-way connector. 20	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 21	--
21	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D4 and make sure the following conditions are met: • The TCM commands the 2-3 SS valve ON and the voltage feedback drops to zero. • The TCM commands the 2-3 SS valve OFF and the voltage feedback increases to B+. • All conditions are met for 5 seconds. 4. Select Specific DTC. 5. Enter DTC P0976. Has the test run and passed?	--	Go to Step 22	Go to Step 2
22	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0977

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The solenoid is a normally-open exhaust valve. With the 1-2 SS valve, the 2-3 SS valve allows 4 different shifting combinations. The solenoid attaches to the control valve body within the transmission. The 2-3 SS valve receives voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 2-3 SS valve control circuit.

When the TCM detects a continuous short to voltage in the 2-3 shift solenoid valve control circuit, then DTC P0977 sets. DTC P0977 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0977 2-3 Shift Solenoid (SS) Control Circuit High Voltage.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine speed is 500 RPM for 5 seconds.

Conditions for Setting the DTC

DTC P0977 sets if the TCM commands the solenoid ON and the voltage feedback remains high, B+.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.

- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0977 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

DTC P0977

DTC P1810

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The automatic transmission fluid pressure (TFP) manual valve position switch consists of 5 pressure switches, 2 normally-closed and 3 normally-open, and a transmission fluid temperature (TFT) sensor combined into 1 unit. The combined unit mounts on the valve body. The transmission control module (TCM) supplies ignition voltage for each range signal. By grounding 1 or more of these circuits through various combinations of the pressure switches, the TCM detects which manual valve position you select. The TCM compares the actual voltage combination of the switches to a TFP manual valve position switch combination chart stored in memory.

The TFP manual valve position switch cannot distinguish between PARK and NEUTRAL because the monitored valve body pressures are identical. With the engine OFF and the ignition switch in the ON position, the TFP manual valve position switch indicates PARK/NEUTRAL. Disconnecting the AT inline 20-way connector removes the ground potential for the 3 range signals to the TCM. In this case, with the engine OFF, and the ignition switch in the ON position, D2 will be indicated.

When the TCM detects an invalid state of the TFP manual valve position switch circuit by deciphering the TFP manual valve position switch inputs, then DTC P1810 sets. DTC P1810 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1810 Transmission Fluid Pressure (TFP) Position Switch Circuit.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine speed is greater than 500 RPM for 5 seconds.

Conditions for Setting the DTC

DTC P1810 sets when the TCM detects an invalid TFP manual valve position switch state for 60 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engaugement.
- The TCM commands 4th gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1810 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Refer to the Transmission Fluid Pressure Manual Valve Position Switch Logic , for the normal range signals and the invalid combinations. On the table, LOW is 0 volts, HI is ignition voltage.
- Sediment in the valve body may cause improper operation of the TFP manual valve position switch. If sediment intrusion is suspected, clean the valve body and replace the TFP manual valve position switch.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step compares the indicated range signal to the selected manual valve position.

5. This step tests for correct voltage from the TCM to the AT inline 20-way connector.

DTC P1810

DTC P1815

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The automatic transmission fluid pressure (TFP) manual valve position switch consists of 5 pressure switches, 2 normally-closed and 3 normally-open, and a transmission fluid temperature (TFT) sensor combined into 1 unit. The combined unit mounts on the valve body. The transmission control module (TCM) supplies ignition voltage for each range signal. By grounding 1 or more of these circuits through various combinations of the pressure switches, the TCM detects which manual valve position you select. The TCM compares the actual voltage combination of the switches to a TFP manual valve position switch combination chart stored in memory.

The TFP manual valve position switch cannot distinguish between PARK and NEUTRAL because the monitored valve body pressures are identical. With the engine OFF and the ignition switch in the ON position, the TFP manual valve position switch indicates PARK/NEUTRAL. Disconnecting the AT inline 20-way connector removes the ground potential for the 3 range signals to the TCM. In this case, with the engine OFF, and the ignition switch in the ON position, D2 will be indicated.

When the TCM detects an invalid state of the TFP manual valve position switch circuit by deciphering the TFP manual valve position switch inputs, then DTC P1815 sets. DTC P1815 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1815 Transmission Fluid Pressure (TFP) Valve Position Switch - Start in Wrong Range.

Conditions for Running the DTC

- No OSS DTCs P0722, or P0723.
- The system voltage is 8-18 volts.
- The engine speed is less than 50 RPM, then between 50-650 RPM for 0.75 seconds, then greater than 650 RPM for 5 seconds.
- OSS speed less than 250 RPM.

Conditions for Setting the DTC

DTC P1815 sets when the TCM detects D2 only, TFP manual valve position switch state after engine start for 7 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM commands 4th gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1815 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Refer to the Transmission Fluid Pressure Manual Valve Position Switch Logic , for the normal range signals and the invalid combinations. On the table, LOW is 0 volts, HI is ignition voltage.
- Sediment in the valve body may cause improper operation of the TFP manual valve position switch. If sediment intrusion is suspected, clean the valve body and replace the TFP manual valve position switch.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step compares the indicated range signal to the selected manual valve position.

5. This step tests for correct voltage from the TCM to the AT inline 20-way connector.

DTC P1815

Step	Action	Values	Yes	No

1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Inspect for correct transmission fluid level. Refer to Transmission Fluid Check . Did you perform the fluid checking procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Start the engine and idle at normal operating temperature. 6. Apply the brake pedal. 7. Select each transmission range: P, R, N, D4, D3, D2 and D1. Does each selected transmission range match the scan tool TFP Sw. display?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the AT inline 20-way connector, additional DTCs may set. 3. Turn ON the ignition, with the engine OFF. Does the scan tool TFP Sw. A/B/C parameter indicate HI for all range signal states?	--	Go to Step 5	Go to Step 9
	1. Turn OFF the ignition. 2. Install the J 44152 Jumper Harness (20 pins) on the engine side of the AT inline 20-way connector. 3. Turn ON the ignition, with the engine OFF. 4. Using the DMM and the J 35616 , measure the voltage from the transmission fluid pressure switch signal A circuit of the J 44152 to ground.			

5	Refer to Component Connector End Views . 5. Measure the voltage from the transmission fluid pressure switch signal B circuit of the J 44152 to ground. 6. Does the voltage measure within the specified range at all three terminals?	10-12 V	Go to Step 6	Go to Step 10
6	Connect a fused jumper wire from the J 44152 , transmission fluid pressure switch signal circuit A, to ground while monitoring the scan tool TFP Sw. A/B/C parameter. When the transmission fluid pressure switch signal circuit A is grounded, do any other signal circuits indicate LOW?	--	Go to Step 11	Go to Step 7
7	Connect a fused jumper wire from the J 44152 , transmission fluid pressure switch signal circuit B, to ground while monitoring the scan tool TFP Sw. A/B/C parameter. When the transmission fluid pressure switch signal circuit B is grounded, do any other signal circuits indicate LOW?	--	Go to Step 11	Go to Step 8
8	Connect a fused jumper wire from the J 44152 , transmission fluid pressure switch signal circuit C, to ground while monitoring the scan tool TFP Sw. A/B/C parameter. When the transmission fluid pressure switch signal circuit C is grounded, do any other signal circuits indicate LOW?	--	Go to Step 11	Go to Step 12
9	Test the signal circuits of the TFP manual valve position switch that did not indicate HI for a short to ground between the TCM and the AT inline 20-way connector. Refer to Testing for Short to Ground and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 16	Go to Step 15
10	Test the signal circuits of the TFP manual valve position switch that did not indicate ignition voltage for an open between the TCM and the AT inline 20-way connector.	--		

	Refer to Testing for Continuity and Wiring Repairs . Did you find and correct the condition?		Go to Step 16	Go to Step 15
11	Test the affected signal circuits of the TFP manual valve position switch for a shorted together condition between the TCM and the AT inline 20-way connector. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 16	Go to Step 15
12	Test the signal circuits of the TFP manual valve position switch for an open or shorted condition between the TFP manual valve position switch and the AT inline 20-way connector. Refer to Circuit Testing and Wiring Repairs . Did you find a condition?	--	Go to Step 13	Go to Step 14
13	Replace the AT wiring harness. Refer to Valve Body and Pressure Switch Replacement . Did you complete the replacement?	--	Go to Step 16	--
14	Replace the TFP manual valve position switch. Refer to Valve Body and Pressure Switch Replacement . Did you complete the replacement?	--	Go to Step 16	--
15	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 16	--
16	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Turn ON the ignition, with the engine OFF for at least 2 seconds. • Start the vehicle and idle for 5 seconds. • Drive in D4 until the torque converter clutch (TCC) locks for 10 seconds.	--		

	• Continue to run the engine for at least 60 seconds from startup. 4. Select Specific DTC. 5. Enter DTC P1815. Has the test run and passed?		Go to Step 17	Go to Step 2
17	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P1816

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit Description

The automatic transmission fluid pressure (TFP) manual valve position switch consists of 5 pressure switches, 2 normally-closed and 3 normally-open, and a transmission fluid temperature (TFT) sensor combined into 1 unit. The combined unit mounts on the valve body. The transmission control module (TCM) supplies ignition voltage for each range signal. By grounding 1 or more of these circuits through various combinations of the pressure switches, the TCM detects which manual valve position you select. The TCM compares the actual voltage combination of the switches to a TFP manual valve position switch combination chart stored in memory.

The TFP manual valve position switch cannot distinguish between PARK and NEUTRAL because the monitored valve body pressures are identical. With the engine OFF and the ignition switch in the ON position, the TFP manual valve position switch indicates PARK/NEUTRAL. Disconnecting the AT inline 20-way connector removes the ground potential for the 3 range signals to the TCM. In this case, with the engine OFF, and the ignition switch in the ON position, D2 will be indicated.

When the TCM detects an invalid state of the TFP manual valve position switch circuit by deciphering the TFP manual valve position switch inputs, then DTC P1816 sets. DTC P1816 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1816 Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Park/Neutral (P/N) with Drive Ratio.

Conditions for Running the DTC

- No OSS DTCs P0722, or P0723.
- The system voltage is 8-18 volts.
- The engine speed is less than 50 RPM, then between 50-650 RPM for 0.75 seconds, then greater than 650 RPM for 5 seconds.
- OSS speed less than 250 RPM.

Conditions for Setting the DTC

DTC P1816 sets when the TCM detects one of the following conditions for 13 seconds.

- PARK/NEUTRAL indicated with a 1st gear ratio.
- PARK/NEUTRAL indicated with a 2nd gear ratio.
- PARK/NEUTRAL indicated with a 3rd gear ratio.
- PARK/NEUTRAL indicated with a 4th gear ratio.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM commands 4th gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1816 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Refer to the Transmission Fluid Pressure Manual Valve Position Switch Logic , for the normal range signals and the invalid combinations. On the table, LOW is 0 volts, HI is ignition voltage.
- Sediment in the valve body may cause improper operation of the TFP manual valve position switch. If sediment intrusion is suspected, clean the valve body and replace the TFP manual valve position switch.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step compares the indicated range signal to the selected manual valve position.

5. This step tests for correct voltage from the TCM to the AT inline 20-way connector.

DTC P1818

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit Description

The automatic transmission fluid pressure (TFP) manual valve position switch consists of 5 pressure switches and a transmission fluid temperature (TFT) sensor combined into one unit. The combined unit mounts on the valve body. The transmission control module (TCM) supplies ignition voltage for each range signal. By grounding one or more of these circuits through various combinations of the pressure switches, the TCM detects which manual valve position you select. The TCM compares the actual voltage combination of the switches to a TFP manual valve position switch combination chart stored in memory.

The TFP manual valve position switch cannot distinguish between PARK and NEUTRAL because the monitored valve body pressures are identical. With the engine OFF and the ignition switch in the ON position, the TFP manual valve position switch indicates PARK/NEUTRAL. Disconnecting the AT inline 20-way connector removes the ground potential for the 3 range signals to the TCM. In this case, with the engine OFF, and the ignition switch in the ON position, D2 will be indicated.

When the TCM detects an invalid state of the TFP manual valve position switch circuit by deciphering the TFP manual valve position switch inputs, then DTC P1818 sets. DTC P1818 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1818 Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Drive without Drive Ratio.

Conditions for Running the DTC

- No OSS DTCs P0722, or P0723.
- No SS DTCs P0751, P0752, P0756, P0757, P0973, P0974, P0976 or P0977.
- No TFP DTCs P1810, P1815 or P1816.
- The system voltage is 8-18 volts.
- The throttle position is greater than 8 percent.
- The engine speed is greater than 650 RPM for 5 seconds.
- OSS speed is 100 RPM or greater.

Conditions for Setting the DTC

DTC P1818 sets when the TCM detects the following condition for 13 seconds.

PARK/NEUTRAL or FORWARD range indicated with a reverse gear ratio.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM commands 4th gear.
- The TCM forces the TCC ON in 4th gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1818 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the third consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Refer to the Transmission Fluid Pressure Manual Valve Position Switch Logic , for the normal range signals and the invalid combinations. On the table, LOW is 0 volts, HI is ignition voltage.
- Sediment in the valve body may cause improper operation of the TFP manual valve position switch. If sediment intrusion is suspected, clean the valve body and replace the TFP manual valve position switch.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step compares the indicated range signal to the selected manual valve position.

5. This step tests for correct voltage from the TCM to the AT inline 20-way connector.

DTC P2534

Circuit Description

The transmission control module (TCM) samples the system voltage on the Ignition 1 voltage circuit every 0.1 seconds. Lower than normal voltage may be inadequate to operate the transmission control solenoids properly. Improper solenoid operation may cause erratic transmission operation, which may result in internal damage.

If the TCM detects low voltage on the Ignition 1 voltage circuit, DTC P2534 sets. DTC 2534 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2534 Ignition 1 Switch Circuit Low Voltage.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

The TCM detects an open or short to ground on the Ignition 1 voltage circuit.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM commands maximum line pressure.
- The TCM commands an immediate landing to 2nd gear.
- The TCM freezes transmission adaptive functions.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.

Conditions for Clearing the DTC

- The TCM turns OFF the MIL after the third consecutive trip in which the diagnostic test runs and passes.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without

an emission-related diagnostic fault occuring.

- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

DTC P2534

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. Does DTC 2534 reset?	--	Go to Step 3	Go to Testing for Intermittent Conditions and Poor Connections

DTC P2763

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit Description

The torque converter clutch pulse width modulation (TCC PWM) solenoid valve controls the fluid acting on the converter clutch valve. The converter clutch valve controls the TCC application and release. The solenoid attaches to the control valve body within the transmission. The solenoid receives voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the TCC PWM solenoid valve control circuit. Current flows through the solenoid coil according to the duty cycle, percentage of ON and OFF time. The TCC PWM solenoid valve provides a smooth engaugement of the TCC by operating during a duty cycle percent of ON time.

When the TCM detects a continuous short to voltage in the TCC PWM solenoid valve control circuit, then DTC P2763 sets. DTC P2763 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2763 Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit High Voltage.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine speed is 500 RPM for 5 seconds.

Conditions for Setting the DTC

DTC P2763 sets if the TCM commands the solenoid ON and the voltage feedback remains high, B+.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.

- The TCM inhibits TCC engagement.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2763 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

DTC P2763

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. With a scan tool, command the TCC control solenoid ON. Does the torque converter clutch (TCC) Duty Cycle CKT status parameter display OK?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
	1. Turn OFF the ignition. 2. Disconnect the automatic transmission (AT) inline 20-way connector, additional DTCs may set. 3. Install the J 44152 Jumper Harness (20 pins) on the engine side of the AT inline			

3	20-way connector. 4. Turn ON the ignition, with the engine OFF. 5. Using the J 35616 Holden Terminal Test Kit, connect a test lamp from TCC PWM shift solenoid valve control circuit of the J 44152 to ground. Refer to Component Connector End Views . Does the test lamp illuminate?	--	Go to Step 6	Go to Step 4
4	1. Install the J 44152 on the transmission side of the AT inline 20-way connector. 2. Using the DMM and J 35616 , measure the resistance between the ignition voltage and TCC PWM shift solenoid valve control circuits of the J 44152 . Refer to Component Connector End Views . Does the resistance measure less than the specified value?	20 Ω	Go to Step 5	Go to Step 7
5	1. Disconnect the AT internal wiring harness from the TCC PWM valve. 2. Measure the resistance of the TCC PWM valve. Does the resistance measure less than the specified value?	20 Ω	Go to Step 8	Go to Step 7
6	Test the control circuit of the TCC PWM valve for a short to voltage between the TCM and the AT inline 20-way connector. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 10	Go to Step 9
7	Replace the AT internal wiring harness. Refer to Torque Converter Clutch Pulse Width Modulation Solenoid, Torque Converter Clutch Solenoid, and Wiring Harness . Did you complete the replacement?	--	Go to Step 10	--
8	Replace the TCC PWM valve. Refer to Control and Shift Solenoids Replacement . Did you complete the replacement?	--	Go to Step 10	--
9	Replace the TCM. Refer to Control Module References . Did you complete the replacement?	--	Go to Step 10	--

10	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D4 and make sure the TCC Duty Cycle CKT Status parameter displays OK for 5 seconds. 4. Select Specific DTC. 5. Enter DTC P2763. Has the test run and passed?	--	Go to Step 11	Go to Step 2
11	With the scan tool, observe the stored information, capture info, and DTC Info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P2764

Circuit Description

The torque converter clutch pulse width modulation (TCC PWM) solenoid valve controls the fluid acting on the converter clutch valve. The converter clutch valve controls the TCC application and release. The solenoid attaches to the control valve body within the transmission. The solenoid receives voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the TCC PWM solenoid valve control circuit. Current flows through the solenoid coil according to the duty cycle, percentage of ON and OFF time. The TCC PWM solenoid valve provides a smooth engaugement of the TCC by operating during a duty cycle percent of ON time.

When the TCM detects a continuous open or short to ground in the TCC PWM solenoid valve control circuit, then DTC P2764 sets. DTC P2764 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2764 Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit Low Voltage.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine speed is 500 RPM for 5 seconds.

Conditions for Setting the DTC

DTC P2764 sets when either of the following conditions occurs for 5 seconds:

- The TCM detects an open in the TCC PWM shift solenoid valve circuit when the TCC PWM is commanded ON.
- The TCM detects a short to ground in the TCC PWM shift solenoid valve circuit when the TCC PWM is commanded ON.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM inhibits 4th gear if in hot mode.

- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2764 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests for voltage to the solenoid.

5. This step tests the ability of the TCM and wiring to control the ground circuit.

7. This step tests the resistance of the TCC PWM solenoid valve and the automatic transmission (AT) wiring harness.

DTC P2769

Circuit Description

The torque converter clutch (TCC) solenoid valve is an electrical device that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve in order to control TCC apply and release. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. The TCC solenoid valve receives voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the TCC solenoid valve control circuit. The TCM monitors the throttle position (TP) voltage, the vehicle speed and other inputs in order to determine when to energise the TCC solenoid valve.

When the TCM detects a continuous open or short to ground in the TCC solenoid valve control circuit, then DTC P2769 sets. DTC P2769 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2769 Torque Converter Clutch (TCC) Enable Solenoid Control Circuit Low Voltage.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine speed is 500 RPM for 5 seconds.

Conditions for Setting the DTC

DTC P2769 sets when either of the following conditions occurs for 5 seconds:

- The TCM detects an open in the TCC solenoid valve circuit when the TCC is commanded ON.
- The TCM detects a short to ground in the TCC shift solenoid valve circuit when the TCC is commanded ON.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the

Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.

- The TCM stores DTC P2769 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.

Diagnostic Aids

With the TCC engauged, the TCC slip speed should be -20 to +40 RPM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests for voltage to the solenoid.

5. This step tests the ability of the TCM and wiring to control the ground circuit.

7. This step tests the resistance of the TCC solenoid valve and the automatic transmission (AT) wiring harness.

DTC P2770

Circuit Description

The torque converter clutch (TCC) solenoid valve is an electrical device that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve in order to control TCC apply and release. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. The TCC solenoid valve receives voltage through the ignition 1 voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the TCC solenoid valve control circuit. The TCM monitors the throttle position (TP) voltage, the vehicle speed and other inputs in order to determine when to energise the TCC solenoid valve.

When the TCM detects a continuous short to voltage in the TCC solenoid valve control circuit, then DTC P2770 sets. DTC P2770 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2770 Torque Converter Clutch (TCC) Enable Solenoid Control Circuit High Voltage.

Conditions for Running the DTC

- The system voltage is 8-18 volts.
- The engine speed is 500 RPM for 5 seconds.

Conditions for Setting the DTC

DTC P2770 sets if the TCM commands the solenoid ON and the voltage feedback remains high, B+.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engaugement.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2770 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the 4th consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

DTC P2770

Step	Action	Values	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the transmission control module (TCM). 3. Record the DTC Freeze Frame and Failure Records. 4. With a scan tool, command TCC Enable ON. Does the TCC Enable Sol. CKT status parameter display OK?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the automatic transmission (AT) inline 20-way connector, additional DTCs may set. 3. Install the J 44152 on the engine side of the AT inline 20-way connector. 4. Turn ON the ignition, with the engine OFF. 5. Drives in Neutral

Drives in Neutral

Checks	Causes
Forward Clutch (446-451)	The clutch does not release
Manual Valve Link (89)	Disconnected
Case (103)	• The face is not flat • Internal leakage exists

3-2 Flare or Tie-Up

3-2 Flare or Tie-Up

Checks	Causes
3-2 Shift Solenoid Valve Assembly (394)	• Shorted or damaged • Contamination • Damaged Seal • Check ball not seating

Buzz Noise or High Frequency Rattle Sound

Buzz Noise or High Frequency Rattle Sound

Checks	Action
DEFINITION: A buzz or high frequency rattle	
• Trace Cooler Pipes • Check for binding or contact at the Radiator, other than at the Cooler Pipe connectors	Verify a pressure buzz by watching for a needle vibration of the pressure gauge. A road test may be necessary. Refer to Road Test .

Case Porosity Repair

Some external leaks are caused by case porosity in non-pressurized areas. You can usually repair these leaks with the transmission in the vehicle.

1. Thoroughly clean the area to be repaired with a cleaning solvent. Air dry the area.

   Caution: Epoxy adhesive may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.

2. Using instructions from the manufacturer, mix a sufficient amount of an epoxy to make the repair.
3. While the transmission case is still hot, apply the epoxy. You can use a clean, dry soldering acid brush to clean the area and also to apply the epoxy cement. Make certain that the area to be repaired is fully covered.
4. Allow the epoxy cement to cure for three hours before starting the engine.
5. Repeat the fluid leak diagnosis procedures.

Clutch Plate Diagnosis

Composition Plates

Dry the plates and inspect the plates for the following conditions:

- Pitting
- Flaking
- Delamination--splitting or separation of bonded clutch material
- Wear
- Glazing
- Cracking
- Charring
- Chips or metal particles embedded in the lining

Replace a composition plate which shows any of these conditions.

Steel Plates

Wipe the plates dry and check the plates for heat discoloration. If the surfaces are smooth, even if colour smear is indicated, you can reuse the plate. If the plate is discolored with heat spots or if the surface is scuffed, replace the plate.

Causes of Burned Clutch Plates

The following conditions can result in a burned clutch plate:

- Incorrect usage of clutch or apply plates
- Engine coolant or water in the transmission fluid
- A cracked clutch piston
- Damaged or missing seals
- Low line pressure
- Valve body conditions
  - The valve body face is not flat.
  - Porosity is between channels.
  - The valve bushing clips are improperly installed.
  - The checkballs are misplaced.
- The Teflon® seal rings are worn or damaged.

Delay in Drive and Reverse

Delay in Drive and Reverse

Checks	Causes
Forward Clutch Piston (630)	Cut or damaged piston seals
Low and Reverse Clutch Piston (695)	Cut or damaged inner, outer or center clutch seals
Reverse Input Clutch Piston Assembly (607)	Cut or damaged inner or outer clutch seals
Pump Cover (215)	Cut or damaged oil seal rings - stator shaft

Engine Coolant / Water in Transmission

Notice: The antifreeze or water will deteriorate the seals, gaskets and the glue that bonds the clutch material to the pressure plate. Both conditions may cause damage to the transmission.

If antifreeze or water has entered the transmission, perform the following:

1. Disassemble the transmission.
2. Replace all of the rubber type seals (the coolant will attack the seal material which will cause leakage).
3. Replace the composition-faced clutch plate assemblies (the facing material may separate from the steel center portion).
4. Replace all of the nylon parts (washers).
5. Replace the torque converter.
6. Thoroughly clean and rebuild the transmission, using new gaskets and oil filter.
7. Flush the cooler lines after the transmission cooler has been properly repaired or replaced.

Engine Starts in Gear

Engine Starts in Gear

Checks	Causes
Manual Valve (24)	Not engaguged to detent lever
Transmission Range Switch	Not working or mispositioned

First Gear Range Only - No Upshift

1st Gear Range Only - No Upshift

Checks	Causes
Control Valve Body (60)	• The 1-2 Shift valve is sticking • The spacer plate or gaskets are mispositioned or damaged
Case (103)	The case to valve body face is damaged or is not flat
Shift Solenoid Valves (366/368)	• Stuck or damaged • Faulty electrical connection
2-4 Servo Assembly (13-28)	• The apply passage case is restricted or blocked • Nicks or burrs on the servo pin or on the pin bore in the case • Fourth servo piston is installed backwards
2-4 Band Assembly (602)	• The 2-4 band is worn or damaged • The band anchor pin is not engauged

Fluid Leak Diagnosis

General Method

1. Verify that the leak is transmission fluid.
2. Thoroughly clean the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the engine.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

1. Thoroughly clean the suspected leak area with solvent.
2. Apply an aerosol type powder, such as foot powder, to the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Shut OFF the engine.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

Dye and Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer's instructions in order to determine the amount of dye to use.
2. Detect the leak with the black light.
3. Make the necessary repairs.

Find the Cause of the Leak

Pinpoint the leak and trace the leak back to the source. You must determine the cause of the leak in order to repair the leak properly. For example, if you replace a gasket, but the sealing flange is bent, the new gasket will not repair the leak. You must also repair the bent flange. Before you attempt to repair a leak, check for the following conditions, and make repairs as necessary:

Gaskets

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Improperly tightened fasteners
- Dirty or damaged threads
- Warped flanges or sealing surface
- Scratches, burrs, or other damage to the sealing surface
- Damaged or worn gasket

- Cracking or porosity of the component
- Improper sealant used, where applicable
- Incorrect gasket

Seals

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Damaged seal bore
- Damaged or worn seal
- Improper installation
- Cracks in component
- Manual or output shaft surface is scratched, nicked, or damaged
- Loose or worn bearing causing excess seal wear

Possible Points of Fluid Leaks

Transmission Oil Pan

- Incorrectly tightened oil pan bolts
- Improperly installed or damaged oil pan gasket
- Damaged oil pan or mounting face
- Incorrect oil pan gasket

Case Leak

- Damaged or missing fill tube seal
- Mislocated fill tube bracket
- Damaged vehicle speed sensor seal
- Damaged manual shaft seal
- Loose or damaged oil cooler connector fittings
- Worn or damaged propeller shaft oil seal
- Loose line pressure pipe plug
- Porous casting

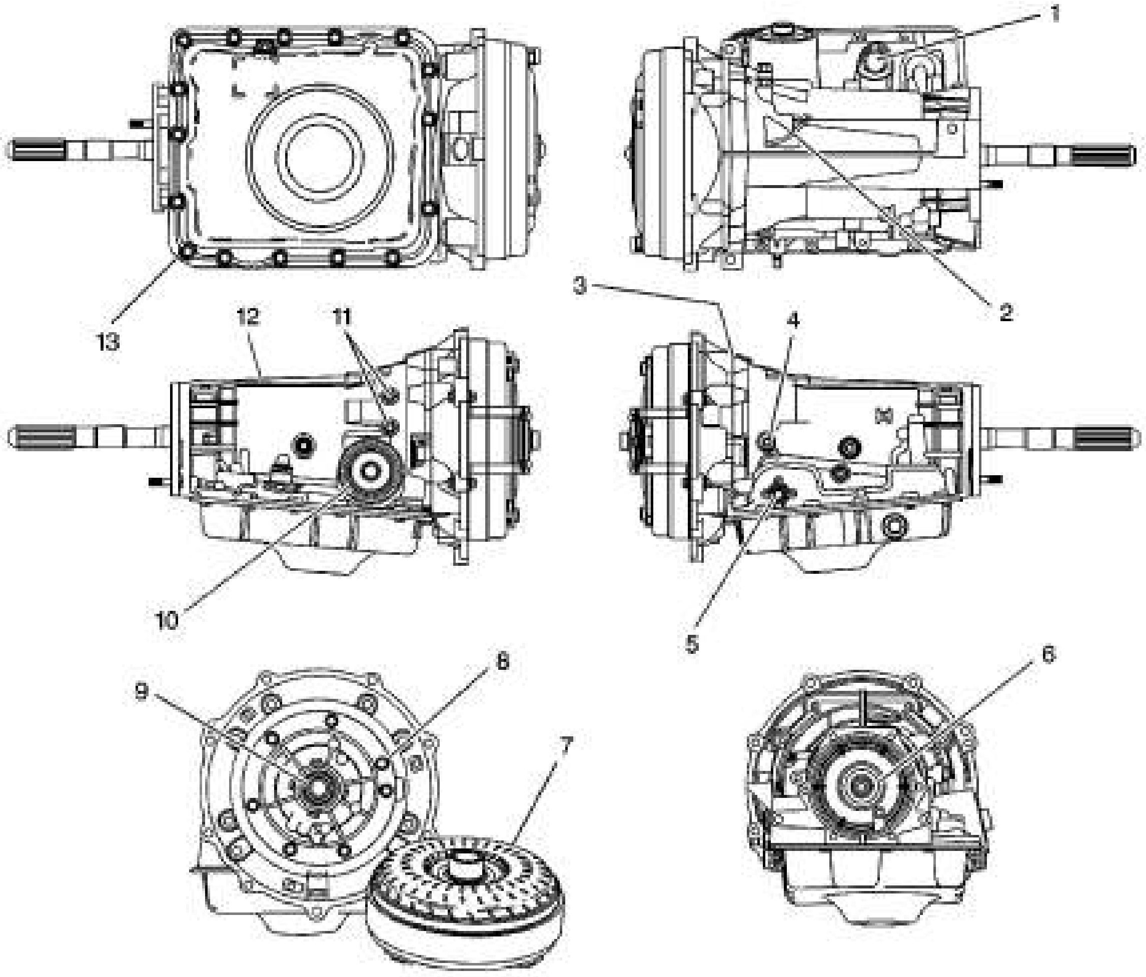
Leak at the Torque Converter End

- Converter leak in the weld area
- Converter seal lip cut. Check the converter hub for damage
- Converter seal bushing moved forward and damaged
- Converter seal garter spring missing from the seal
- Porous casting of the transmission case or the oil pump

Leak at the Vent Pipe or the Fluid Fill Tube

- Overfilled system
- Water or coolant in the fluid. The fluid will appear milky
- Transmission case porous
- Incorrect fluid level indicator
- Plugged vent
- Drain-back holes plugged
- Mispositioned oil pump to case gasket, if equipped

Leak Inspection Points



(1) Wiring Harness Pass-through Connector O-Ring Seal
(2) Transmission Vent Assembly
(3) Converter Housing to Case Joint (Pump to Case Oil Seal)

(4) Line Pressure Plug
(5) Manual Shaft Seal
(6) Case Rear Oil Seal Assembly
(7) Torque Converter Assembly
(8) Pump to Case Oil Seal
(9) Pump Oil Seal Assembly
(10) 2-4 Servo Cover O-Ring Seal
(11) Oil Cooler Pipe Connectors
(12) Transmission Case
(13) Transmission Oil Pan Gasket

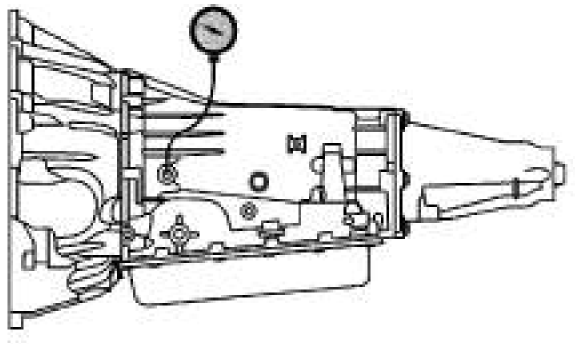
Line Pressure Check



Tools Required

J 21867 Pressure Gage

> **Caution:** Keep the brakes applied at all times in order to prevent unexpected vehicle motion. Personal injury may result if the vehicle moves unexpectedly.

> **Important:** Before performing the line pressure check, verify that the transmission pressure control (PC) solenoid is operating correctly.

1. Install a scan tool.
2. Start the engine.
3. Inspect the transmission for the proper fluid levels. Refer to Transmission Fluid Check.
4. Use the scan tool to inspect for any active or stored diagnostic trouble codes.
5. Inspect the manual linkage at the transmission for proper function.
6. Turn the engine OFF.

> **Important:** It may be necessary to remove or disconnect components in order to gain access to the transmission line pressure test port/plug.

7. Remove the pressure plug.
8. Install the J 21867 .
9. Access the Scan Tool Output Control for the PC Solenoid.
10. Start the engine.

Important: In order to achieve accurate line pressure readings, the following procedure must be performed at least three times in order to gather uniform pressure readings.

The scan tool is only able to control the PC solenoid in PARK and NEUTRAL with engine speeds below 1500 RPM. This protects the clutches from extreme high or low line pressures.

11. Begin commanding PC Solenoid at 1.0 amp and lower the amperage in one-tenth increments (0.01) until maximum line pressure is achieved.
12. Allow the pressure to stabilize between increments.
13. Compare your pressure readings to the Line Pressure table. Refer to Line Pressure.
14. If the pressure readings vary greatly from the line pressure table, refer to Oil Pressure High or Low.
15. Turn the engine OFF.
16. Remove the J 21867 .

Notice: Refer to Fastener Notice in the Preface section.

17. Install the pressure plug.

Tighten
Tighten the pressure plug to 8-14 N·m (6-10 lb ft).

No 2-3 Shift or 2-3 Shift Slips, Rough or Hunting

No 2-3 Shift or 2-3 Shift slipping, Rough or Hunting

Checks	Causes
Oil Pump (4)	Stator shaft bushings scored or off location
Valve Body Assembly (60)	• 2-3 Shift valve train stuck • Gaskets or spacer plate incorrect, mispositioned or damaged • 2-3 Accumulator valve stuck • Face not flat • Chips in servo feed oil, orifice #7 in spacer plate • Mislocated valve body to spacer plate checkball or checkballs
Input Housing Assembly (620-621, 646-655)	• 3-4 clutch or forward clutch plates worn • Excessive clutch plate travel • Cut or damaged 3-4 clutch or forward clutch piston seals • Porosity in input clutch housing or piston • 3-4 clutch piston checkball stuck, damaged or not sealing • Restricted apply passages • Forward clutch piston retainer and ball assembly not seating • Sealing balls loose or missing • Input housing (621) cracked or broken
Case (103)	3rd accumulator retainer and ball assembly not seating
2-4 Servo Assembly (13-28)	2nd apply piston seals missing, cut or damaged

No 3-4 Shift, Slips or Rough 3-4 Shift

No 3-4 Shift / Slipping or Rough 3-4 Shift

Checks	Causes
Oil Pump Assembly (4)	• Pump cover retainer and ball assembly omitted or damaged • Faces not flat
Valve Body Assembly (60)	• Valves stuck - 2-3 Shift valve train - Accumulator valve - 1-2 Shift valve train - 3-2 Shift solenoid valve assembly • Spacer plate or gaskets incorrect, mispositioned or damaged
2-4 Servo Assembly (13-28)	• Incorrect band apply pin • Missing or damaged servo seals • Porosity in piston, cover or case • Damaged piston seal grooves • Plugged or missing orifice cup plug
Case (103)	• 3rd Accumulator retainer and ball assembly leaking • Porosity in 3-4 accumulator piston or bore • 3-4 Accumulator piston seal or seal grooves damaged • Plugged or missing orifice cup plug • Restricted oil passage
Input Housing Assembly (621)	Refer to No 2-3 Shift or 2-3 Shift Slips, Rough or Hunting .
2-4 Band Assembly (602)	Worn or misassembled

No Drive in All Ranges

No Drive in All Ranges

Checks	Causes
Torque Converter (1)	The converter to flex plate bolts are missing

No Drive in Drive Range

No Drive in Drive Range

Checks	Causes
Torque Converter (1)	• The stator roller clutch is not holding • The converter is not bolted to the flex plate

No First or Second Gear / No Third or Fourth Gear

No 1st or 2nd / No 3rd or 4th

Checks	Causes
2-3 Shift Solenoid Valve (367B)	• Sediment is in the valves • The electrical connection is faulty • Damaged seal

No Fourth Gear, or Slips in Fourth Gear

No 4th or Slipping 4th

Checks	Causes
Checkball #2, 4, 8 or 12	Valve body checkball in wrong location or an additional checkball is installed. Refer to Control Valve Body Installation.
Orificed Cup Plug (240)	Not fully pressed into pump cover. Refer to Oil Pump Stator Shaft Bushing Replacement.

No Gear Selection

No Gear Selection

Checks	Causes
Detent Lever (63)	Nut loose or missing
Manual Valve (84)	Stuck
Spacer Plate/Gaskets (47, 48, 52)	Blocked holes
Control Valve Body to Case (60/103)	Blocked channels

No Overrun Braking - Manual 3-2-1

No Overrun Braking - Manual 3-2-1

Checks	Causes
External Linkage	Not adjusted properly
Valve Body Assembly (60)	• 4-3 Sequence valve stuck • Checkball mispositioned • Spacer plate and gaskets incorrect, damaged or mispositioned
Overrun and Forward Clutch Assembly (644-651)	• Turbine shaft oil passages plugged or not drilled • Turbine shaft seal rings damaged • Turbine shaft sealing balls loose or missing • Porosity in forward or overrun clutch piston • Overrun piston seals cut or damaged • Overrun piston checkball not sealing

No Park

No Park

Checks	Causes
Parking Lock Actuator Linkage (85-90)	• Actuator rod assembly bent or damaged • Actuator rod spring binding or improperly crimped • Actuator rod not attached to inside detent lever • Parking lock bracket damaged or not torqued properly • Inside detent lever not torqued properly • Parking pawl binding or damaged

No Part Throttle or Delayed Downshifts

No Part Throttle or Delayed Downshifts

Checks	Causes
Input Housing Assembly (621)	• 3-4 Apply ring stuck in applied position • Forward clutch not releasing • Turbine shaft seals missing, cut or damaged
Manual Valve Link (89)	Disconnected
Valve Body Assembly (60)	• 2-3 Shift valve stuck • Manual linkage not adjusted • Spacer plate and gaskets incorrect, mispositioned or damaged • Lo overrun valve stuck • Orificed cup plug restricted, missing or damaged
Reverse Input Clutch Assembly (606-614)	• Clutch plate worn • Reverse input housing and drum assembly cracked at weld • Clutch plate retaining ring out of groove • Return spring assembly retaining ring out of groove • Seals cut or damaged • Restricted apply passage • Porosity in piston • Belleville plate installed incorrectly • Excessive clutch plate travel • Oversized housing
Lo and Reverse Clutch (694-696)	• Clutch plates worn • Porosity in piston • Seals damaged • Return spring assembly retaining ring mispositioned • Restricted apply passage

No Reverse or Slips in Reverse

No Reverse or Slips in Reverse

Checks	Causes
Input Housing Assembly (602)	• 3-4 Apply ring stuck in applied position • Forward clutch not releasing • Turbine shaft seals missing, cut or damaged
Manual Valve Link (89)	Disconnected
Valve Body Assembly (60)	• 2-3 Shift valve stuck • Manual linkage not adjusted • Spacer plate and gaskets incorrect, mispositioned or damaged • Lo overrun valve stuck • Orificed cup plug restricted, missing or damaged
Reverse Input Clutch Assembly (605-614)	• Clutch plate worn • Reverse input housing and drum assembly cracked at weld • Clutch plate retaining ring out of groove • Return spring assembly retaining ring out of groove • Seals cut or damaged • Restricted apply passage • Porosity in piston • Belleville plate installed incorrectly • Excessive clutch plate travel • Oversized housing
Lo and Reverse Clutch (694-696)	• Clutch plates worn • Porosity in piston • Seals damaged • Return spring assembly retaining ring mispositioned • Restricted apply passage
Reaction Sun Shell (670)	Broken spline on reaction sun shell/replace shell

No Second Gear, No Fourth Gear, and No Reverse Gear

No Second Gear, No Fourth Gear and No Reverse Gear

Checks	Causes
Reaction Sun Shell (670)	Broken spline on reaction sun shell/replace shell.

No Third Gear

No 3rd

Checks	Causes
Orificed Cup Plug (698)	Missing or blown out

No Torque Converter Clutch Apply

No Torque Converter Clutch (TCC) Apply

Checks	Causes
Valve Body Assembly (60)	• Regulator apply valve side loading • Stuck converter clutch valve • TCC apply valve stuck closed (debris in bore) • TCC/PWM solenoid broken/cracked • Turbine shaft O-ring omitted • TCC/PWM solenoid leaking
Input Housing and Turbine Shaft Assembly (621)	• Turbine shaft hole not drilled to full depth • Scratched turbine shaft journals • Turbine shaft O-ring omitted/damaged • Turbine shaft retainer and ball assembly restricted or damaged
Electrical	• 12 volts not supplied to transmission • Outside electrical connector damaged • Inside electrical connector damaged • Wire harness damaged • TCC solenoid damaged • Electrical short (pinched wire) • TCC solenoid not grounded
Torque Converter Clutch (1)	Internal damage (blue or distorted)
Oil Pump Assembly (4)	• TCC outer spring cocked • Orifice cup plug restricted or damaged • Pump to case gasket mispositioned • Converter clutch valve retaining ring mispositioned • Converter clutch valve stuck or assembled backwards
Transmission Fluid Pressure Manual Valve Position Switch (69)	• Contamination • Damaged seals
Solenoid Screen (367A/367B)	Blocked
TCC Solenoid Valve (Part of 66)	Internal damage
Engine Speed Sensor	Internal damage
Engine Coolant Temperature Sensor	Internal damage
Automatic Transmission Fluid Temperature	Internal damage

Sensor (Part of 69)	
Brake Switch	Internal damage
TCM	Internal damage
TCC PWM Solenoid (Part of 66)	Internal damage

No Torque Converter Clutch Release

No TCC Release

Checks	Causes
TCC Solenoid Valve (Part of 66)	• External ground • Clogged exhaust orifice
Converter (1)	Internal damage
Valve Body Assembly (60)	The converter clutch apply valve is stuck in the apply position
Oil Pump Assembly (4)	The converter clutch valve is stuck
TCM	External ground

Noise and Vibration Analysis

A noise or vibration that is noticeable when the vehicle is in motion MAY NOT be the result of the transmission.

If noise or vibration is noticeable in PARK and NEUTRAL with the engine at idle, but is less noticeable as RPM increases, the cause may be from poor engine performance.

- Inspect the tires for the following conditions:
  - Uneven wear
  - Imbalance
  - Mixed sizes
  - Mixed radial and bias ply
- Inspect the suspension components for the following conditions:
  - Alignment and wear
  - Loose fasteners
- Inspect the engine and transmission mounts for damage and loose bolts.
- Inspect the transmission case mounting holes for the following conditions:
  - Missing bolts, nuts, and studs
  - Stripped threads
  - Cracks
- Inspect the flywheel for the following conditions:
  - Missing or loose bolts
  - Cracks
  - Imbalance
- Inspect the torque converter for the following conditions:
  - Missing or loose bolts or lugs
  - Missing or loose balance weights
  - Imbalance

Range Selector Displays Incorrect Range

Circuit Description

The transmission range (TR) switch is part of the park/neutral position (PNP) and back-up lamp switch assembly, which is externally mounted on the transmission manual shaft. The TR switch contains four internal switches that indicate the transmission gear range selector lever position. The powertrain control module (PCM) supplies ignition voltage to each switch circuit. As the gear range selector lever is moved, the state of each switch may change, causing the circuit to open or close. An open circuit or switch indicates a high voltage signal. A closed circuit or switch indicates a low voltage signal. The PCM detects the selected gear range by deciphering the combination of the voltage signals. The PCM compares the actual voltage combination of the switch signals to a TR switch combination chart stored in memory.

Diagnostic Aids

Refer to the Transmission Range Switch Logic table for valid combinations of switch signal circuits A, B, C and Parity. On the table, HI indicates an ignition voltage signal. LOW indicates a zero voltage signal.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. By disconnecting the TR switch, the ground path of all TR switch circuits is removed and the PCM should recognize all circuits as open. The scan tool should display HI for all range signal states.

5. This step tests the TR switch wiring for an open or the lack of the signal voltage from the PCM.

6. This step tests the TR switch wiring and the PCM by providing a ground path through a fused jumper wire. When grounded, the scan tool range signal states should change to LOW.

7. This step tests the TR switch wiring and the PCM by providing a ground path through a fused jumper wire. When grounded, the scan tool range signal states should change to LOW.

8. This step tests the TR switch wiring and the PCM by providing a ground path through a fused jumper wire. When grounded, the scan tool range signal states should change to LOW.

9. This step tests the TR switch wiring and the PCM by providing a ground path through a fused jumper wire. When grounded, the scan tool range signal states should change to LOW.

Range Selector Display Inoperative or Displays Incorrect Range (4.2L)

Step	Action	Values	Yes	No
	1. Install a scan tool. 2. Turn ON the ignition, with the engine			

1	OFF. 3. Select TR Sw. on the scan tool. 4. With the scan tool, observe the TR Sw. display while selecting each transmission range: P, R, N, D4, D3, D2 and D1. Does each selected transmission range match the scan tool TR Sw. display?	--	Go to Step 2	Go to Step 3
2	Observe the IPC gear range display while selecting each transmission range: P, R, N, D4, D3, D2, D1. Does each selected transmission range match the IPC display?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 16
3	With the scan tool, observe the TR Sw. A/B/C/P display. Does the scan tool TR Sw. A/B/C/P parameter indicate HI for all range signal states?	--	Go to Step 13	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the TR switch connector. 3. Turn ON the ignition, with the engine OFF. Does the scan tool TR Sw. A/B/C/P parameter indicate HI for all range signal states?	--	Go to Step 5	Go to Step 10
5	1. Using the DMM and the J 35616 GM Terminal Test Kit, measure the voltage from the transmission range signal A circuit of the TR switch connector to ground. 2. Measure the voltage from the transmission range signal B circuit of the TR switch connector to ground. 3. Measure the voltage from the transmission range signal C circuit of the TR switch connector to ground. 4. Measure the voltage from the transmission range signal P circuit of the TR switch connector to ground. Does the voltage measure within the specified range at all 4 terminals?	10-12 V	Go to Step 6	Go to Step 11
6	Connect a fused jumper wire from the TR switch connector, signal circuit A, to ground while monitoring the scan tool TR Sw. A/B/C/P parameter. When signal circuit A is grounded, do any other signal circuits indicate LOW?	--	Go to Step 12	Go to Step 7
	Connect a fused jumper wire from the TR switch connector, signal circuit B, to ground			

7	while monitoring the scan tool TR Sw. A/B/C/P parameter. When signal circuit B is grounded, do any other signal circuits indicate LOW?	--	Go to Step 12	Go to Step 8
8	Connect a fused jumper wire from the TR switch connector, signal circuit C, to ground while monitoring the scan tool TR Sw. A/B/C/P parameter. When signal circuit C is grounded, do any other signal circuits indicate LOW?	--	Go to Step 12	Go to Step 9
9	Connect a fused jumper wire from the TR switch connector, signal circuit P, to ground while monitoring the scan tool TR Sw. A/B/C/P parameter. When signal circuit P is grounded, do any other signal circuits indicate LOW?	--	Go to Step 12	Go to Step 13
10	Test the signal circuits of the TR switch that did not indicate HI for a short to ground. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 17	Go to Step 15
11	Test the signal circuits of the TR switch that did not indicate proper voltage for an open. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 17	Go to Step 15
12	Test the affected signal circuits of the TR switch for a shorted together condition. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 17	Go to Step 15
13	Test the ground circuit of the TR switch for an open. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 17	Go to Step 14
14	Replace the TR switch, this switch is part of the park/neutral position switch. Refer to Park/Neutral Position Switch Replacement. Did you complete the replacement?	--	Go to Step 17	--

15	Replace the PCM. Refer to Control Module References for replacement, setup, and programming. Did you complete the replacement?	--	Go to Step 17	--
16	Replace the IPC. Refer to Control Module References for replacement, setup, and programming. Did you complete the replacement?	--	Go to Step 17	Go to Step 2
17	1. Turn ON the ignition, with the engine OFF. 2. With the scan tool, observe the TR Sw. display while selecting each transmission range: P, R, N, D4, D3, D2 and D1. Does each selected transmission range match the scan tool TR Sw. display?	--	System OK	Go to Step 2

Ratcheting Noise

Ratcheting Noise

Checks	Causes
Parking Brake Pawl (50-81)	The parking pawl return spring is weak, damaged, or misassembled

Road Test

Important: The Road Test Procedure should be performed only as part of the Symptom Diagnosis. Refer to Symptoms - Automatic Transmission .

The following test provides a method of evaluating the condition of the automatic transmission. The test is structured so that most driving conditions can be achieved. The test is divided into the following parts:

- Electrical Function Check
- Upshift Control and Torque Converter Clutch (TCC) Apply
- Part Throttle Detent Downshifts
- Full Throttle Detent Downshifts
- Manual Downshifts
- Coasting Downshifts
- Manual Gear Range Selection
  - REVERSE
  - Manual FIRST
  - Manual SECOND
  - Manual THIRD

Important: Complete the test in the sequence given. Incomplete testing cannot guarantee an accurate evaluation.

Before the road test, make sure the following:

- The engine is performing properly.
- Transmission fluid level is correct. Refer to the Transmission Fluid Check .
- Tire pressure is correct.

During the road test:

- Perform the test only when traffic conditions permit.
- Operate the vehicle in a controlled, safe manner.
- Observe all traffic regulations.
- View the scan tool data while conducting this test.

  Take along qualified help in order to operate the vehicle safely.
- Observe any unusual sounds or smells.

After the road test, check the following:

- Transmission fluid level. Refer to the Transmission Fluid Check .

- Diagnostic trouble codes (DTCs) that may have set during the testing. Refer to the applicable DTC.
- Scan tool data for any abnormal readings or data.

Electrical Function Check

Perform this check first, in order to make sure the electronic transmission components are connected and functioning properly. If these components are not checked, a simple electrical condition may be mis-diagnosed.

1. Connect the scan tool.
2. Ensure the gear selector is in PARK and set the parking brake.
3. Start the engine.
4. Verify that the following scan tool data can be obtained and is functioning properly.

   Refer to Control Module References for typical data values. Data that is questionable may indicate a concern.

   - Engine speed
   - Transmission output speed
   - Vehicle speed
   - TFP manual valve position switch
   - Transmission range, engine list
   - Commanded gear, current gear
   - PC solenoid reference current
   - PC solenoid actual current
   - PC solenoid duty cycle
   - Brake switch
   - Engine coolant temperature
   - Transmission fluid temperature
   - Throttle angle
   - Ignition voltage
   - 1-2 shift solenoid
   - 2-3 shift solenoid
   - TCC solenoid duty cycle
   - TCC slip speed
5. Monitor the brake switch signal while depressing and releasing the brake pedal. The scan tool should display:
   - Closed when the brake pedal is released.
   - Open when the brake pedal is depressed.
6. Check the garage shifts.
   - 6.1. Apply the brake pedal and make sure that the parking brake is set.
   - 6.2. Move the gear selector through the following ranges:
     - 6.2.1. PARK to REVERSE
     - 6.2.2. REVERSE to NEUTRAL

            6.2.3. NEUTRAL to DRIVE
        6.3. Pause 2 to 3 seconds in each gear position.
        6.4. Verify the gear engaugements are immediate and not harsh.

Important: Harsh engagement may be caused by any of the following conditions:

- High idle speed. Compare engine idle speed to desired idle speed.
- Commanded low PC solenoid current. Compare PC solenoid reference current to PC solenoid actual current.
- A default condition caused by certain DTCs that result in maximum line pressure to prevent slippage.

Important: Soft or delayed engagement may be caused by any of the following conditions:

- Low idle speed. Compare engine idle speed to desired idle speed.
- Low fluid level
- Commanded high PC solenoid current. Compare PC solenoid reference current to PC solenoid actual current.
- Cold transmission fluid. Check for low transmission fluid temperature.

7. Monitor transmission range on the scan tool, engine list.
    7.1. Apply the brake pedal and make sure the parking brake is set.
    7.2. Move the gear selector through all ranges.
    7.3. Pause 2-3 seconds in each range.
    7.4. Return gear selector to PARK.
    7.5. Verify that all selector positions match the scan tool display.
8. Check throttle angle input.
    8.1. Apply the brake pedal and make sure that the parking brake is set.
    8.2. Ensure the gear selector is in PARK.
    8.3. Monitor throttle angle while increasing and decreasing engine speed with the throttle pedal. The scan tool throttle angle should increase and decrease with engine speed.

If any of the above checks do not perform properly, record the result for reference after completion of the road test.

Upshift Control and Torque Converter Clutch (TCC) Apply

The TCM calculates the upshift points based primarily on two inputs: throttle angle and vehicle speed. When the TCM determines that conditions are met for a shift to occur, the TCM commands the shift by closing or opening the ground circuit for the appropriate solenoid.

Perform the following steps:

1. Refer to the Shift Speed , table in this section and choose a throttle position of 12 percent, 25 percent or 50 percent. All throttle angles shown should be tested to cover the normal driving range.
2. Monitor the following scan tool parameters:
    - Throttle angle
    - Vehicle speed

  - Engine speed
  - Output shaft speed
  - Commanded gear
  - Slip speed
  - Solenoid states
3. Place the gear selector in the OVERDRIVE position.
4. Accelerate the vehicle using the chosen throttle angle. Hold the throttle steady.
5. As the transmission upshifts, note the vehicle speed when the shift occurs for each gear change. There should be a noticeable shift feel or engine speed change within 1-2 seconds of the commanded gear change.
6. Compare the shift speeds to the Shift Speed table. Refer to Shift Speed . Shift speeds may vary slightly due to transmission fluid temperature or hydraulic delays in responding to electronic controls.
   - Note any harsh, soft or delayed shifts or slipping.
   - Note any noise or vibration.
7. Repeat steps 1 through 6 to complete all throttle angles.

   Important: This transmission is equipped with an electronically controlled capacity clutch (ECCC). The pressure plate does not fully lock to the torque converter cover. Instead, the pressure plate maintains a small amount of slippage, about 20 RPM, in SECOND, THIRD and FOURTH gears, depending on the vehicle application. ECCC was developed to reduce the possibility of noise, vibration or chuggle caused by TCC apply. Typical apply speeds are 49-52 km/h (30-32 mph) in THIRD gear and 65-73 km/h (40-45 mph) in FOURTH gear. Full lockup is available at highway speeds on some applications.

   Important: The TCC will not engauge until the engine is in closed loop operation and the vehicle speed is as shown in the Shift Speed table. Refer to Shift Speed . The vehicle must be in a near-cruise condition, not accelerating or coasting, and on a level road surface.

8. Check for TCC apply in THIRD and FOURTH gear.
   - Note the TCC apply point. When the TCC applies there should be a noticeable drop in engine speed and a drop in slip speed to below 100 RPM. If the TCC apply can not be detected:
     - Check for DTCs.
     - Refer to Torque Converter Diagnosis .
   - Refer to the Shift Speed , table for the correct apply speeds.
   - Lightly tap and release the brake pedal. The TCC will release on most applications.

Part Throttle Detent Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 64-88 km/h (40-55 mph) in FOURTH gear.
3. Quickly increase throttle angle to greater than 50 percent.
4. Verify the following:
   - The TCC releases
   - The transmission downshifts immediately to THIRD gear

Full Throttle Detent Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to speeds of 64-88 km/h (40-55 mph) in FOURTH gear.
3. Quickly increase throttle angle to 100 percent (WOT).
4. Verify the following:
   - The TCC releases
   - The transmission downshifts immediately to SECOND gear

Manual Downshifts

The shift solenoid valves do not control the initial downshift for the 4-3 or the 3-2 manual downshifts. The 4-3 and the 3-2 manual downshifts are hydraulic. The 2-1 manual downshift is electronic. The solenoid states should change during or shortly after a manual downshift is selected.

Manual 4-3 Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 64-88 km/h (40-55 mph) in FOURTH gear.
3. Release the throttle while moving the gear selector to THIRD.
4. Verify the following:
   - The TCC releases
   - The transmission downshifts immediately to THIRD gear
   - The engine slows the vehicle

Manual 4-2 Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 64-72 km/h (40-45 mph).
3. Release the throttle while moving the gear selector to SECOND.
4. Verify the following:
   - The TCC releases
   - The transmission downshifts immediately to SECOND gear
   - The engine slows the vehicle

Manual 4-1 Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 48 km/h (30 mph).
3. Release the throttle while moving the gear selector to FIRST.
4. Verify the following:
   - The TCC releases.
   - The transmission downshifts immediately to FIRST gear.
   - The engine slows the vehicle.

Coasting Downshifts

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to FOURTH gear with the TCC applied.
3. Release the throttle and lightly apply the brakes.

4. Verify the following:
    - The TCC releases
    - Downshifts occur at speeds shown in the Shift Speed table. Refer to Shift Speed .

Manual Gear Range Selection

The shift solenoids control the upshifts in the manual gear ranges.

Perform the following tests using 10-15 percent throttle angle.

Reverse

1. With the vehicle stopped, move the gear selector to REVERSE.
2. Slowly accelerate the vehicle.
3. Verify that there is no noticeable slip, noise or vibration.

Manual First

1. With the vehicle stopped, move the gear selector to FIRST.
2. Accelerate the vehicle to 32 km/h (20 mph).
3. Verify the following:
    - No upshifts occur
    - The TCC does not apply
    - There is no noticeable slip, noise, or vibration

Manual Second

1. With the vehicle stopped, move the gear selector to SECOND.
2. Accelerate the vehicle to 57 km/h (35 mph).
3. Verify the following:
    - The 1-2 shift occurs
    - The 2-3 shift does not occur
    - There is no noticeable slip, noise or vibration

Manual Third

1. With the vehicle stopped, move the gear selector to THIRD.
2. Accelerate the vehicle to 64 km/h (40 mph).
3. Verify the following:
    - The 1-2 shift occurs
    - The 2-3 shift occurs
    - There is no noticeable slip, noise or vibration

Second / Third Gear Only or First / Fourth Gears Only

Second / Third Gears Only or First / Fourth Gears Only

Checks	Causes
1-2 Shift Solenoid Valve (367A)	• Sediment is in the valves • The electrical connection is faulty • Damaged seal

Second Gear Start

Second Gear Start

Checks	Causes
Forward Clutch Sprag Assembly (642)	The sprag assembly is installed backward

Shift Lever Indicates Wrong Gear

Shift Lever Indicates Wrong Gear

Checks	Causes
Manual Valve (340)	Not engauged to detent lever
Detent Roller Pin (63)	Missing or damaged
Detent Roller (63)	Broken or disconnected
Detent Spring (63)	Broken or disconnected
Manual Valve Link (89)	Loose or missing
Manual Shaft (84)	Flats not parallel
Indicator Linkage	Misadjusted

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Diagnostic Information and Procedures |

Shift Solenoid Leak Test

Tools Required

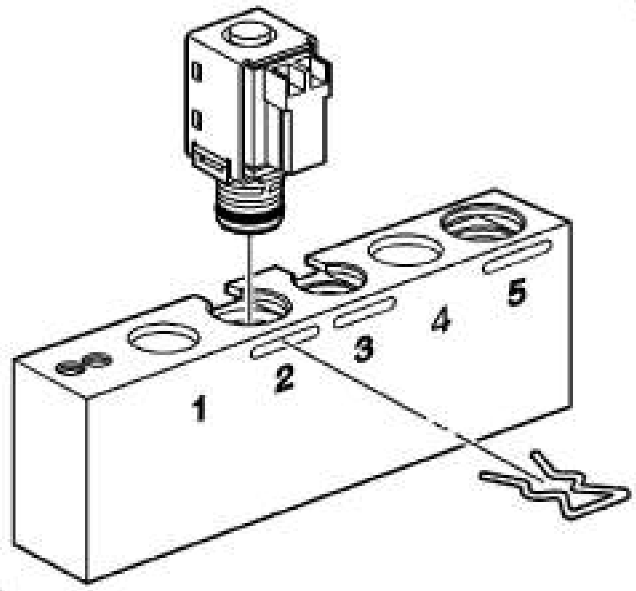
- J 35616 Holden Terminal Test Kit
- J-44246 Solenoid Testing Kit

Leak Test Procedure

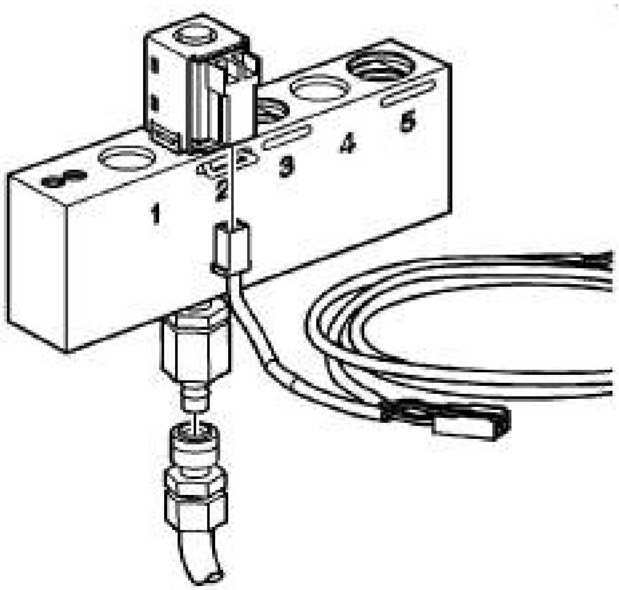
Important:

- This procedure tests On/Off type solenoid valves.
- Visually inspect the physical condition of the solenoid before testing. Inspect the O-rings before and after the test to be sure that they are not cut or damaged.

1. Remove the shift solenoid valve from the control valve body or the torque converter clutch (TCC) solenoid valve from the transmission case. Refer to Control and Shift Solenoid Replacement or Torque Converter Clutch Pulse Width Modulation (TCC PWM) Solenoid, TCC Solenoid and Wiring Harness.



2. Install the TCC solenoid valve, the 1-2 shift solenoid valve or the 2-3 shift solenoid valve into bore number 2 of the J-44246 and install the factory retainer clip to retain the solenoid.



Important: The supplied solenoid testing harness will not power the 4L60-E TCC On/Off solenoid. To energise this solenoid, apply battery, 12-volt, positive (+) and negative (-) to the TCC On/Off solenoid wiring harness using connector test adapter kit J 35616 . Use terminal E, Red, Power, and terminal T, Black, Ground. Refer to the Component Connector End Views .

3. Connect the solenoid testing harness supplied with the J-44246 to the solenoid.

   Important: Do not use air pressure in excess of 827.4 kPa (120 psi). Excessive pressure will not allow the solenoid ball check valve to seat properly. Recommended air pressure is 344.75 kPa (50 psi).

4. Apply compressed air to the J-44246 .
5. Air should flow through the solenoid. If air does not flow through the solenoid, replace the solenoid. Refer to Control and Shift Solenoids Replacement.
6. Connect the solenoid testing harness to the 12-volt positive (+) and negative (-) battery terminals.
7. Observe if the solenoid is operating electrically. An audible clicking noise can be heard when connecting or disconnecting power.

   Important:
   - All solenoids need to be energised to seal.
   - A small amount of air leakage is normal +/- 21 kPa (+/- 3 psi).

8. Observe the air flow through the solenoid. The flow will completely or nearly completely stop. Replace the solenoid if there continues to be an obvious air leak when the solenoid is energised.

   Important: Inspect the O-rings after the test to be sure that they are not cut or damaged.

9. Install the shift solenoid valve into the control valve body or the TCC solenoid valve into the transmission case. Refer to Control and Shift Solenoids Replacement or Torque Converter

Clutch Pulse Width Modulation (TCC PWM) Solenoid, TCC solenoid and Wiring Harness.

Slip / Flare in Any Gear

Slip / Flare in any Gear

Checks	Causes
Pump Slide Inner/Outer Spring (206/207)	Omitted

Slipping or Harsh 1-2 Shift

Slipping or Rough 1-2 Shift

Checks	Causes
Valve Body Assembly (60)	• Mislocated valve body to spacer plate checkball or checkballs. • 1-2 Shift valve train stuck due to sediment • Gaskets or spacer plate incorrect, mispositioned or damaged • 1-2 Accumulator valve stuck or damaged • Face not flat • 4-3 sequence valve stuck or damaged • #1 or #8 checkball missing or mis-located • 1-2 accumulator valve bushing rotated 180°
2-4 Servo Assembly (13-28)	• Apply pin too long or too short • 2nd servo apply piston seal missing, cut or damaged • Restricted or missing oil passages • Servo bore in case damaged
2nd Accumulator (55-57, 104)	• Porosity in 1-2 accumulator cover or piston • Piston seal or groove damaged • Nicks or burrs in 1-2 accumulator housing • Missing or restricted oil passage • 1-2 accumulator piston spring not seated • Rough finish in 1-2 accumulator bore in case • A cracked 1-2 accumulator piston - allowing fluid to leak by
2-4 Band (602)	Worn or mispositioned
Oil Pump Assembly (4) or Case (103)	Faces not flat

Slips in First Gear

Slips in 1st Gear

Checks	Causes
Forward Clutch Assembly (646-651)	• Clutch plates worn • Porosity or damage in forward clutch piston • Forward clutch piston inner and outer seals missing, cut or damaged • Damaged forward clutch housing • Forward clutch housing retainer and ball assembly not sealing or damaged
Forward Clutch Accumulator (353-358)	• Piston seal missing, cut or damaged • Piston out of its bore • Porosity in the piston or valve body • Stuck abuse valve
Input Housing and Shaft Assembly (621)	Turbine shaft seals missing, cut or damaged
Valve Body (60)	• 1-2 Accumulator valve stuck • Face not flat, damaged lands or interconnected passages • Spacer plate or gaskets incorrect, mispositioned or damaged
Low Roller Clutch (678)	• Damage to lugs to inner ramps • Rollers not free moving • Inadequate spring tension • Damage to inner splines • Lube passage plugged
Torque Converter (1)	Stator roller clutch not holding
1-2 Accumulator Assembly (55-57, 104)	• Porosity in piston or 1-2 Accumulator cover and pin assembly • Damaged ring grooves on piston • Piston seal missing, cut or damaged • Valve body to spacer plate gasket at 1-2 Accumulator cover, missing or damaged • Leak between piston and pin • Broken 1-2 Accumulator spring
Line Pressure	Refer to Oil Pressure High or Low .
2-4 Servo Assembly (13-28)	4th Servo piston in backward

Symptoms - Automatic Transmission

Diagnostic Category	Diagnostic Information
This table consists of nine diagnostic categories that are located in the left column. Using this column, choose the appropriate category based on the operating conditions of the vehicle or transmission. After selecting a category, use the right column to locate the specific symptom diagnostic information.	
Fluid Diagnosis This category contains the following topics: • Fluid condition - appearance, contaminants, smell, overheating • Line pressure - high or low • Fluid leaks	• Refer to Transmission Fluid Check . • Refer to Oil Pressure High or Low . • Refer to Fluid Leak Diagnosis . • Refer to Oil Out the Vent .
Noise and Vibration Diagnosis This category contains the following topics: • Ratcheting noise • Noise - drive gear, final drive, whine, growl, rattle, buzz, popping • Vibration	• Refer to Ratcheting Noise . • Refer to Vibration in Reverse and Whining Noise in Park . • Refer to Popping Noise . • Refer to Whine Noise Varying with RPM or Fluid Pressure . • Refer to Buzz Noise or High Frequency Rattle Sound . • Refer to Noise in Random Ranges .
Range Performance Diagnosis This category contains the following topics: • Drives in Neutral • No Park • No Reverse • No Drive • No engine braking • Lack of Power or Hesitation	• Refer to Drives in Neutral . • Refer to No Park . • Refer to No Reverse or Slips in Reverse . • Refer to No Drive in All Ranges . • Refer to No Drive in Drive Range . • Refer to No Overrun Braking - Manual 3-2-1 . • Refer to Lack of Power or Hesitation .
Shift Quality (Feel) Diagnosis This category contains the following topic: • Harsh, soft or slipping shifts • Harsh, soft or delayed engagement • Shift shudder, flare or tie-up	• Refer to Harsh Shifts . • Refer to Slipping or Harsh 1-2 Shift . • Refer to No 2-3 Shift or 2-3 Shift Slips, Rough or Hunting . • Refer to No 3-4 Shift, Slips or Rough 3-4 Shift . • Refer to Harsh Garage Shift .

	• Refer to Delay in Drive and Reverse . • Refer to 3-2 Flare or Tie-Up .
Shift Pattern This category contains the following topics: • One forward gear only • Two forward gears only • Gear missing or slipping • No upshift or slipping upshift • No downshifts • Non-First gear start	• Refer to First Gear Range Only - No Upshift . • Refer to Third Gear Only . • Refer to Second/Third Gear Only or First/Fourth Gears Only . • Refer to Slips in First Gear . • Refer to Slipping or Harsh 1-2 Shift . • Refer to No 2-3 Shift or 2-3 Shift Slips, Rough or Hunting . • Refer to No 3-4 Shift, Slips or Rough 3-4 Shift . • Refer to No Part Throttle or Delayed Downshifts . • Refer to Second Gear Start .
Shift Speed Diagnosis This category contains the following topic: Inaccurate or inconsistent shift points	Refer to Inaccurate Shift Points .
Torque Converter Diagnosis This category contains the following topics: • Torque converter diagnosis • TCC does not apply • TCC does not release • TCC apply/release quality	• Refer to Torque Converter Diagnosis . • Refer to No Torque Converter Clutch Apply . • Refer to No Torque Converter Clutch Release .
Indicator On or Message Centre Displays Message This category contains the following topics: High Trans Temp light does illuminate	Refer to DTC P0218 .
If Symptom Not Found	• Refer to Transmission Fluid Check . • Refer to Road Test . • Refer to Line Pressure Check .

Third Gear Only

Third Gear Only

Checks	Causes
System Voltage	• 12 volts not supplied to transmission • Electrical short (pinched solenoid wire) • Solenoid not grounded

Torque Converter Clutch Intermittent - OK Cold / Slips Hot

Intermittent TCC OK Cold / Slips Hot

Checks	Causes
TCC PWM Solenoid (396)	Leaks
Regulator Apply Valve (216)	Sticking valve
Converter Clutch Shift Valve (224)	Sticking valve

Torque Converter Clutch Shudder

No Torque Converter Clutch Shudder

Checks	Causes
Electrical	• 12 volts not supplied to transmission • Outside electrical connector damaged • Inside electrical connector, wiring harness or solenoid damaged • Electrical short (pinched solenoid wire)
Converter (1)	Internal damage
Oil Pump Assembly (4)	• Converter clutch valve stuck or assembled backwards • Converter clutch valve retaining ring mispositioned • Pump to case gasket mispositioned • Orifice cup plug restricted or damaged • Solenoid O-ring seal cut or damaged • High or uneven bolt torque (pump body to cover)
Input Housing and Shaft (621)	• Turbine shaft O-ring seal cut or damaged • Turbine shaft retainer and ball assembly restricted or damaged
Transmission Fluid Pressure Switch Assembly (69)	• Contamination • Damaged seals
Control Valve Body Assembly (60)	• TCC signal valve stuck • Solenoid O-ring leaking
Shift Solenoid Screen (367A/367B)	Blocked

Torque Converter Clutch Slip - 100 RPM Slip

TCC Slip (100 RPM)

Checks	Causes
Valve Body Assembly (60)	• TCC/PWM solenoid leaks • Regulator apply valve or converter clutch shift valve sticking or side loading
Oil Pump Assembly (4)	• Stator shaft bushings worn, due to scratched turbine shaft journal (replace bushings and input housing assembly) • TCC apply valve is stuck open • TCC solenoid leaking
Input Housing and Turbine Shaft Assembly (621)	• Scratched journal on turbine shaft • Turbine shaft O-ring cut • Turbine shaft hole not drilled to full depth

Torque Converter Clutch Slip with Stall/Stumble

TCC Slip with Stall/Stumble

Checks	Causes
TCC Apply Valve (Part of 66)	Stuck open

Torque Converter Diagnosis

The Torque Converter Clutch (TCC) is applied by fluid pressure, which is controlled by a PWM solenoid valve. This solenoid valve is located inside of the automatic transmission assembly. The solenoid valve is controlled through a combination of computer controlled switches and sensors.

Torque Converter Stator

The torque converter stator roller clutch can have two different malfunctions.

- The stator assembly freewheels in both directions.
- The stator assembly remains locked up at all times.

Poor Acceleration at Low Speed

If the stator is freewheeling at all times, the car tends to have poor acceleration from a standstill. At speeds above 50-55 km/h (30-35 mph), the car may act normally. For poor acceleration, you should first determine that the exhaust system is not blocked, and the transmission is in First gear when starting out.

If the engine freely accelerates to high RPM in NEUTRAL, you can assume that the engine and the exhaust system are normal. Check for poor performance in DRIVE and REVERSE to help determine if the stator is freewheeling at all times.

Poor Acceleration at High Speed

If the stator is locked up at all times, performance is normal when accelerating from a standstill. Engine RPM and car speed are limited or restricted at high speeds. Visual examination of the converter may reveal a blue colour from overheating.

If the converter has been removed, you can check the stator roller clutch by inserting a finger into the splined inner race of the roller clutch and trying to turn the race in both directions. You should be able to freely turn the inner race clockwise, but you should have difficulty in moving the inner race counterclockwise or you may be unable to move the race at all.

Noise

Important: Do not confuse this noise with pump whine noise, which is usually noticeable in PARK, NEUTRAL and all other gear ranges. Pump whine will vary with line pressure.

You may notice a torque converter whine when the vehicle is stopped and the transmission is in DRIVE or REVERSE. This noise will increase as you increase the engine RPM. The noise will stop when the vehicle is moving or when you apply the torque converter clutch, because both halves of the converter are turning at the same speed.

Torque Converter Clutch Shudder

The key to diagnosing Torque Converter Clutch Shudder is to note when it happens and under what conditions.

TCC shudder which is caused by the transmission should only occur during the apply or the release of the converter clutch. Shudder should never occur after the TCC plate is fully applied.

If Shudder Occurs During TCC Apply or Release

If the shudder occurs while the TCC is applying, the condition can be within the transmission or the torque converter. Something is causing one of the following conditions to occur:

- Something is not allowing the clutch to become fully engauged.
- Something is not allowing the clutch to release.
- The clutch is releasing and applying at the same time.

One of the following conditions may be causing the condition to occur:

- Leaking turbine shaft seals
- A restricted release orifice
- A distorted clutch or housing surface due to long converter bolts
- Defective friction material on the TCC plate

If Shudder Occurs After TCC has Applied

If shudder occurs after the TCC has applied, most of the time there is nothing wrong with the transmission.

The TCC is not likely to slip after the TCC has been applied. Engine conditions may go unnoticed under light throttle and load, but they become noticeable after the TCC apply when going up a hill or accelerating. This is due to the mechanical coupling between the engine and the transmission.

Once TCC is applied, there is no torque converter (fluid coupling) assistance. Engine or driveline vibrations may be unnoticeable before TCC engaugement.

Inspect the following components in order to avoid misdiagnosis of TCC shudder. An inspection will also avoid the unnecessary disassembly of a transmission or the unnecessary replacement of a torque converter.

- Spark plugs - Inspect for cracks, high resistance or a broken insulator.
- Plug wires - Look in each end. If there is red dust (ozone) or a black substance (carbon) present, then the wires are bad. Also look for a white discoloration of the wire. This indicates arcing during hard acceleration.
- Coil - Look for a black discoloration on the bottom of the coil. This indicates arcing while the engine is misfiring.
- Fuel injector - The filter may be plugged.
- Vacuum leak - The engine will not get a correct amount of fuel. The mixture may run rich or lean depending on where the leak occurs.
- EGR valve - The valve may let in too much or too little unburnable exhaust gas and may

cause the engine to run rich or lean.

- MAP/MAF sensor - Like a vacuum leak, the engine will not get the correct amount of fuel for proper engine operation.
- Carbon on the intake valves - Carbon restricts the proper flow of air/fuel mixture into the cylinders.
- Flat cam - Valves do not open enough to let the proper fuel/air mixture into the cylinders.
- Oxygen sensor - This sensor may command the engine too rich or too lean for too long.
- Fuel pressure - This may be too low.
- Engine mounts - Vibration of the mounts can be multiplied by TCC engaugement.
- Axle joints - Check for vibration.
- TP Sensor - The TCC apply and release depends on the TP Sensor in many engines. If the TP Sensor is out of specification, TCC may remain applied during initial engine loading.
- Cylinder balance - Bad piston rings or poorly sealing valves can cause low power in a cylinder.
- Fuel contamination - This causes poor engine performance.

Replace the torque converter if any of the following conditions exist:

- External leaks appear in the hub weld area.
- The converter hub is scored or damaged.
- The converter pilot is broken, damaged, or fits poorly into the crankshaft.
- You discover steel particles after flushing the cooler and the cooler lines.
- The pump is damaged, or you discover steel particles in the converter.
- The vehicle has TCC shudder and/or no TCC apply. Replace the torque converter only after all hydraulic and electrical diagnoses have been made. The converter clutch material may be glazed.
- The converter has an imbalance which cannot be corrected. Refer to Flex Plate/Torque Converter Vibration Test.
- The converter is contaminated with engine coolant which contains antifreeze.
- An internal failure occurs in the stator roller clutch.
- You notice more than specfied end play.
- Overheating produces heavy debris in the clutch.
- You discover steel particles or clutch lining material in the fluid filter or on the magnet, when no internal parts in the unit are worn or damaged. This condition indicates that lining material came from the converter.

Do not replace the torque converter if you discover any of the following symptoms:

- The oil has an odor or the oil is discolored, even though metal or clutch facing particles are not present.
- The threads in one or more of the converter bolt holds are damaged. Correct the condition with a new thread inset.
- Transmission failure did not display evidence of damaged or worn internal parts, steel particles or clutch plate lining material in the unit and inside the fluid filter.
- The vehicle has been exposed to high mileage only. An exception may exist where the lining

of the torque converter clutch dampener plate has seen excess wear by vehicles operated in heavy and/or constant traffic, such as taxi, delivery, or police use.

Transmission Fluid Check

1. Start the engine and operate the vehicle for 15 minutes or until the transmission fluid reaches an operating temperature of 82-93°C (180-200°F).
2. Park the vehicle on a level surface.
3. With your foot on the brake, move the shift lever through each gear range. Pause for about 3 seconds in each range, ending in PARK.
4. Apply the parking brake and let the engine idle for 3 minutes.
5. Remove the transmission fluid level indicator. Wipe the indicator clean. Insert the indicator. Give the indicator a full twist in order to close.
6. Wait 3 seconds and remove the indicator.
7. Read both sides of the indicator. The fluid must be within the hot cross-hatched area using the lowest level reading.

Step	Action	Values	Yes	No
1	Check the fluid colour. Is the fluid red in colour?	--	Go to Step 5	Go to Step 2
2	Is the fluid a non-transparent pink in colour?	--	Go to Step 14	Go to Step 3
3	**Important:** Fluid may turn a dark brown in colour from normal use. This does not always indicate an oxidation or a contamination issue. Is the fluid a light brown in colour?	--	Go to Step 5	Go to Step 4
4	Is the fluid black in colour and or have a "burnt" smell?	--	Go to Step 14	Go to Step 5
5	Does the fluid appear as a solid "liquid" and not "foamy" or full of bubbles on level indicator?	--	Go to Step 6	Go to Step 6
6	Check the fluid level. Proper level should be in middle of the "X" pattern, on level indicator. Is the level OK?	--	Go to Step 19	Go to Step 7
7	Is the fluid level high on indicator?	--	Go to Step 12	Go to Step 8
8	Is the fluid level low on indicator?	--	Go to Step 9	Go to Step 4
9	Check for any external leak or leaks. Refer to Fluid Leak Diagnosis. Did you find an external leak or leaks?	--	Go to Step 10	Go to Step 11
10	Correct leak or leaks as needed. Are any leak or leaks still present?	--	Go to Step 9	Go to Step 11
11	Add fluid until level is in middle of "X" pattern on the level indicator.	--		

	Is the level OK?		Go to Step 19	Go to Step 6
12	Drain fluid until level is in middle of "X" pattern on the level indicator. Is level OK?	--	Go to Step 19	Go to Step 6
13	Replace oil cooler and flush lines. Is the replacement complete?	--	Go to Step 15	--
14	**Important:** A small amount of "friction" material in pan bottom is a "normal" condition, but large pieces and or metal particles will require complete transmission overhaul. Drain fluid and remove oil pan to inspect. Is there sign or signs of internal component damage noted in bottom of transmission oil pan?	--	Go to Step 16	Go to Step 13
15	Replace the filter and fluid. Refer to Automatic Transmission Fluid/Filter Replacement. Is the replacement complete?	--	Go to Step 6	--
16	Flush oil cooler and lines. Refer to Transmission Fluid Cooler Flushing and Flow Test. Is the Automatic Transmission Oil Cooler Flushing and Flow Test complete?	--	Go to Step 17	--
17	Overhaul transmission. Is the Transmission Overhaul Procedure complete?	--	Go to Step 18	--
18	Add new fluid. Is the procedure complete?	--	Go to Step 6	--
19	Check the fluid level and correct as necessary. Is the fluid level satisfactory?	--	System OK	--

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Diagnostic Information and Procedures |

Document ID: 1979868

Transmission Fluid Cooler Flushing and Flow Test

Studies indicate that plugged or restricted transmission oil coolers and pipes cause insufficient transmission lubrication and elevated operating temperatures which can lead to premature transmission failure. Many repeat repair cases may have been prevented by following published procedures for transmission oil cooler flushing and flow checking. This procedure includes flow checking and flushing the auxiliary transmission oil cooler, if equipped.

Only DEXRON®VI automatic transmission fluid should be used when doing a repair on this transmission.

Tools Required

- Shop air supply with water/oil filters, regulator and pressure gauge -- minimum 620 kPa (90 psi).
- Eye protection.
- Rubber gloves.
- Suitable container to catch fluid.

Reverse Flush

1. Disconnect both fluid lines at the transmission and cooler hoses / lines at the radiator cooler.
2. Check the cooler hoses / lines to radiator cooler fittings sealing washers for damage, replace as required.
3. Carefully check the radiator cooler lower fitting to see if any foreign material is evident at this point. If foreign material is found, remove it with a suitable tool and/or compressed air at a reduced pressure of approximately 345 kPa (50 psi) blown in the reverse direction through the cooler.
4. Using compressed air at a reduce pressure of approximately 345 kPa (50 psi) blown in a reverse direction, clean the fluid lines, cooler hoses / lines and if required any external cooler (where fitted).

   Important: Do not reconnect the fluid inlet line at the transmission end. This line needs to be left disconnected to perform the flow rate test.

5. Perform the flow rate test.
6. If the flow rate is satisfactory, reconnect the fluid inlet line to the transmission.

Flow Rate Test

1. Ensure the transmission fluid is at the recommended level or slightly above.
2. Disconnect the fluid inlet line at the transmission.
3. Place a suitable size container underneath the disconnected fluid inlet line.
4. With the selector lever in the P position, start the engine and observe the fluid flow into the container after all the air bubbles have ceased and a steady flow is evident. Measure the flow rate over 20 seconds and make sure it is within the specification.

   · Transmission fluid flow rate specification per 20 Seconds:

· Temperature: Ambient 0.7 Litres.

· Temperature: 86° - 93° C 1.2 Litres.

5. If the flow rate is less than the specification, the cause of the low flow rate must be located and rectified. Possible cause may include:

   · restricted cooler within the radiator tank.

   · damaged or restricted external cooler, where fitted,

   · kinked or damaged transmission fluid lines and/or cooler hoses / lines, or

   · internal transmission fault such as a faulty pump.

6. Reinstall the fluid inlet line to the transmission .

Transmission Overheats

Transmission Overheats

Checks	Causes
TCC Circuit	Blockage during apply or release
Pump Cover (215)	Cross channel leakage
Pressure Regulator Valve (216)	The valve is stuck in a high demand position
Oil Cooler	The cooler or the cooler lines are blocked
Oil Pan Gasket (73)	The gasket is damaged
Turbine Shaft O-ring (618)	The O-ring is damaged
Turbine Shaft Seals (619)	The seals are damaged
Stator Shaft Bushings (234/241)	The bushing is worn or damaged
Fluid	The fluid level is low
Radiator	Air flow is restricted or internal blockage

Vibration in Reverse and Whining Noise in Park

Vibration in Reverse and Whining Noise in Park

Checks	Causes
Oil Pump (4)	Chamber in pump body rotor pocket
Miscellaneous	Fluid level--overfilled

Whine Noise Varying with RPM or Fluid Pressure

Whine Noise Varying with RPM or Fluid Pressure

Checks	Action
DEFINITION: In all ranges, a whine which may be sensitive to RPM load, or which ceases when the TCC engauges, or which is sensitive to the oil pressure	
Torque Converter (1)	Verify that the noise is internal to the torque converter by placing your left foot on the brake with the gear or selector in Drive. Momentarily stall the engine. Torque Converter noise increases under load.
Oil Pump System	Verify that the noise is internal to the oil pump during a preliminary oil pressure check. An increase in line pressure will vary an oil pump noise.

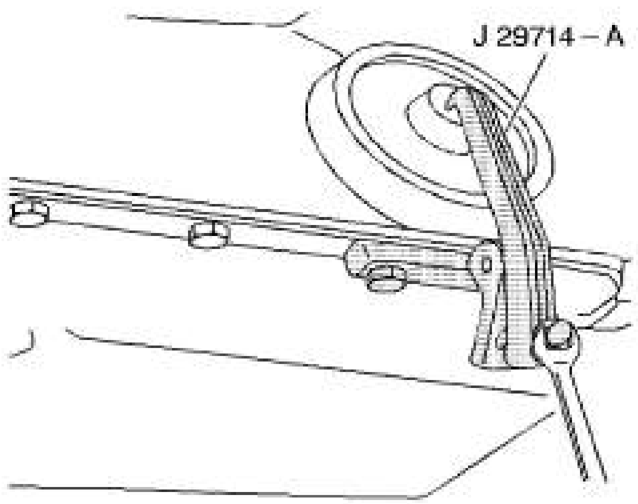
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | **Document ID: 1992305**

2-4 Servo

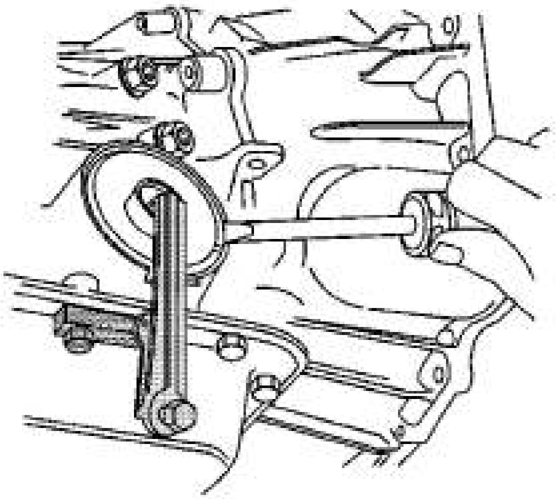
Tools Required

J 29714-A Servo Cover Depressor

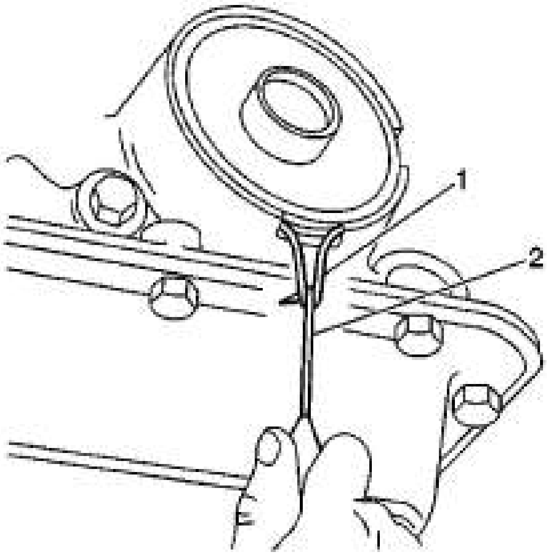
Removal Procedure



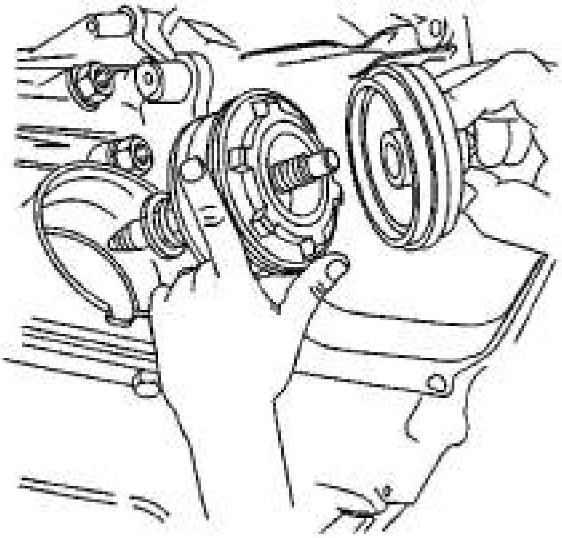
1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Install a transmission jack and remove the transmission mount. Refer to Transmission Mount Replacement.
3. Lower the transmission.
4. Remove the oil pan bolt below and to the left of the 2-4 servo cover.
5. Install the J 29714-A to the oil pan rail.
6. Tighten the bolt on the J 29714-A to compress the servo cover.



7. Remove the servo cover retaining ring.
8. Loosen the bolt on the J 29714-A to release tension on the servo cover.



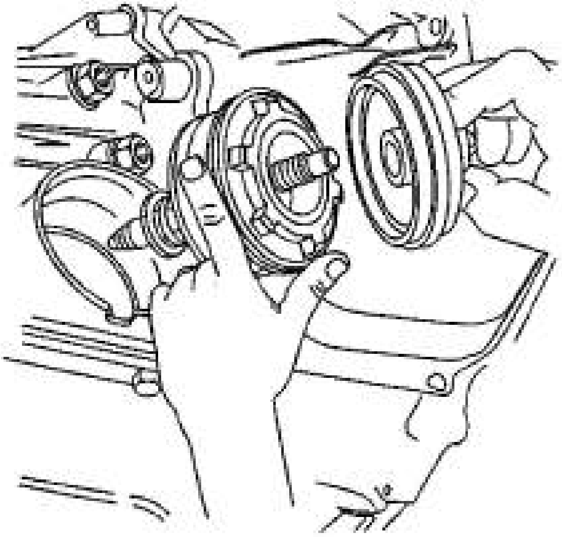
9. Remove the servo cover and O-ring seal. If the cover is hung up on the seal, use a pick (2) to pull and stretch the seal (1) out of the groove. Cut and remove the O-ring seal before removing the cover.



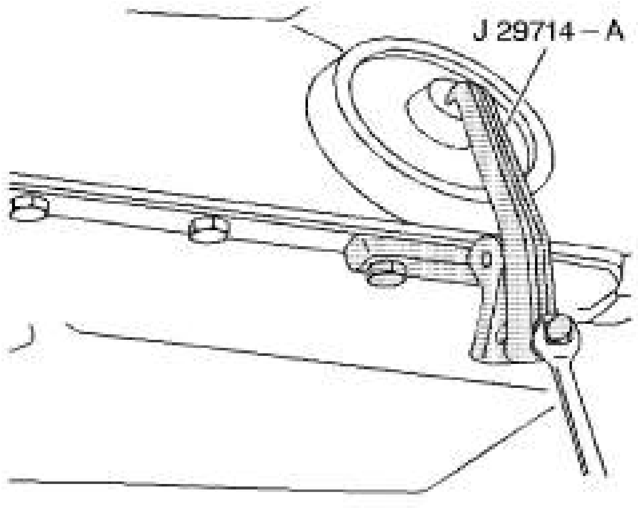
10. Remove the 2-4 servo from the transmission.
11. Inspect the 4th apply piston, 2-4 servo converter, 2nd apply piston, and the servo piston inner housing for the following defects:
    - Cracks
    - Scoring
    - Burrs and nicks

Installation Procedure

1. Install new seals on the servo pistons and the servo cover.



2. Install the 2-4 servo to the transmission.
3. Install the servo cover and O-ring seal.



4. Tighten the bolt on the J 29714-A to compress the servo cover.
5. Install the servo cover retaining ring.
6. Loosen the bolt on the J 29714-A to release tension on the servo cover.
7. Remove the J 29714-A from the oil pan rail.

   Notice: Refer to Fastener Notice in the Preface section.

8. Install the oil pan bolt below the 2-4 servo cover.

   Tighten
   Tighten the oil pan bolt to 12 N·m (106 lb in).

9. Raise the transmission.
10. Install the transmission mount. Refer to Transmission Mount Replacement.
11. Remove the transmission jack.
12. Lower the vehicle.
13. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check

    Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

    Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

14. Reset the TAP values. Refer to Transmission Adaptive Functions.

Accumulator Assembly, Spacer Plate, and Gaskets

Tools Required

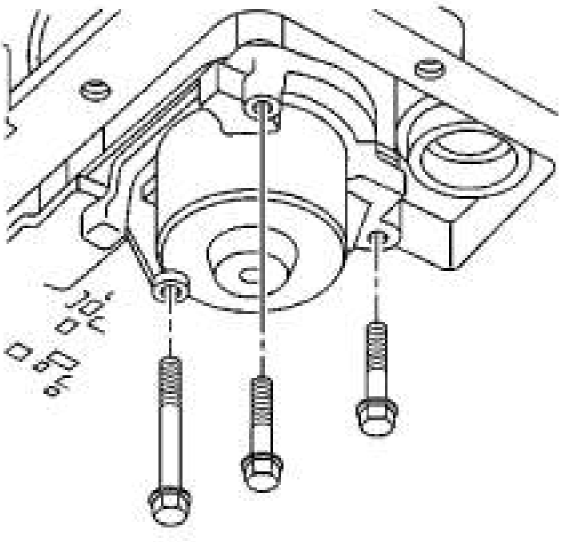
J 25025-B Pump and Valve Body Alignment Pin Set

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

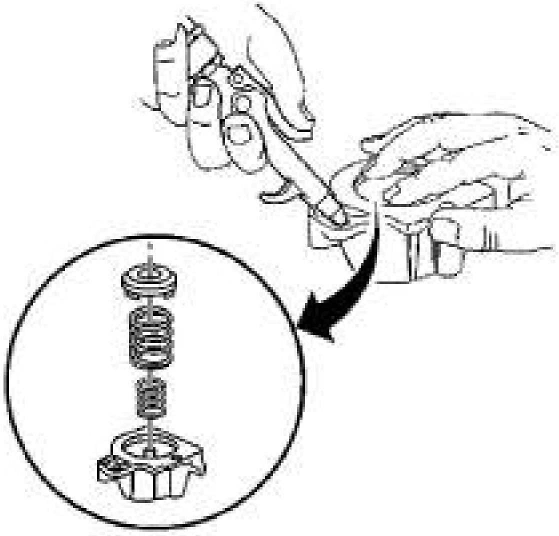
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



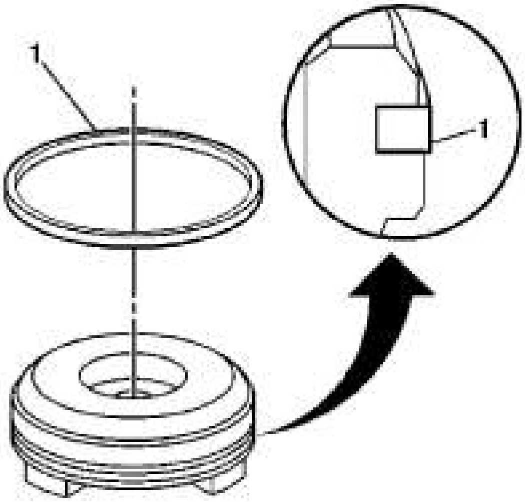
2. Remove the transmission oil pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement .

Important: The 1-2 accumulator can be removed without removing the control valve assembly.

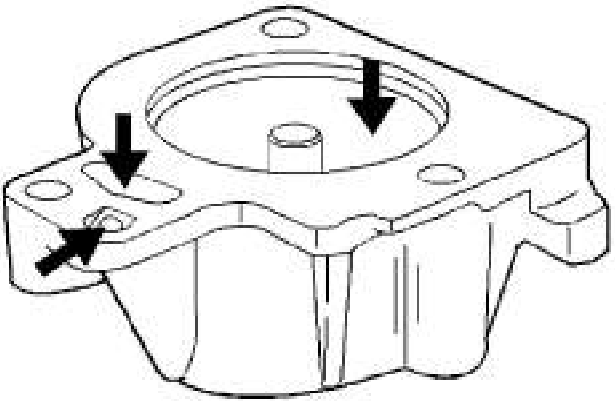
3. Remove the control valve body. Refer to Valve Body and Pressure Switch Replacement .
4. Remove the accumulator cover retaining bolts.
5. Remove the 1-2 accumulator cover assembly.



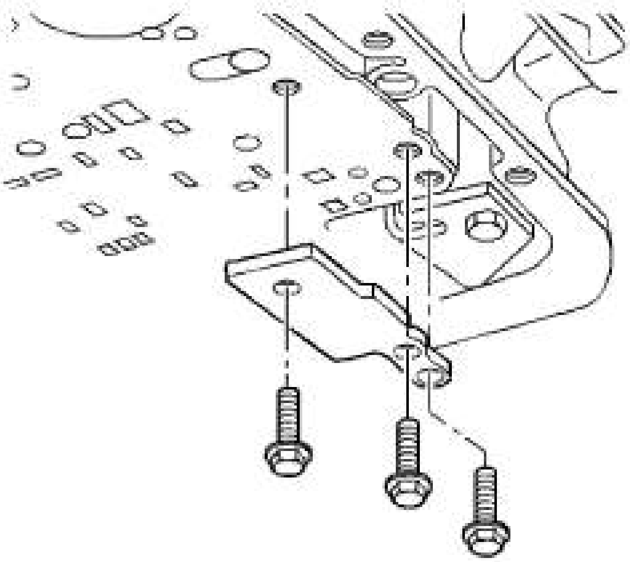
6. Disassemble the 1-2 accumulator.
    6.1. Blow compressed air into the 1-2 accumulator cover, as shown, to remove the 1-2 accumulator piston.
    6.2. Remove the 1-2 accumulator inner (not in all models) and outer springs.
7. Inspect the 1-2 accumulator inner (not in all models) and outer springs for cracks.



8. Remove the 1-2 accumulator piston seal (1) from the 1-2 accumulator piston.
9. Inspect the 1-2 accumulator piston for the following defects:
    - Porosity
    - Cracks
    - Scoring
    - Nicks and scratches



10. Inspect the 1-2 accumulator cover for the following defects:
    - Porosity
    - Cracks
    - Scoring
    - Nicks and scratches



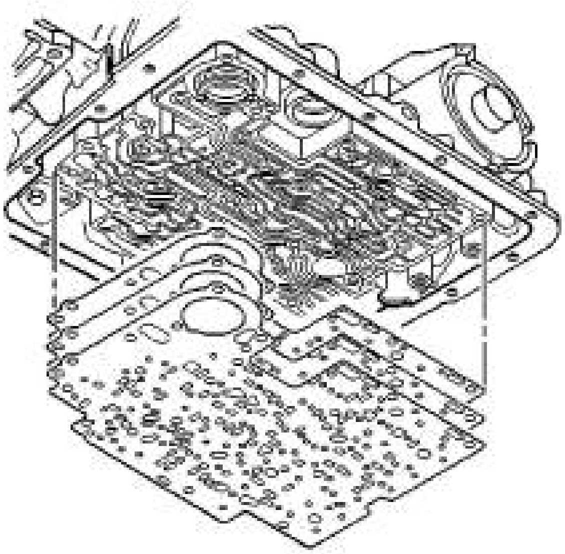
11. Remove the spacer plate support retaining bolts.

    Important: Use care not to drop the following items that will be removed along with the spacer plate:

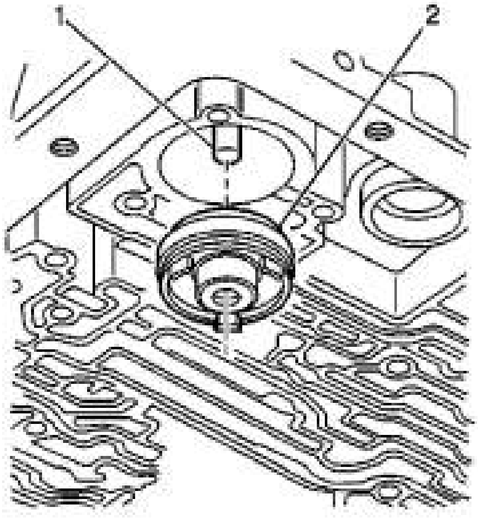
    - The number 1 checkball

- The 3-4 accumulator spring
- The 3-4 accumulator pin

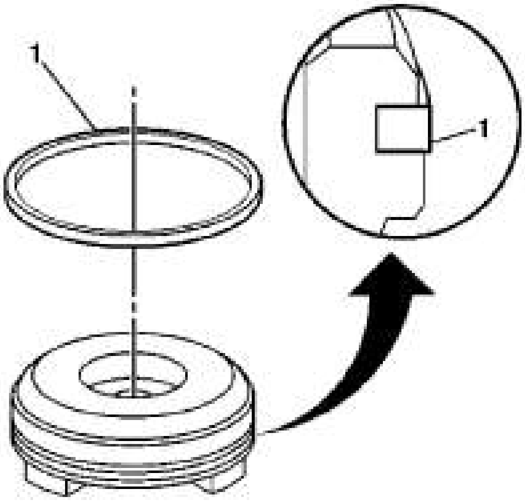
12. Remove the spacer plate support.



13. Remove the spacer plate to valve body gasket, the spacer plate and the spacer plate to transmission case gasket.

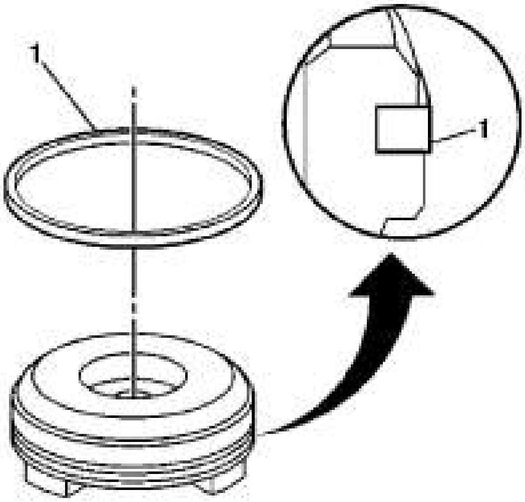


14. Remove the 3-4 accumulator piston (2).
15. Inspect the 3-4 accumulator spring for cracks.

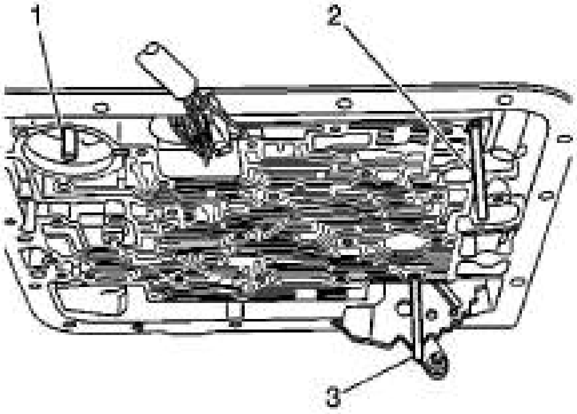


16. Remove the 3-4 accumulator piston seal (1) from the 3-4 accumulator piston.
17. Inspect the 3-4 accumulator piston for the following defects:
    - Porosity
    - Cracks
    - Scoring
    - Nicks and scratches

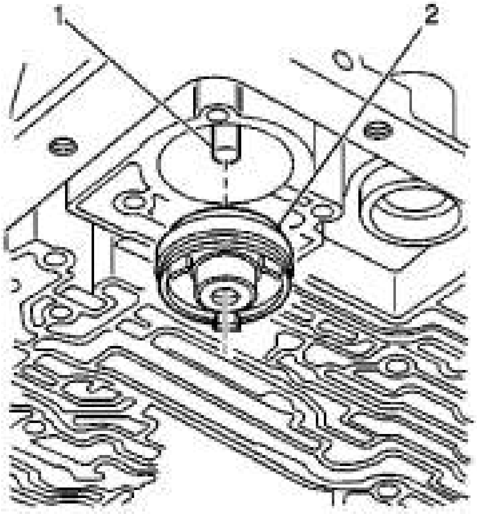
Installation Procedure



1. Install a new 3-4 accumulator piston seal (1) to the 3-4 accumulator piston.

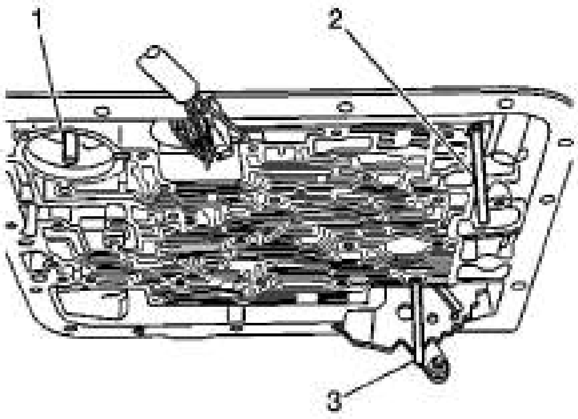


2. Install the 3-4 accumulator pin (1) into the transmission case and retain the pin with J 36850 J 36850 .

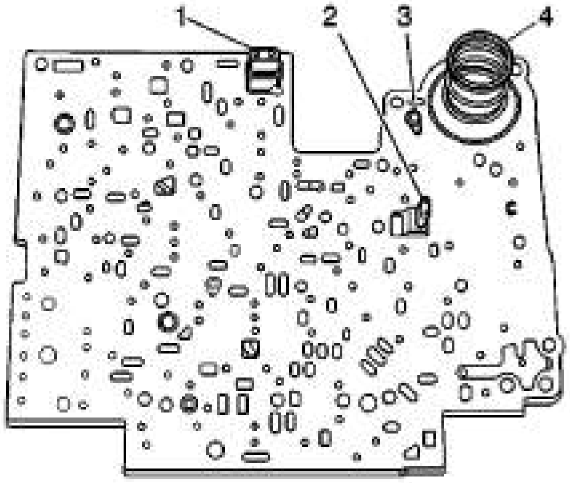


3. Install the 3-4 accumulator piston (2) onto the pin (1) in the transmission case.

   Ensure that the 3-4 accumulator piston legs face away from the transmission case.

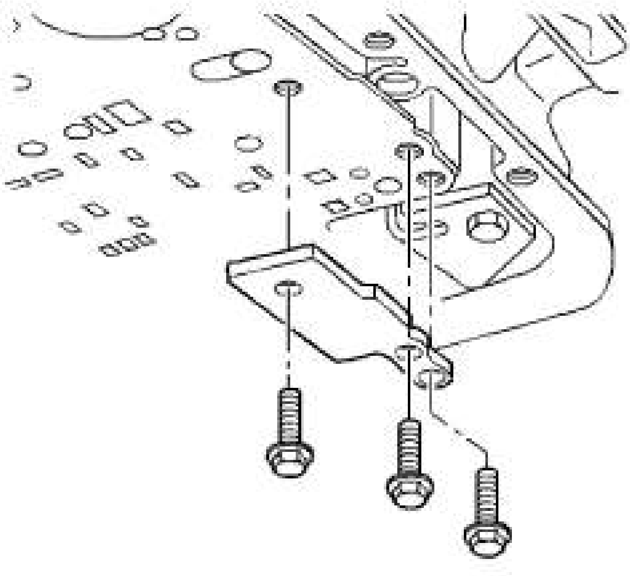


4. Install the J 25025-B (2, 3) to the transmission case.



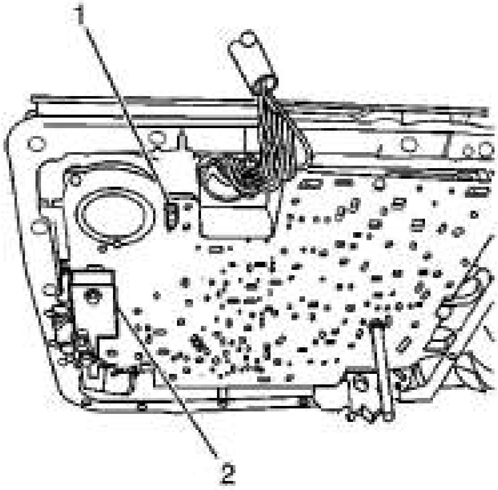
5. Install the spacer plate to transmission case gasket and the spacer plate to valve body gasket to the spacer plate; use J 36850 in order to retain the gaskets to the spacer plate.
   - The case gasket is identified by a C.
   - Be sure to place the case gasket on the transmission case side of the spacer plate.
   - The valve body gasket is identified by a V.
   - Be sure to place the valve body gasket on the valve body side of the spacer plate.
6. Ensure that the solenoid screens (1, 2) are in place on the spacer plate.
7. Place the checkball (3) on the spacer plate in the location shown.
8. Place the 3-4 accumulator spring (4) on the spacer plate.
9. Install the spacer plate and related components to the transmission.

Notice: Refer to Fastener Notice in the Preface section.

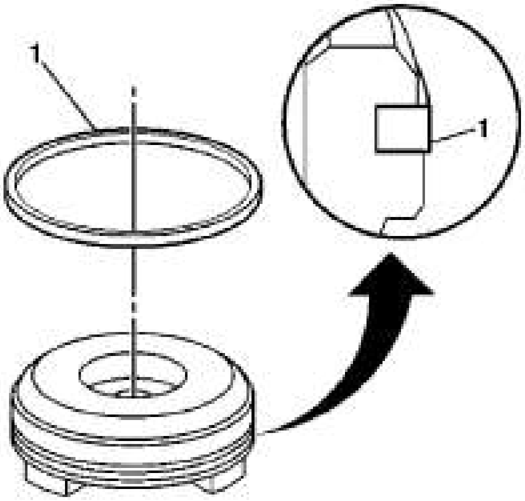


10. Install the spacer plate support and the spacer plate support retaining bolts.

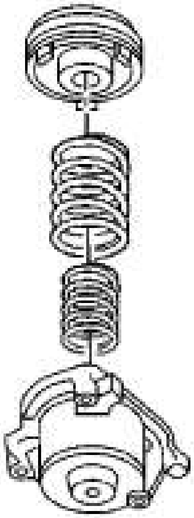
    Tighten
    Tighten the spacer plate support retaining bolts to 11 N·m (97 lb in).



11. After installing the spacer plate support (2), look through the hole in the spacer plate to make sure that the checkball (1) has remained in the proper location.

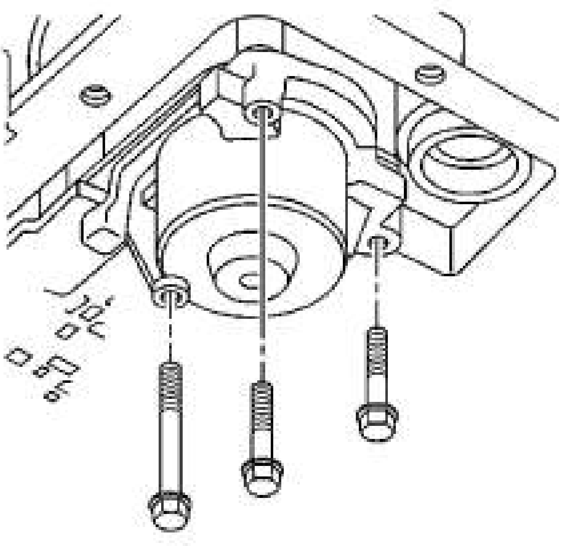


12. Install a new 1-2 accumulator piston seal (1) to the 1-2 accumulator piston.



13. Install the 1-2 accumulator inner (not in all models) and outer springs to the 1-2 accumulator cover.
14. Install the 1-2 accumulator piston onto the pin in the 1-2 accumulator cover.

    Ensure that the piston legs face the accumulator cover.



15. Install the 1-2 accumulator cover and the accumulator cover retaining bolts.

    Tighten
    Tighten the accumulator cover retaining bolts to 11 N·m (97 lb in).

16. Remove the J 25025-B from the transmission case.
17. Install the control valve body. Refer to Valve Body and Pressure Switch Replacement .
18. Install the transmission oil pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement .
19. Lower the vehicle.
20. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check .

    Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

    Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

21. Reset the TAP values. Refer to Transmission Adaptive Functions .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | **Document ID: 1992318**

Automatic Transmission Fluid and Filter Replacement

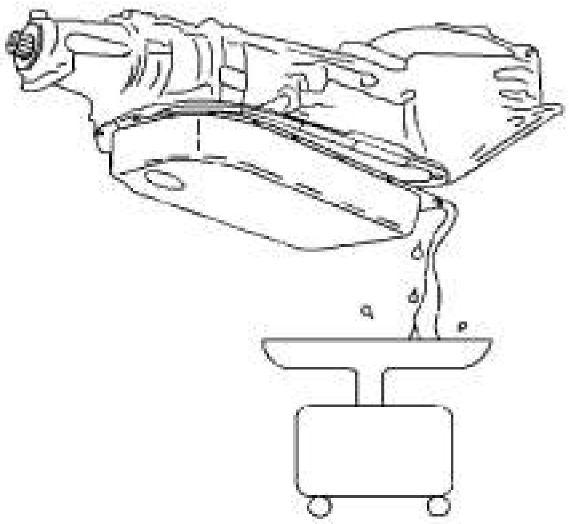
Removal Procedure

Caution: When the transmission is at operating temperatures, take necessary precautions when removing the drain plug, to avoid being burned by draining fluid.

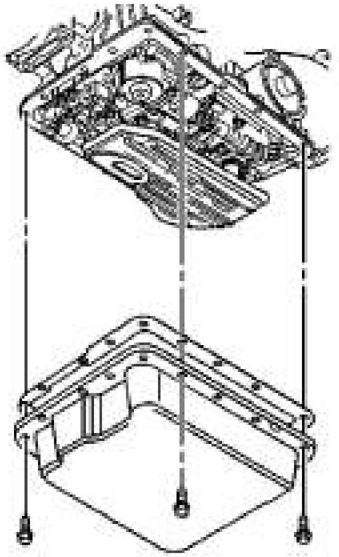
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

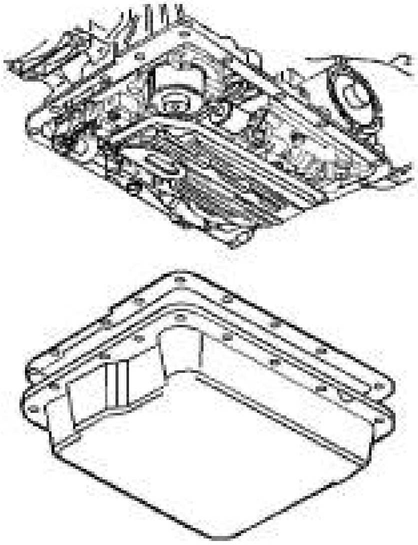
1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle .



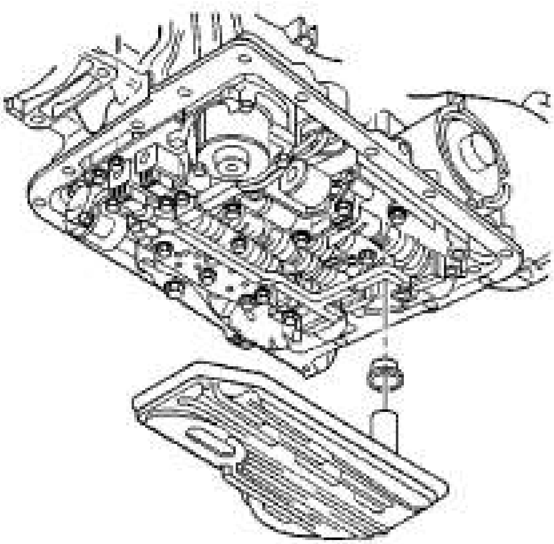
2. Place a drain pan under the transmission oil pan.
3. Remove the oil pan bolts from the front and sides of the pan only.
4. Loosen the rear oil pan bolts approximately 4 turns.
5. Lightly tap the oil pan with a rubber mallet in order to loosen the pan to allow the fluid to drain.



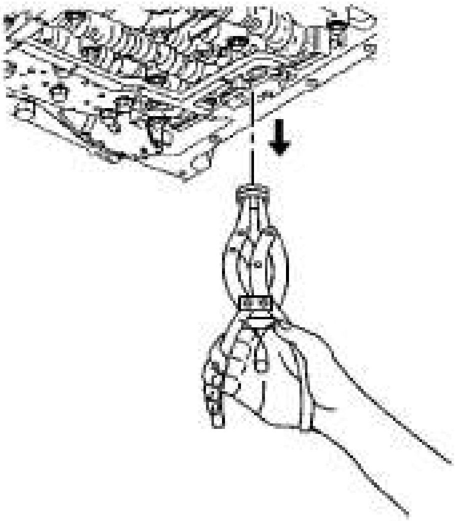
6. Remove the remaining oil pan bolts.



7. Remove the oil pan and the gasket.

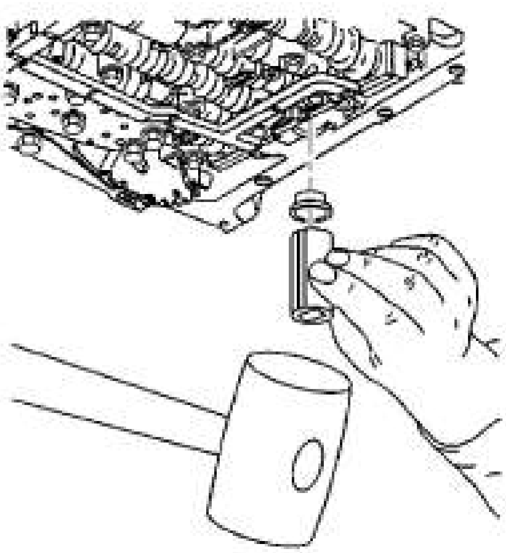


8. Grasp firmly while pulling down with a twisting motion in order to remove the filter.

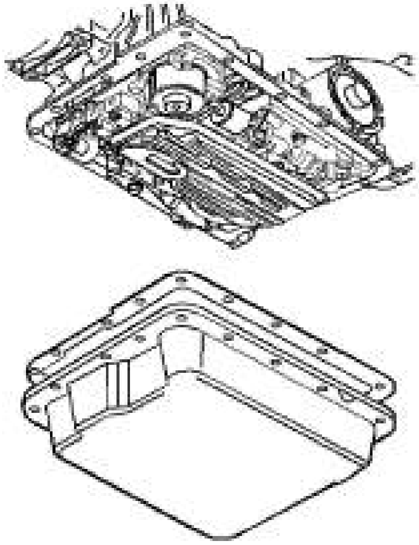


9. Remove the filter seal. The filter seal may be stuck in the pump; if necessary, carefully use pliers or another suitable tool to remove the seal.
10. Discard the seal.
11. Inspect the fluid colour.
12. Inspect the filter. Pry the metal crimping away from the top of the filter and pull apart. The filter may contain the following evidence for root cause diagnosis:
    - Clutch material
    - Bronze slivers indicating bushing wear
    - Steel particles
13. Clean the transmission case and the oil pan gasket surfaces with solvent, and air dry. You must remove all traces of the old gasket material.

Installation Procedure

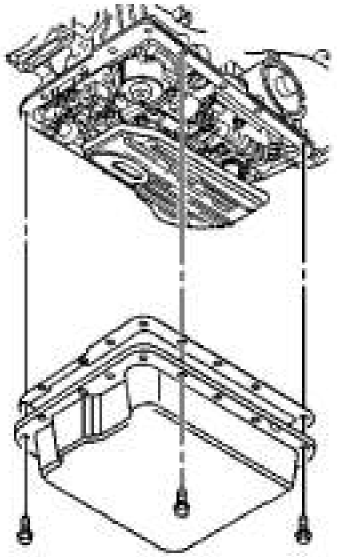


1. Coat the new filter seal with automatic transmission fluid.
2. Install the new filter seal into the transmission case. Tap the seal into place using a suitable size socket.
3. Install the new filter into the case.



4. Install the oil pan and a new gasket.

   Notice: Refer to Fastener Notice in the Preface section.



5. Install the oil pan bolts.

   Tighten
   Tighten the oil pan to transmission case bolts alternately and evenly to 12 N·m (106 lb in).

6. Lower the vehicle.
7. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check and Fluid Capacity Specifications .
8. Check the COLD fluid level reading for initial fill only.
9. Inspect the oil pan gasket for leaks.

Case Extension Assembly Replacement

Tools Required

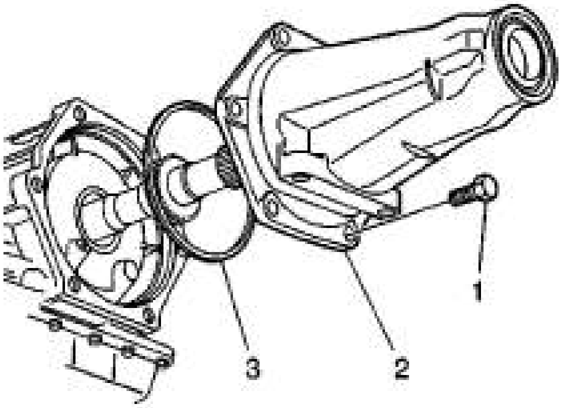
J 21426 Extension Housing Seal Installer

Removal Procedure

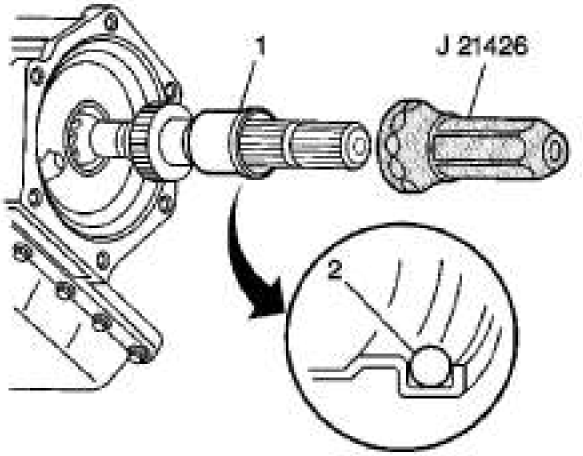
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

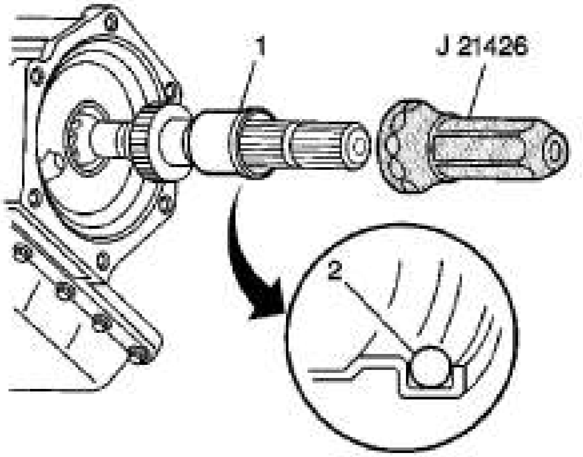


2. Remove the catalytic converter support bracket.
3. Remove the catalytic converter from the vehicle. Refer to Catalytic Converter Replacement - Left Side and Catalytic Converter Replacement - Right Side .
4. remove the transmission mount from the vehicle. Refer to Transmission Mount Replacement .
5. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
6. Remove the transmission extension housing bolts (1).
7. Remove the transmission extension housing (2).
8. Remove the transmission extension housing O ring (3). Discard the O ring (3).

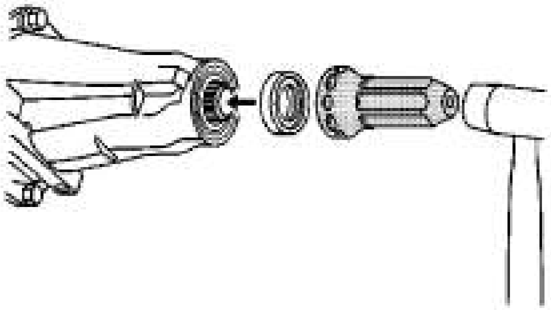


9. Remove the output shaft sleeve (1), if necessary.
10. Remove the output shaft seal (2), if necessary.

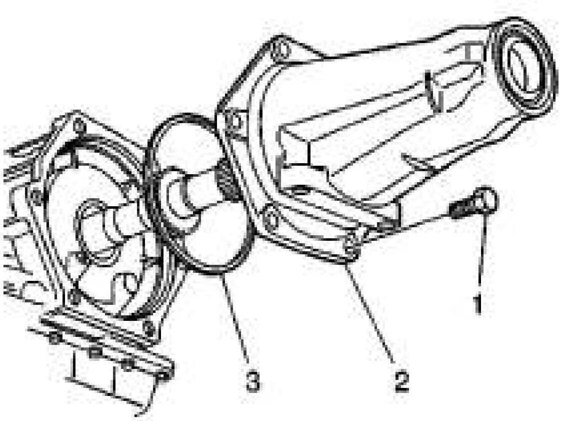
Installation Procedure



1. Install the output shaft sleeve seal (2), if necessary.
2. Install the output shaft sleeve (1) using J 21426 , if necessary.



3. Install a new transmission extension housing seal using a soft face hammer and J 21426 .



4. Install a new transmission extension housing O ring (3).

Notice: Refer to Fastener Notice in the Preface section.

5. Install the case extension (2).
6. Install the case extension bolts (1).

Tighten
Tighten the case extension bolts (1) to 45 N·m (33 lb ft).

7. Install the propeller shaft. Refer to Propeller Shaft Replacement .
8. Install the catalytic converter from the vehicle. Refer to Catalytic Converter Replacement -

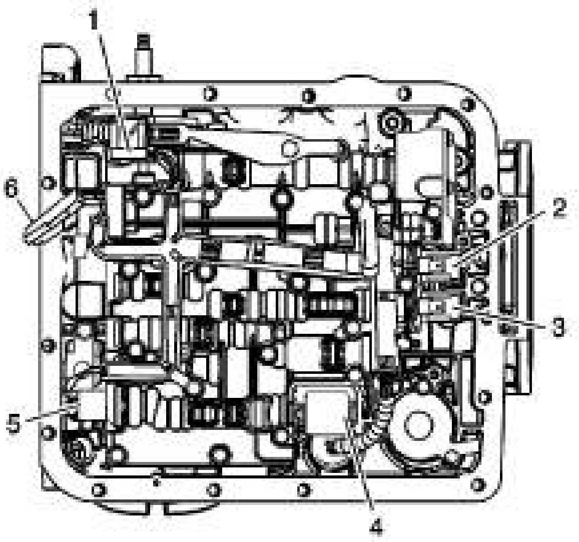
Left Side and Catalytic Converter Replacement - Right Side ..

9. Install the catalytic converter support bracket.
10. Lower the vehicle.
11. Check the transmission fluid level.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | **Document ID: 2085575**

Control and Shift Solenoids Replacement

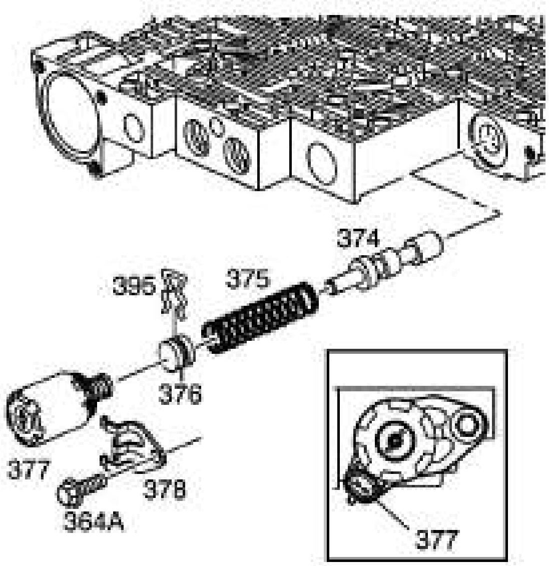
Removal Procedure



1. Remove the transmission oil pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

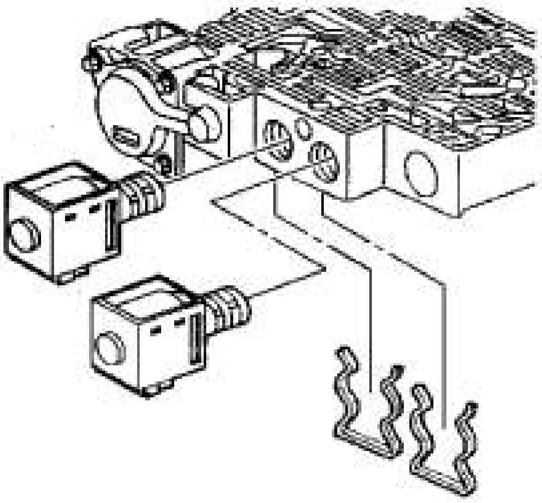
   Note: Do not remove the valve body for the following procedures. Removal of the 1-2 accumulator is necessary only if servicing the pressure control solenoid.

2. Remove the 1-2 accumulator if necessary. Refer to Accumulator Assembly, Spacer Plate, and Gaskets.
3. Disconnect all the internal wiring harness electrical connectors from the electrical components (1-6).



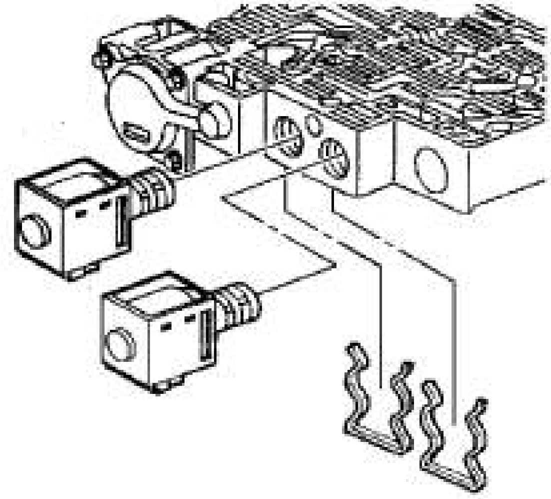
4. Remove the solenoid retainer bolt (364A) and the solenoid retainer (378).
5. Remove the pressure control solenoid (377).

   Note the orientation upon removal.



6. Remove the 1-2 and 2-3 shift solenoid retainers.
7. Remove the 1-2 and 2-3 shift solenoids.

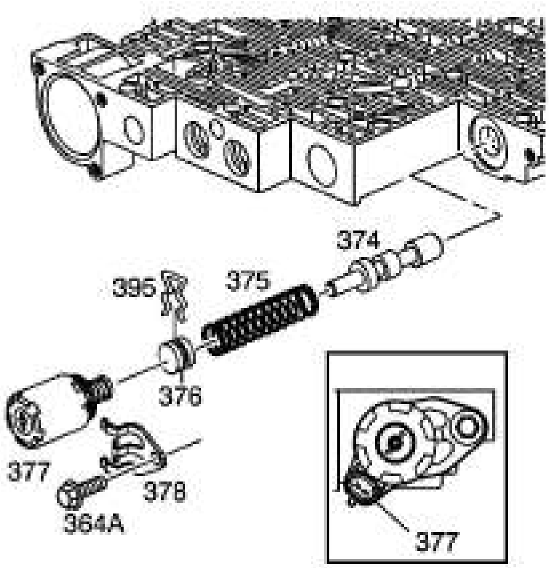
Installation Procedure



Caution: Be sure all solenoids are installed with the electrical connectors facing the non-machined (cast) side of the valve body; otherwise, the solenoids will bind against the transmission case as the valve body bolts are tightened and damage may occur.

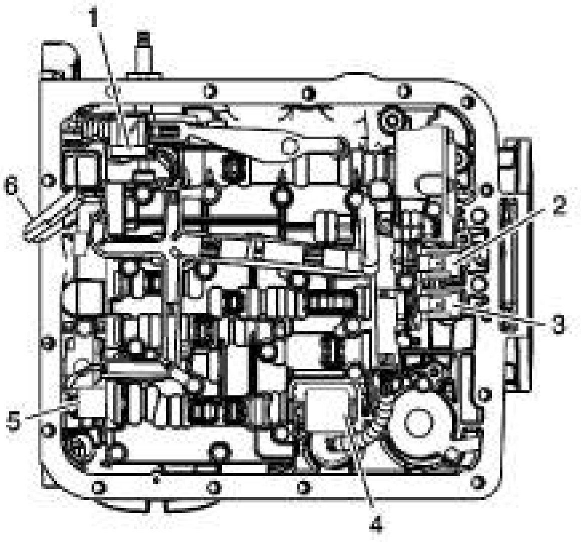
1. Install the 1-2 and 2-3 shift solenoids.
2. Install the 1-2 and 2-3 shift solenoid retainers.

Caution: Refer to Fastener Caution in the Preface section.



3. Install the following items:
   3.1. The actuator feed limit valve (374)

3.2. The actuator feed limit valve spring (375)
3.3. The bore plug (376)
3.4. The bore plug retainer (395)
3.5. The pressure control solenoid (377)
3.6. The solenoid retainer (378)
3.7. Tighten the pressure control solenoid retaining bolt to **11 N·m (97 lb in)**



4. Connect all the internal wiring harness electrical connectors to the electrical components (1-6).
5. Install the 1-2 accumulator. Refer to Accumulator Assembly, Spacer Plate, and Gaskets.
6. Install the transmission oil pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.
7. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.

Note: It is recommended that transmission adaptive pressure (TAP) information be reset.

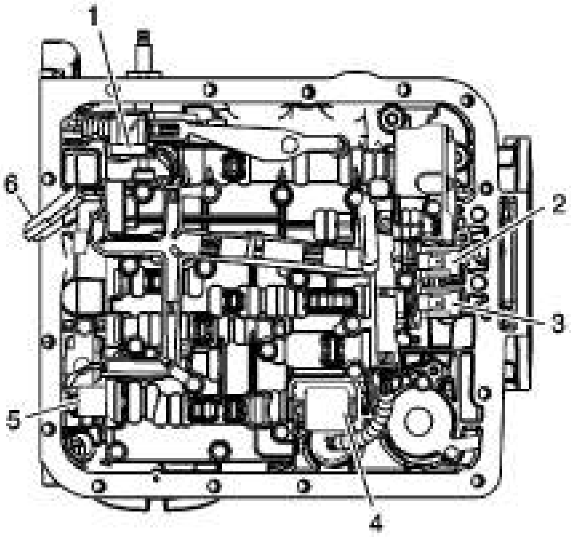
Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, the engine control module (ECM), powertrain control module (PCM) or transmission control module (TCM) will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

8. Reset the TAP values. Refer to Transmission Adaptive Functions.

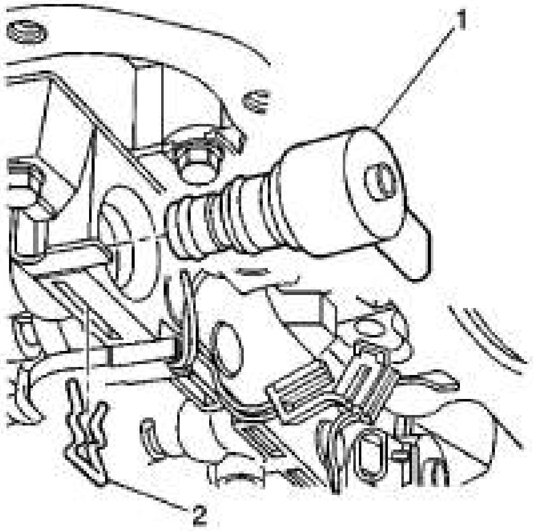
Control Valve Body Replacement

Removal Procedure

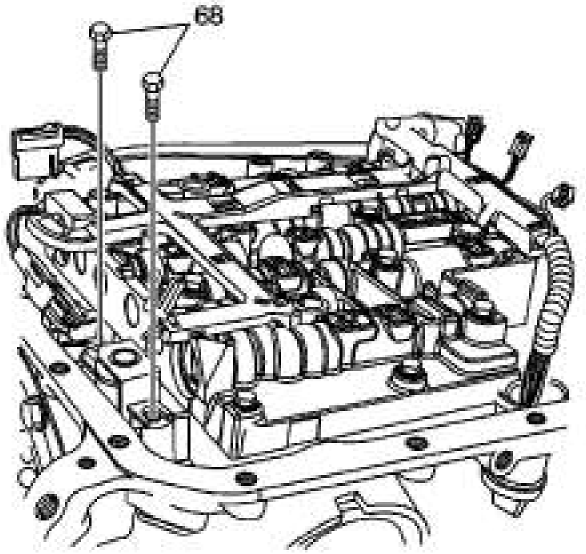
1. Remove the fluid level indicator.
2. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the oil pan, gasket, and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



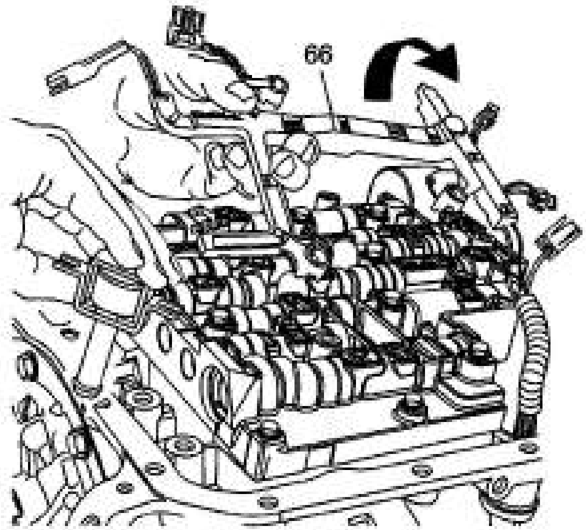
4. Disconnect all the internal wiring harness electrical connectors from the electrical connectors (1-6) components.



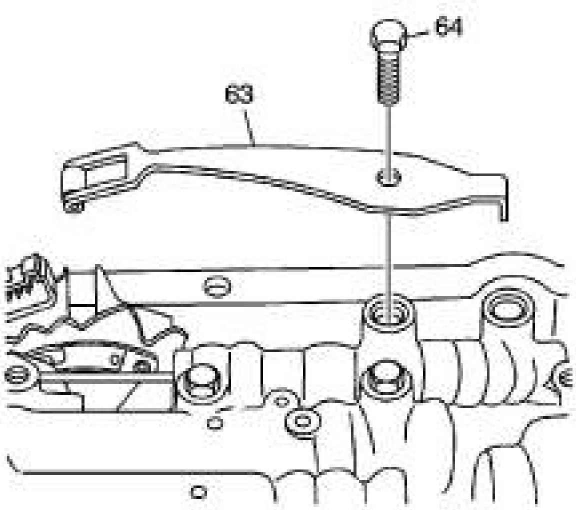
5. Remove the torque converter clutch (TCC) pulse width modulation (PWM) solenoid retainer (2) with a small screwdriver. Rotate the solenoid (1) in the bore, if necessary, until the flat part of the retainer (2) is visible.
6. Remove the TCC PWM solenoid (1) in order to access the TCC solenoid retaining bolts.



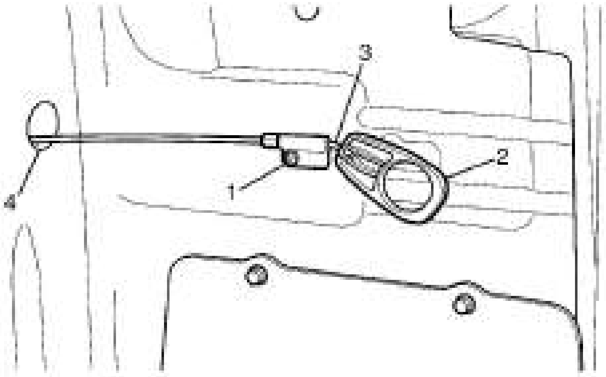
7. Remove the TCC solenoid retaining bolts (68).



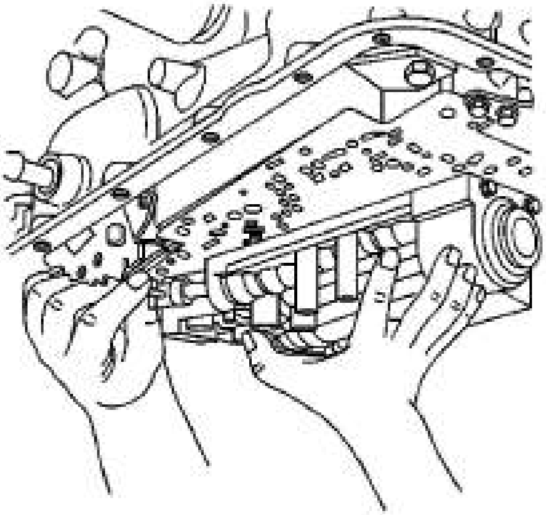
8. Remove the TCC solenoid (with O-ring seal) and wiring harness (66) from the control valve body.
9. Reposition the harness to the side of the transmission case.



10. Remove the manual detent spring bolt (64) and the spring assembly (63).

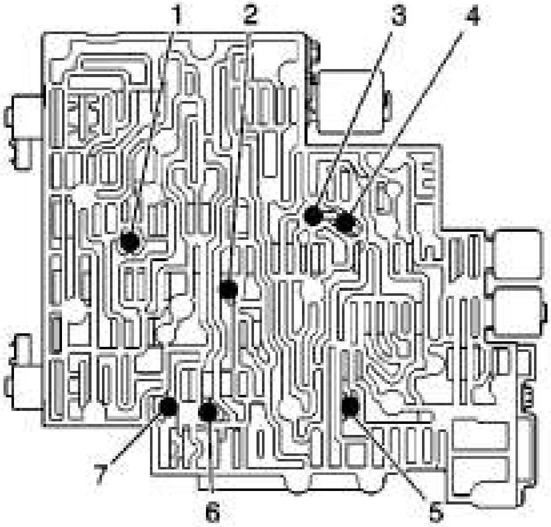


11. Remove all valve body bolts (59, 62, 120).

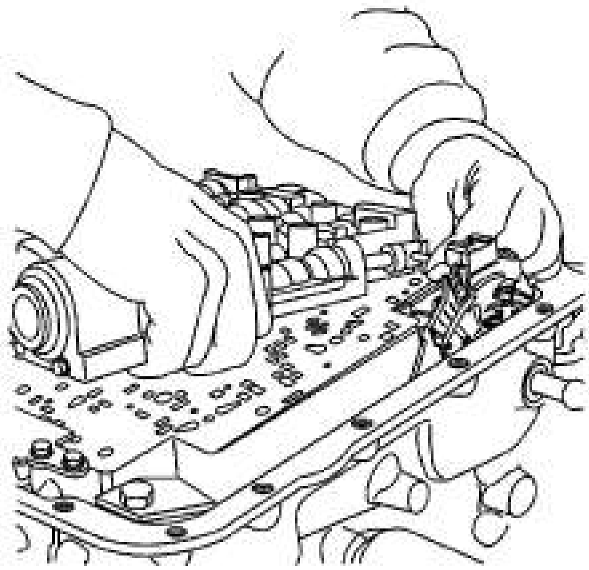


12. Carefully begin to lower the control valve body down from the transmission case while simultaneously disconnecting the manual valve link.

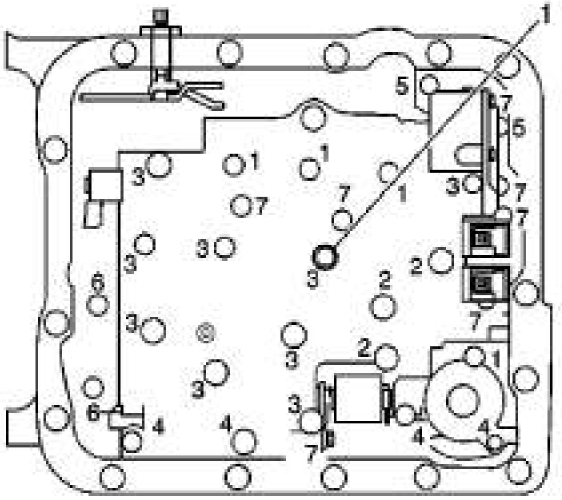
Installation Procedure



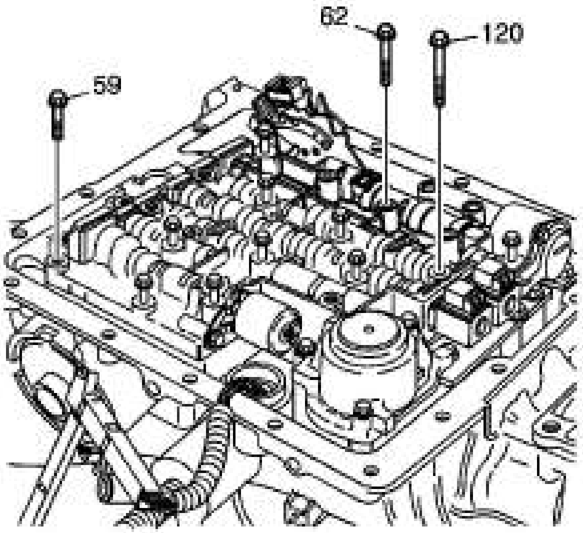
1. Install the checkballs (1-7) in the valve body.



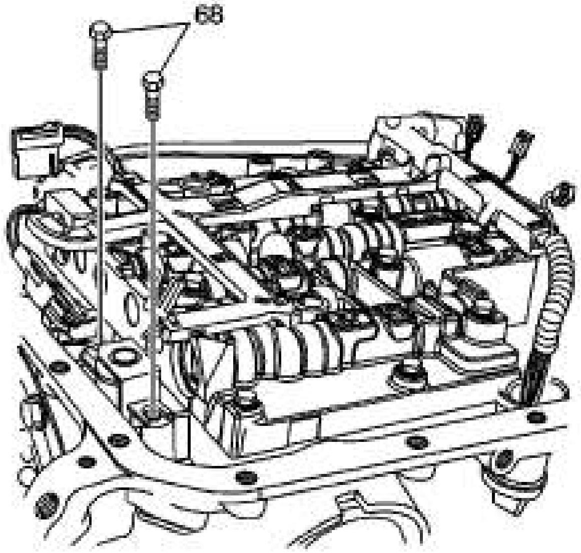
2. Install the control valve body to the transmission case while simultaneously connecting the manual valve link to the manual valve.
3. Verify that the manual valve link is installed properly to the inside detent lever and the manual valve.



4. Install one bolt (M6 X 1.0 X 47.5) hand tight in the center (1) of the valve body to hold it in place.



5. Install the 12 valve body bolts (62), 2 bolts (59) and 3 bolts (120) that are shown only.
6. Finger tighten the bolts.

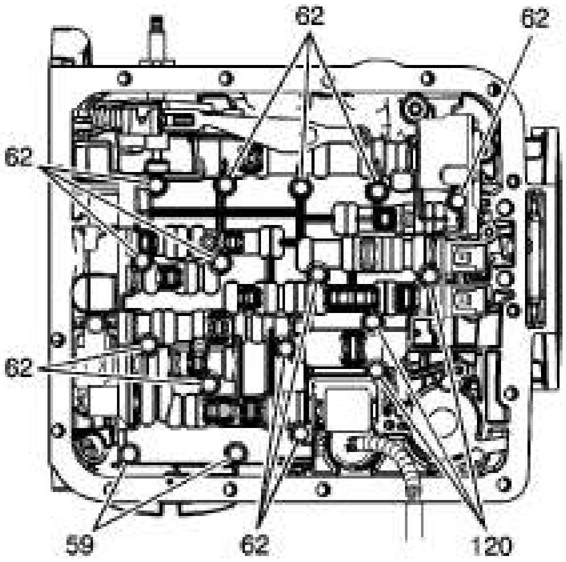


7. Install the transmission wiring harness on the valve body.

Caution: Refer to Fastener Caution in the Preface section.

8. Install the TCC solenoid valve and bolts (68).

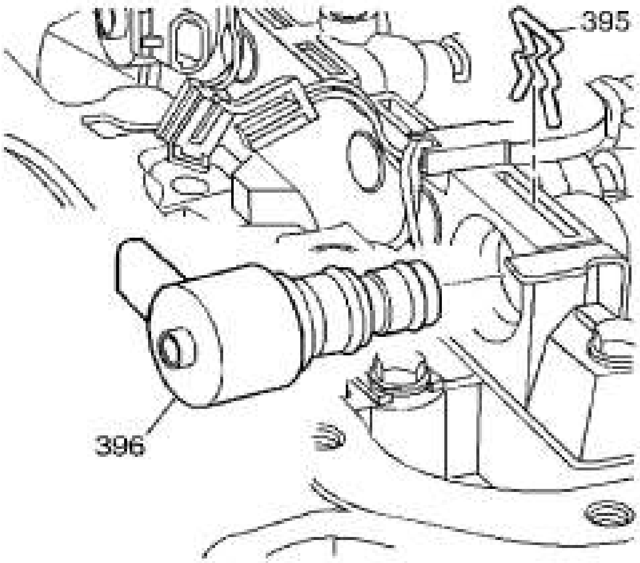
Tighten the bolts to **814 N·m (610 lb ft).**



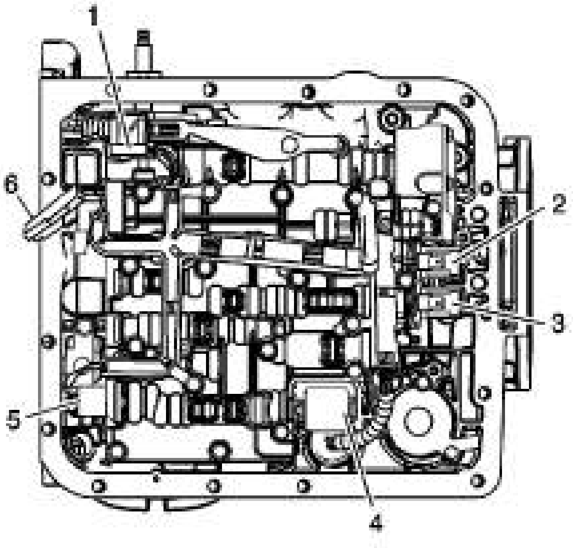
Caution: Do not over-tighten the bolts. Over-tightening the bolts will distort the valve bores. Begin tightening from the center of the valve body tighten the bolts in a outward direction.

9. Inspect the ensure all of the valve body bolts are in the correct location. Each bolt number refers to a specific size, as indicated in the following list:
   - 59 M6 x 1.0 x 35.0 (Qty: 2)
   - 62 M6 x 1.0 x 47.5 (Qty: 12)
   - 120 M6 x 1.0 x 54.4 (Qty: 3)
10. Tighten the bolts from the center of the valve body working your way out in a spiral pattern to the outside edge.

    Tighten the bolts to **814 N·m (610 lb ft).**



11. Install the TCC PWM solenoid valve (396) and the solenoid retainer (395).



12. Snap the wiring harness in place on the valve body bolts. Ensure the harness loom tab is located under the transmission fluid pressure (TFP) switch.
13. Install the wiring connectors to the electrical components (1-6) as indicated in the following list:
    - 13.1. The manual shift detent lever with shaft position switch assembly
    - 13.2. The 1-2 shift solenoid
    - 13.3. The 2-3 shift solenoid
    - 13.4. The pressure control solenoid (PCS)
    - 13.5. The TCC PWM solenoid
    - 13.6. The input speed sensor (ISS)
14. Install the transmission oil pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.
15. Lower the vehicle.
16. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.

Note: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, the engine control module (ECM), powertrain control module (PCM) or transmission control module (TCM) will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

17. Reset the TAP values. Refer to Transmission Adaptive Functions.

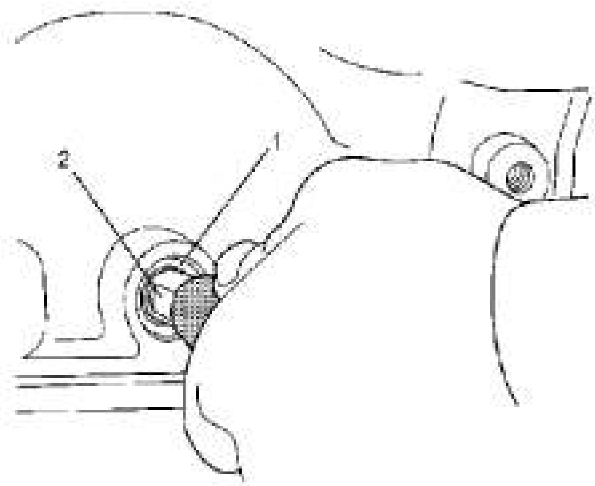
Manual Shift Shaft Seal Replacement

Tools Required

- J 43909 Selector Shaft Seal Installer
- J 43911 Selector Shaft Seal Remover

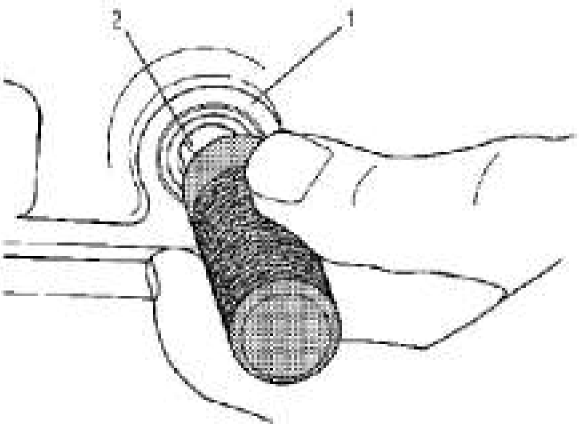
Removal Procedure

1. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the Park/Neutral Position (PNP) Switch. Refer to Park/Neutral Position Switch Replacement.



3. Be sure that the jackscrew for J 43911 is backed off and will not interfere with installation of the removal tool. Slide the seal remover tool over the selector shaft (2) with the threaded end of the tool toward the seal.
4. Rotate the removal tool so that the threads on the end of the tool engauge the steel shell (1) of the seal. Use a wrench to be sure that the removal tool is firmly attached to the seal shell.
5. Rotate the jackscrew in the clockwise direction to remove the seal from the bore. Discard the seal that was removed.

Installation Procedure



1. Carefully slide a new selector shaft seal (1) over the selector shaft (2) with the wide face of the steel case facing outward. Position the seal so that it is starting to enter the seal bore.
2. Obtain J 43909 and remove the inner sleeve so that the tool will slide over the selector shaft.
3. Slide the J 43909 into position so that the end of the tool contacts the seal being installed. Use a mallet to strike the J 43909 and drive the new seal into the seal bore until it is seated at the bottom of the bore.
4. Install the PNP Switch. Refer to Park/Neutral Position Switch Replacement.
5. Lower the vehicle.
6. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | **Document ID: 1992308**

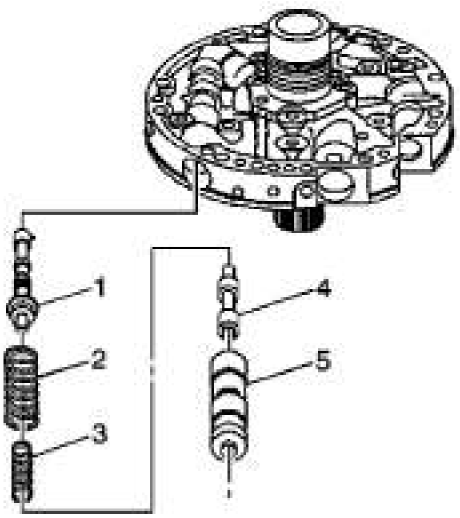
Pressure Regulator Valve Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

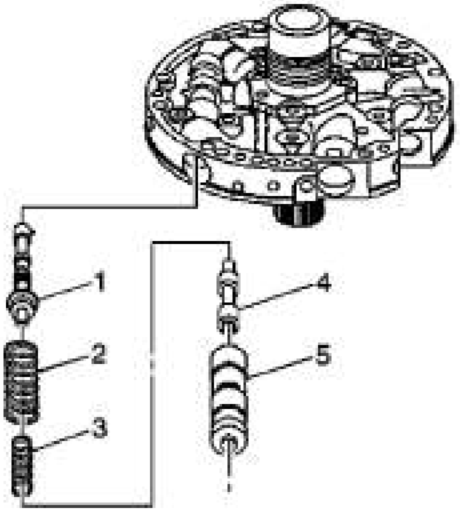
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the transmission oil pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.
3. Compress the reverse boost valve sleeve into the bore of the oil pump to release tension on the reverse boost valve retaining ring.
4. Remove the reverse boost valve retaining ring, then slowly release tension on the reverse boost valve sleeve.

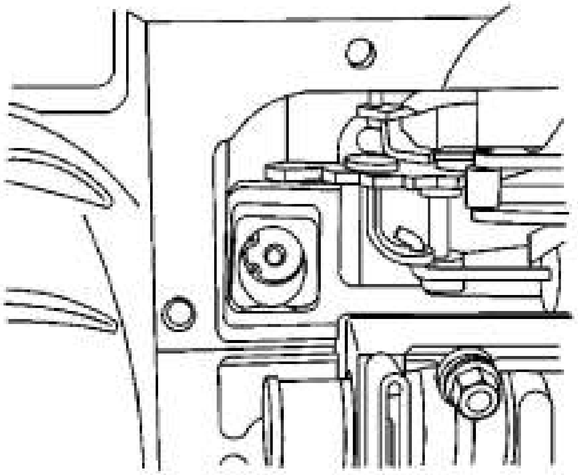


5. Remove the reverse boost valve sleeve (5) and the reverse boost valve (4).
6. Remove the pressure regulator isolator spring (3) and the pressure regulator valve spring (2).
7. Remove the pressure regulator valve (1).

Installation Procedure



1. Install the pressure regulator valve (1).
2. Install the pressure regulator isolator spring (3) and the pressure regulator valve spring (2).
3. Install the reverse boost valve (4) in the reverse boost valve sleeve (5).
4. Install the reverse boost valve (4) and sleeve (5) in the oil pump cover.



5. Compress the reverse boost valve sleeve into the bore of the oil pump to expose the retaining ring slot.
6. Install the reverse boost valve retaining ring, then slowly release tension on the reverse boost valve sleeve.
7. Install the transmission oil filter and pan. Refer to Automatic Transmission Fluid and Filter Replacement.
8. Lower the vehicle.
9. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

10. Reset the TAP values. Refer to Transmission Adaptive Functions.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | **Document ID: 1994185**

Propeller Shaft Front Slip Yoke Oil Seal Replacement

Tools Required

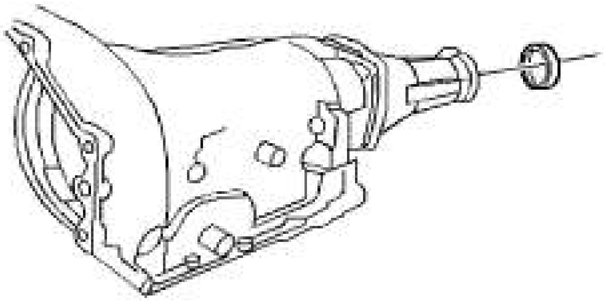
J 21426 Extension Housing Seal Installer

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

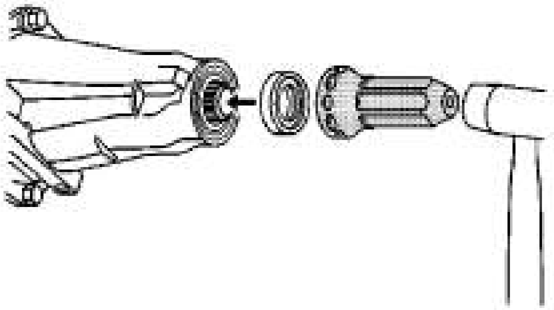
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Place a drain pan under the vehicle.



3. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
4. Remove the transmission extension housing rear oil seal. Use a flat-bladed tool and carefully pry the seal from the housing.
5. Inspect the case extension housing for damage. Replace the extension housing if necessary. Refer to Case Extension Assembly Replacement .

Installation Procedure



1. Lubricate the inside diameter of the new seal with J 36850 .
2. Use the J 21426 with a soft faced mallet to install the seal.
3. Install the seal to the extension housing.
4. Install the propeller shaft. Refer to Propeller Shaft Replacement .
5. Remove the drain pan and lower the vehicle.
6. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | Document ID: 1975531

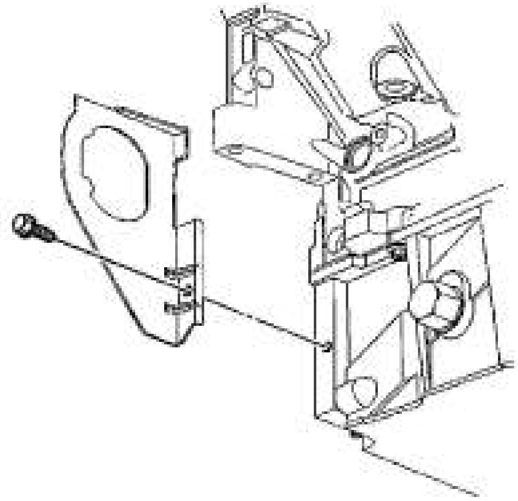
Torque Converter Cover Replacement

Removal Procedure

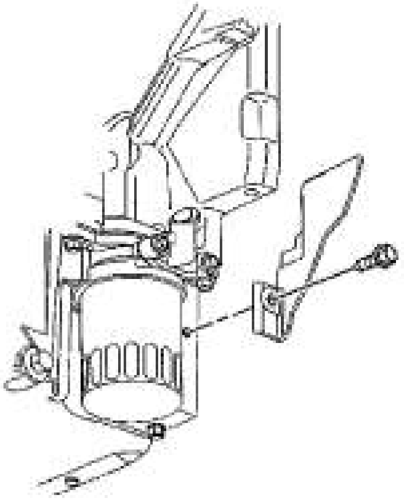
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the starter motor, If servicing the right side transmission cover only. Refer to Starter Motor Replacement .

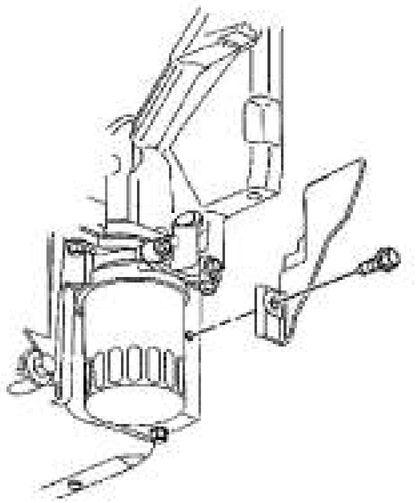


3. Remove the right side transmission cover bolt.
4. Remove the right side transmission cover.



5. Remove the left side transmission cover bolt
6. Remove the right side converter cover.

Installation Procedure

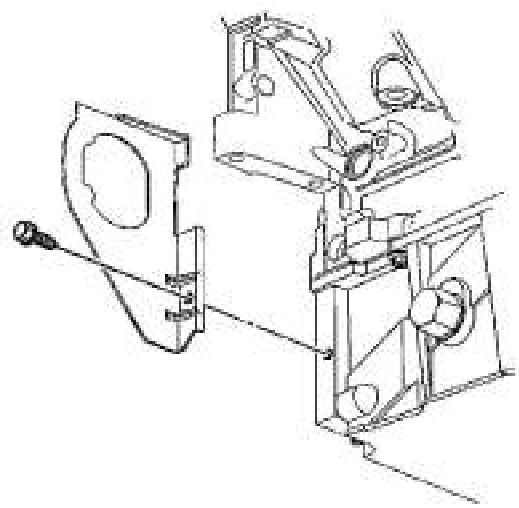


1. Install the left side converter cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the left side converter cover bolt.

   Tighten
   Tighten the left side converter cover bolt to 12 N·m (106 lb in).



3. Install the right side converter cover.
4. Install the right side converter cover bolt.

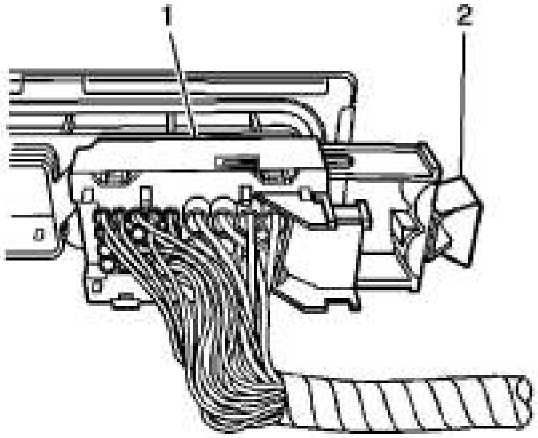
   Tighten
   Tighten the right side converter cover bolt to 12 N·m (106 lb in).

5. Install the starter motor, if removed. Refer to Starter Motor Replacement .
6. Lower the vehicle.

Transmission Control Module Replacement

Removal Procedure

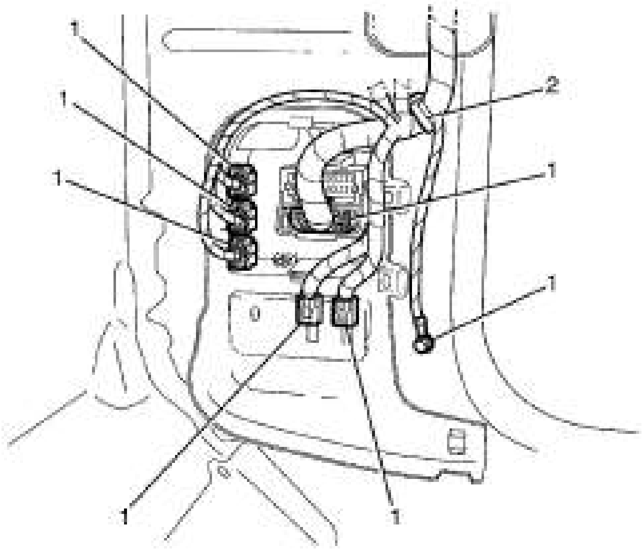
1. Remove the hinge pillar trim from the vehicle. Refer to Body Hinge Pillar Trim Panel Replacement .
2. Remove the knee bolster assembly. Refer to Knee Bolster Replacement .



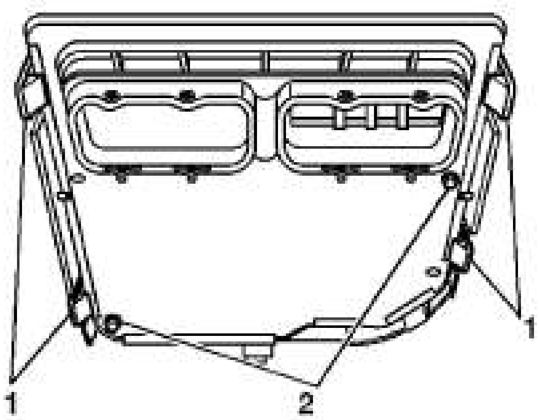
3. Unlock the transmission control module electrical connector by pulling the retainer (2) away from the electrical connector (1).

   Important: Twisting or tilting of the transmission control module electrical connector while disconnecting may result in bent or misaligned electrical terminal pins.

4. Carefully disconnect the electrical connector (1) from the transmission control module.

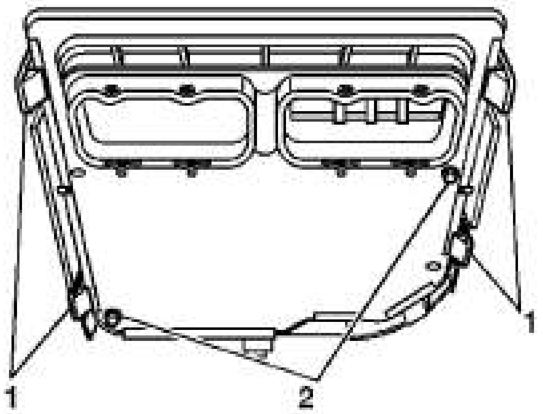


5. Disconnect the electrical connectors (1) from the right hand side junction box and remove loom retaining clip (2).
6. Position loom toward cowl.

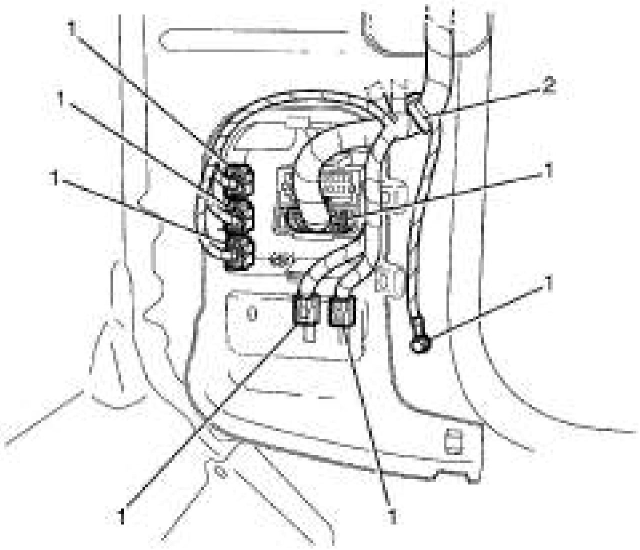


7. Remove the transmission control module from the mounting bracket by pulling back on the retaining tabs (1) to release the control module .

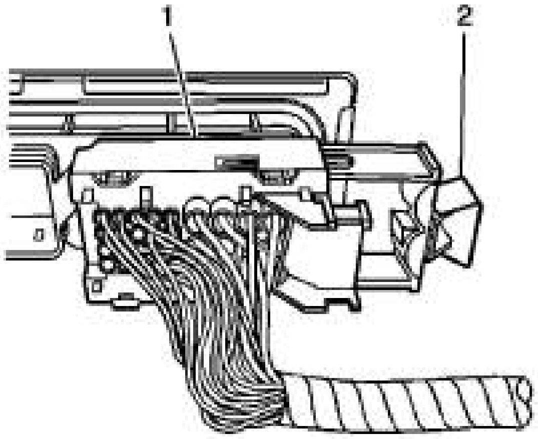
Installation Procedure



1. Align the transmission control module with the locating pins (2) on the module mounting bracket.
2. Install the transmission control module by seating it fully into the bracket until all of the retaining tabs (1) have engaged the edge of the module edge.



3. Connect the electrical connectors (1) to right hand side junction box and install loom retaining clip (2).



Important: Twisting or tilting of the transmission control module electrical connector while connecting may result in bent or misaligned electrical terminal pins.

4. Carefully connect the transmission control module electrical connector (1) to the transmission control module.
5. Lock the transmission control module electrical connector securely to the transmission control module by pushing the retainer (2) toward the electrical connector (1) until fully seated.
6. Install the hinge pillar trim on the vehicle. Refer to Body Hinge Pillar Trim Panel Replacement .
7. Install the knee bolster assembly. Refer to Knee Bolster Replacement .
8. If re-programming is required. Refer to Control Module References .

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

9. Reset the TAP values. Refer to Transmission Adaptive Functions .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | Document ID: 1990944

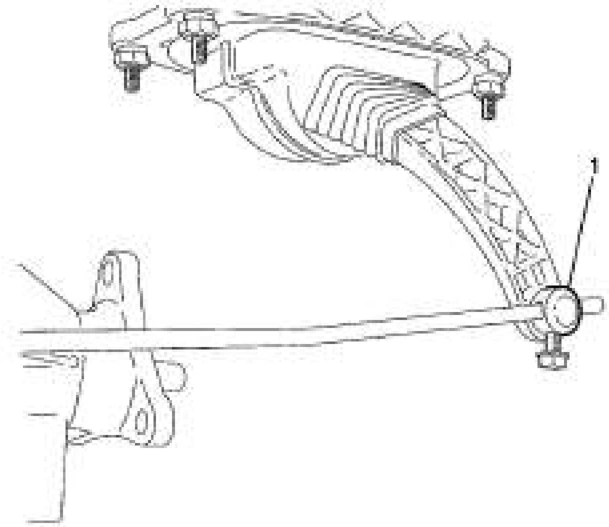
Transmission Control Replacement

Removal Procedure

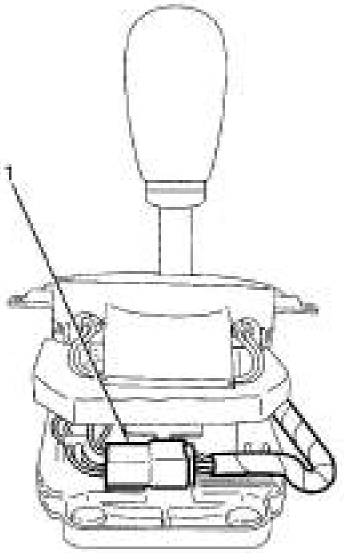
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

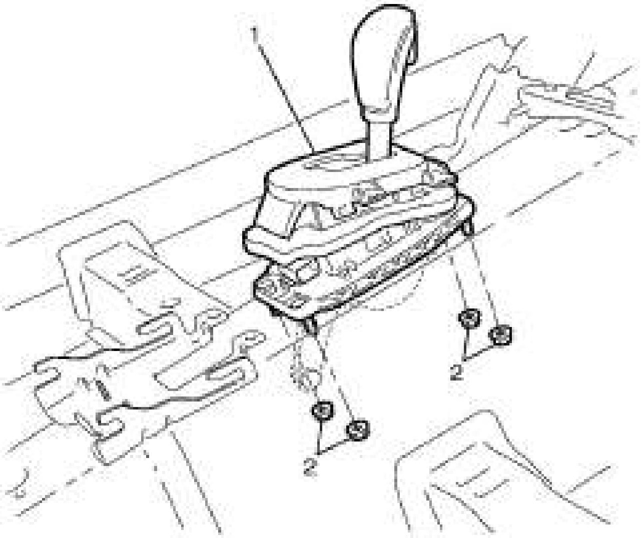
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Remove the adjustment nut (1) from the shift control linkage.
3. Disconnect the shift control linkage rod from the shift control assembly.
4. Lower the vehicle.
5. Remove the centre console assembly. Refer to Front Floor Console Replacement

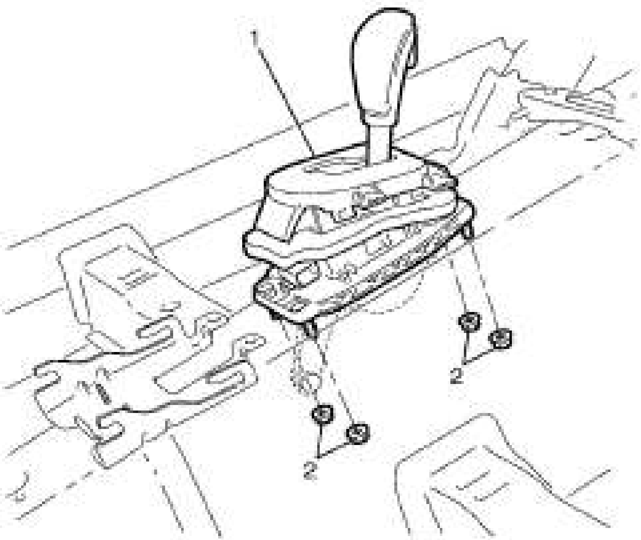


6. Remove the electrical connector (1) from the shift control assembly.



7. Remove the nuts (2) securing the shift control assembly to the tunnel reinforcement.
8. Remove the shift control assembly (1) from the tunnel reinforcement.

Installation Procedure

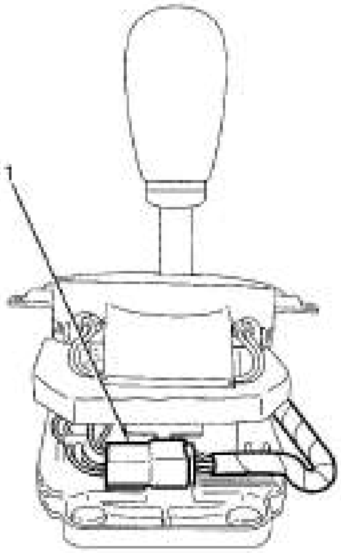


1. Install the shift control assembly (1) to the tunnel reinforcement.

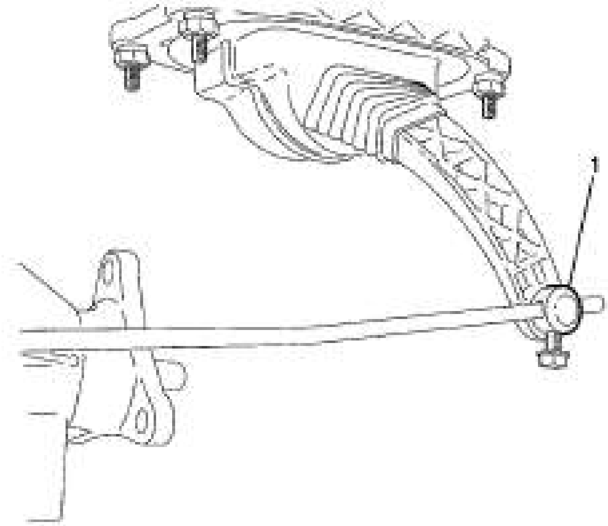
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the nuts (2) securing the shift control assembly to the tunnel reinforcement.

   Tighten
   Tighten the nuts to 12 N·m (106 lb in).



3. Install the electrical connector (1) to the shift control assembly.
4. Install the center console assembly. Refer to Front Floor Console Replacement.
5. Install the shift control trim plate by inserting the front retaining tabs to the console. Press down on the rear of the trim plate to engage the rear retaining tabs.
6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



7. Connect the shift control linkage rod to the shift control assembly.
8. Install the shift control linkage adjustment nut (1) finger tight.

9. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment.
10. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | **Document ID: 1992275**

Transmission Fluid Cooler Hose/Pipe Replacement

Tools Required

J 41623-B Cooler Line Release Tool

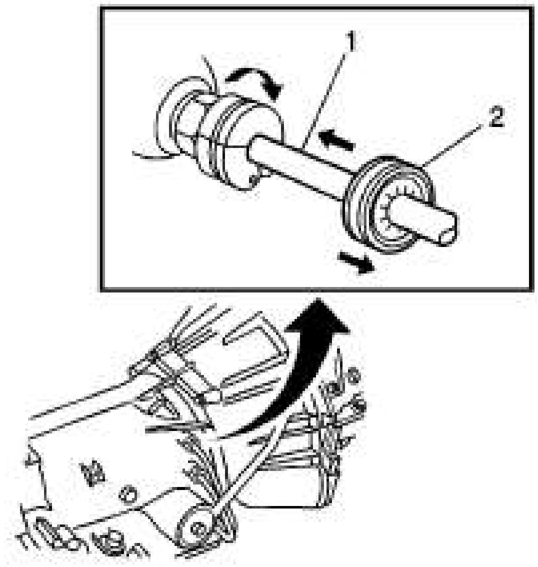
Removal Procedure

1. Disconnect the upper and lower oil cooler pipes from the quick disconnect fittings at the radiator.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

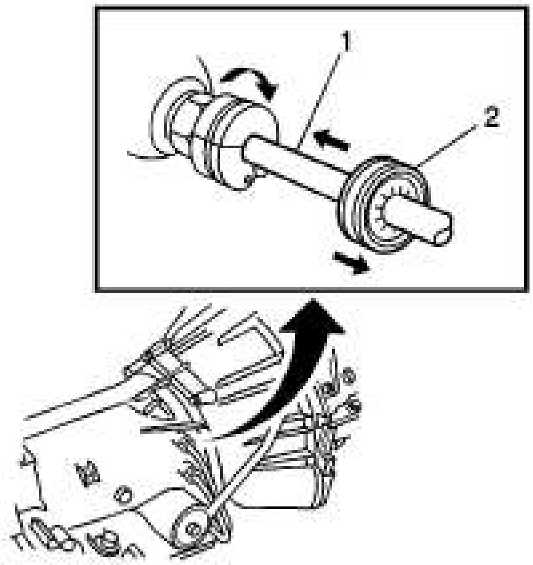
2. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Plug all openings to prevent the system from contamination.
4. Remove the retaining bolt securing the transmission cooler pipes to the left hand front side of the engine.
5. Remove the retaining bolt securing the transmission cooler pipes to the Park/Neutral Position (PNP) switch.
6. Remove the transmission mount. Refer to Transmission Mount Replacement.
7. Slightly lower the transmission to gain access to the transmission cooler pipes.



8. Release the verifier disc (2) by pulling it backwards down the pipe.
9. Using J-41623-B, remove the transmission cooler pipes from the transmission.
10. Remove the transmission cooler pipes from the vehicle; separate the pipes, as necessary.

Installation Procedure

1. Position the transmission cooler pipes in the vehicle.
2. Remove the plugs from the cooler pipes; then wipe the pipe connector ends with a clean towel.
3. Apply a small amount of clean transmission fluid on the end of the pipes; then insert the pipes into the quick connect fittings on the radiator.
4. Apply a small amount of clean transmission fluid on the end of the pipes; then insert the pipes into the quick connect fittings in the transmission.



5. Push the verifier discs (2) over the transmission quick disconnect fittings to make sure that the pipes are seated correctly.

   Notice: Refer to Fastener Notice in the Preface section.

6. Install the retaining bolt securing the transmission cooler pipes to the left hand front side of the engine.

   Tighten
   Tighten the bolt to 10 N·m (84 lb in).

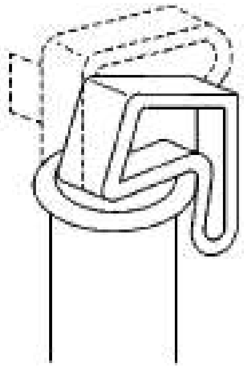
7. Install the retaining bolt securing the transmission cooler pipes to the PNP switch.

   Tighten
   Tighten the bolt to 25 N·m (18 lb ft).

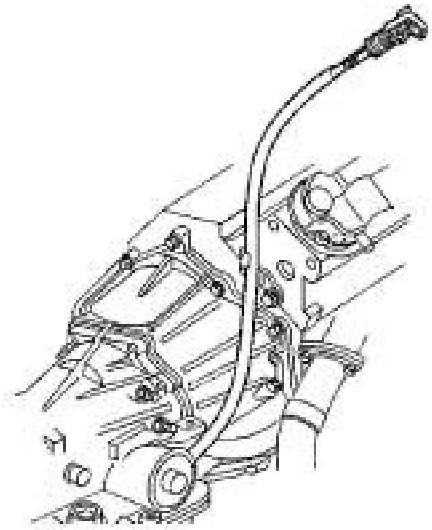
8. Install the transmission mount. Refer to Transmission Mount Replacement.
9. Lower the vehicle.
10. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.
11. Ensure that the engine can only be started in the PNP positions, if adjustment is necessary, refer to Park/Neutral Position Switch Adjustment.
12. Check the reverse lamps for proper operation; if adjustment is necessary, refer to Park/Neutral Position Switch Adjustment.

Transmission Fluid Filler Tube and Seal Replacement

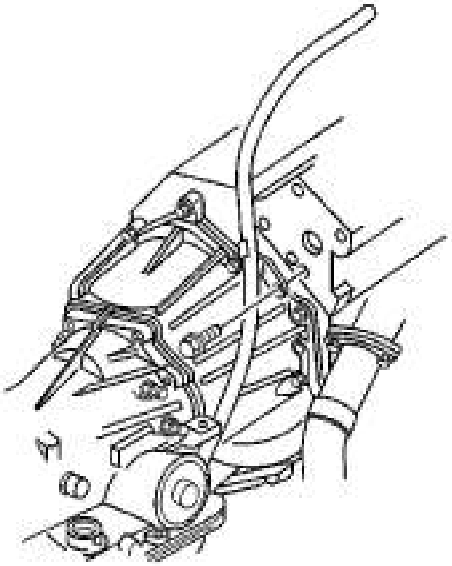
Removal Procedure



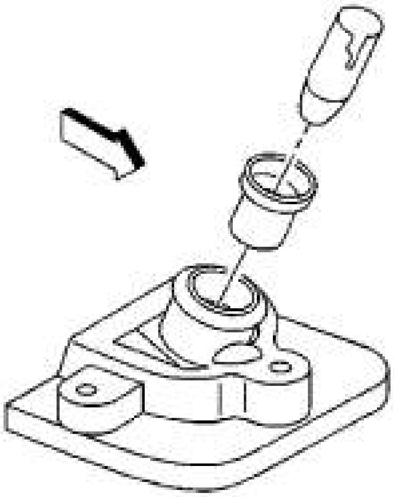
1. Lift the fluid level indicator handle lock up.



2. Remove the fluid level indicator.

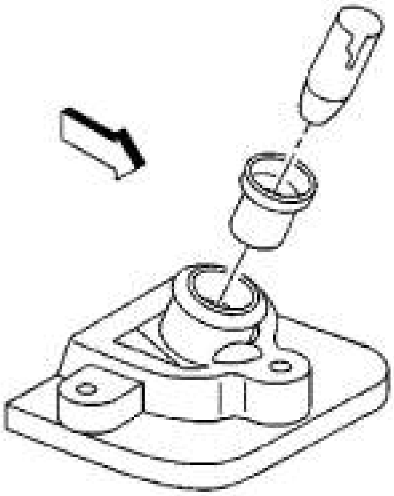


3. Remove the bolt attaching the fill tube to the cylinder head.



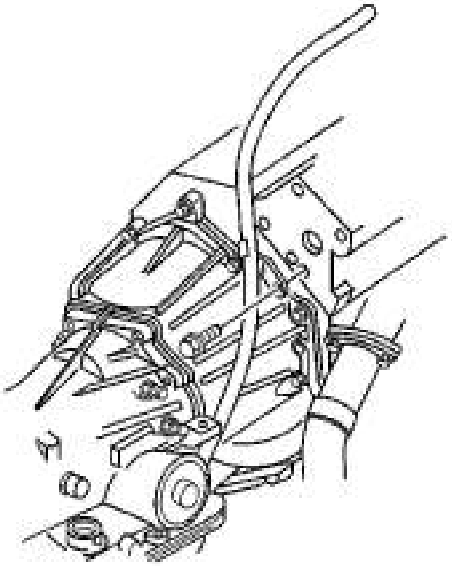
4. Remove the fill tube and seal from the transmission.

Installation Procedure



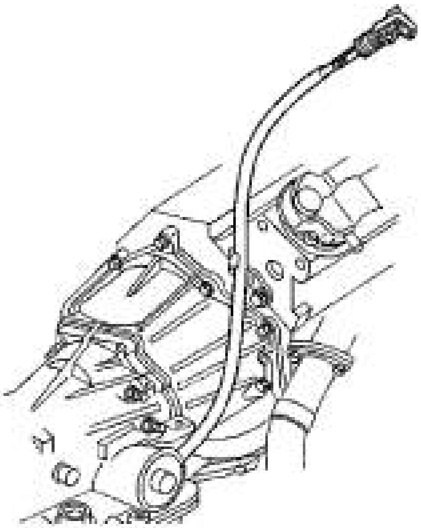
1. Insert the seal into the automatic transmission case hole.
2. Install the fill tube to the transmission.

Notice: Refer to Fastener Notice in the Preface section.

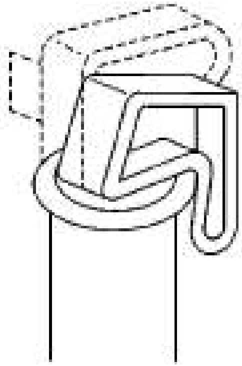


3. Install the transmission bolt attaching the fill tube to the cylinder head.

Tighten
Tighten the fill tube bolt to 30 N·m (22 lb ft).



4. Check the transmission fluid level.
5. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.



6. Push the fluid level indicator handle lock down.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | **Document ID: 1994188**

Transmission Replacement

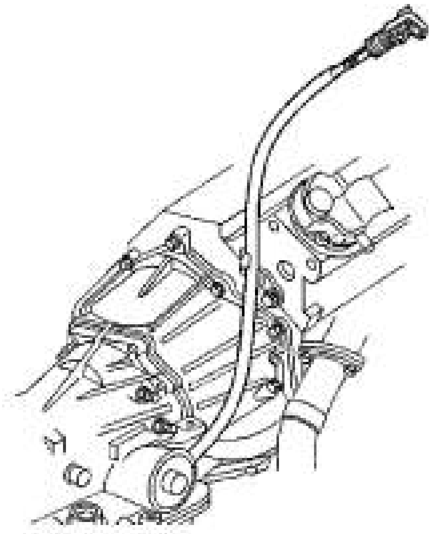
Tools Required

- J 21366 Converter Holding Strap
- EN-48536 Frame Support Tool (Engine Lower 65mm Kit)

Removal Procedure

Important: NEW torque converter bolts will be required each time the torque converter bolts are removed.

1. Disconnect the negative battery cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

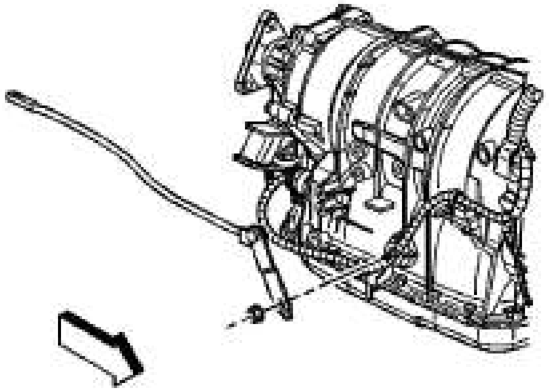


2. Remove the transmission fluid filler tube. Refer to Transmission Fluid Filler Tube and Seal Replacement .

Caution: Refer to Safety Glasses Caution in the Preface section.

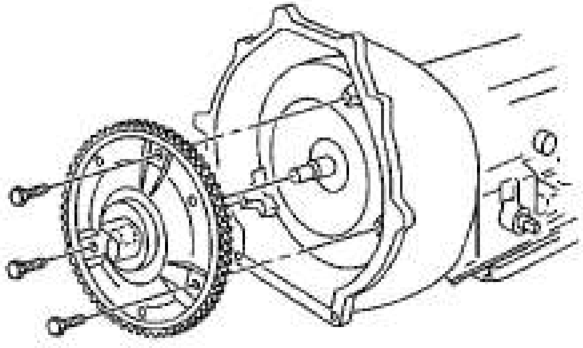
Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
5. Remove the catalytic converter assembly from the vehicle. Refer to Catalytic Converter Replacement - Left Side and Catalytic Converter Replacement - Right Side .
6. Remove the starter motor from the engine. Refer to Starter Motor Replacement .



7. Disconnect the selector lever linkage from the transmission. Refer to Park/Neutral Position Switch Replacement .
8. Support the rear of the vehicle with a suitable jack.
9. Remove the torque converter covers. Refer to Torque Converter Cover Replacement .

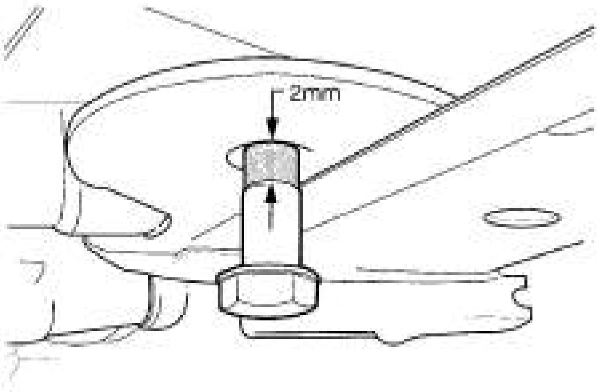
Important: Mark the position of the flywheel and torque converter positions for realignment during installation.



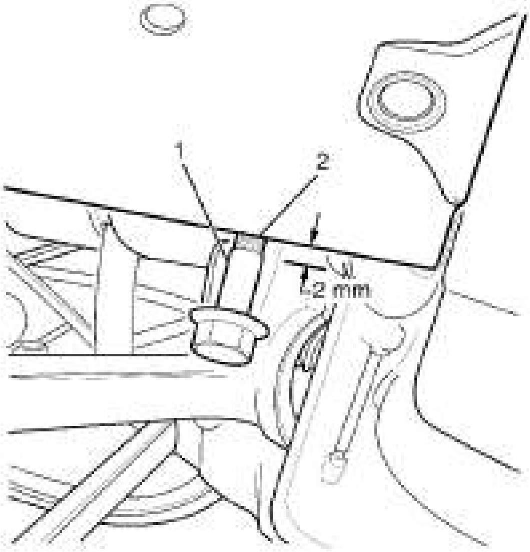
10. Remove the torque converter retaining bolts, then discard the retaining bolts.

Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

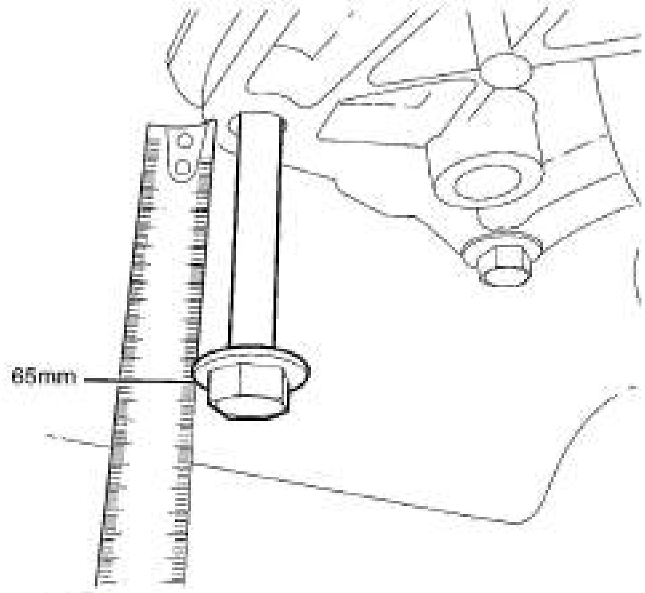
11. Support the power train with a suitable jack or table.
12. Using EN-48536 lower engine and transmission assembly 65mm.



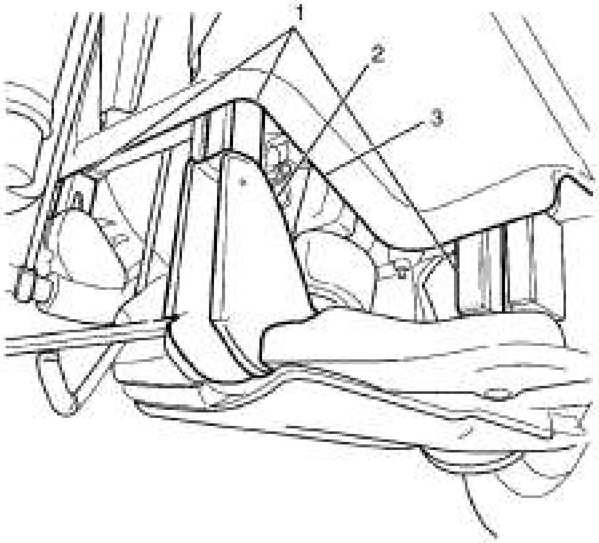
13. Replace the front sub frame rear bolts and fit bolts from special tool kit EN-48536
14. Install bolt till stepped shank (1) is 2mm below sub frame (2).



15. Replace the front sub frame front bolts and fit bolts from special tool kit EN-48536
16. Install bolt till stepped shank (1) is 2mm below chassis rail flange (2).



17. Remove transmission mount to body bolt and install two bolts from special tool kit in diagonal holes e.g Left hand front and Right hand rear.
18. Install bolts from special tool EN-48536 until 65mm is measured between bolt heads (1) and transmission mount (2).
19. Remove front sub frame middle retaining bolts.
20. Lower power train slowly until the subframe and transmission mount are resting on bolts.



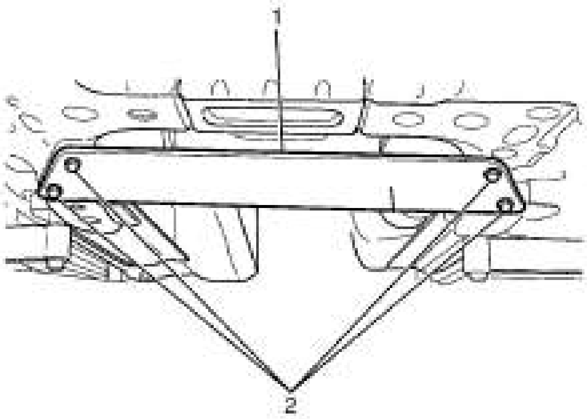
21. Insert 65mm spacer blocks (1) between subframe (2) and chassi rails (3).
22. Tension front sub frame front and rear retaining bolts.

    Tighten
    Tighten the retaining bolts to 95 N·m (70 lb. ft).

23. Install and tension middle sub frame retaining bolts.

Tighten
Tighten the retaining bolts to 95 N·m (70 lb. ft).

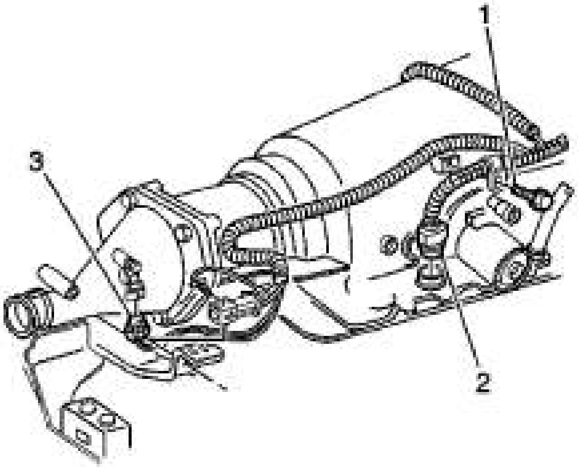
24. Remove supporting jack or table



25. Install engine support plate (1) to front sub frame (2).
26. Tension plate retaining bolts (3).

Tighten
Tighten the retaining bolts to 10 N·m (89 lb. in).

27. Disconnect the transmission oil cooler pipes from the transmission. Refer to Transmission Fluid Cooler Hose/Pipe Replacement .

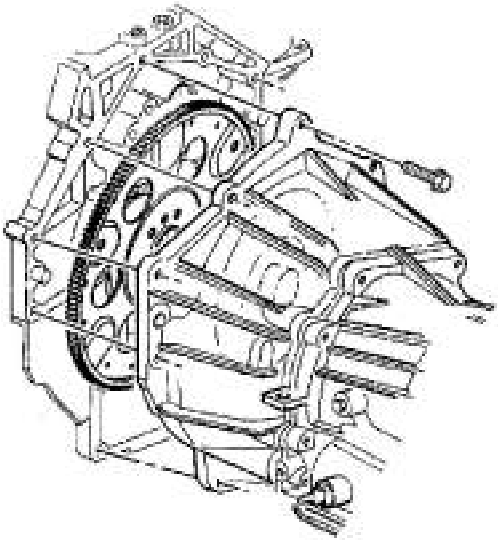


28. Remove the wiring harness clamp retaining bolt (1) attaching the clamp to the transmission.

29. Disconnect the transmission 20-way electrical connector (2).

    Compress both tabs on the connector and pull straight up; do not pry the connector.

30. Disconnect the vehicle speed sensor electrical connector (3).
31. Support the transmission using a transmission jack.



32. Remove the transmission to engine retaining bolts.
33. Separate the transmission from the engine.
34. Attach the J 21366 to the transmission.
35. Lower the transmission from the vehicle.

Installation Procedure

Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

1. Raise the transmission up to the vehicle.
2. Remove the J 21366 from the transmission.

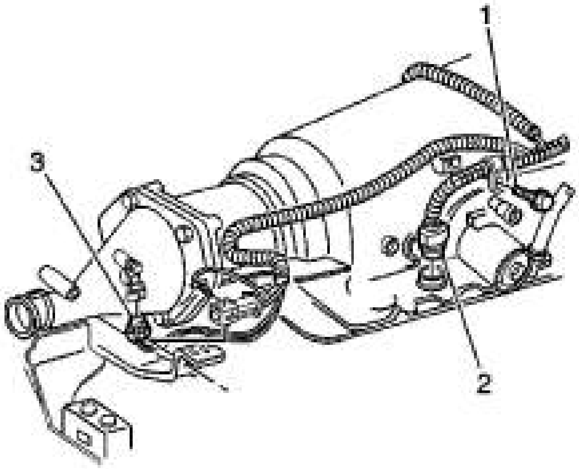
    Notice: Refer to Fastener Notice in the Preface section.

3. Align and install the transmission to the engine.
4. Install the transmission to engine retaining bolts.

    Tighten
    Tighten the transmission to engine retaining bolts to 38 N·m (28 lb ft).

5. Raise the powertrain back up into the engine bay and tighten front sub frame retaining bolts.

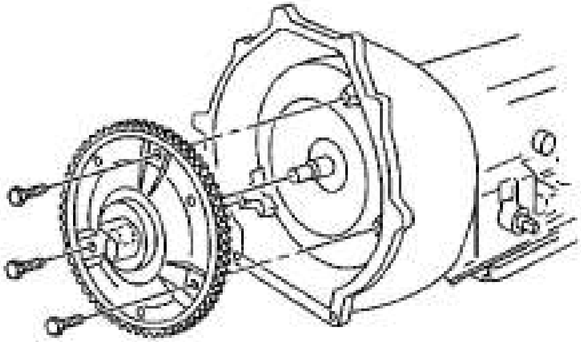
    Tighten
    Tighten the retaining bolts to 160 N·m (118 lb. ft.) for the front four bolts and
    240 N·m (177 lb ft)



6. Connect the vehicle speed sensor electrical connector (3).
7. Connect the 20-way electrical connector (2).
8. Install the wiring harness clamp retaining bolt (1) attaching the clamp to the transmission.

Tighten
Tighten the wiring harness clamp retaining bolt (1) to 2.5 N·m (22 lb in).

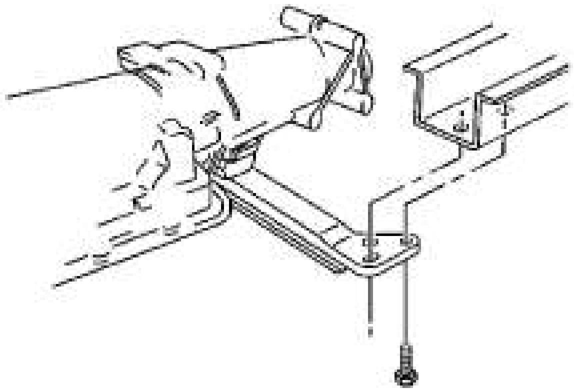
9. Connect the transmission oil cooler pipes to the transmission. Refer to Transmission Fluid Cooler Hose/Pipe Replacement .



10. Align the torque converter and flywheel mating marks, then install the New transmission torque converter retaining bolts.

Tighten
Tighten the New transmission torque converter retaining bolts to 65 N·m (48 lb ft).

11. Install the torque converter covers. Refer to Torque Converter Cover Replacement .



12. Install the transmission crossmember support. Refer to Transmission Mount Replacement .
13. Install and adjust the selector lever linkage. Refer to Park/Neutral Position Switch Replacement .
14. Remove the transmission jack.
15. Install the propeller shaft. Refer to Propeller Shaft Replacement .
16. Install the starter motor from the engine. Refer to Starter Motor Replacement .
17. Install the catalytic converter assembly on the vehicle. Refer to Catalytic Converter Replacement - Left Side and Catalytic Converter Replacement - Right Side .
18. Remove the jack supporting the rear of the vehicle.
19. Lower the vehicle.
20. Install the transmission fluid filler tube. Refer to Transmission Fluid Filler Tube and Seal Replacement .

    Notice: Refer to General Repair Instructions in the Preface section.

21. Flush the transmission oil cooler, oil cooler pipes and the hoses. Refer to Transmission Fluid Cooler Flushing and Flow Test .
22. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
23. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check .

    Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

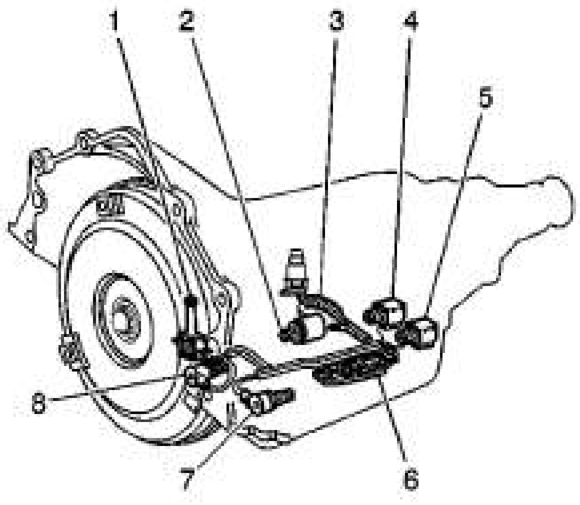
    Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

24. Reset the TAP values. Refer to Transmission Adaptive Functions .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - On Vehicle | Document ID: 1992312

Valve Body and Pressure Switch Replacement

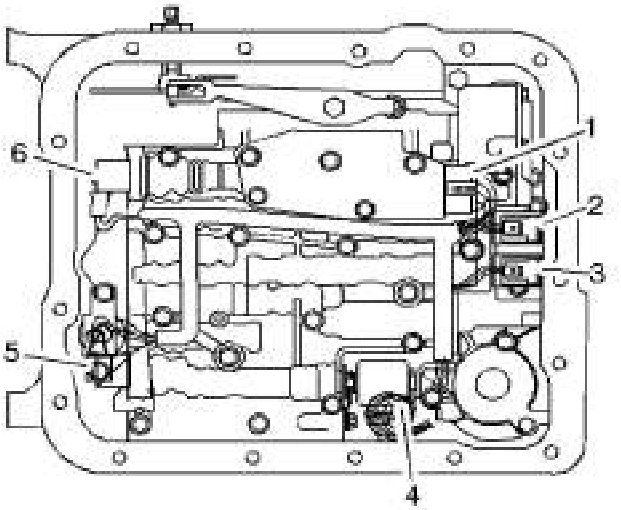
Removal Procedure



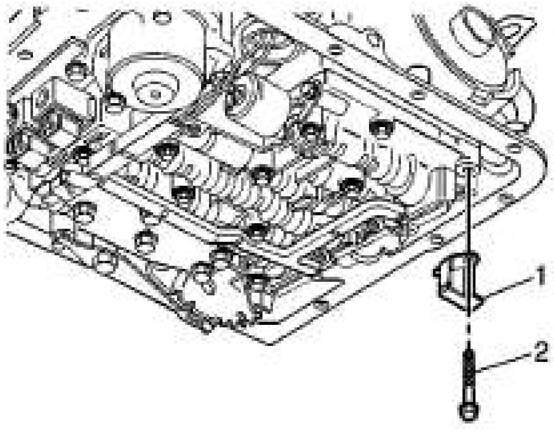
1. Ensure that removal of the valve body is necessary before proceeding.

   Important: The following components can be serviced without removing the valve body from the transmission:

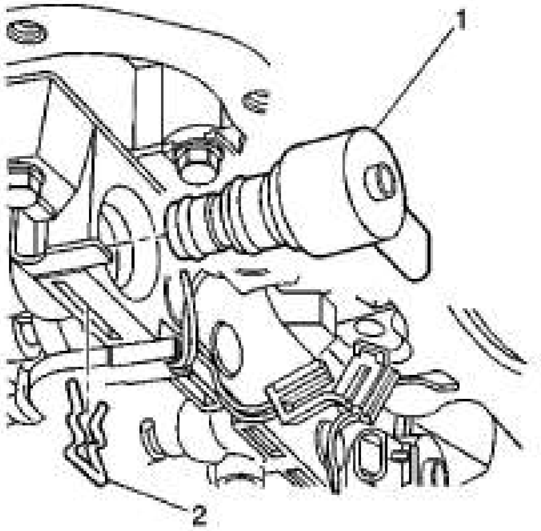
   - The torque converter clutch solenoid (1)
   - The pressure control solenoid (2)
   - The internal wiring harness (3)
   - The 2-3 shift solenoid (4)
   - The 1-2 shift solenoid (5)
   - The transmission fluid pressure manual valve position switch (6)
   - The 3-2 shift solenoid (7)
   - The torque converter clutch pulse width modulation (TCC PWM) solenoid (8)
2. Remove the fluid level indicator.
3. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Remove the catalytic converter assembly from the vehicle. Refer to Catalytic Converter Replacement - Left Side and Catalytic Converter Replacement - Right Side.
5. Remove the oil pan, gasket, and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



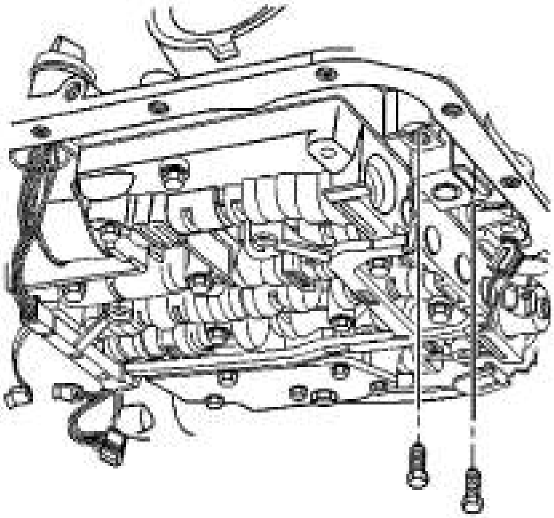
6. Disconnect the internal wiring harness electrical connectors from the following components:
   - The transmission fluid pressure manual valve position switch (1)
   - The 1-2 shift solenoid (2)
   - The 2-3 shift solenoid (3)
   - The pressure control solenoid (4)
   - The TCC PWM solenoid (5)
   - The 3-2 shift solenoid (6)



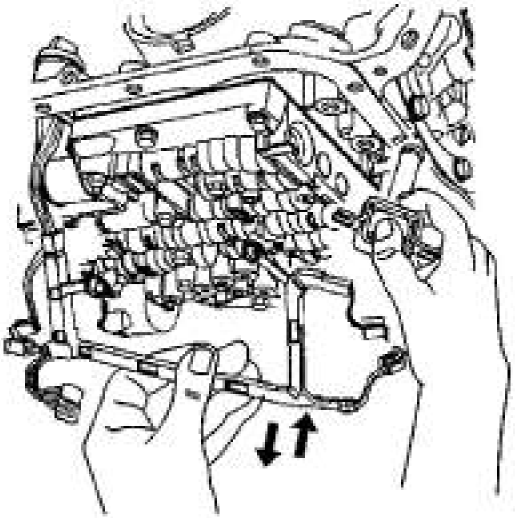
7. Remove the fluid indicator stop bracket bolt (2).
8. Remove the fluid indicator bracket (1).



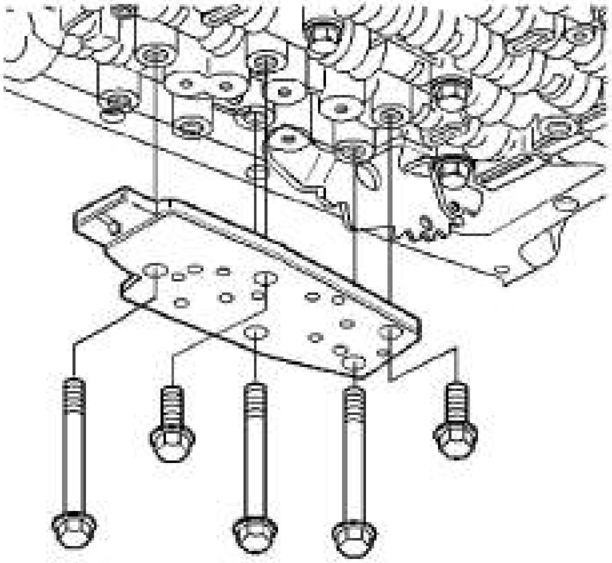
9. Remove the TCC PWM solenoid retainer (2) with a small screwdriver. Rotate the solenoid (1) in the bore, if necessary, until the flat part of the retainer (2) is visible.
10. Remove the TCC PWM solenoid (1) in order to access the torque converter clutch (TCC) solenoid retaining bolts.



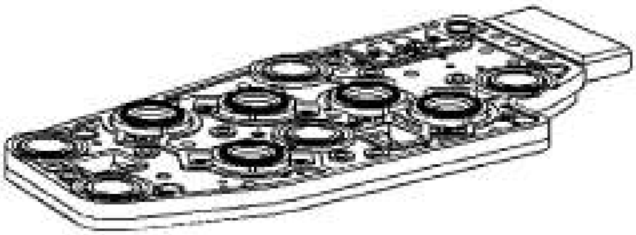
11. Remove the TCC solenoid retaining bolts.



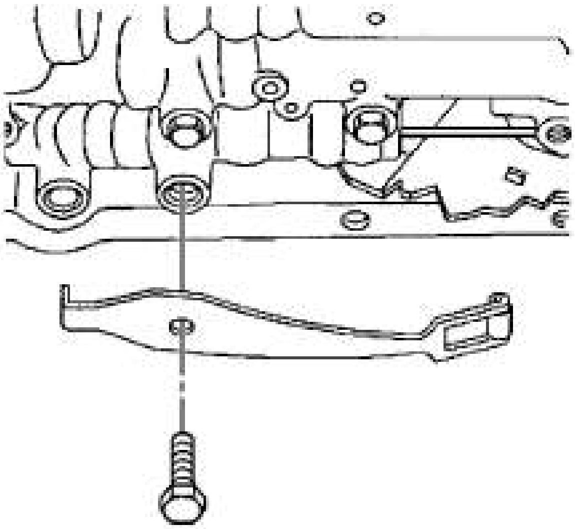
12. Remove the TCC solenoid (with O-ring seal) and wiring harness from the control valve body.
13. Reposition the harness to the side of the transmission case.



14. Remove the control valve body bolts which retain the transmission fluid pressure switch to the control valve body.
15. Remove the transmission fluid pressure switch.



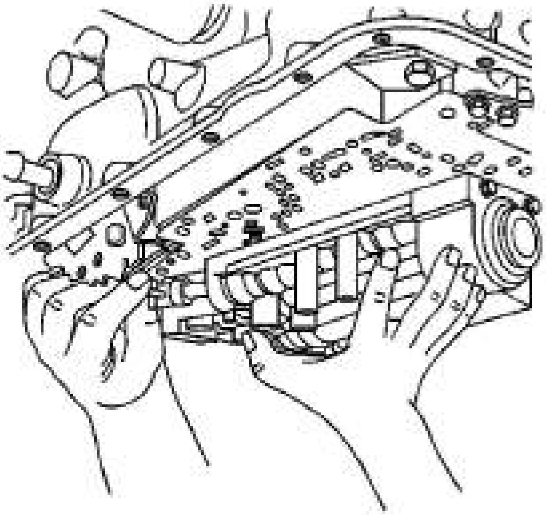
16. Inspect the transmission fluid pressure switch for damage or debris.



17. Remove the manual detent spring retaining bolt.
18. Remove the manual detent spring.
19. Inspect the manual detent spring for cracks or damage.

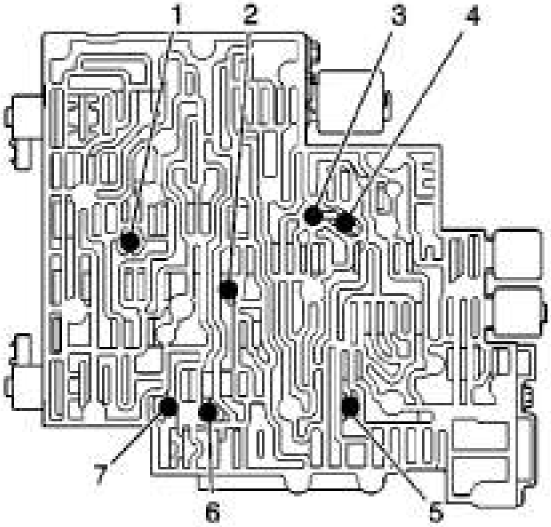
Important: Keep the control valve body level when lowering it from the vehicle. This will prevent the loss of checkballs located in the control valve body passages.

20. Remove the remaining control valve body bolts.

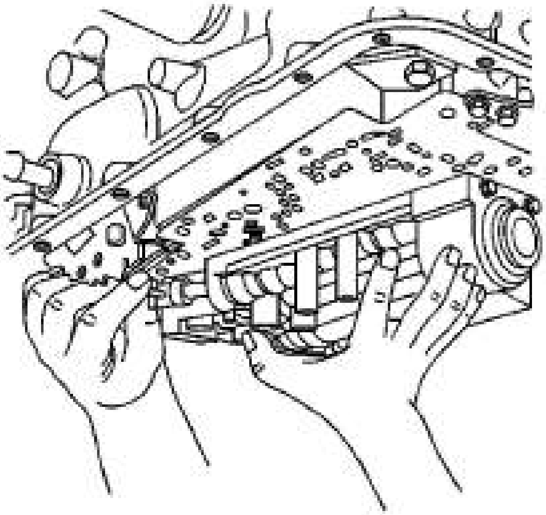


21. Carefully begin to lower the control valve body down from the transmission case while simultaneously disconnecting the manual valve link.

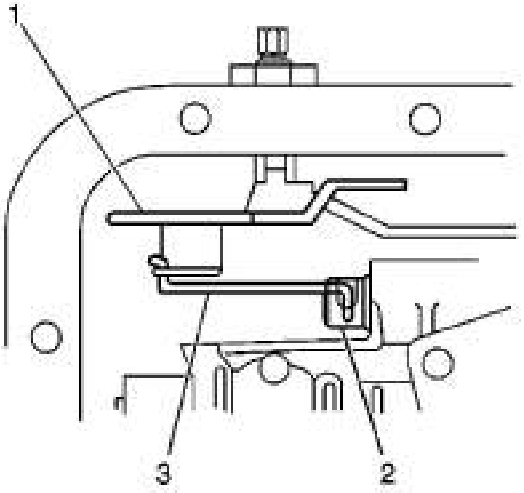
Installation Procedure



1. Install the checkballs (1-7) in the valve body.



2. Install the control valve body to the transmission case while simultaneously connecting the manual valve link to the manual valve.



3. Verify that the manual valve link (3) is installed properly to the inside detent lever (1) and the manual valve (2).

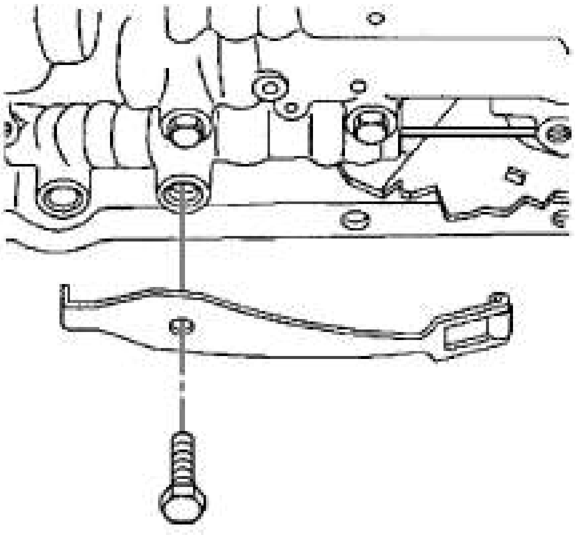
Important: When installing bolts throughout this procedure, be sure to use the correct bolt size and length in the correct location as specified.

5. Do not install the transmission fluid indicator stop bracket and bolt at this time.

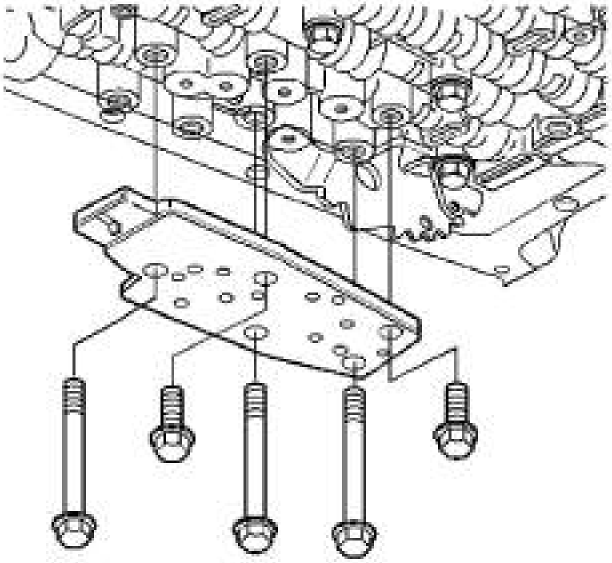
   Install but do not tighten the control valve body bolts which retain only the valve body directly.

   Each numbered bolt location corresponds to a specific bolt size and length, as indicated by the following:

- M6 X 1.0 X 65.0 (1)
- M6 X 1.0 X 54.4 (2)
- M6 X 1.0 X 47.5 (3)
- M6 X 1.0 X 35.0 (4)
- M8 X 1.0 X 20.0 (5)
- M6 X 1.0 X 12.0 (6)
- M6 X 1.0 X 18.0 (7)



6. Install the manual detent spring.
7. Install but do not tighten the manual detent spring retaining bolt.

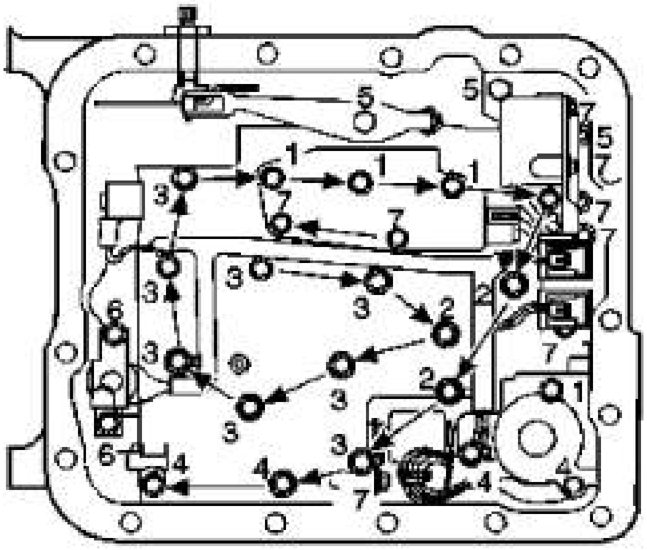


8. Install the transmission fluid pressure switch.

9. Install but do not tighten the control valve body bolts which retain the transmission fluid pressure switch to the control valve body.

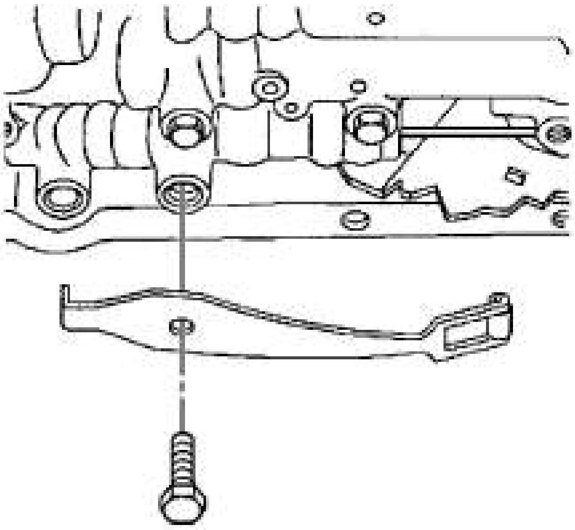
   Notice: Refer to Fastener Notice in the Preface section.

   Notice: Torque valve body bolts in a spiral pattern starting from the center. If the bolts are torqued at random, valve bores may be distorted and inhibit valve operation.



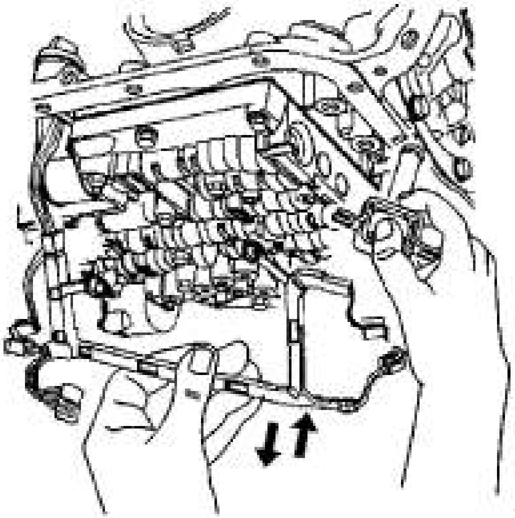
10. Tighten the control valve body bolts in a spiral pattern starting from the center, as indicated by the arrows.

    Tighten
    Tighten the control valve body bolts (in sequence) to 12 N·m (106 lb in).

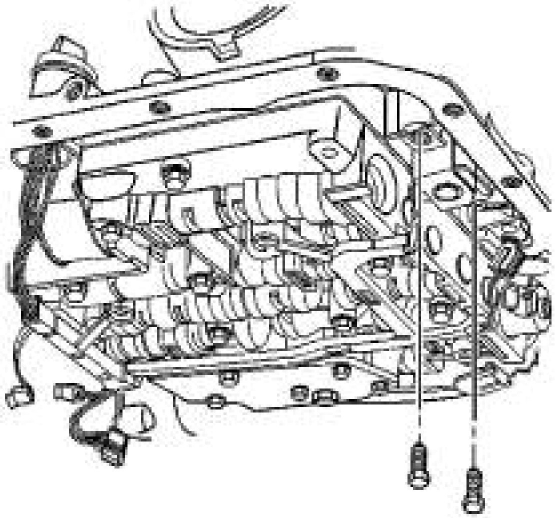


11. Ensure that the manual detent spring is aligned properly with the detent lever.

Tighten
Tighten the manual detent spring bolt to 31 N·m (23 lb ft).



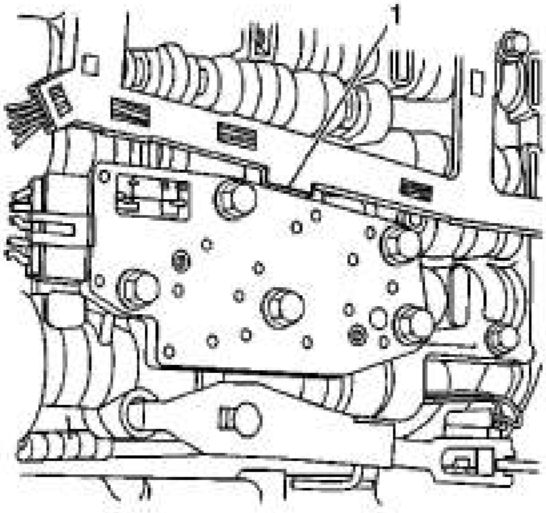
12. Install the TCC solenoid with a new O-ring seal to the valve body.



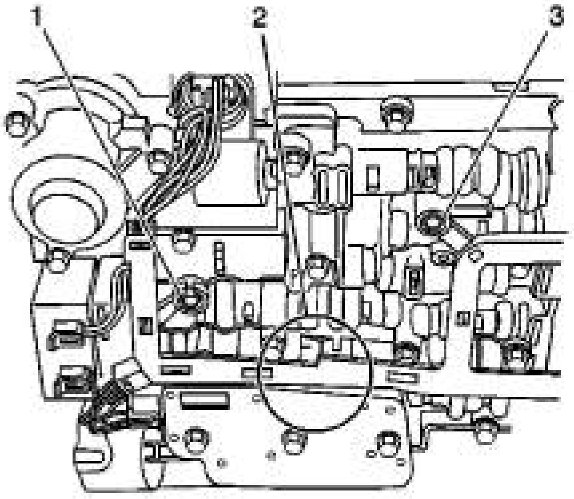
13. Install the TCC solenoid bolts.

Tighten

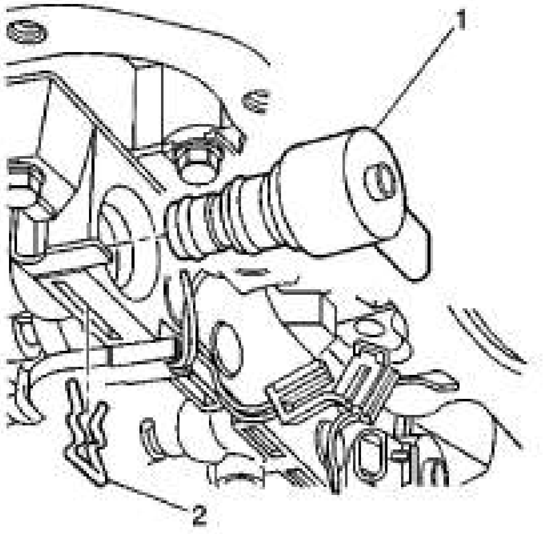
Tighten the TCC solenoid retaining bolts to 12 N·m (106 lb in).



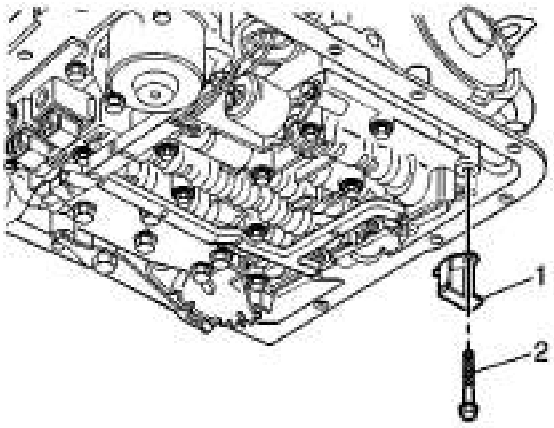
14. Install the internal wiring harness to the valve body. The internal wiring harness has a tab (1) on the edge of the conduit.



15. Place the tab between the valve body and the pressure switch in the location shown (2). Press the harness into position on the valve body bolt bosses (1, 3).

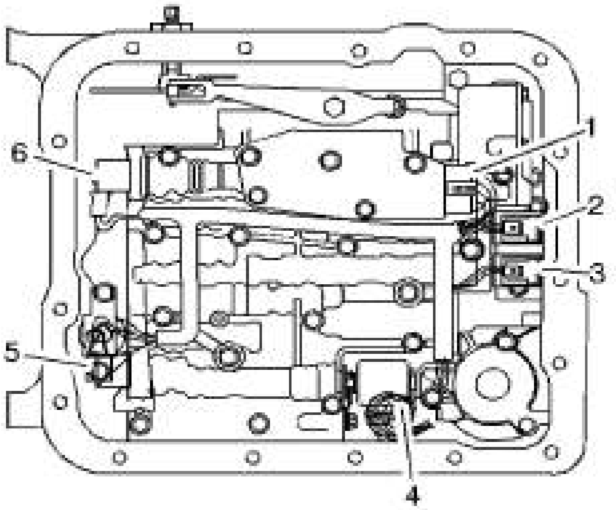


16. Install the TCC PWM solenoid (1) to the control valve body.
17. Install the TCC PWM solenoid retainer (2).



18. Install the transmission fluid indicator stop bracket (1) and retaining bolt (2).

    Tighten
    Tighten the transmission fluid indicator stop bracket retaining bolt to 12 N·m (106 lb in).



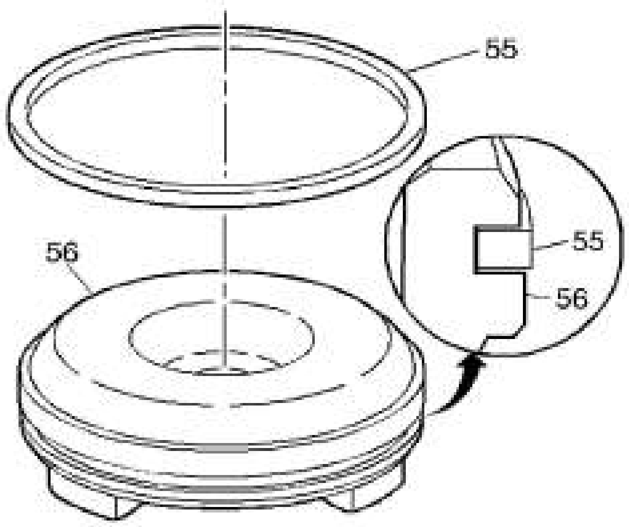
19. Connect the internal wiring harness electrical connectors to the following components:
    - The transmission fluid pressure manual valve position switch (1)
    - The 1-2 shift solenoid (2)
    - The 2-3 shift solenoid (3)
    - The pressure control solenoid (4)
    - The TCC PWM solenoid (5)
    - The 3-2 shift solenoid (6)
20. Install the transmission oil pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.
21. Install the catalytic converter assembly from the vehicle. Refer to Catalytic Converter Replacement - Left Side and Catalytic Converter Replacement - Right Side.
22. Lower the vehicle.
23. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.

    Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

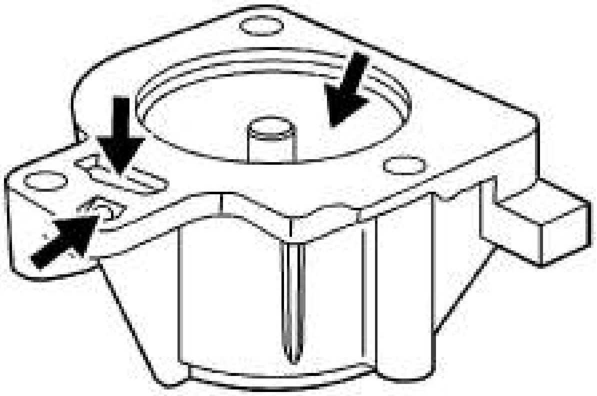
    Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

24. Reset the TAP values. Refer to Transmission Adaptive Functions.

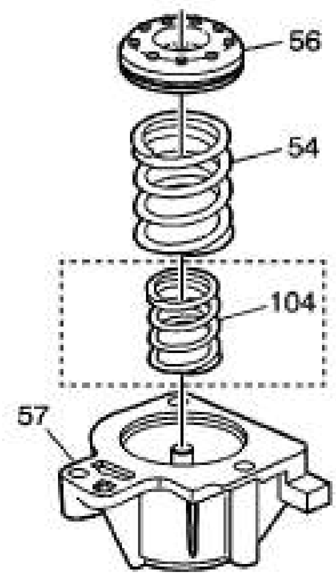
1-2 Accumulator Assemble



1. Inspect the 1-2 accumulator piston (56) for the following conditions:
   - Porosity
   - Cracks
   - Scoring
   - Nicks and Scratches
2. Install a 1-2 accumulator piston oil seal ring (55) on the 1-2 accumulator piston (56).



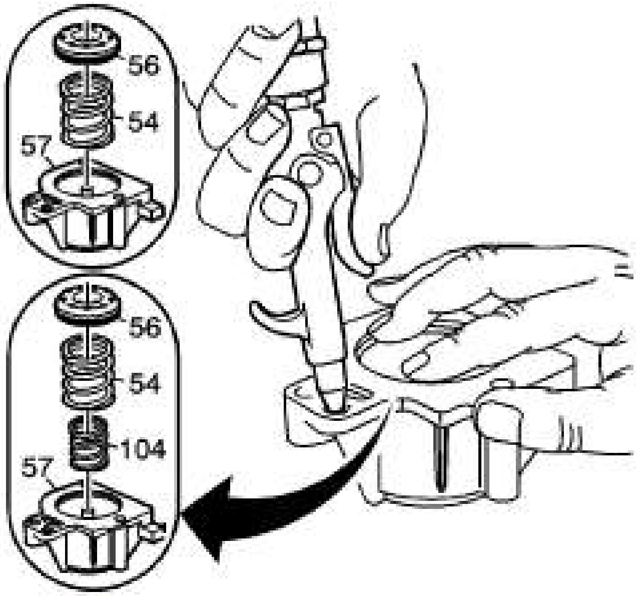
3. Inspect the 1-2 accumulator housing for the following conditions:
    - Porosity
    - Cracks
    - Scoring
    - Nicks and Scratches
    - Debris or blocked passages



Important: Some models do not use 1-2 accumulator spring - inner (104).

4. Install the 1-2 inner (104) and outer (54) accumulator springs.
5. Install the 1-2 accumulator piston (56).

1-2 Accumulator Disassemble



Important: Some models may not use a 1-2 accumulator spring - inner (104) or outer (54).

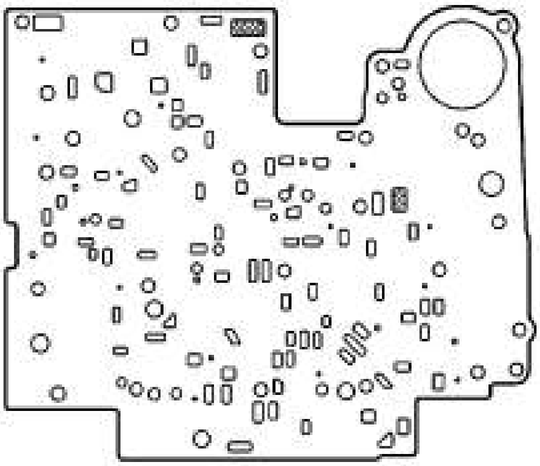
1. Blow air into the 1-2 accumulator housing (57) to remove the 1-2 accumulator piston (56).
2. Remove the 1-2 inner (104) and outer (54) accumulator springs.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | Document ID: 2036974

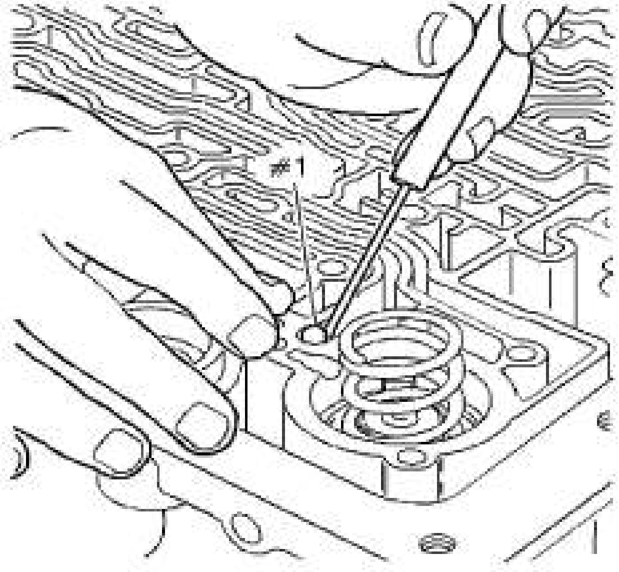
1-2 Accumulator Installation

Special Tools

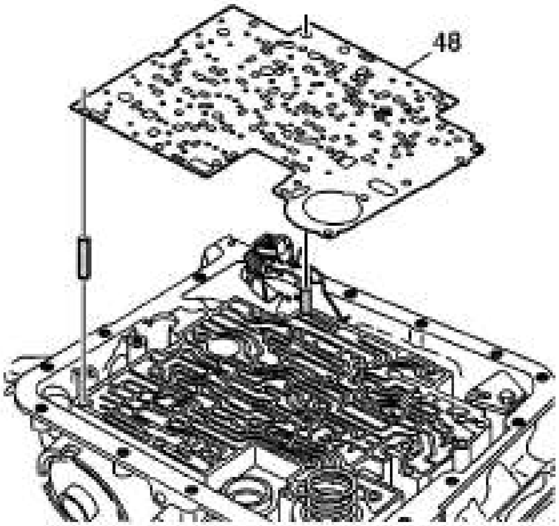
- *J 25025-5* Guide Pins
- *J 36850* Transjel Lubricant



1. Inspect the valve body bonded spacer plate for damage or debris.



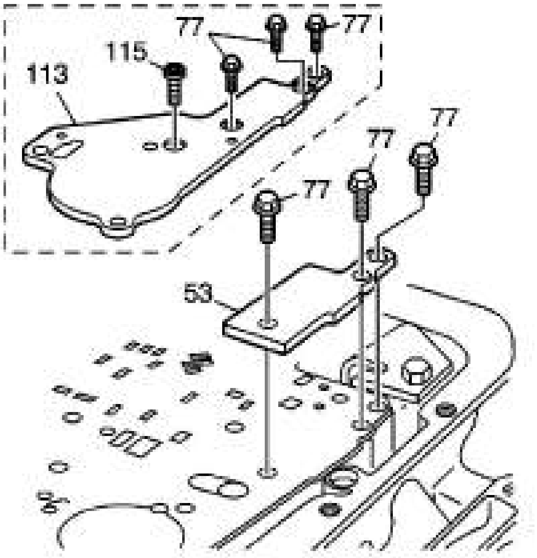
2. Install the #1 checkball into the case.



3. Install the *J 25025-5* guide pins into the case.

Note: Do not reuse the bonded spacer plate. Replace with a NEW bonded spacer plate.

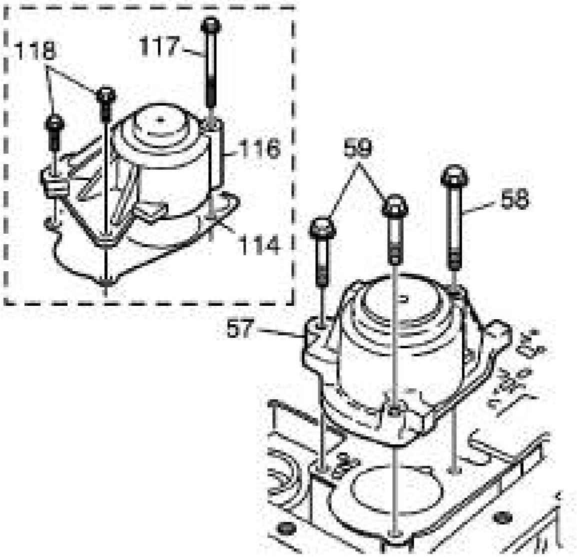
4. Place the bonded spacer plate (48) on the case.



5. Install the spacer plate support plate (53 or 113).
6. Install the spacer plate support bolts (77).

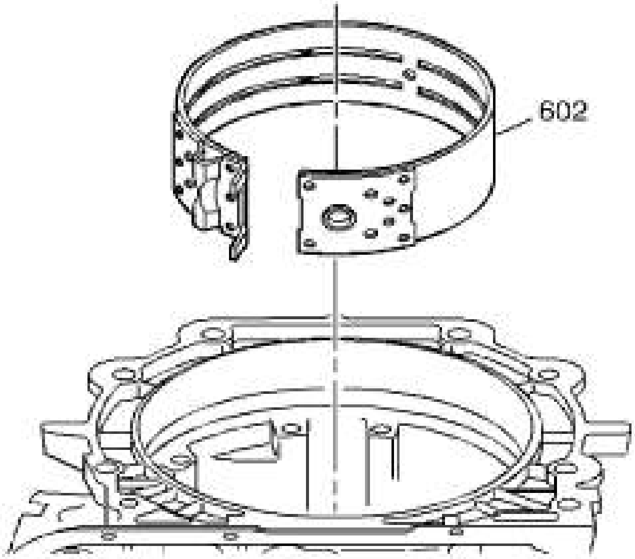
Caution: Refer to Fastener Caution in the Preface section.

7. Install the accumulator bolt (115), model dependent. Tighten the accumulator bolt to **11 N·m (8.11 lb ft)**.

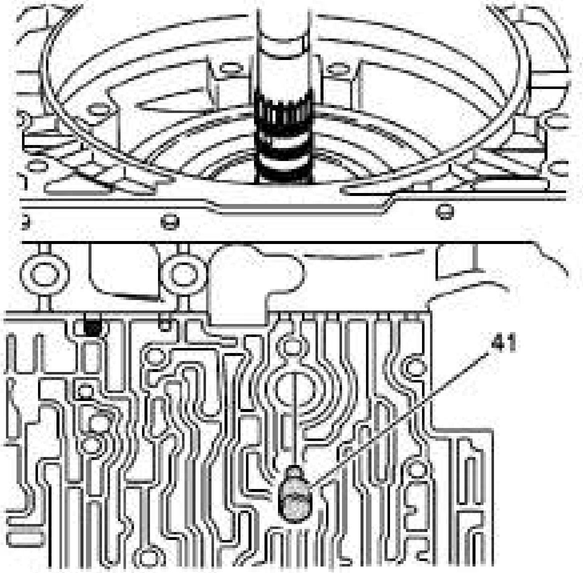


8. Install the 1-2 accumulator housing assembly (57) or gasket (114) and housing (116).
9. Install the 1-2 accumulator housing bolts (58, 59 or 117, 118).
   - Tighten the bolts 58 and 59 to **11 N·m (8 lb ft)**.
   - Tighten the bolts 117 and 118 to **8-14 N·m (6-10 lb ft)**.

2-4 Band Installation



1. Inspect the 2-4 band assembly (602) for damage or wear.
2. Install the 2-4 band (602) into the case.

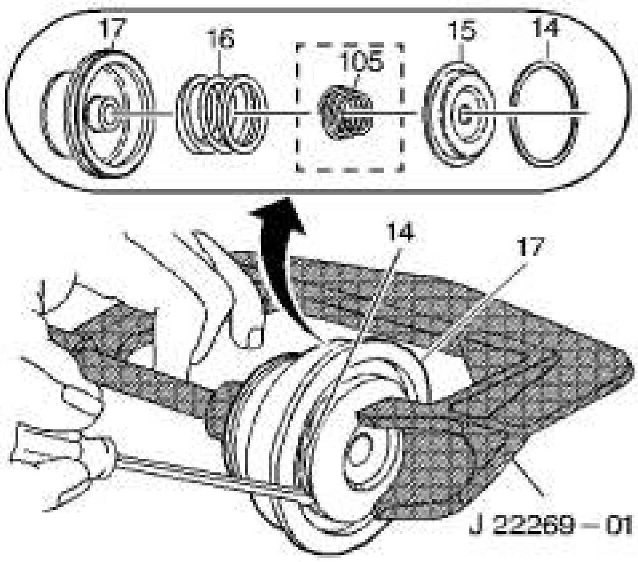


3. Install the band anchor pin (41) into the case.
4. Index the band to fit the band anchor pin into the band.

2-4 Band Servo 2nd Apply Piston Disassemble

Tools Required

J 22269-01 Accumulator and Servo Piston Remover

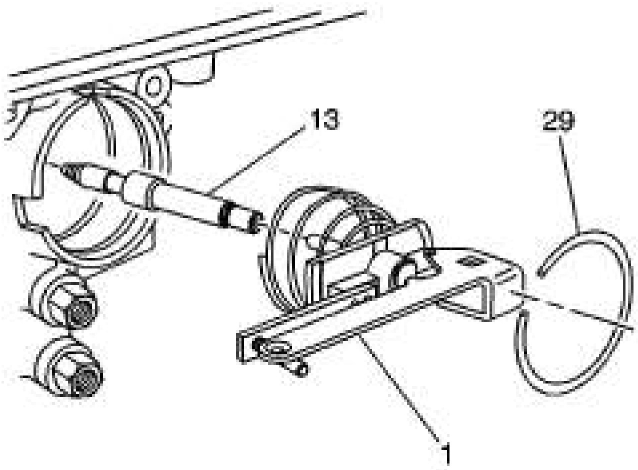


1. Use a J 22269-01 to compress the second apply piston assembly (17).
2. Remove the second apply piston retaining ring (14).
3. Remove the servo cushion spring retainer (15), the servo cushion outer spring (16) and the servo cushion inner spring (105) (model dependent).

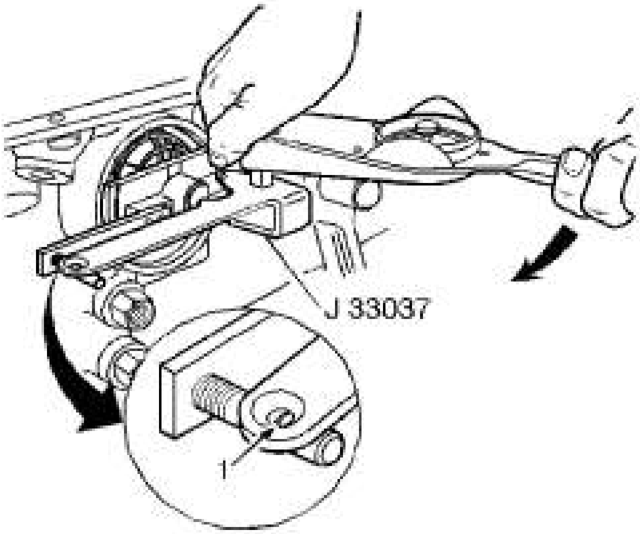
2-4 Band Servo Piston Pin Length Check

Tools Required

J 33037 2-4 Intermediate Band Apply Pin Gage



1. Install the band apply pin and the J 33037 .
2. Install the servo cover retaining ring to secure the tool.

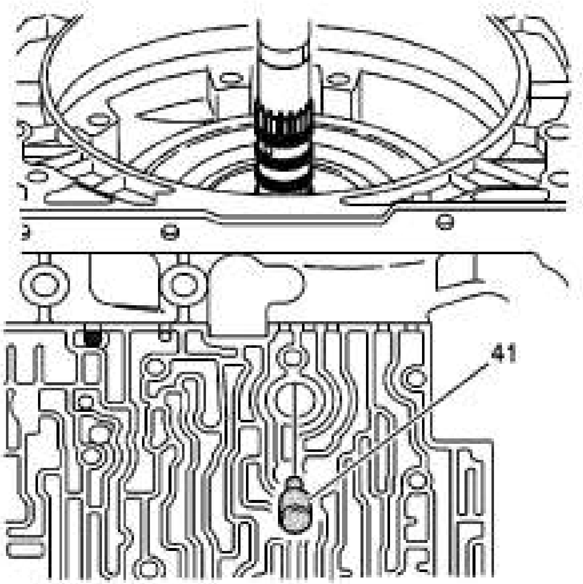


3. Apply 11 N·m (98 lb in) torque. If the white line appears in the gauge slot (1), the pin length

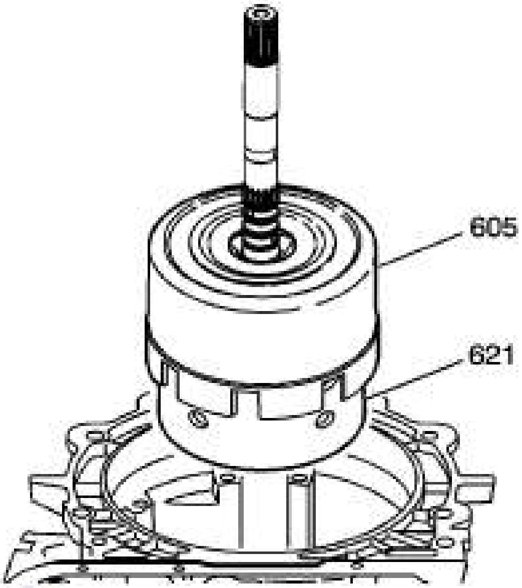
is correct.

4. If a new pin is needed, refer to 2-4 Band Servo Piston Pin Length Check, in order to determine the correct pin length.

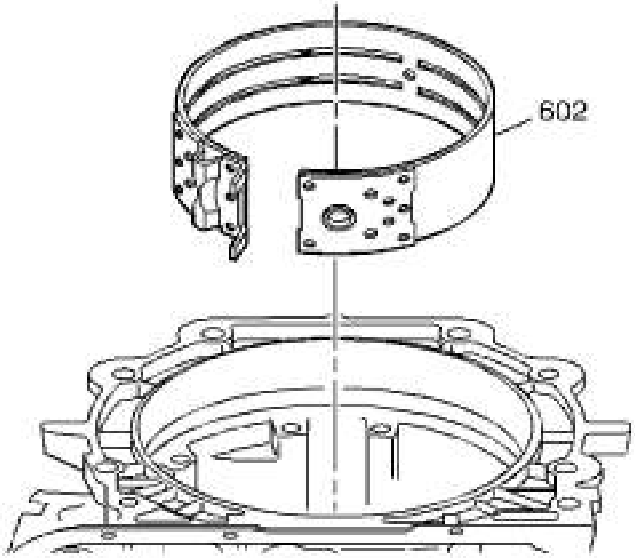
2-4 Band, Input Clutches, Input Gear Set Removal



1. Remove the band anchor pin (41).



2. Remove the input housing and shaft assembly (621), along with the reverse input clutch housing and drum assembly (605).

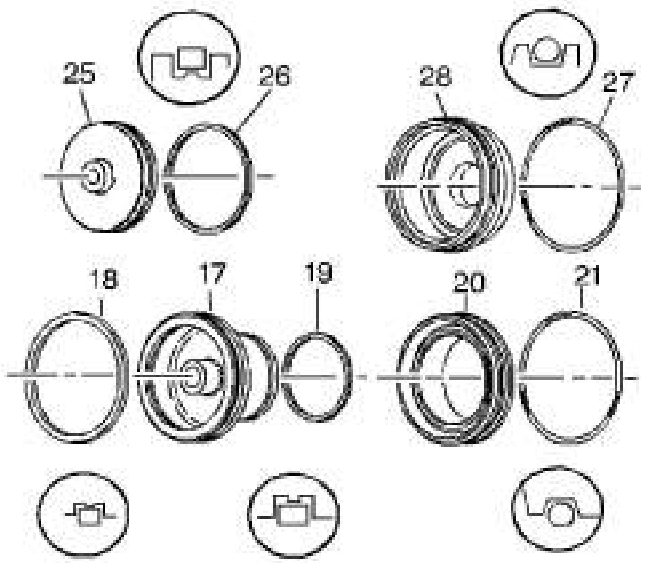


3. Remove the 2-4 band assembly (602).

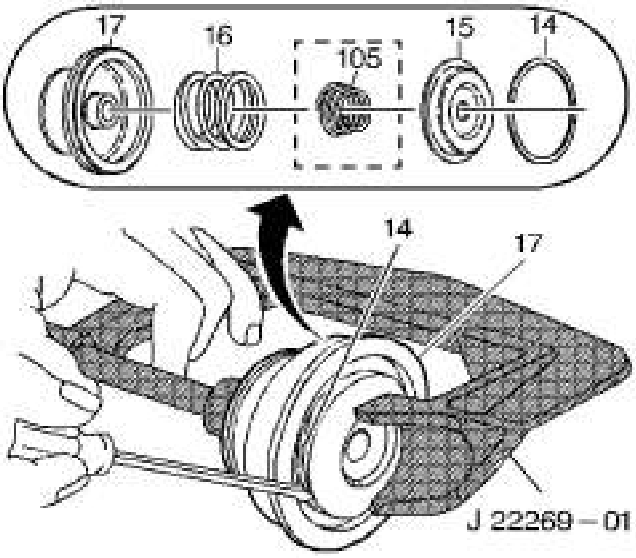
2-4 Servo Assembly Installation

Tools Required

- J 22269-01 Accumulator and Servo Piston Remover
- J 29714-A Servo Cover Depressor

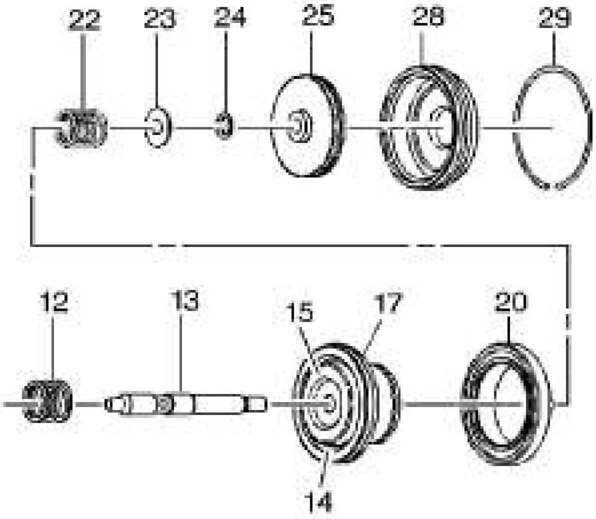


1. Inspect the 4th apply piston (25), the 2-4 servo cover (28), the 2nd apply piston (17), and the servo piston inner housing (20) for the following conditions:
   - Cracks
   - Scoring
   - Burrs and nicks
2. Install the following seals:
   - The 4th apply piston outer oil seal ring (26) on the 4th apply piston (25).
   - The 2-4 servo cover O-ring seal (27) on the 2-4 servo cover (28).
   - The 2nd apply piston outer (18) and inner (19) oil seal rings on the 2nd apply piston (17).
   - The O-ring seal (21) on the servo piston inner housing (20).



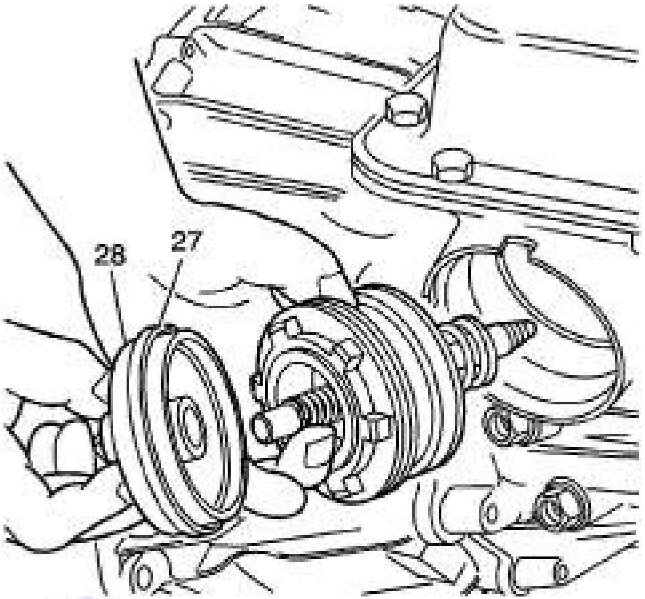
17
16
105
15
14
14
17
J 22269 – 01

3. Install the servo cushion outer spring (16), the servo cushion inner spring (105) (model dependent) and the cushion spring retainer (15) in the 2nd apply piston (17).
4. Use the J 22269-01 and compress the second apply piston assembly (17).
5. Install the second apply piston retaining ring (14).

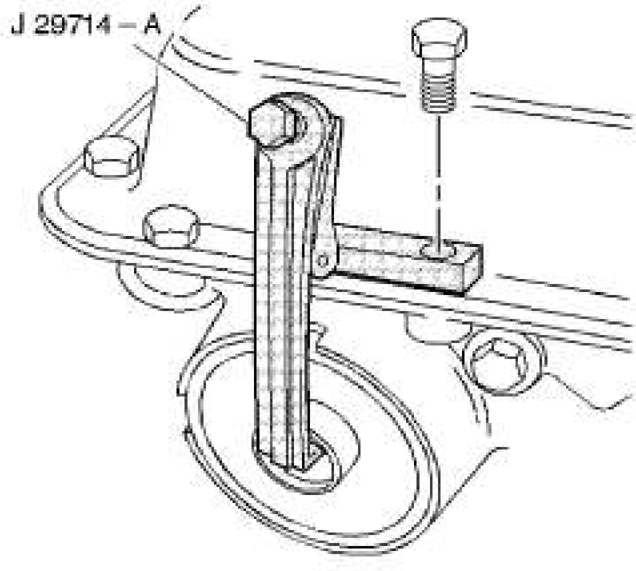


22
23
24
25
28
29
12
13
15
17
20
14

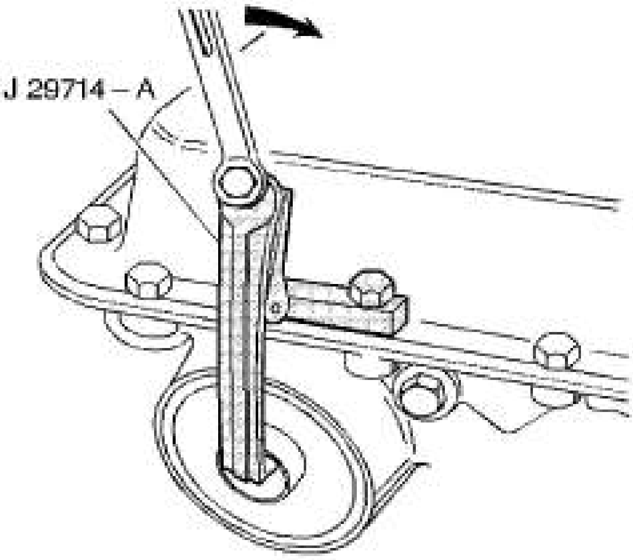
6. Assemble the 2-4 servo components in the order shown: (12-15, 17, 20, 22-25, 28, 29).



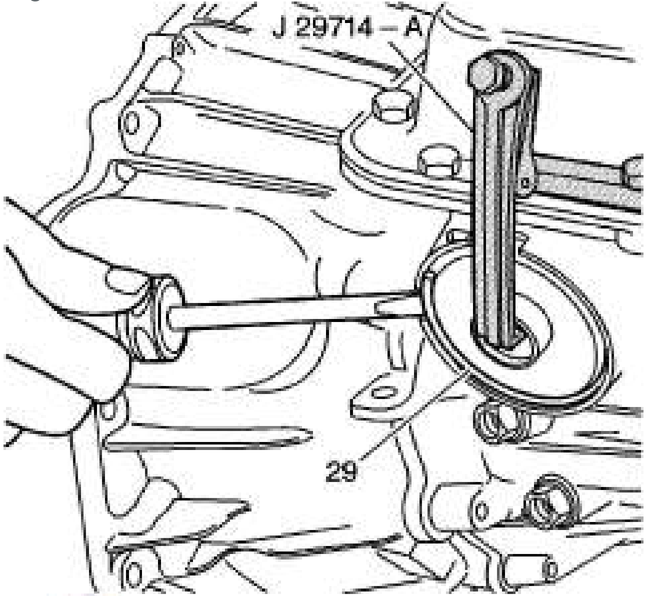
7. Install the 2-4 servo assembly into the 2-4 servo bore.



8. Install the J 29714-A .



9. Tighten the bolt on the J 29714-A in order to compress the servo cover.



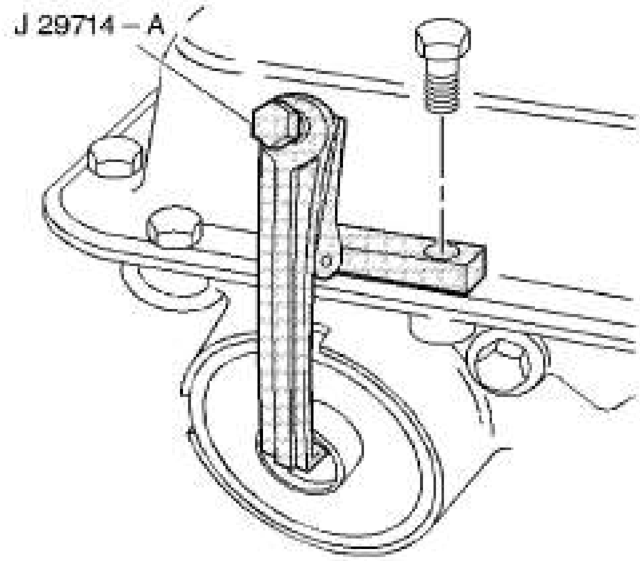
10. Install the servo cover retaining ring.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975560**

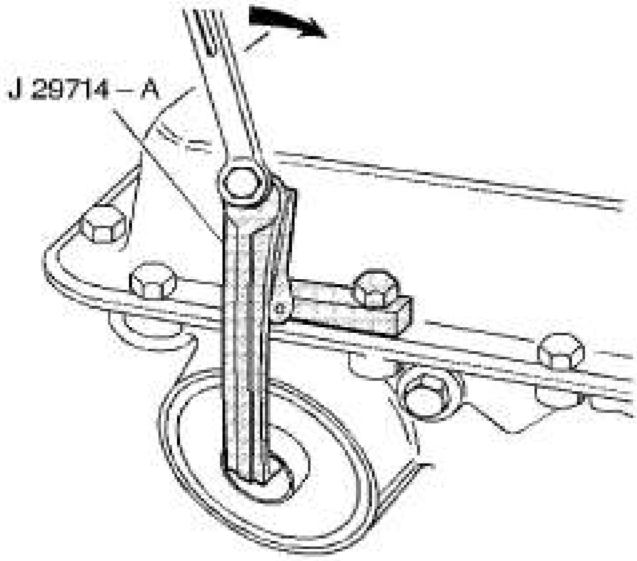
2-4 Servo Cover and Assembly Removal

Tools Required

J 29714-A Servo Cover Depressor

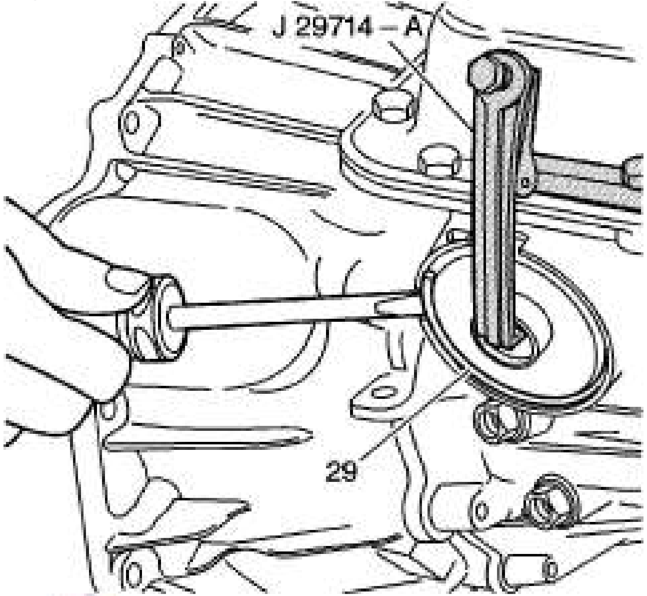


1. Install the J 29714-A .

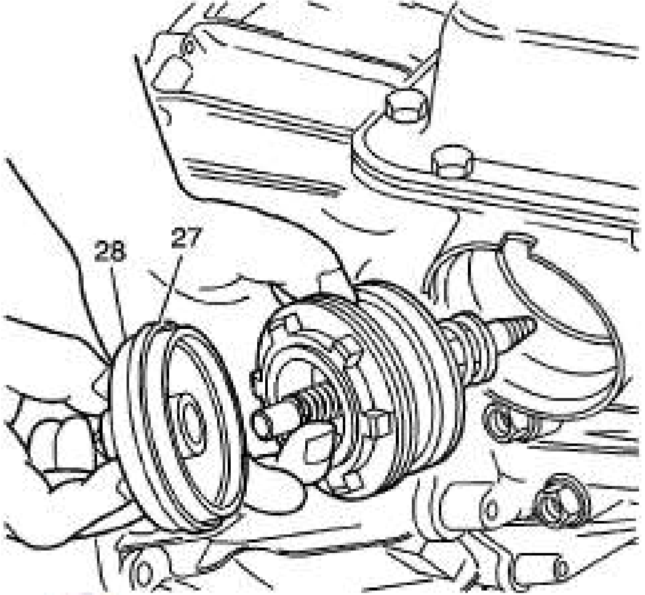


Important: If the cover does not move inwards with the tool, use a block of wood or suitable material and lightly tap on cover using a hammer to free up cover in bore.

2. Tighten the J 29714-A bolt to compress the servo cover.

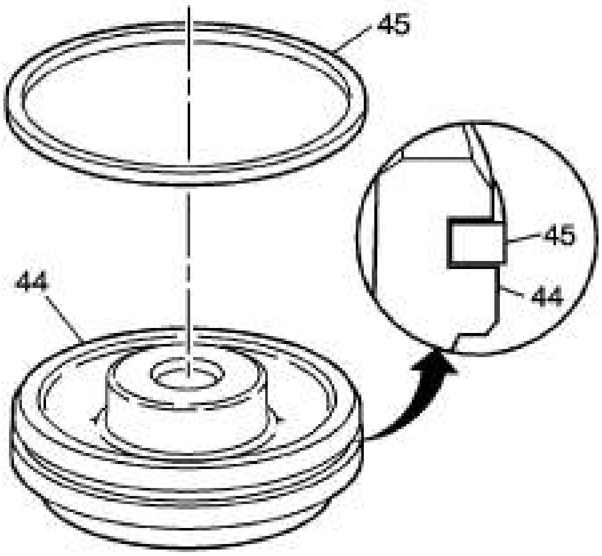


3. Remove the servo cover retaining ring (29) and the J 29714-A .

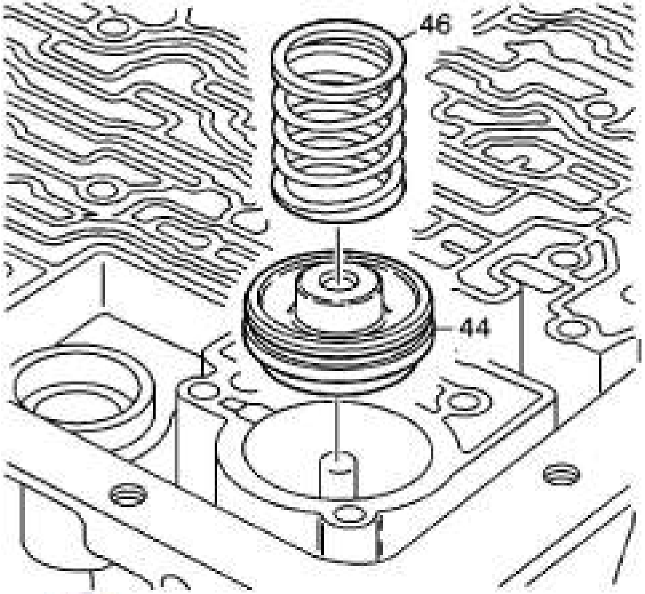


4. Remove the servo cover (28) and O-ring seal (27). If the servo cover seems to be hung up on the seal, cut and remove the O-ring seal before removing the cover.
5. Remove the 2-4 servo assembly.

3-4 Accumulator Installation



1. Inspect the 3-4 accumulator piston (44) for the following conditions:
   - Porosity
   - Cracks
   - Scoring
   - Nicks and scratches
2. Install the 3-4 accumulator piston oil seal ring (45) on the 3-4 accumulator piston (44).

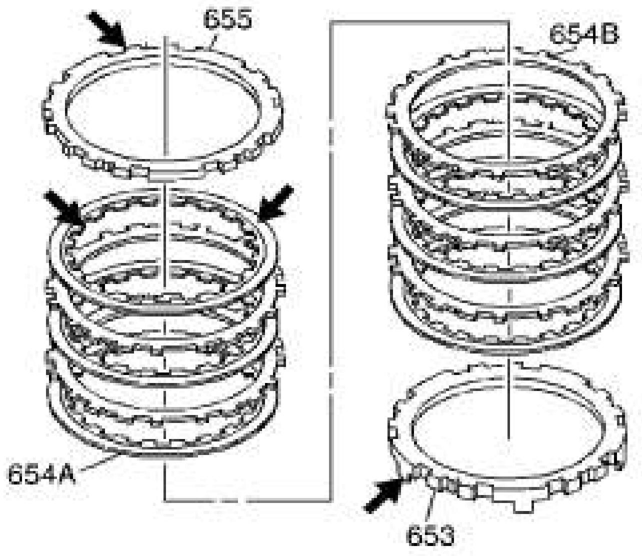


3. Install the 3-4 accumulator piston (44) and seal assembly into the bore.
4. Inspect the 3-4 accumulator spring (46) for cracks.

   Important: Some models do not use a 3-4 accumulator spring.

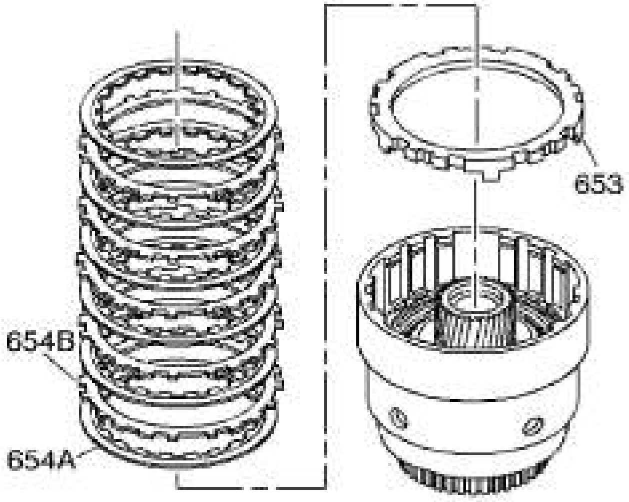
5. Install the 3-4 accumulator spring.

3-4 Clutch Assemble



Important: The part 654A may have 5, 6 or 7 plates.

1. Inspect the 3rd and 4th clutch apply plate (653), the fiber plate assemblies (654A), the steel plates (654B) and the selective backing plate (655) for the following conditions:
    - Damaged tangs
    - Delamination
    - Excessive wear
    - Heat damage or wear
    - Surface finish
    - Flatness



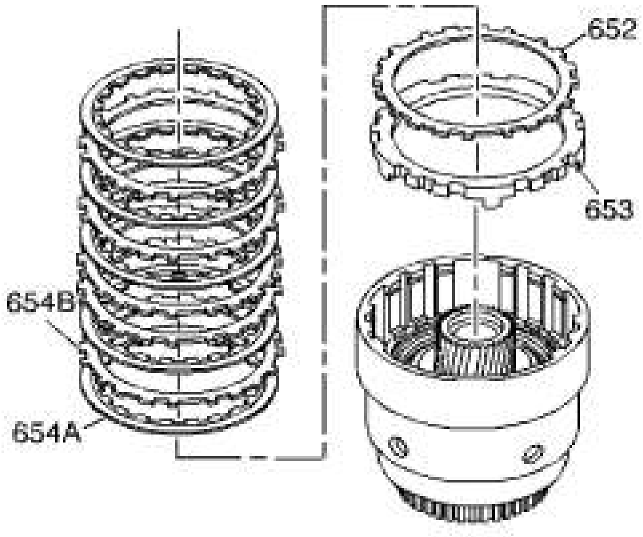
2. Install the 3rd and 4th clutch apply plate (653) into the input housing. Index each leg of the apply plate into the apply ring legs.

   Notice: Refer to General Repair Instructions in the Preface section.

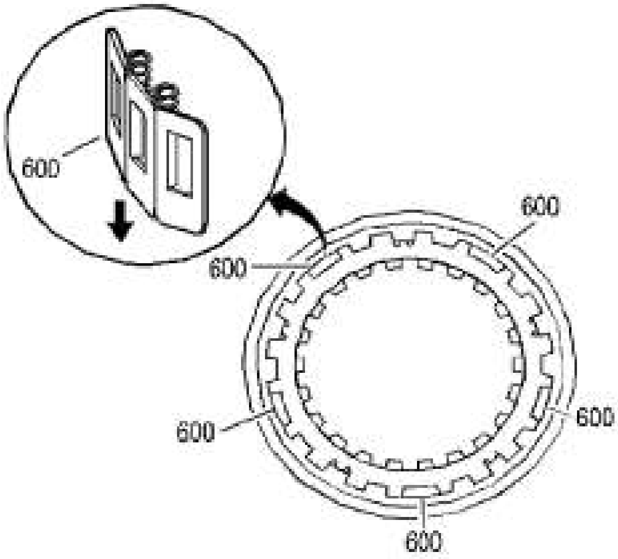
   Important: The first steel plate (654B) has the same spline configuration as the 3rd and 4th clutch apply plate (653).

   Important: The 3rd and 4th clutch plate stack is model specific. Clutch plate stack up may be either 6 or 7 plates.

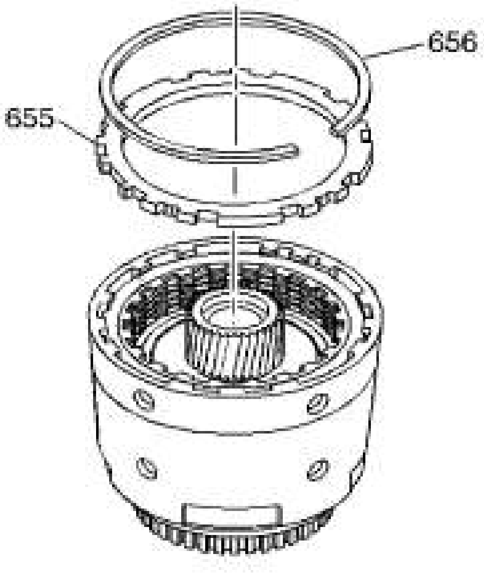
3. Install the 3rd and 4th clutch plates starting with a fiber plate assembly (654A) and alternate with a steel plate (654B).



4. Continue the stack up if seven 654A plates are used.

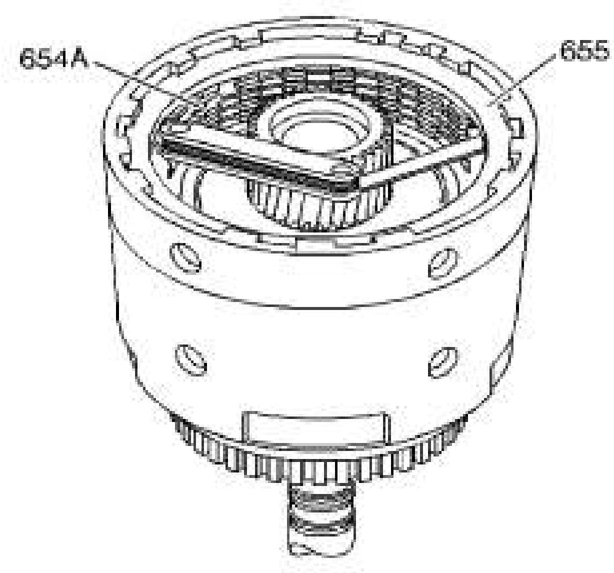


5. Inspect the five 3-4 clutch boost spring assemblies (600) for damaged, worn, broken or missing springs. Springs must be held securely by retainer.
6. Install the 3-4 clutch boost spring assemblies (600) into the input housing.



7. Install the 3rd and 4th clutch selective backing plate (655). Some models may have a chamfer on one side of the selective backing plate. Install the chamfer side up.
8. Install the 3rd and 4th clutch backing plate retainer ring (656).

3-4 Clutch Plate Travel Check



1. Use feeler gauges to check the 3rd and 4th clutch plate travel.
2. Check the travel between the selective backing plate (655) and the first fiber plate assembly (654A).

   The 3rd and 4th clutch plate travel should be:

   Specification

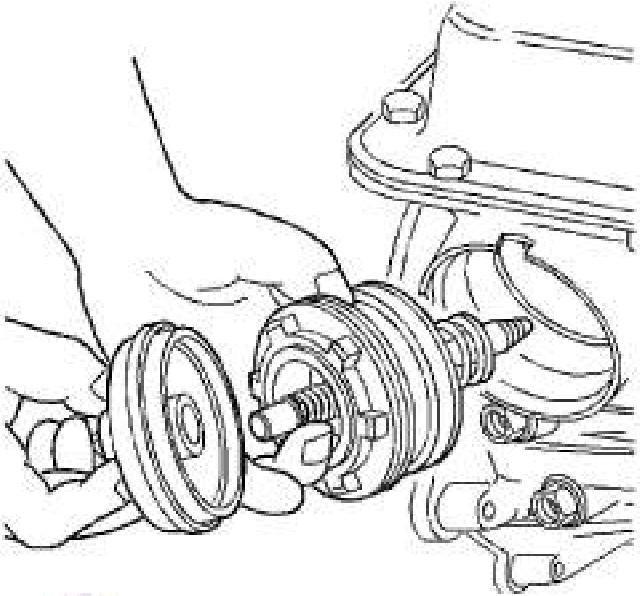
   - Five plate - 0.99-2.14 mm (0.038-0.084 in)
   - Six plate - 0.90-2.10 mm (0.035-0.082 in)
   - Seven plate - 1.12-2.04 mm (0.044-0.080 in)
3. Select the proper 3rd and 4th clutch selective backing plate to obtain the correct travel..

3rd Accumulator Retainer with Ball Assembly Leak Check

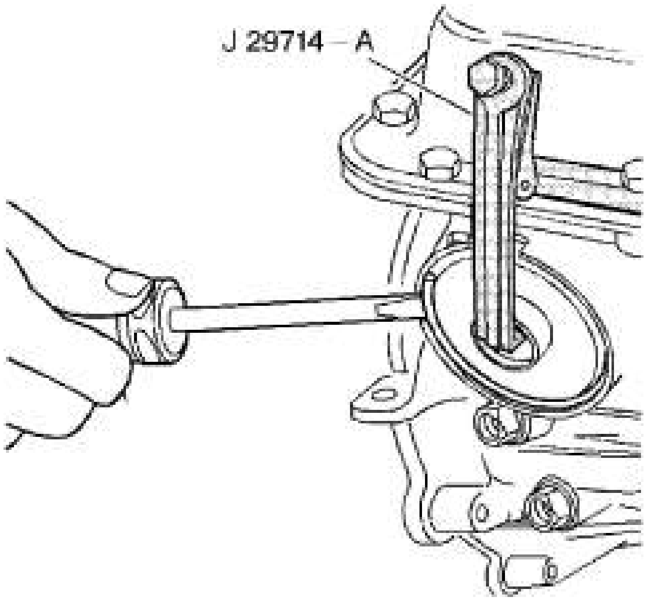
Installation Procedure

Tools Required

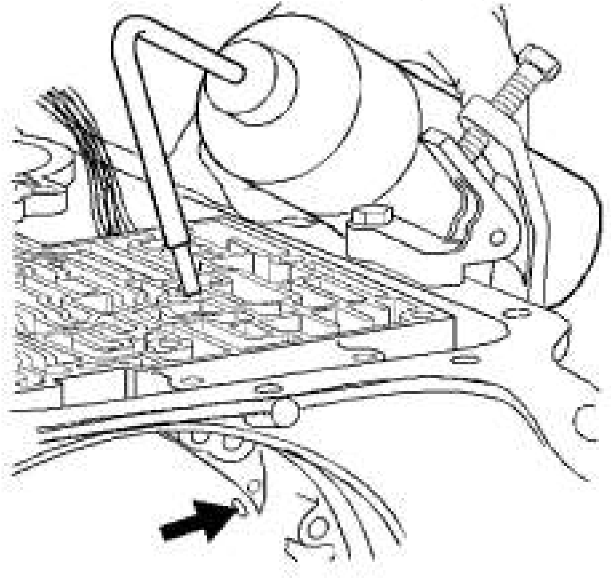
J 29714-A Servo Cover Compressor



1. Install the 2-4 servo into the case.



2. Install oil pan with only four retaining bolts to align pan to case.
3. Use the J 29714-A in order to compress the servo cover.
4. Install the servo cover retaining ring.

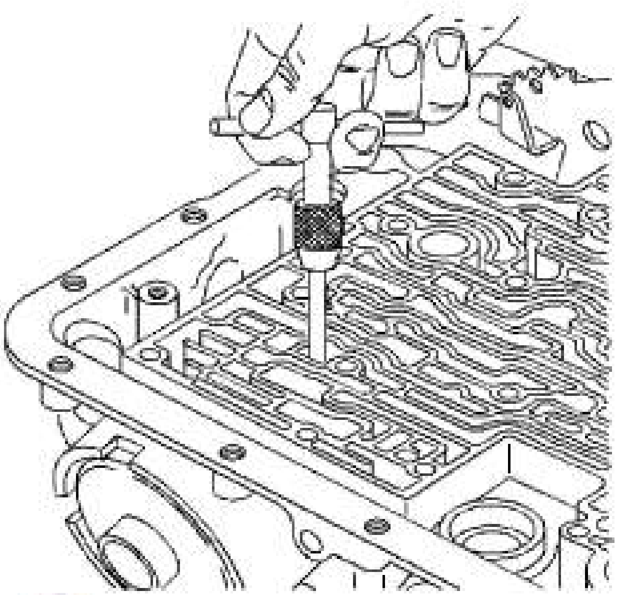


5. Remove oil pan.
6. Pour solvent into the accumulator bore until the channel is filled. Watch for leaks in the case channel.

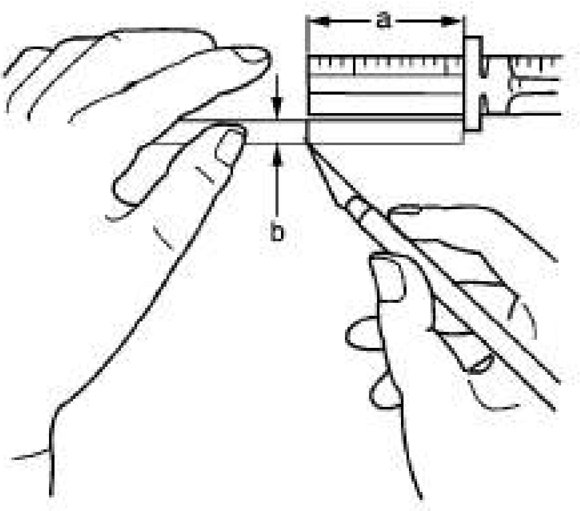
   Important: It is normal to see leakage from the small hole next to the larger oval hole, see arrow.

7. If leakage from the oval shaped hole is observed, replace the third accumulator retainer and ball assembly.

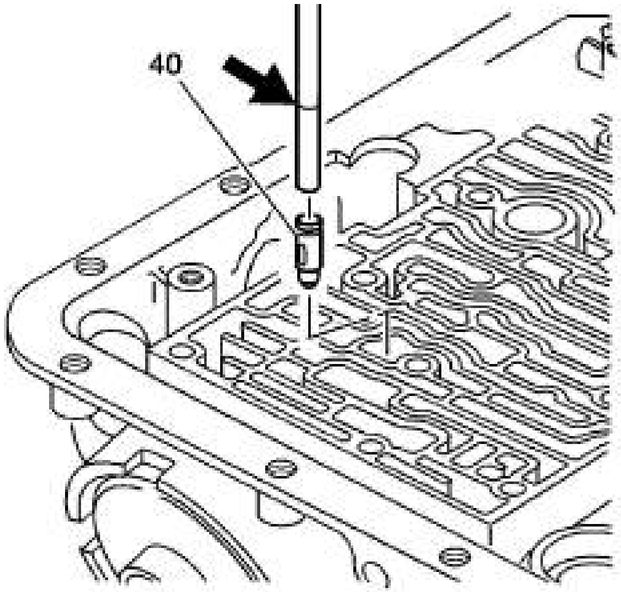
3rd Accumulator Retainer with Ball Replacement



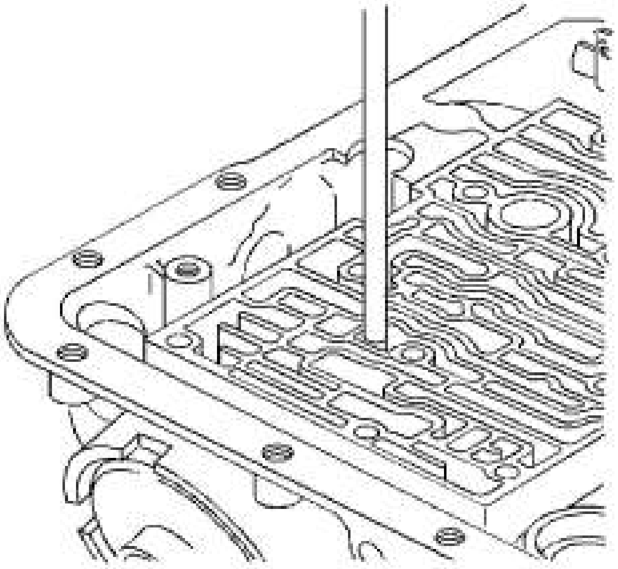
1. Remove the third accumulator retainer and ball assembly, using a 6.3 mm (0.25 in) #4 screw extractor.



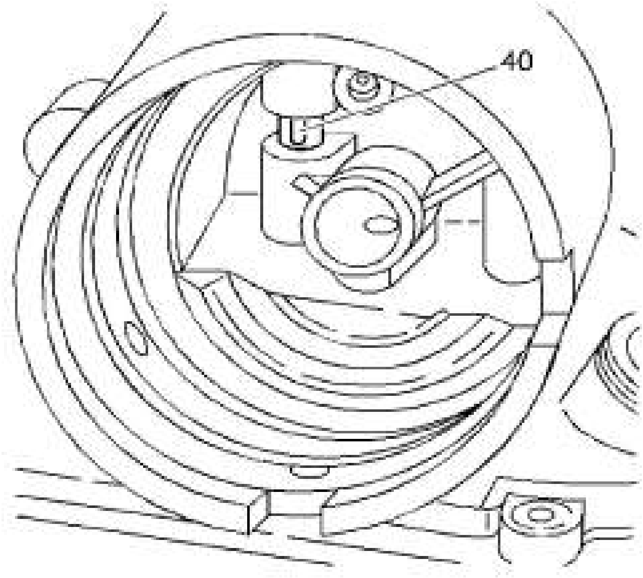
2. Scribe a mark at 42 mm (1.653 in) on a 9.5 mm (0.375 in) diameter metal rod. The scribe mark is used to gauge the proper depth of the third accumulator retainer and ball assembly.



3. Perform the following functions:
   3.1. Line up the oil feed slots in the third accumulator retainer and ball assembly (40) with the servo bore.
   3.2. Using the 9.5 mm (0.375 in) diameter metal rod, install the third accumulator retainer and ball assembly.



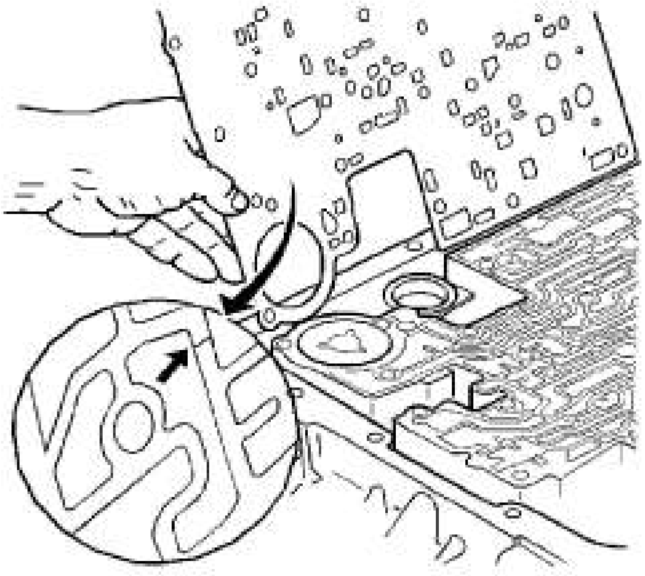
4. Ensure that the third accumulator retainer and ball assembly and the scribe mark on the rod are flush with the case surface.



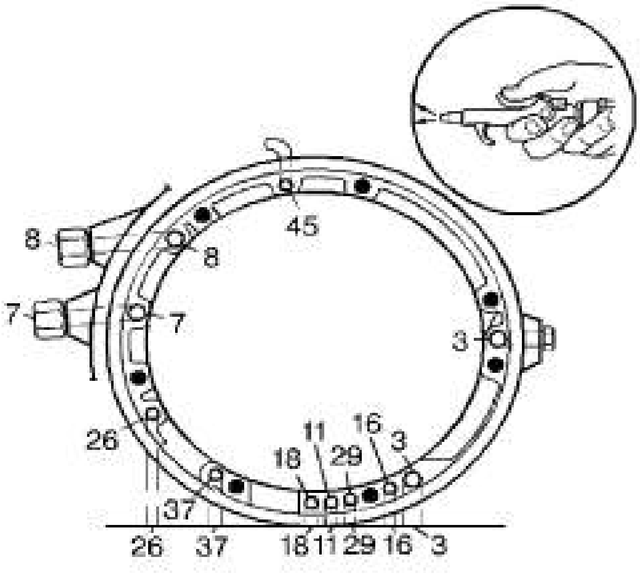
5. Check the third accumulator retainer and ball assembly (40) for alignment. The slot in the retainer must be completely open in the servo bore.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975582**

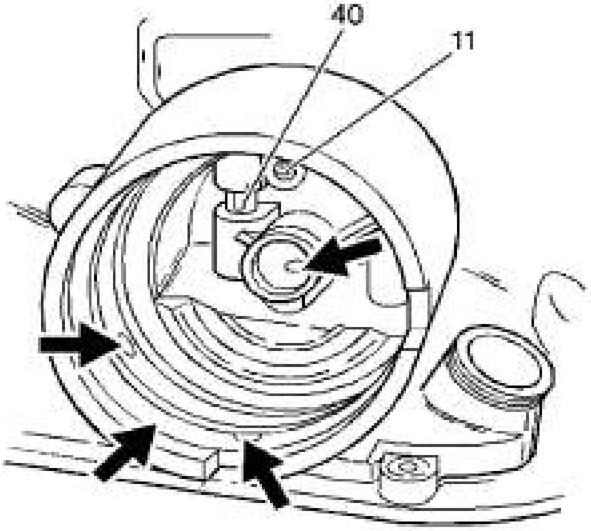
Case Assembly Inspection



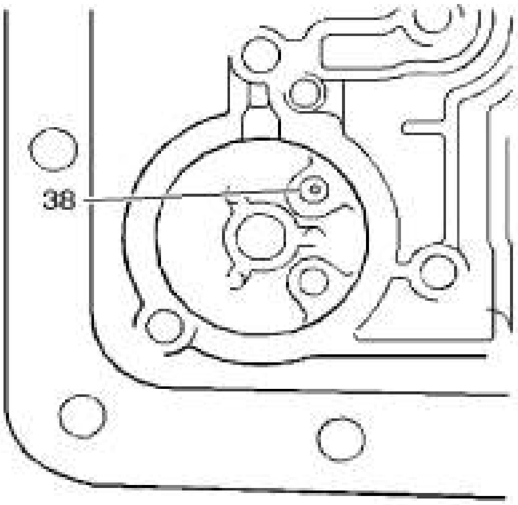
1. Inspect the spacer plate to case gasket for witness marks. The witness marks should be complete. Incomplete witness marks may come from an uneven case surface or from cross channel leaks.



2. Using compressed air, blow into all of the case fluid passages (3, 7, 8, 11, 16, 18, 26, 29, 37, 45) to make sure that all case fluid passages are clear of any obstruction.



3. Inspect the 2-4 servo bore, the 3rd accumulator retainer and ball assembly (40), the orifice cup plug (11) in the servo bore, and the 2nd apply piston pin bore for any of the following conditions:
   - Porosity
   - Burrs
   - Debris
   - Any other damage



4. Inspect the 3-4 accumulator bore and the orifice cup plug (38) for any of the following conditions:
   - Porosity

- Burrs
- Blockage
- Any other damage

5. Inspect all bolt holes for thread damage. Use heli-coil to repair damaged threads.
6. Inspect the cooler connectors for damage and proper torque.

   Specification
   Cooler connector torque should be 38 N·m (28 lb ft)

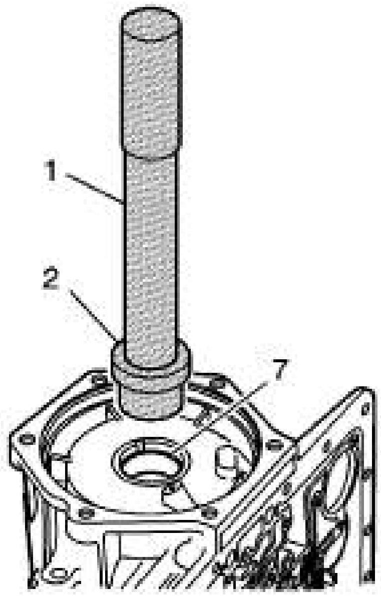
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1994194**

Case Bushing

Removal Procedure

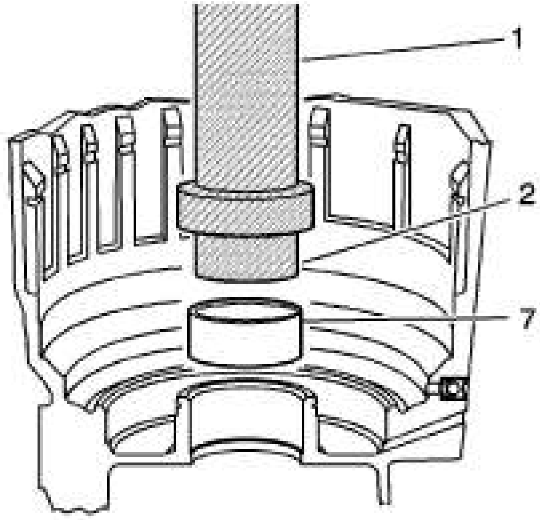
Tools Required

- J 8092 Driver Handle
- J 34196-B Transmission Bushing Service Set



Remove the case bushing (7) using J 8092 (1) and J 34196-10 (2) which is part of kit J 34196-B .

Installation Procedure

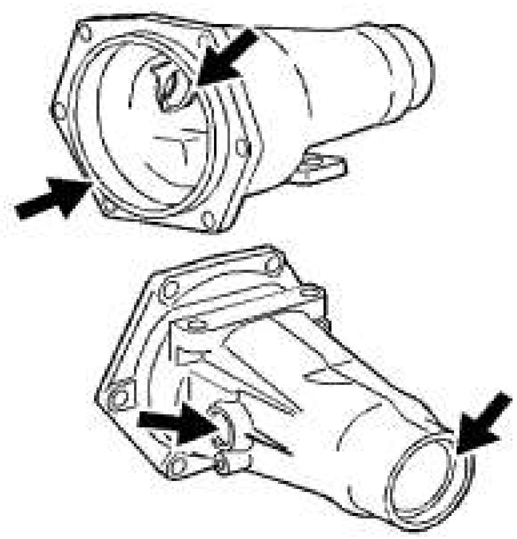


Install a case bushing (7) using J 8092 (1) and J 34196-10 (2) which is part of kit J 34196-B .

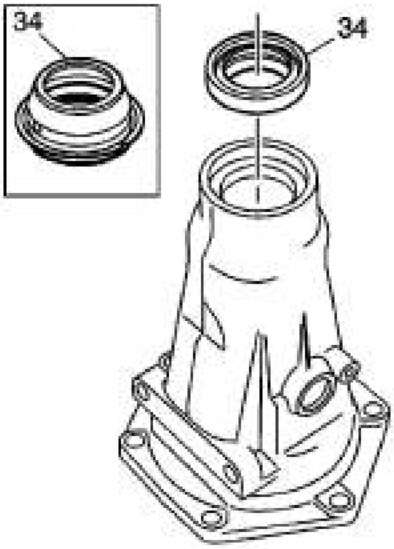
Case Extension Bushing Replacement

Tools Required

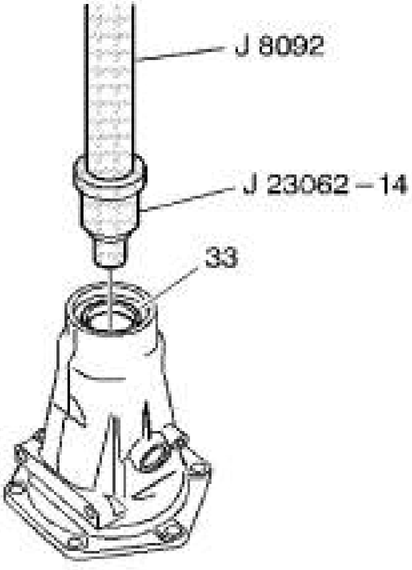
- J 8092 Driver Handle
- J 23062-14 Bushing Remover
- J 34196-B Transmission Bushing Service Set



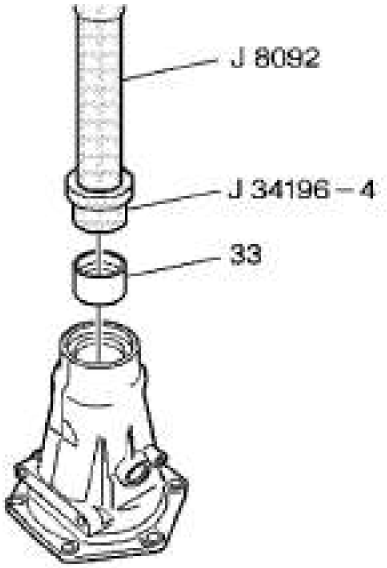
1. Inspect the case extension for the following conditions:
    - Porosity
    - Cracks
    - Nicks
    - Burrs
    - Worn bushings



2. Remove the case extension oil seal assembly (34) (model dependent).



3. Using the J 23062-14 and the J 8092 J 8092 , remove the case extension bushing (33).

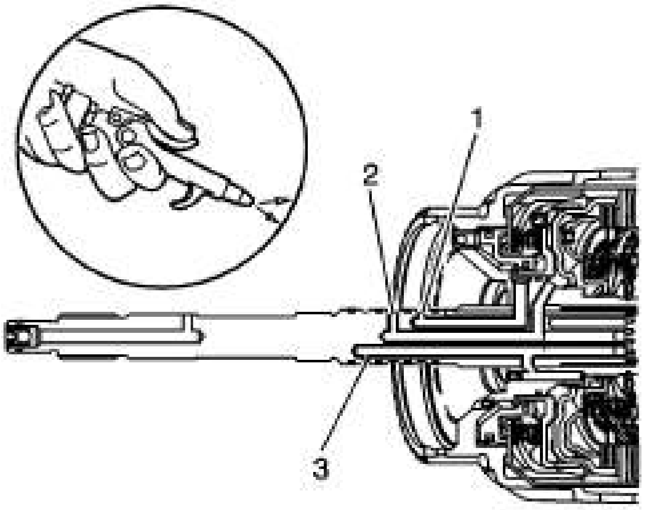


4. Using the J 34196-4 which is part of kit J 34196-B and the J 8092 , install a case extension bushing (33).

Clutch Air Check

Inspection Procedure

Important: When the overrun clutch is checked, the air will blow by the forward clutch piston lip seals and exit out of the forward clutch feed hole in the turbine shaft.

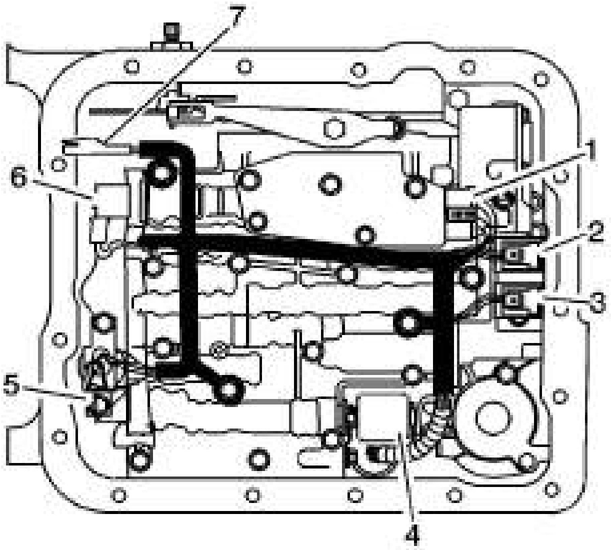


Apply air into the feed holes in the turbine shaft in order to check the following items:

- The 3rd and 4th clutch (1)
- The forward clutch (2)
- The overrun clutch (3)

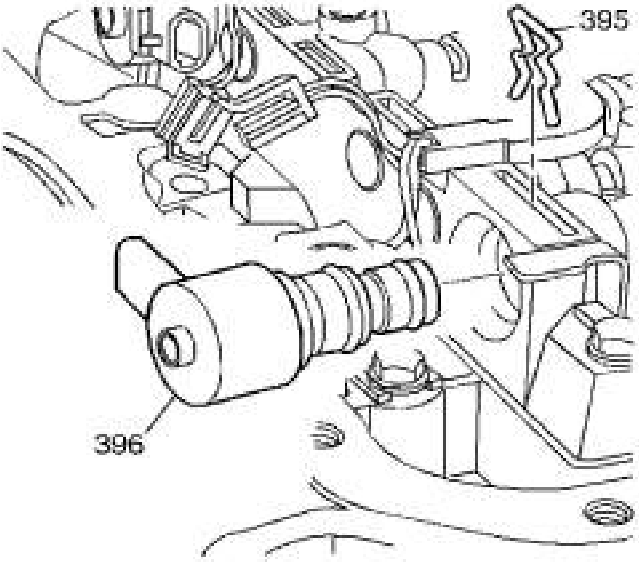
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1994191**

Control Valve Body and Wiring Harness Removal

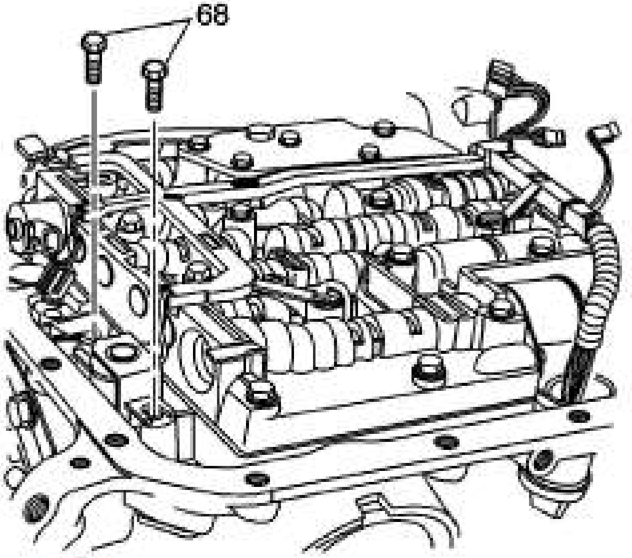


1. Remove all electrical connectors (1-6) from the electrical components.

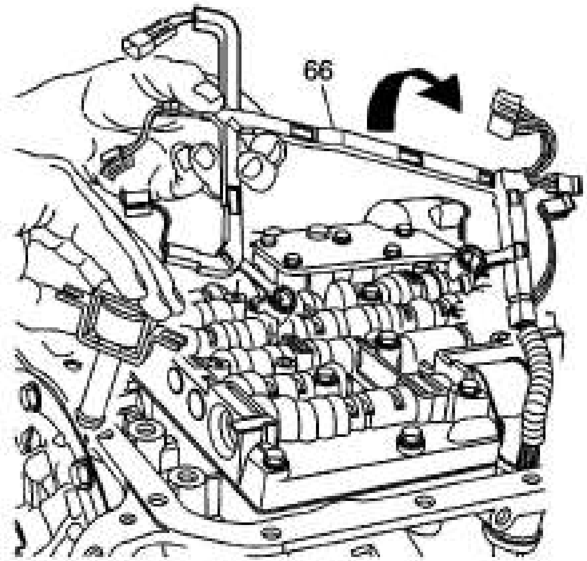
   For Transmission with input speed sensor, disconnect electrical connector (7).



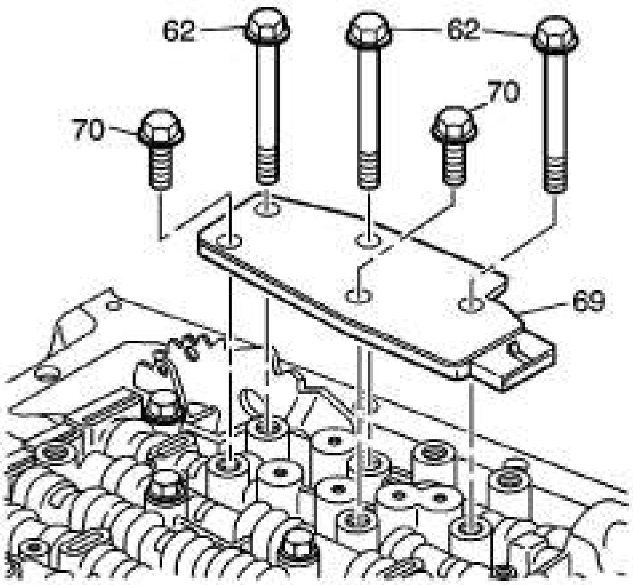
2. Remove the torque converter clutch (TCC/PWM) pulse width modulation retainer clip (395).
3. Remove the TCC/PWM solenoid (396).



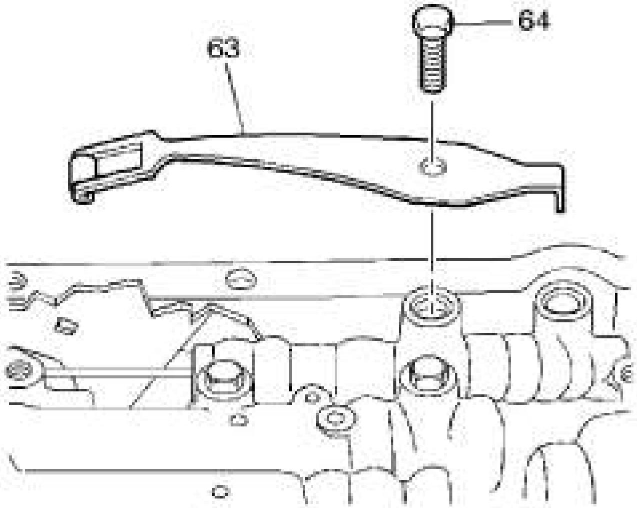
4. Remove the TCC solenoid retaining bolts (68).



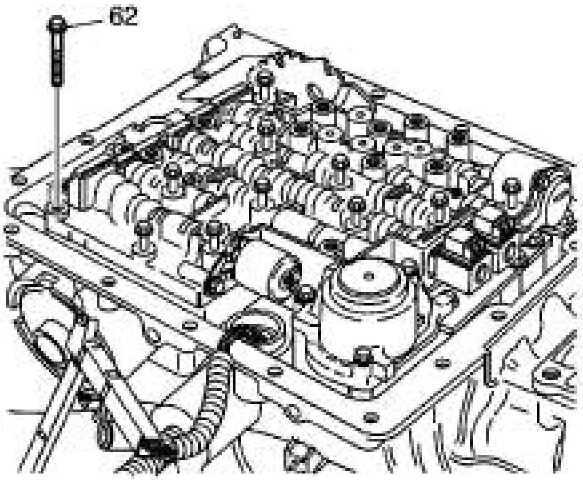
5. Remove the TCC solenoid and wiring harness (66). Turn the wiring harness over so that it hangs over the side of the transmission.



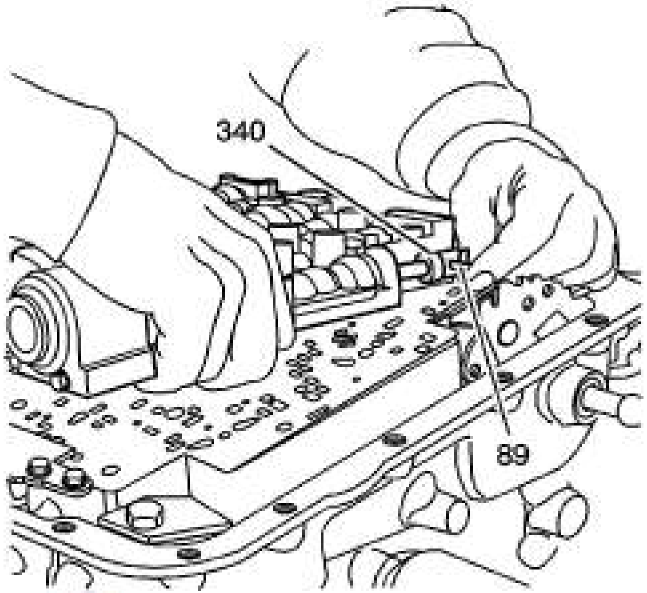
6. Remove the transmission fluid pressure (TFP) manual valve position switch assembly retaining bolts (62, 70).
7. Remove the TFP manual valve position switch (69).



8. Remove the manual detent spring retaining bolt (64).
9. Remove the manual detent spring assembly (63).

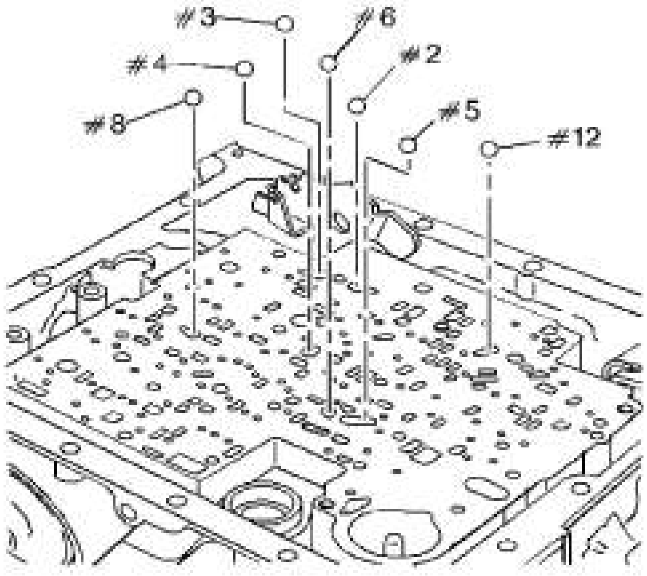


10. Remove all valve body retaining bolts (62).



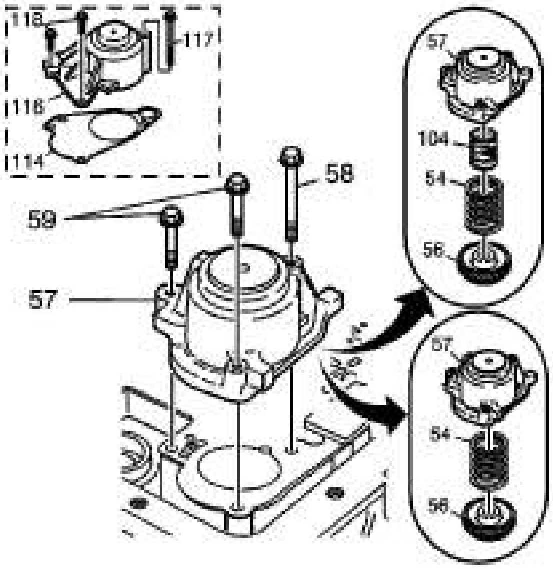
11. Lift the valve body carefully so that the checkballs remain on the spacer plate in the correct location. While lifting the valve body, disconnect the manual valve link (89) from the manual valve (340).

Notice: Refer to General Repair Instructions in the Preface section.



Important: Some models do not use a #5 ball check valve.

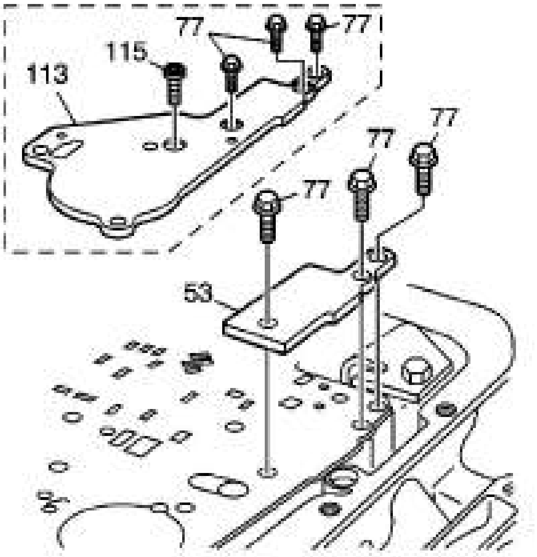
12. Remove the 7 valve body ball check valves (2-6, 8, and 12).



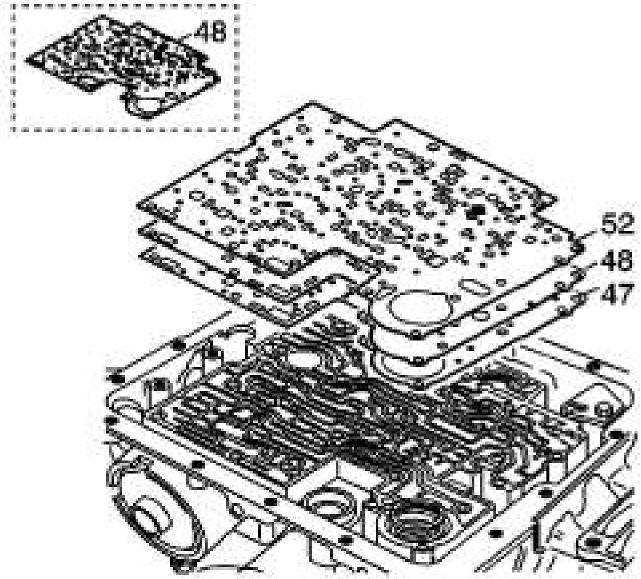
13. Remove the accumulator cover retaining bolts (58, 59 or 117, 118).
14. Remove the 1-2 accumulator cover and pin assembly (57) or 1-2 accumulator cover assembly (116), and gasket (114).

Important: Some models may not use a 1-2 accumulator spring - inner (104) or outer (54).

15. Disassemble the 1-2 accumulator assembly (54, 56, 57, 104).



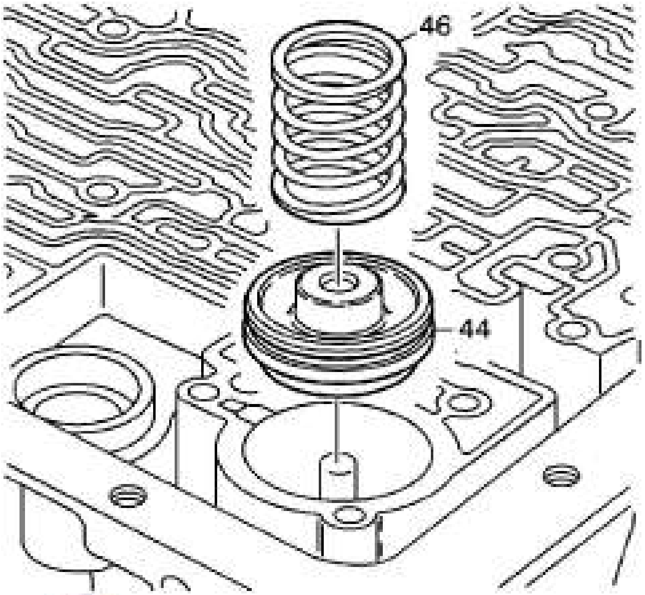
16. Remove the spacer plate support retaining bolts (77).
17. Remove the spacer plate support (53 or 113).



Important: Some models use a spacer plate (48) with bonded gasket material.

18. Remove the valve body gasket (52), the valve body spacer plate (48) and the case gasket (47).

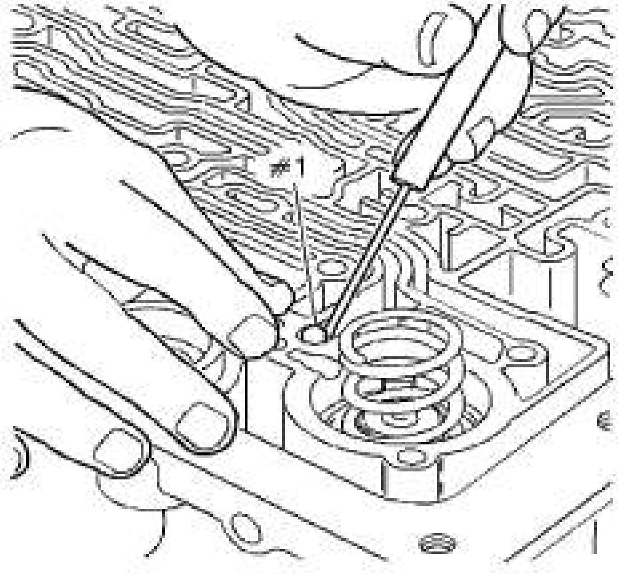
    Discard gaskets. Do not reuse.



Important: Some models do not use a 3-4 accumulator spring (46).

19. Remove the 3-4 accumulator spring (46) and the 3-4 accumulator piston (44).

Notice: Refer to General Repair Instructions in the Preface section.

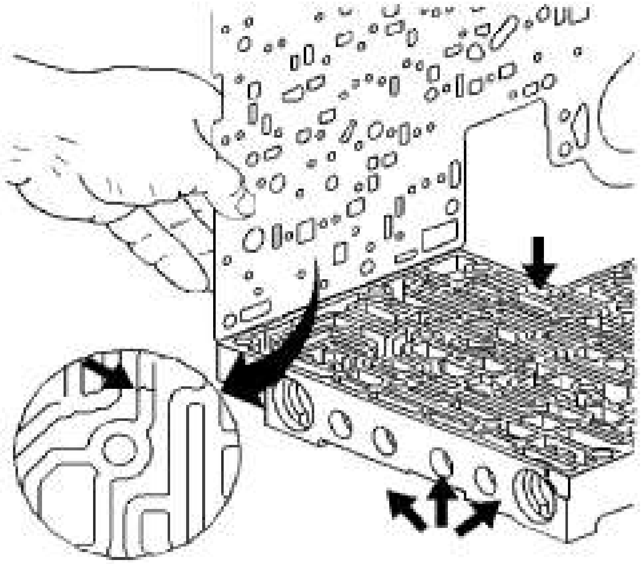


20. Remove the #1 case ball check valve.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | Document ID: 2036973

Control Valve Body Assemble

Inspection Procedure



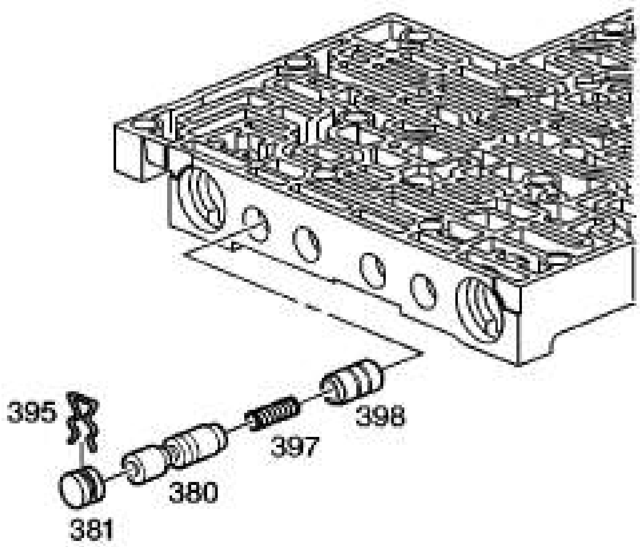
1. Inspect the valve body to spacer plate gasket for valve body channel witness marks. The witness marks should be complete. Incomplete witness marks may be caused by an uneven case surface. Incomplete witness marks may also be caused by cross-channel leaks.
2. Inspect the valve body casting for the following conditions:
   - Porosity
   - Cracks
   - Damaged machined surfaces
   - Chips or debris

Cleaning Procedure

1. Clean all the valves, springs, bushings, and the control valve body in clean solvent.
2. Dry all the parts using compressed air.

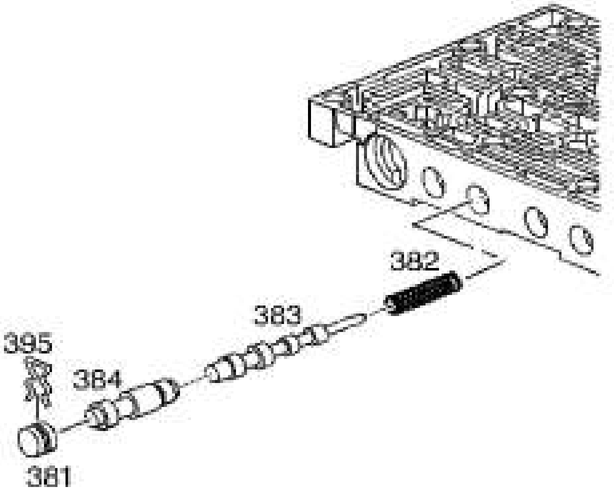
Installation Procedure

Warning: Refer to Valve Springs Can Be Tightly Compressed Warning in the Preface section.



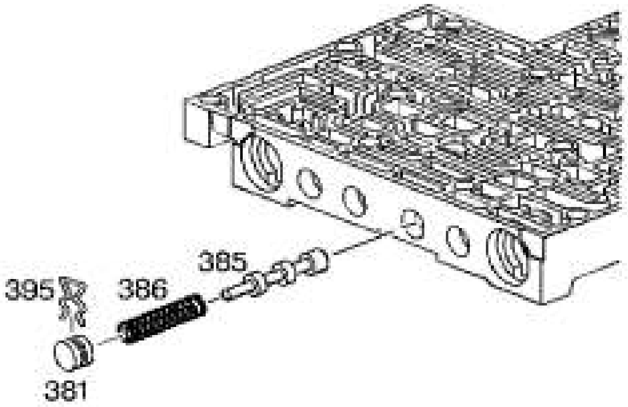
Note: Lubricate all parts with DEXRON®VI automatic transmission fluid before installation.

1. Install the following items:
   1.1. The isolator valve (398)
   1.2. The regulator apply spring (397)
   1.3. The regulator apply valve (380)
   1.4. The bore plug (381)
   1.5. The bore plug retainer (395)



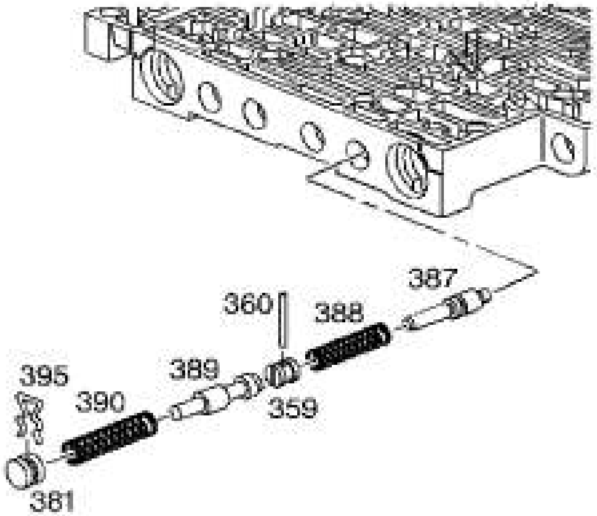
2. Install the following items:

    2.1. The 4-3 sequence valve spring (382)
    2.2. The 4-3 sequence valve (383)
    2.3. The 3-4 relay valve (384)
    2.4. The bore plug (381)
    2.5. The bore plug retainer (395)



385
395
386
381

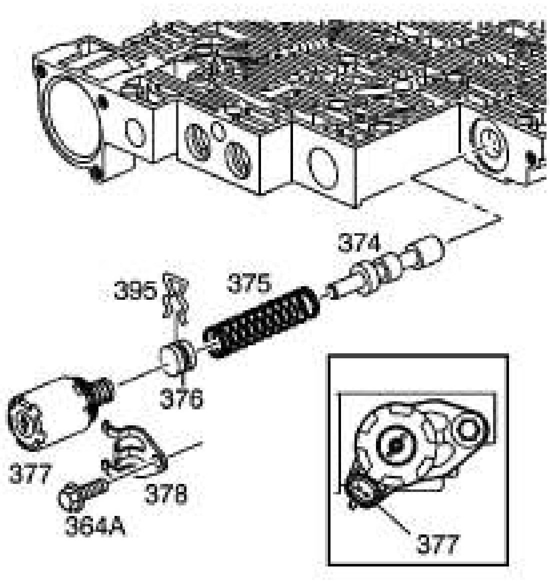
3. Install the following items:
    3.1. The 3-4 shift valve (385)
    3.2. The 3-4 shift valve spring (386)
    3.3. The bore plug (381)
    3.4. The bore plug retainer (395)



387
360
388
395
389
390
359
381

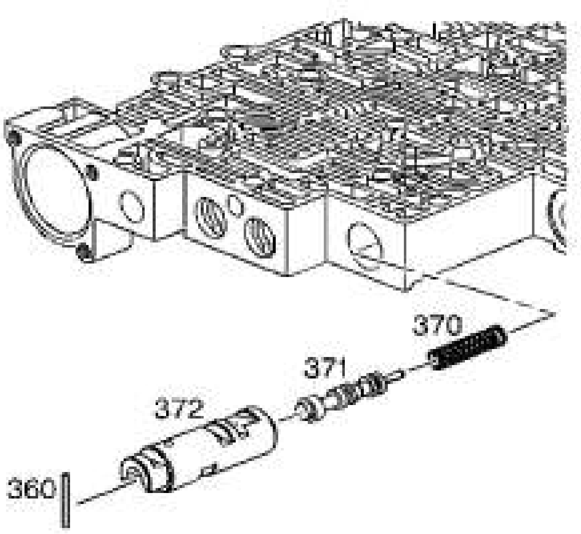
4. Install the following items:
    4.1. The reverse abuse valve (387)
    4.2. The reverse abuse valve spring (388)
    4.3. The bore plug (359)
    4.4. The coiled spring pin (360)
    4.5. The 3-2 downshift valve (389)
    4.6. The 3-2 downshift valve spring (390)
    4.7. The bore plug (381)
    4.8. The bore plug retainer (395)

Caution: Refer to Fastener Caution in the Preface section.

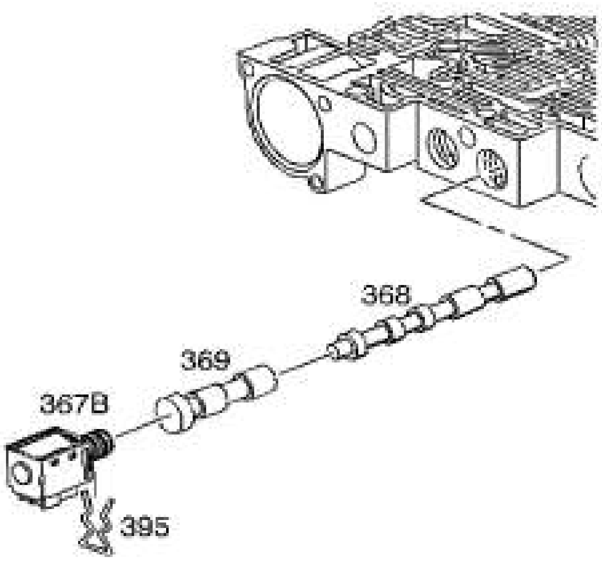


Caution: Be sure all solenoids are installed with the electrical connectors facing the non-machined (cast) side of the valve body; otherwise, the solenoids will bind against the transmission case as the valve body bolts are tightened and damage may occur.

5. Install the following items:
    5.1. The actuator feed limit valve (374)
    5.2. The actuator feed limit valve spring (375)
    5.3. The bore plug (376)
    5.4. The bore plug retainer (395)
    5.5. The pressure control solenoid (377)
    5.6. The solenoid retainer (378)
    5.7. The solenoid retainer bolt (364) Tighten the bolt to **8-14 N·m (6-10 lb ft)**.

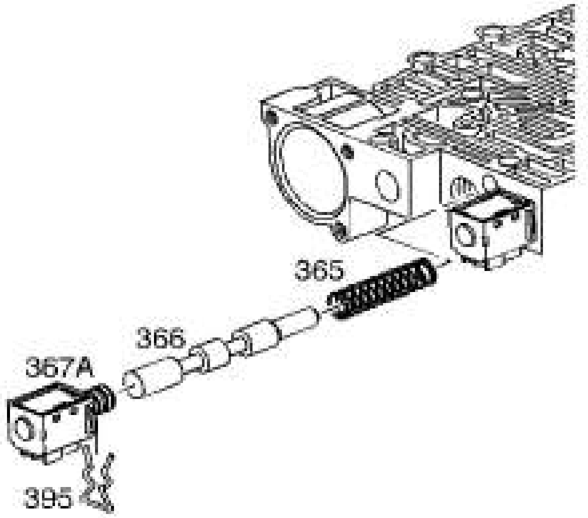


6. Install the following items:
    - 6.1. The 1-2 accumulator valve spring (370)
    - 6.2. The 1-2 accumulator valve (371) in the 1-2 accumulator valve sleeve (372)
    - 6.3. The 1-2 accumulator valve and sleeve assembly
    - 6.4. The coiled spring pin (360)



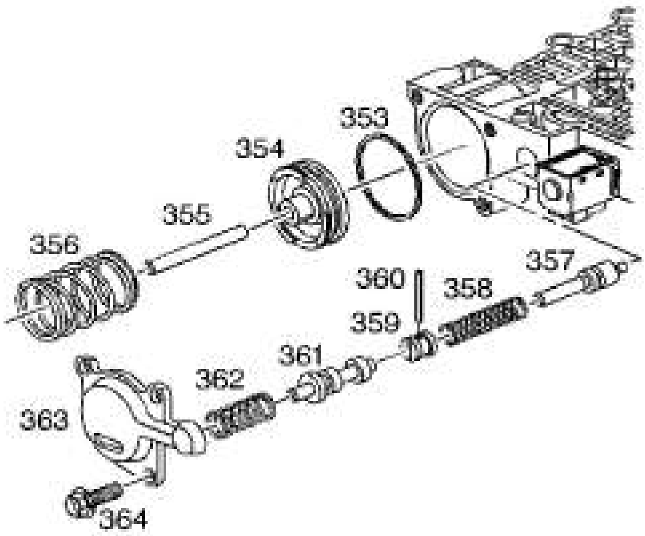
7. Install the following items:
    - 7.1. The 2-3 shift valve (368)
    - 7.2. The 2-3 shuttle valve (369)
    - 7.3. The 2-3 shift solenoid valve (367B)

   7.4. The solenoid retainer (395)



365
366
367A
395

8. Install the following items:
   8.1. The 1-2 shift valve spring (365)
   8.2. The 1-2 shift valve (366)
   8.3. The 1-2 shift solenoid valve (367A)
   8.4. The solenoid valve retainer (395)

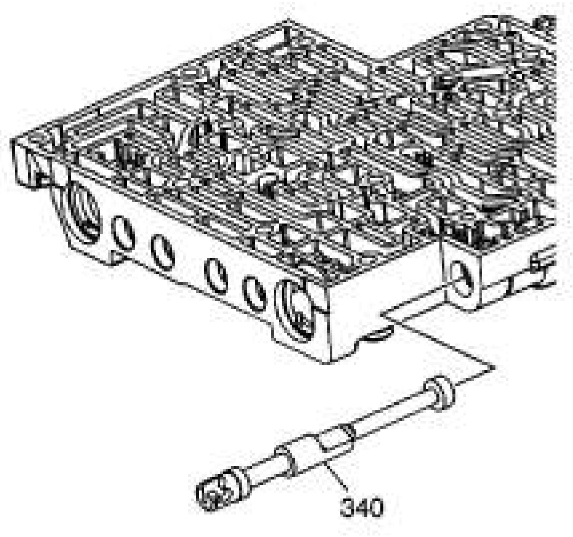


353
354
355
356
357
358
360
359
361
362
363
364

9. Install the following items:
   9.1. The forward abuse valve (357)
   9.2. The forward abuse valve spring (358)

  9.3. The bore plug (359)
  9.4. The coiled spring pin (360)
  9.5. The low overrun valve (361)
  9.6. The low overrun valve spring (362)

10. Install the following items:
  10.1. The forward accumulator oil seal (353) on the forward accumulator piston (354)
  10.2. The forward accumulator pin (355)
  10.3. The forward accumulator piston (354)
  10.4. The forward accumulator spring (356)
  10.5. The forward accumulator cover (363)
  10.6. The forward accumulator cover bolts (364)

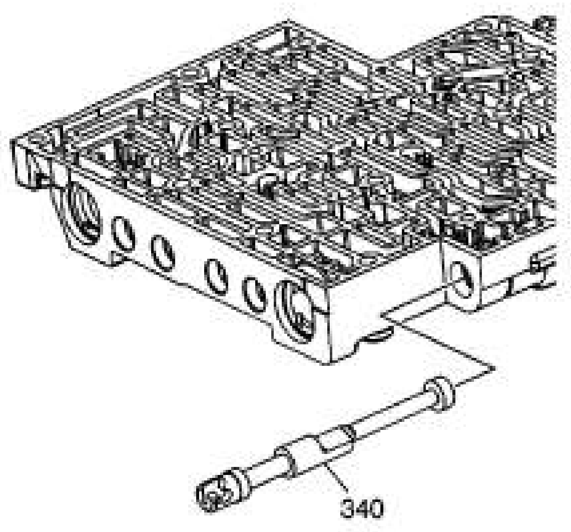


11. Install the manual valve (340).

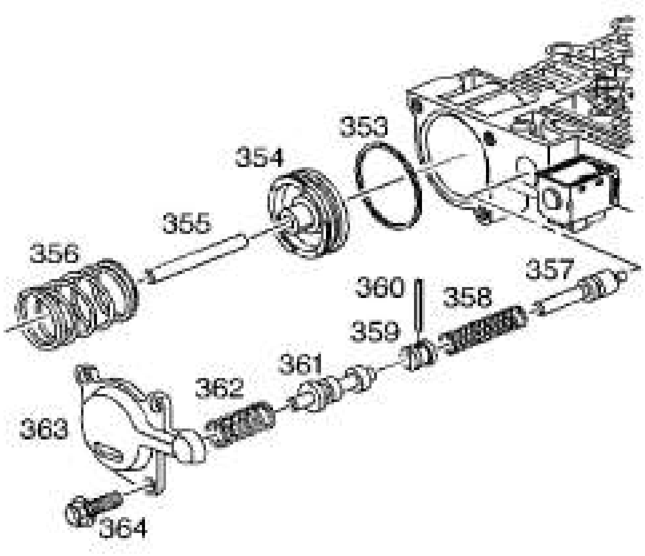
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 2041929**

Control Valve Body Disassemble

Warning: Refer to Valve Springs Can Be Tightly Compressed Warning in the Preface section.

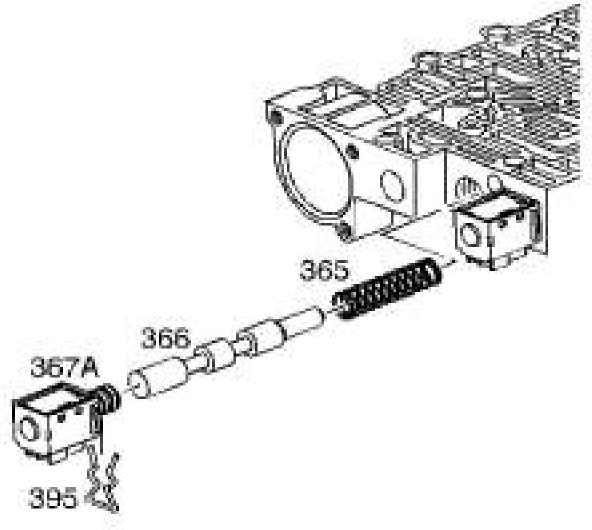


1. Remove the manual valve (340).

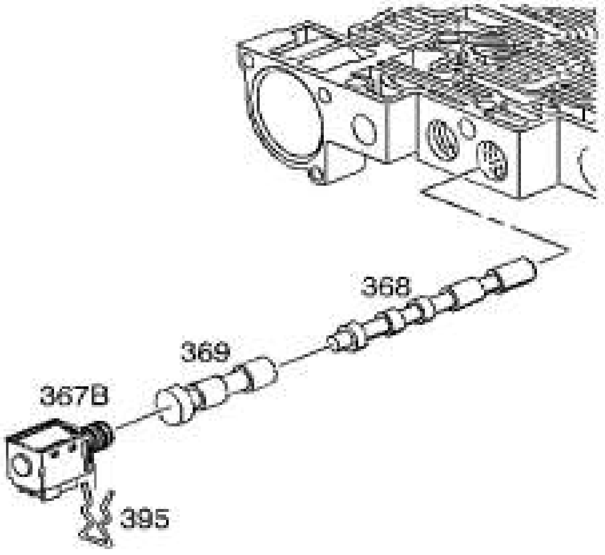


2. Remove the forward accumulator cover bolts (364) and the forward accumulator cover (363).
3. Remove the forward accumulator spring (356), forward accumulator piston (354), and the forward accumulator pin (355).
4. Remove the low overrun valve spring (362) and the low overrun valve (361).

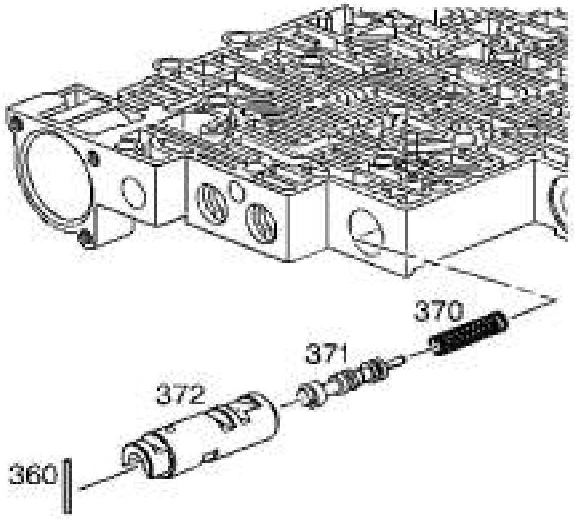
5. Remove the coiled spring pin (360) and the bore plug (359).
6. Remove the forward abuse valve spring (358) and the forward abuse valve (357).



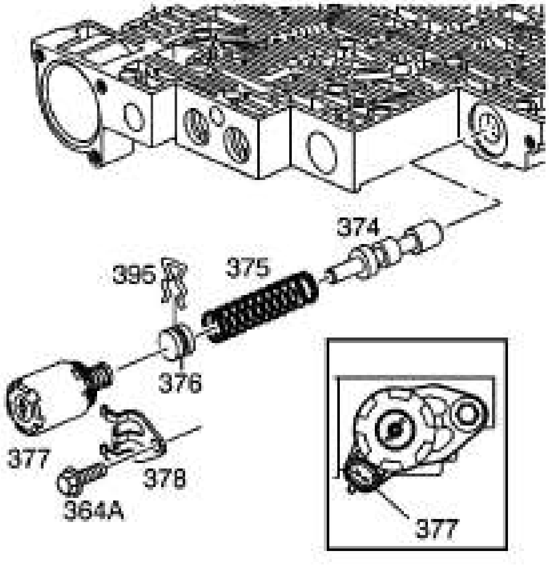
7. Remove the solenoid retainer (395) and the 1-2 shift solenoid (367A).
8. Remove the 1-2 shift valve (366) and the 1-2 shift valve spring (365).



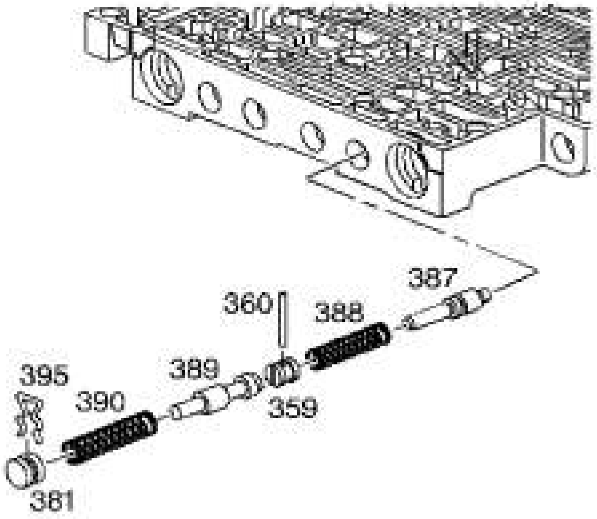
9. Remove the solenoid retainer (395) and the 2-3 shift solenoid (367B).
10. Remove the 2-3 shuttle valve (369) and the 2-3 shift valve (368).



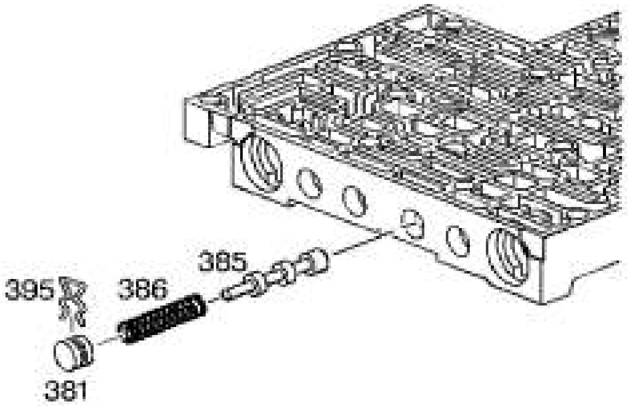
11. Remove the coiled spring pin (360).
12. Remove the 1-2 accumulator valve sleeve (372).
13. Remove the 1-2 accumulator valve (371) and the 1-2 accumulator valve spring (370).



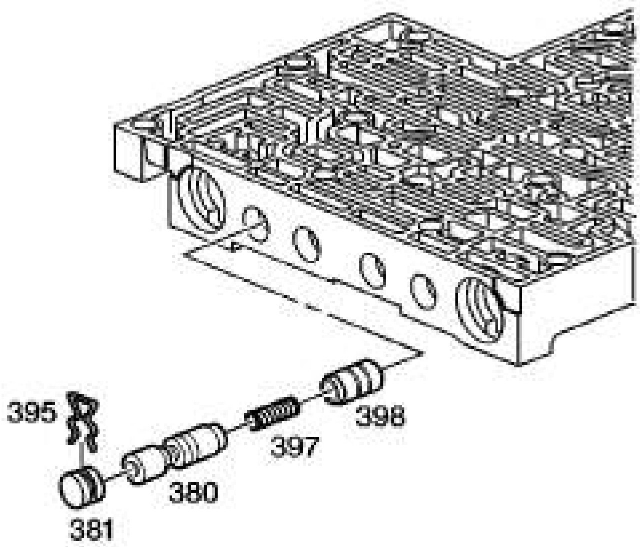
14. Remove the solenoid retainer bolt (364A) and the solenoid retainer (378). Remove the pressure control solenoid (377), note orientation upon removal.
15. Compress the actuator feed limit valve spring (375).
16. Remove the bore plug retainer (395) and release the spring slowly.
17. Remove the bore plug (376).
18. Remove the actuator feed limit valve spring (375) and the actuator feed limit valve (374).



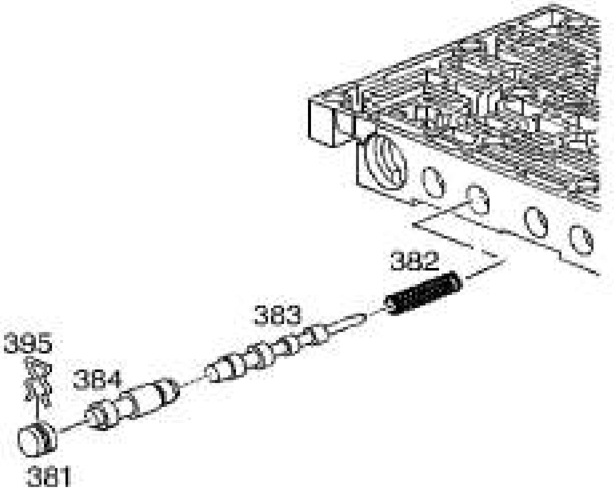
19. Remove the bore plug retainer (395) and the bore plug (381).
20. Remove the 3-2 downshift valve spring (390) and the 3-2 downshift valve (389).
21. Remove the coiled spring pin (360) and the bore plug (359).
22. Remove the reverse abuse valve spring (388) and the reverse abuse valve (387).



23. Remove the bore plug retainer (395) and the bore plug (381).
24. Remove the 3-4 shift valve spring (386) and the 3-4 shift valve (385).



25. Remove the bore plug retainer (395) and the bore plug (381).
26. Remove the regulator apply valve (380) and the regulator apply spring (397) and the isolator valve (398).

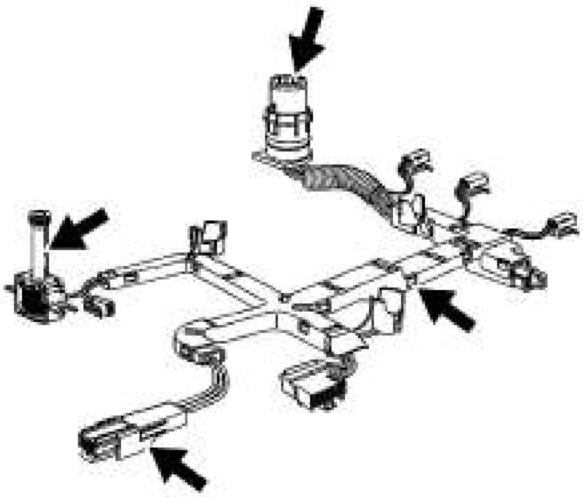


27. Remove the bore plug retainer (395) and the bore plug (381).
28. Remove the 3-4 relay valve (384) and the 4-3 sequence valve (383) and the 4-3 sequence valve spring (382).

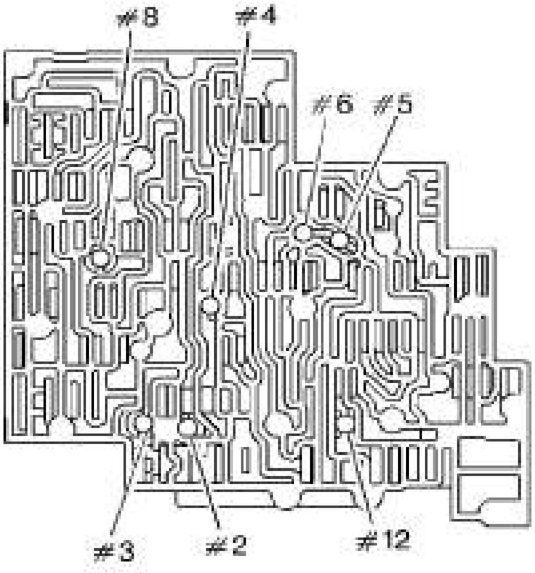
Control Valve Body Installation

Special Tools

- *J 25025-5* Dial Indicator Mounting Post-M6 x 1.00
- *J 36850* Transjel Lubricant

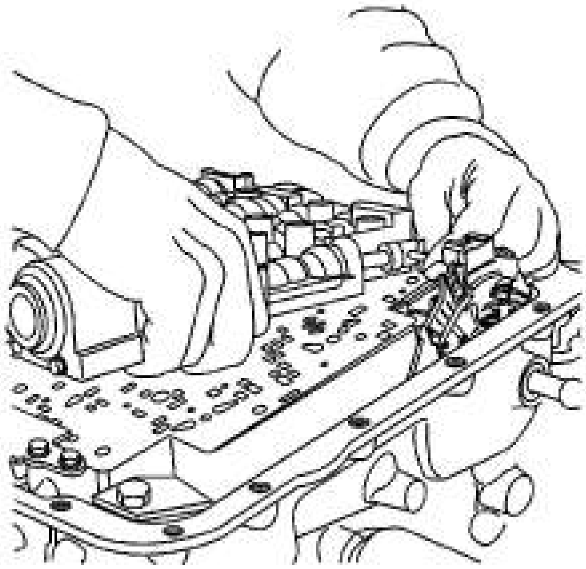


1. Inspect the wiring harness and solenoid assembly for the following conditions:
    - Damage
    - Cracked connectors
    - Exposed wires
    - Loose electrical terminals
    - Damaged wiring loom and conduit
    - Worn, missing, or cut pass-through connector O-ring seal.
2. Install the transmission wiring harness pass-through connector into the transmission case. Ensure connector tabs lock into place.
3. Move the harness to one side in order to install the valve body.



Note: Valve bodies are model dependent.

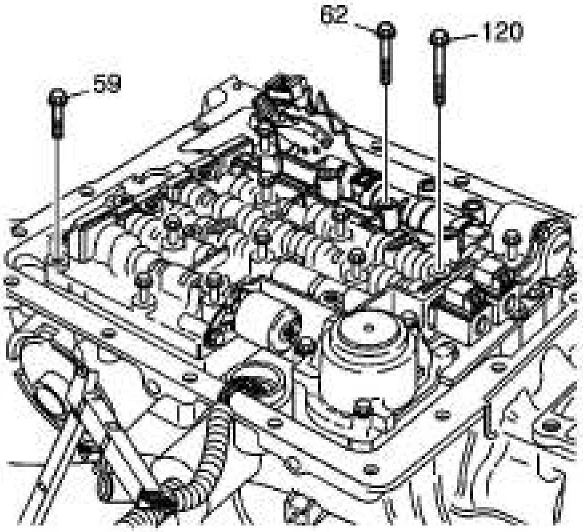
4. Install the ball check valves (2-6, 8, 12) in the valve body and retain ball check valves with *J 36850* transjel lubricant or an equivalent.



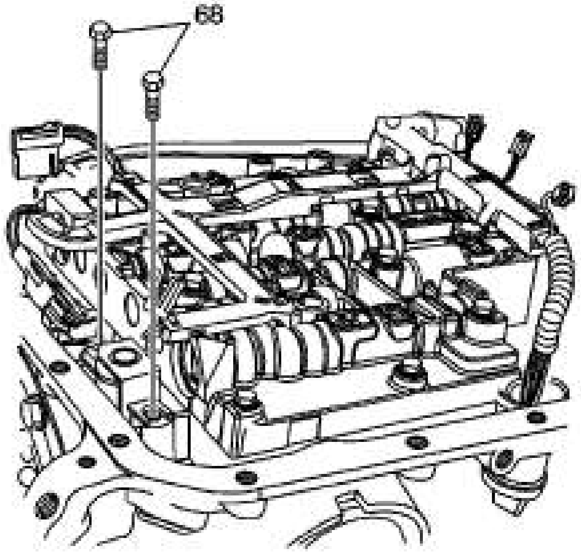
Caution: Be sure all solenoids are installed with the electrical connectors facing the non-machined (cast) side of the valve body; otherwise, the solenoids will bind against the transmission case as the valve body bolts are tightened and damage may occur.

5. Install the valve body over the *J 25025-5* mounting post , and connect the manual valve link to the manual valve.
6. Install 2 valve body bolts to hold the valve body in place.

7. Remove the *J 25025-5* mounting post .



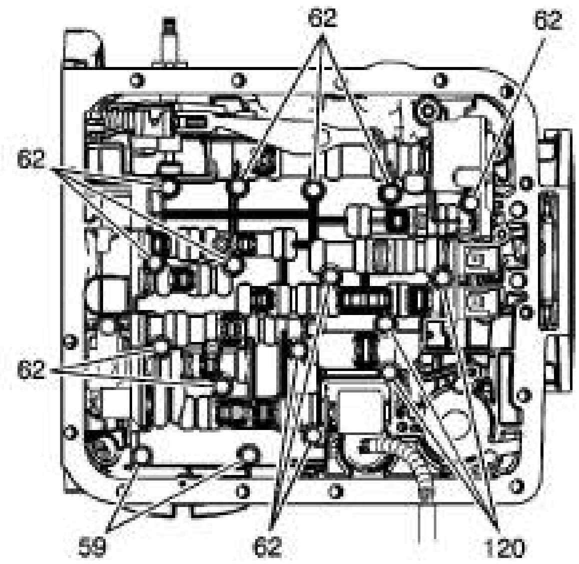
8. Install the 12 valve body bolts (62), 2 bolts (59) and 3 bolts (120) that are shown only.
9. Finger tighten the bolts.



10. Install the transmission wiring harness on the valve body.

Caution: Refer to Fastener Caution in the Preface section.

11. Install the torque converter clutch (TCC) solenoid valve and bolts (68). Tighten the bolts to **8-14 N·m (6-10 lb ft)**.

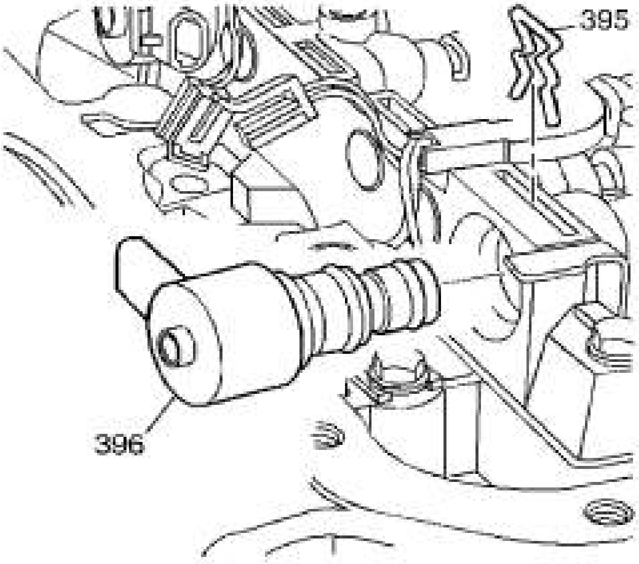


Caution: Do not over-tighten the bolts. Over-tightening the bolts will distort the valve bores. Begin tightening from the center of the valve body tighten the bolts in a outward direction.

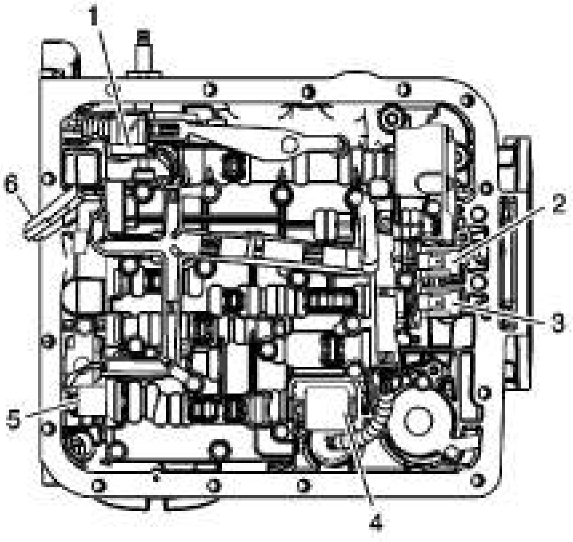
12. Inspect to ensure all of the valve body bolts are in the correct location.

    Each bolt number refers to a specific bolt size, as indicated in the following list:

    - 59 - M6 x 1.0 x 35.0 (Qty: 2)
    - 62 - M6 x 1.0 x 47.5 (Qty: 12)
    - 120 - M6 x 1.0 x 54.4 (Qty: 3)
13. Tighten the bolts from the center of the valve body working your way out in a spiral pattern to the outside edge. Tighten the bolts to **8-14 N·m (6-10 lb ft)**.



14. Install the torque converter clutch pulse width modulation (TCC PWM) solenoid valve (396) and the solenoid retainer (395).

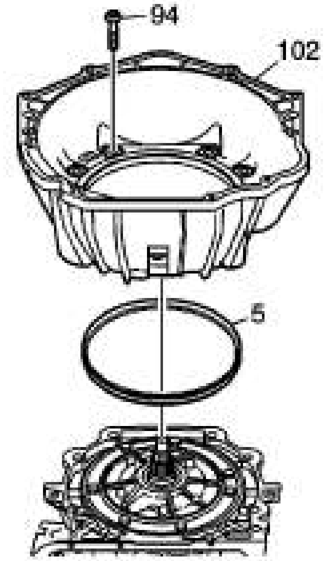


15. Snap the wiring harness in place on the valve body bolts. Ensure the harness loom tab is located under the TFP switch.
16. Install the wiring connectors to the electrical components as indicated in the following list:
    - 1 - Manual shift detent lever with shaft position switch assembly
    - 2 - 1-2 shift solenoid
    - 3 - 2-3 shift solenoid
    - 4 - Pressure control solenoid (PCS)
    - 5 - TCC PWM solenoid
    - 6 - Input speed sensor (ISS)

Converter Housing Installation

Tools Required

- J 41510 T-50 Plus Bit.
- DT-49362 Mortorq Bit.



Important: Ensure converter housing and case face are clean before installing new pump seal.

Important: When installing a new oil pump seal (5), the seal will protrude slightly above the case surface. The oil pump seal is a wedge design that will conform to the surfaces between the oil pump body and the transmission case as the converter housing (105) is installed.

1. Install the oil pump seal (5). Seat oil pump seal (5) by hand, between pump body and case. Ensure the seal is evenly seated.
2. Install the converter housing (102).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the converter housing retaining bolts (94) to the transmission case. Use the J 41510 or DT-49362 .

   Tighten
   Tighten the converter housing retaining bolts (94) to 65-75 N·m (48-55 lb ft).

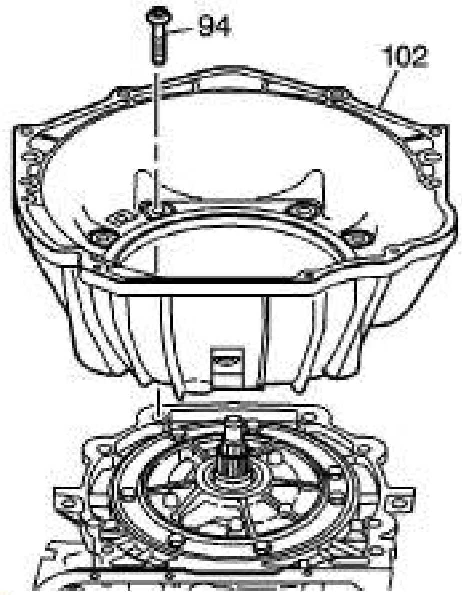
   Tighten converter housing retaining bolts evenly in a star pattern sequence.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975557**

Converter Housing Removal

Tools Required

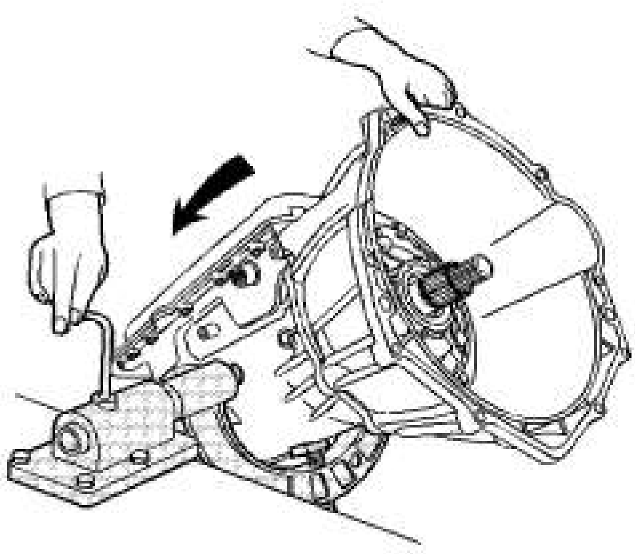
- J 41510 T-50 Plus Bit.
- DT-49362 Mortorq Bit.



1. Remove the converter housing retaining bolts (94). Use the J 41510 or DT-49362 .
2. Remove the converter housing (102).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975555**

Drain Oil



Rotate the transmission so that the converter housing is up. Allow the transmission fluid to drain from the case extension.

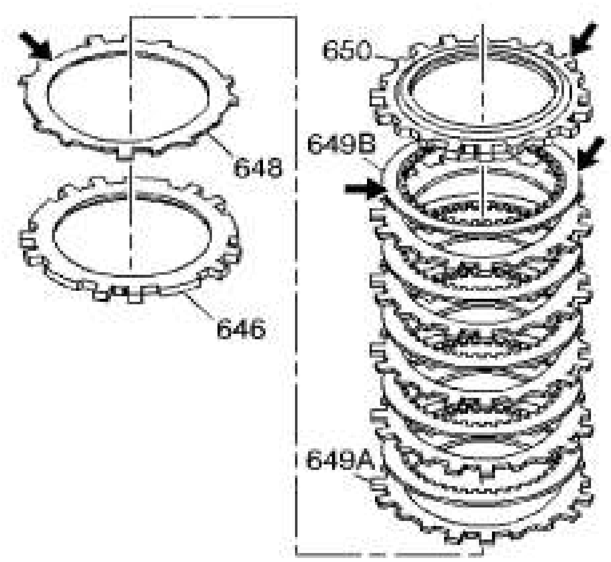
Fluid Pump Rotor and Slide Measurement

- 
Important: Measure the rotor and slide thickness for surface wear. The rotor and slide measurements must both fall into the same thickness range. If the rotor and slide measurements do not fall into the same thickness range, or are outside of all the ranges, the oil pump must be replaced as an assembly.

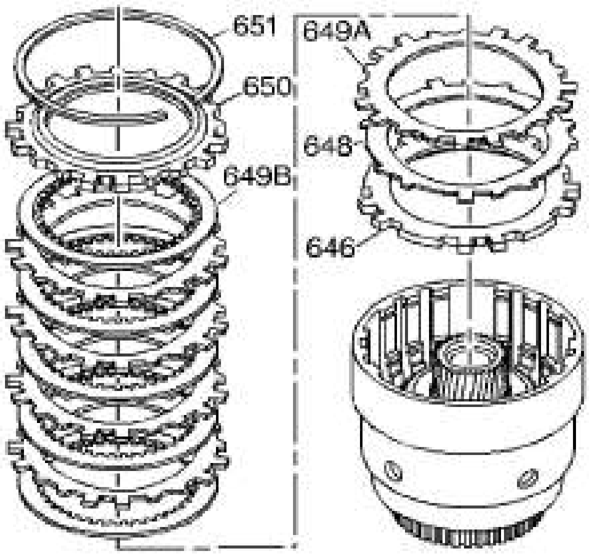
  - Refer to Fluid Pump Rotor and Slide Measurement .
- Measure the oil pump rotor (212) thickness.
- Measure the oil pump slide (203) thickness.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975635**

Forward Clutch Assembly Assemble

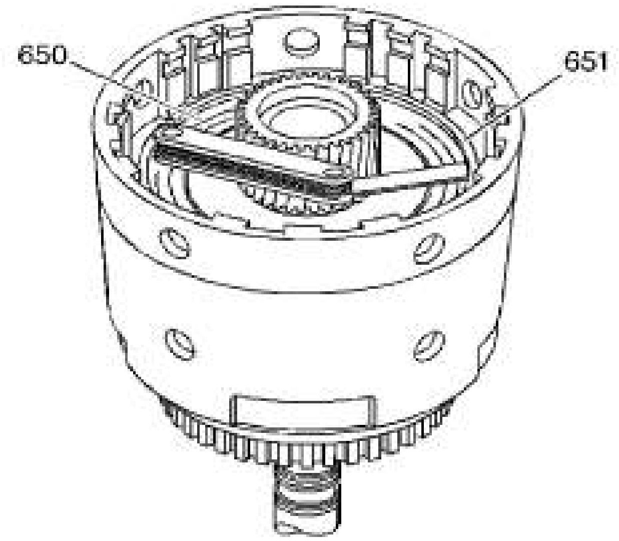


1. Inspect the forward clutch waved plate (648), the apply plate (646), the fiber plate assemblies (649B), the steel plates (649A) and the selective backing plate (650) for the following conditions:
   - Damaged tangs
   - Delamination
   - Excessive wear
   - Heat damage
   - Flatness
   - Surface finish damage
   - Burrs and nicks



2. Install the forward clutch apply plate (646).
3. Install the forward clutch waved plate (648).
4. Install the forward clutch steel plates (649A) and alternate with the fiber plate assemblies (649B).
5. Install the forward clutch selective backing plate (650).
6. Install the forward clutch backing plate retainer ring (651).

Forward Clutch Piston Travel Check

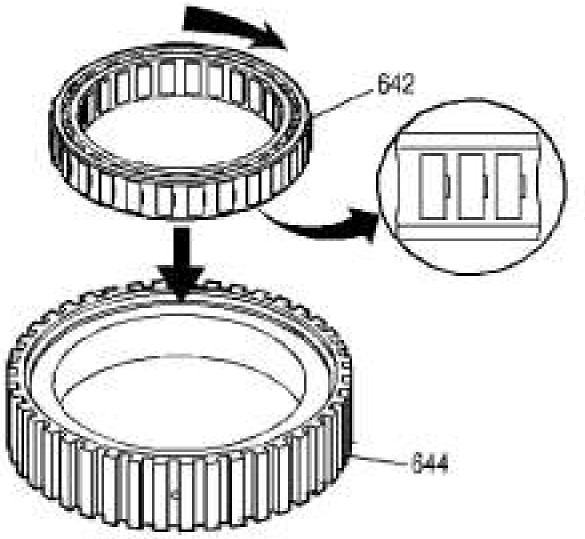


1. Use feeler gauges to check the forward clutch plate travel. Check travel between the forward clutch backing plate retainer ring (651) and the forward clutch selective backing plate (650).

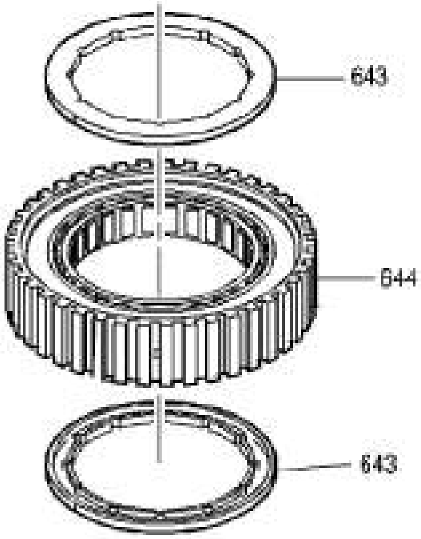
   The forward clutch plate travel should be:

   Specification
   - 245 mm Torque Converter-- 0.766-1.756 mm (0.030-0.069 in)
   - 298 mm/300 mm Torque Converter-- 0.866-1.876 mm (0.034-0.074 in)
2. Select the proper forward clutch selective backing plate (650) to obtain the correct travel.

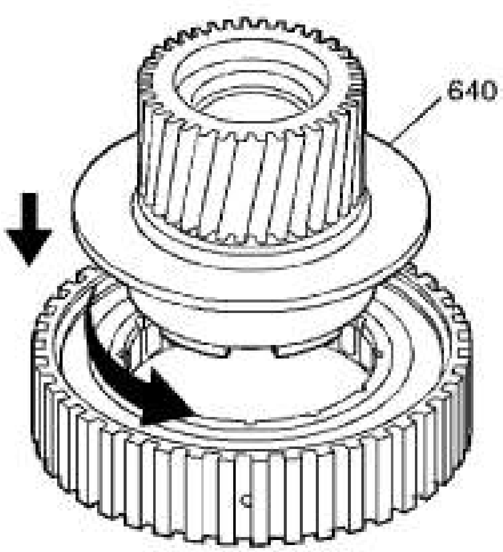
Forward Clutch Sprag Assemble



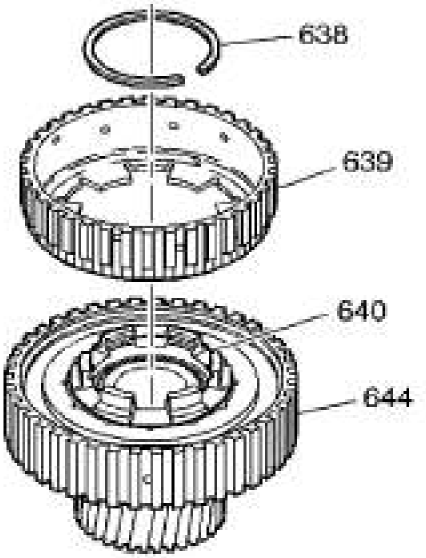
1. Inspect the forward sprag assembly (642) for the following conditions:
   - Wear or damage
   - Weak or broken springs
2. Inspect the forward clutch outer race (644) for the following conditions:
   - Race wear or damage
   - Spline wear
   - Surface finish damage
3. Install the forward sprag assembly (642) into the forward clutch outer race (644).



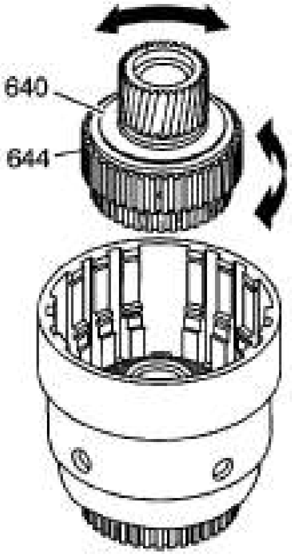
4. Inspect the sprag assembly retainer rings (643) for wear or damage.
5. Install the sprag assembly retainer rings (643) into the forward clutch sprag assembly (644).



6. Inspect the forward sprag clutch inner race and input sun gear assembly (640) for the following conditions:
   - Damaged spline or gear teeth
   - Ring groove damage
   - Surface finish damage
   - Loose retainer
   - Wear
   - Cracks
7. Install the forward sprag clutch inner race and input sun gear assembly (640) into the forward sprag and outer race assembly.



8. Inspect the overrun clutch hub (639) for the following conditions:
   - Spline damage
   - Plugged lubrication holes
   - Damaged tangs
   - Cracks
9. Install the overrun clutch hub (639) onto the sprag clutch inner race and input sun gear assembly (640).
10. Install the overrun clutch hub retaining snap ring (638).



Important: If the forward clutch sprag assembly operates backward, you have installed the sprag backward. Reassemble the sprag correctly.

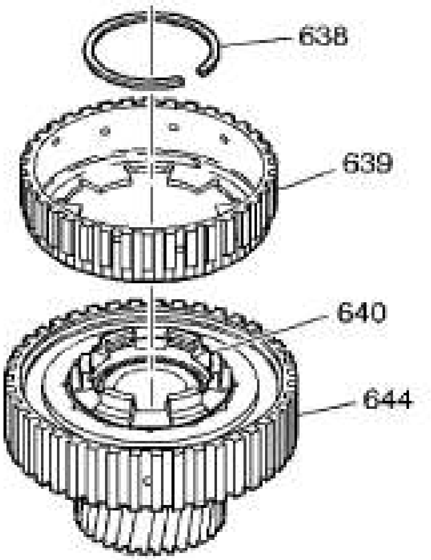
11. Test the forward clutch sprag assembly for proper operation.
    11.1. Position the forward clutch sprag assembly with the input sun gear facing up.

        Important: The sun gear should only rotate in a counterclockwise direction.

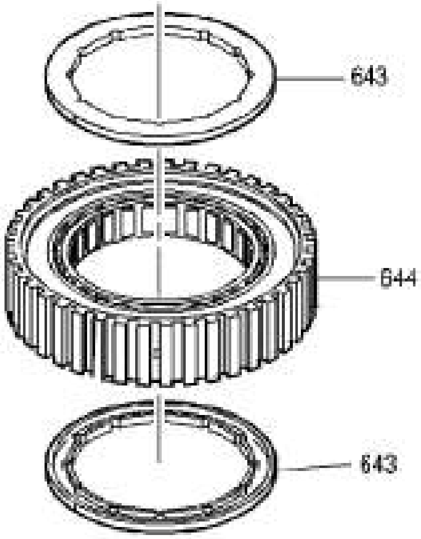
    11.2. Hold the forward sprag clutch outer race (644) with one hand and rotate the input sun gear (640) with the other hand.
12. Install the forward clutch sprag and input sun gear assembly into the input clutch housing.
13. Index the overrun clutch hub into the overrun clutch plates.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975630**

Forward Clutch Sprag Disassemble



1. Remove the overrun clutch hub retaining snap ring (638).
2. Remove the overrun clutch hub (639).
3. Remove the forward sprag clutch inner race and input sun gear assembly (640).

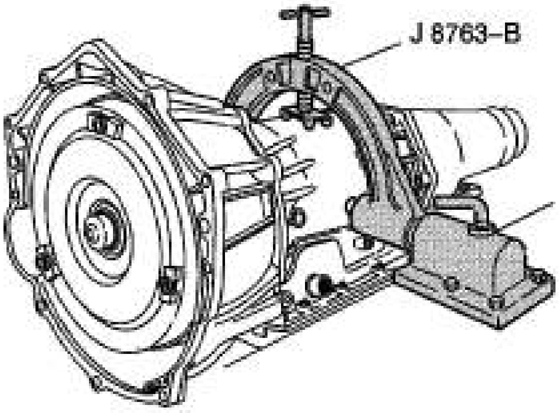


4. Remove the sprag assembly retainer rings (643).
5. Remove the forward sprag assembly from the forward clutch outer race (644).

Holding Fixture Installation

Tools Required

J 8763-B Holding Fixture and Base

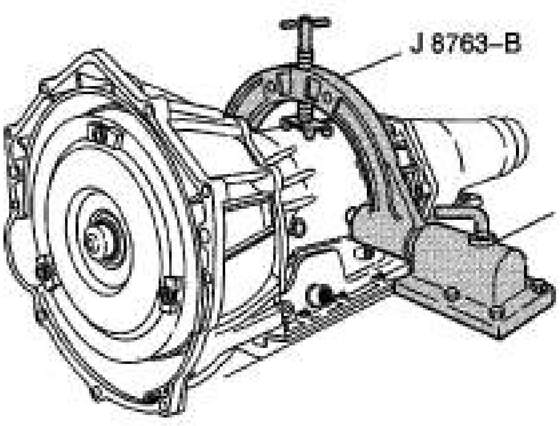


1. Install the J 8763-B onto the transmission.
2. Install the J 8763-B into the base.

Holding Fixture Removal

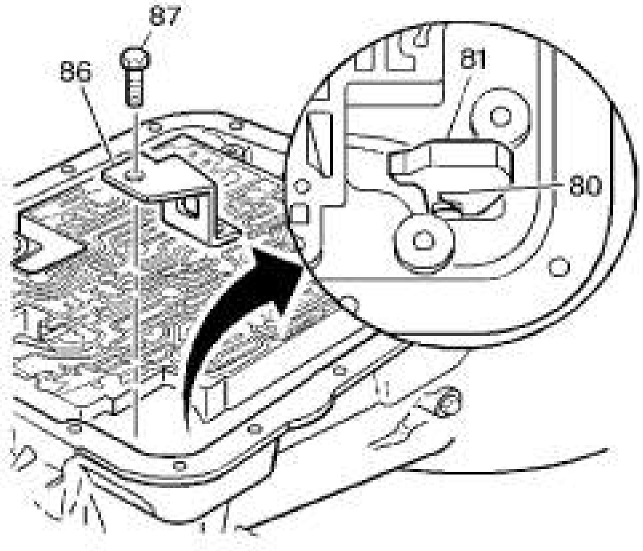
Tools Required

J 8763-B Holding Fixture and Base



Remove the transmission from the J 8763-B .

Inner Manual Linkage Installation



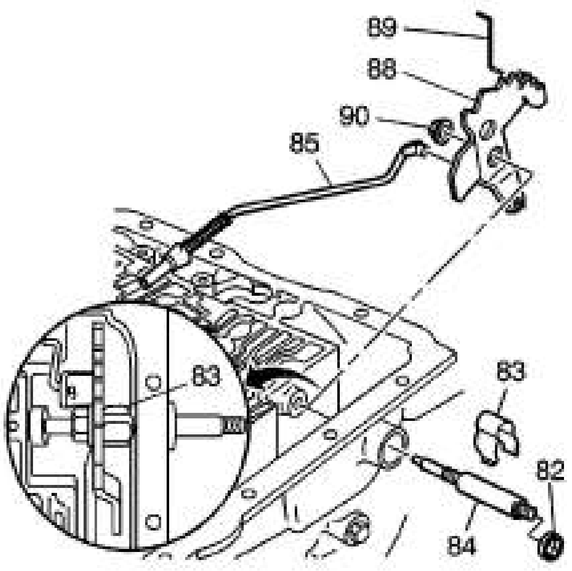
1. Install the parking lock bracket (86).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the parking lock bracket retaining bolt (87).

   Tighten
   Tighten the retaining bolt to 31 N·m (23 lb ft).

3. Inspect the following items:
   - The parking brake pawl (81) for damage or cracks
   - The parking pawl return spring (80) for being broken or missing

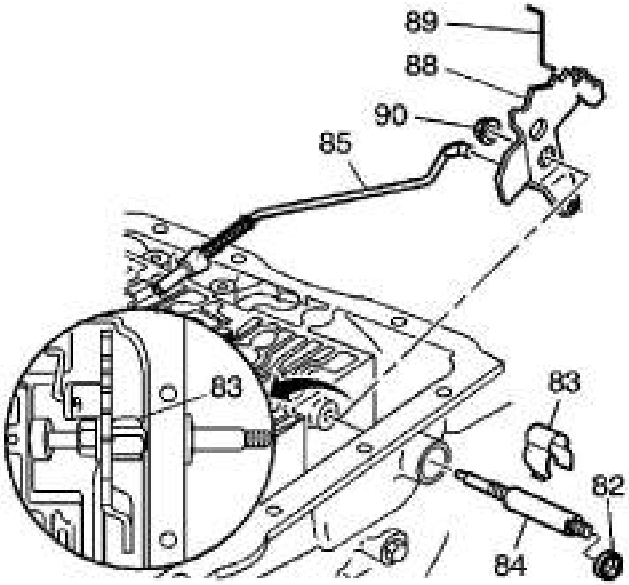


4. Inspect the following items:
    - The manual shaft retainer (83) for damage or cracks
    - The manual shaft (84) for damage or burrs
    - The parking lock actuator assembly (85) for damage
    - The inside detent lever (88) for damage or cracks
    - The manual valve link (89) for damage
    - The hex head nut (90) for damage or stripped threads
5. Install the following items:
    - The inside detent lever (88)
    - The parking lock actuator assembly (85)
    - The manual shaft (84) (model dependent)
    - The manual shaft retainer (83)
    - The hex head nut (90)
    - The manual valve link (89)

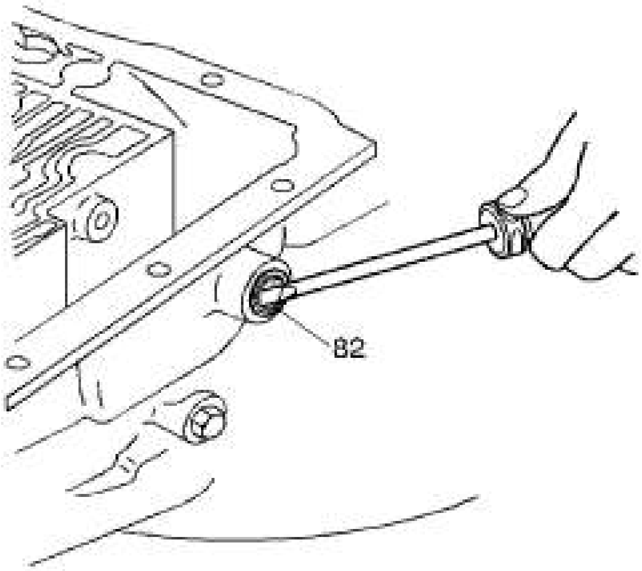
Tighten
Tighten the retaining nut to 31 N·m (23 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975580**

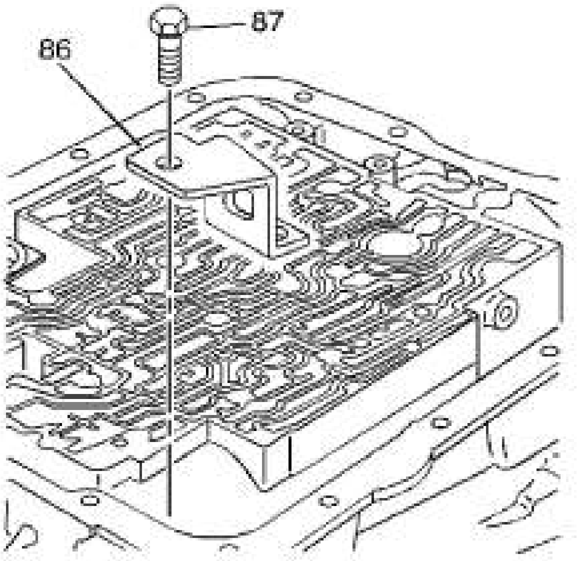
Inner Manual Linkage Removal



1. Remove the following parts:
    1.1. Hex head nut (90)
    1.2. Manual valve link (89)
    1.3. Detent lever (88)
    1.4. Parking lock actuator assembly (85)
    1.5. Manual shaft retainer (83)
    1.6. Manual shaft (84)



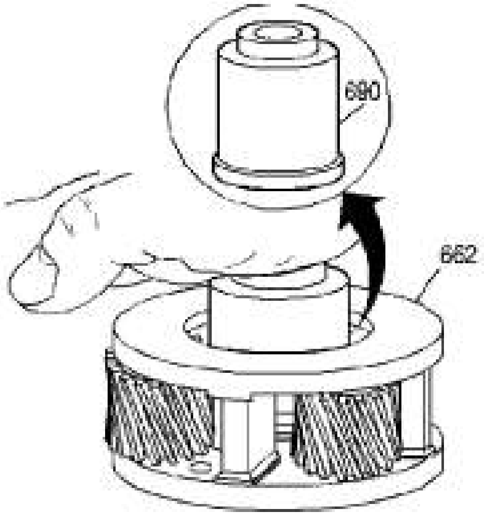
2. Remove the manual shaft seal (82) using a suitable tool.



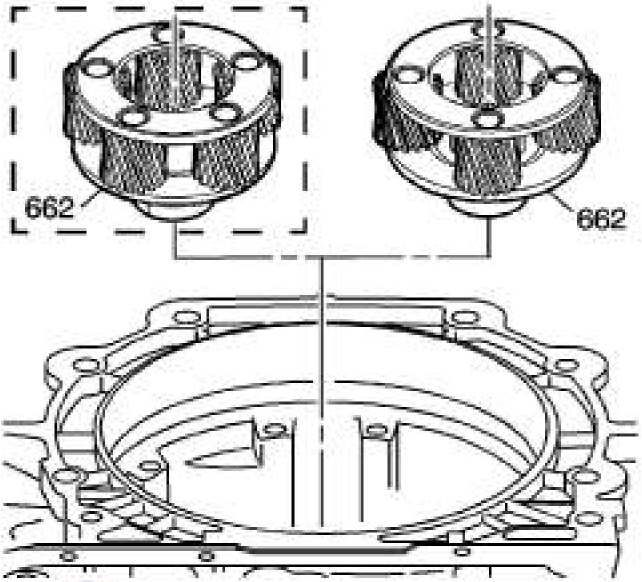
3. Remove the following components:
    3.1. The parking lock bracket retaining bolt (87)
    3.2. The parking lock bracket (86)

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975624**

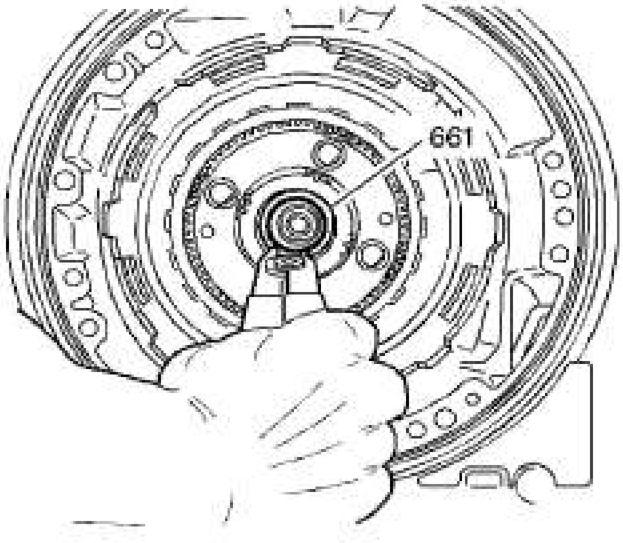
Input Carrier Inspection and Installation



1. Inspect the input carrier captive thrust bearing assembly. To check the captive thrust bearing in the input carrier (662) for wear, place a bushing or an output shaft sleeve (690) onto the bearing race and turn it with the palm of your hand. Do not touch the pinion gears. Any imperfections will be felt through the bushing.



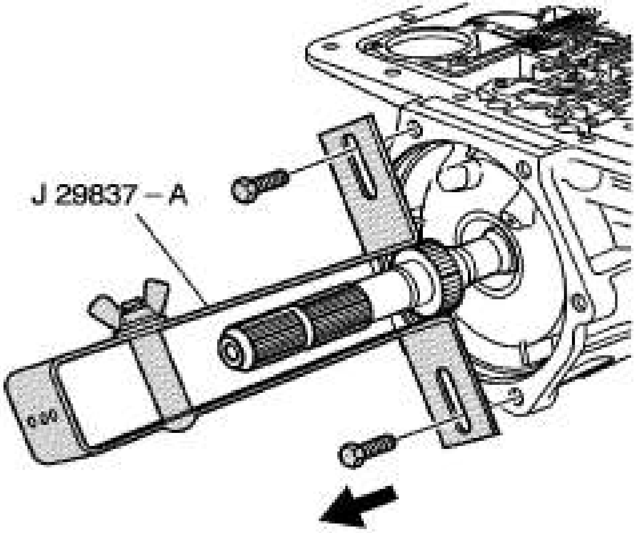
2. Install the input carrier assembly (662) onto the output shaft. The carrier assembly can be either a 4 or 5 pinion design, depending on model.



Important:

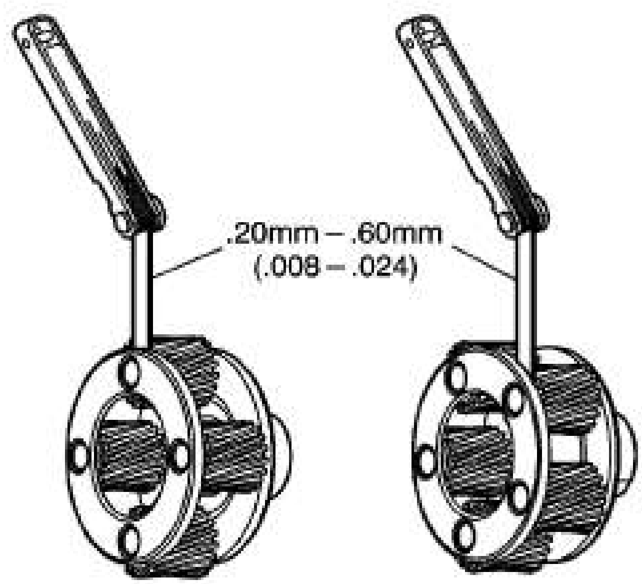
- Do not reuse the old output shaft to input carrier retainer (661).
- Do not over expand the new output shaft to input carrier retainer during installation.

3. Install a new output shaft to input carrier retainer (661).



4. Remove the J 29837-A .

Input Carrier Inspection



Important: Check end play on each pinion. Clearance is the same for 4 or 5 pinion design.

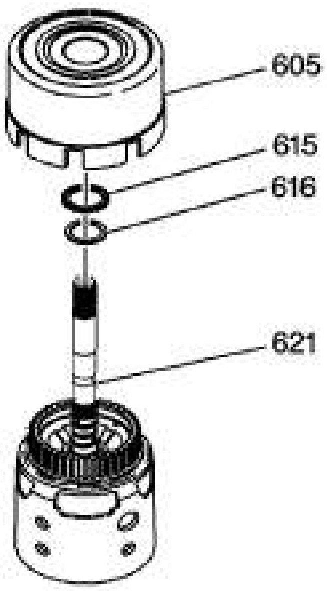
1. Check the input carrier pinion end play. The end play must not exceed 0.61 mm (0.024 in).
2. Inspect the input carrier for pinion gear damage, proper pin stake and keystoned pinion gears. Pinions must rotate freely.

Input Clutch Assembly Disassemble

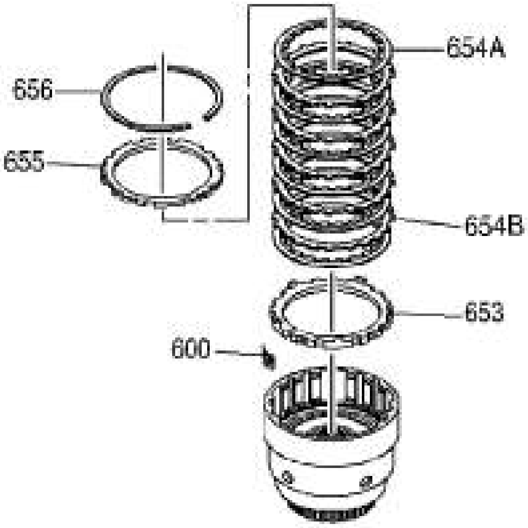
Removal Procedure

Tools Required

- J 23327-1 Forward Clutch Spring Compressor (Bridge)
- J 23456 Booster and Clutch Pack Compressor
- J 25018-A Clutch Spring Compressor Adapter



1. Remove the reverse input clutch housing and drum assembly (605) from the input clutch assembly (621).
2. Remove the stator shaft/selective washer bearing assembly (615).
3. Remove the selective thrust washer (616).

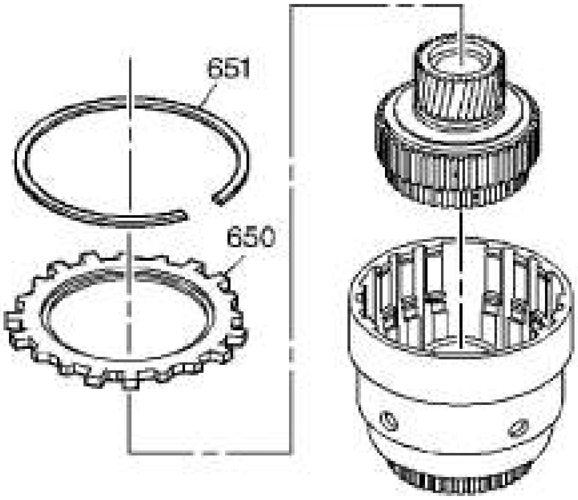


4. Remove the 3rd and 4th clutch backing plate retainer ring (656).

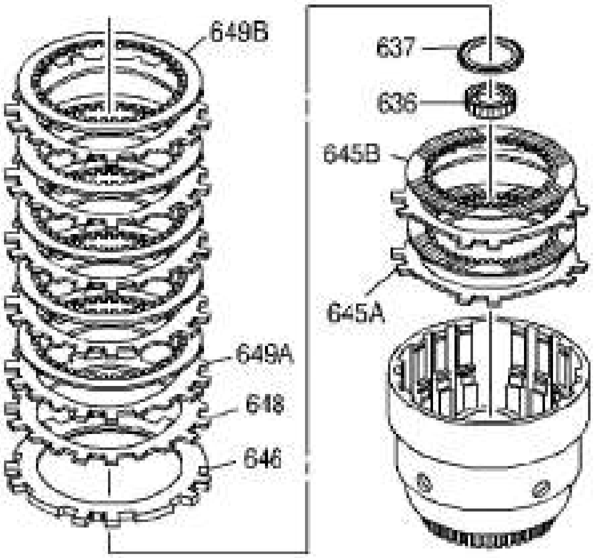
Notice: Refer to General Repair Instructions in the Preface section.

Important: The 3rd and 4th clutch plate stack is model specific. Clutch plate stack up may be either 6 or 7 plates.

5. Remove all 3rd and 4th clutch plates (653-655).
6. Remove the 3-4 clutch boost spring assemblies (600).

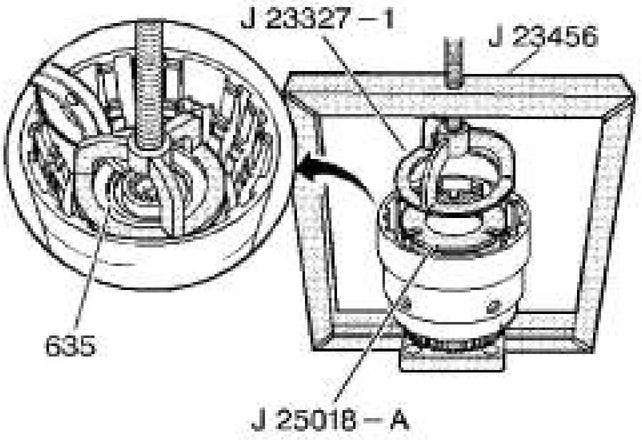


7. Remove the forward clutch backing plate retainer ring (651).
8. Remove the forward clutch selective backing plate (650).
9. Remove the forward clutch sprag assembly.



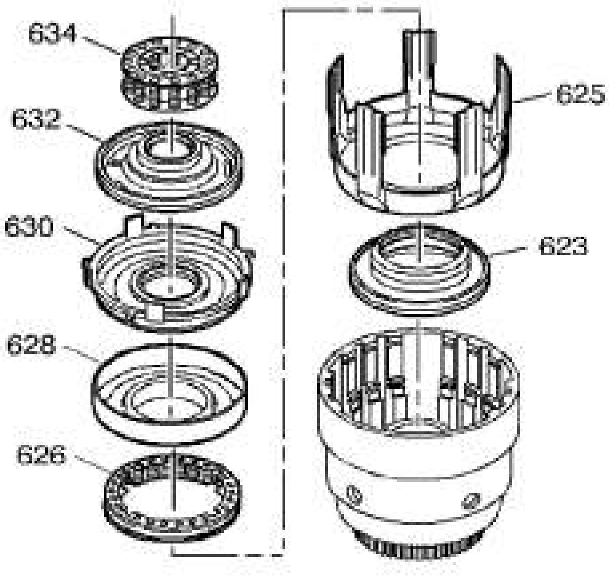
649B
637
636
645B
645A
649A
648
646

10. Remove all forward clutch plates (646, 648, 649A, 649B).
11. Remove the input sun gear bearing assembly (637).
12. Remove the input housing to output shaft seal (636).
13. Remove all overrun clutch plates (645A, 645B).



J 23327 –1
J 23456
635
J 25018 – A

14. Install the J 23327-1 and the J 25018-A .
15. Compress the overrun clutch spring, using the J 23456 .
16. Remove the overrun clutch spring retainer snap ring (635).
17. Remove the J 23327-1 and the J 25018-A .



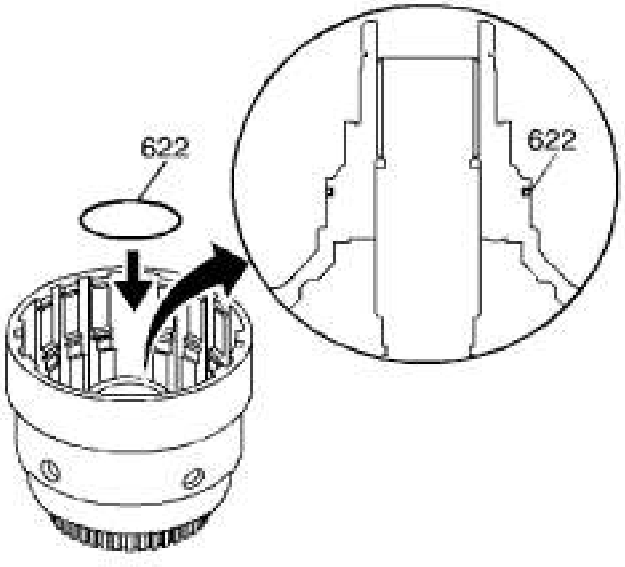
18. Remove the overrun clutch spring assembly (634).
19. Remove the overrun clutch piston (632).
20. Remove the forward clutch piston (630).
21. Remove the forward clutch housing (628).
22. Remove the 3rd and 4th clutch spring assembly (626).
23. Remove the 3rd and 4th clutch apply ring (625).
24. Remove the 3rd and 4th clutch piston (623).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975628**

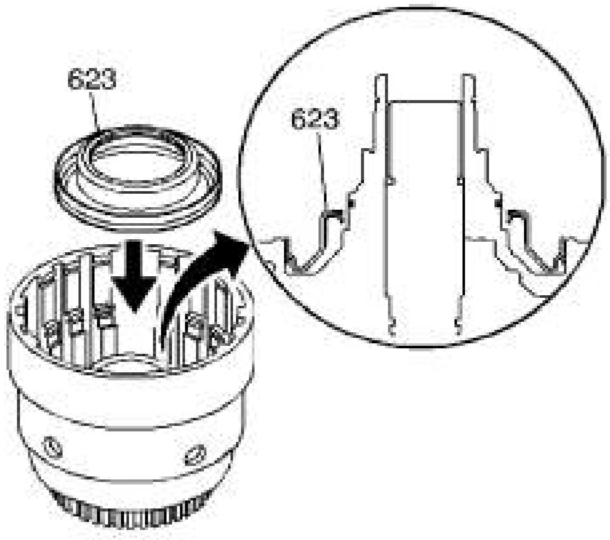
Input Housing and Shaft Assembly Assemble

Tools Required

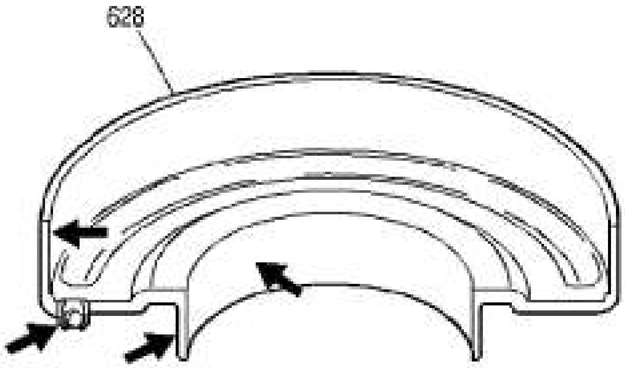
- J 23327-1 Forward Clutch Spring Compressor (Bridge)
- J 23456 Booster and Clutch Pack Compressor
- J 25018-A Clutch Spring Compressor Adapter
- J 26744-A Seal Installer
- J 29882 Overrun Clutch Seal Protector
- J 29883 Forward Clutch Seal Protector



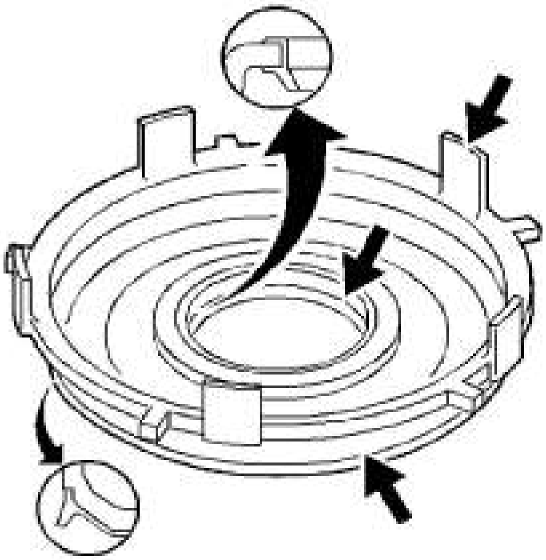
1. Install a new input to forward clutch housing O-ring seal (622).



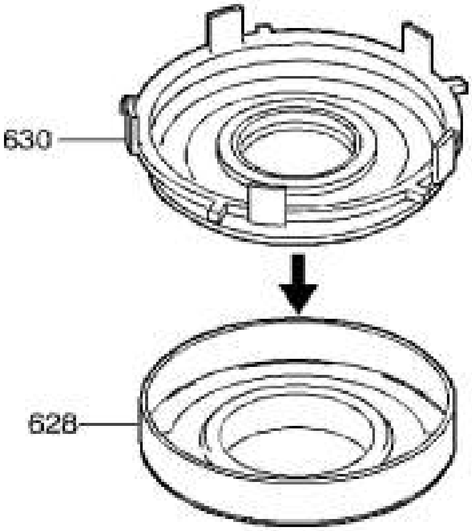
2. Inspect the 3rd and 4th clutch piston (623) for the following conditions:
   - Porosity or damage
   - Seal damage
3. Install the 3rd and 4th clutch piston (623) into the input housing.



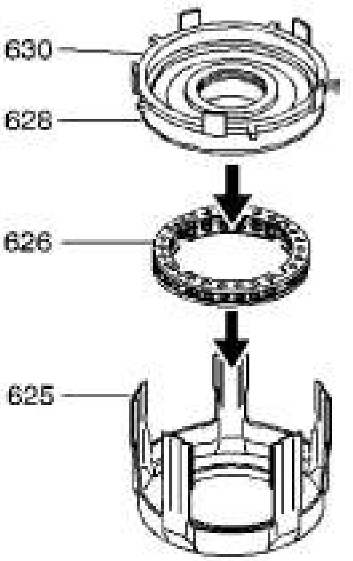
4. Inspect the forward clutch housing (628) for the following conditions:
   - Proper check ball operation
   - Damage or distortion
   - Burrs in the seal areas
   - Cracks



5. Inspect the forward clutch piston for the following conditions:
    - Porosity or damage
    - Seal damage
    - Apply leg damage



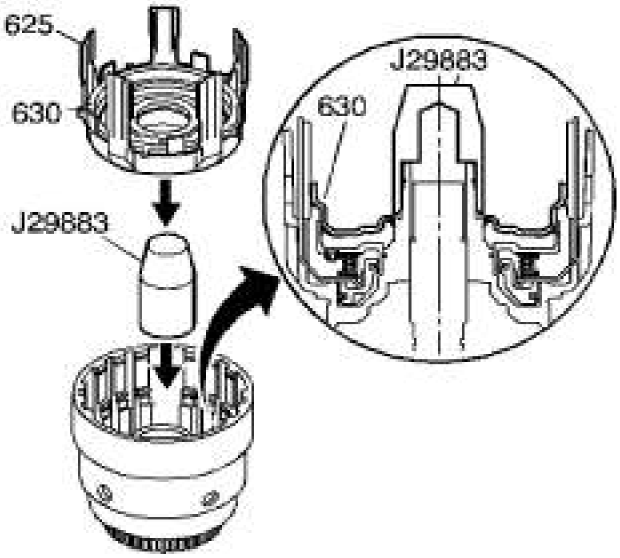
6. Install the forward clutch piston (630) into the forward clutch housing (628).



7. Install the 3rd and 4th spring assembly (626) into the 3rd and 4th clutch apply ring (625).

Important: The forward clutch piston (630) apply legs must be indexed with the 3rd and 4th clutch apply ring (625) legs.

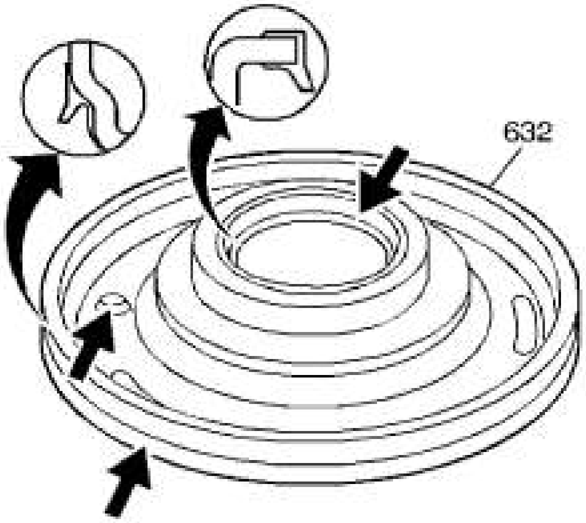
8. Install the forward clutch housing (628) and forward clutch piston (630) into the 3rd and 4th apply ring (625).



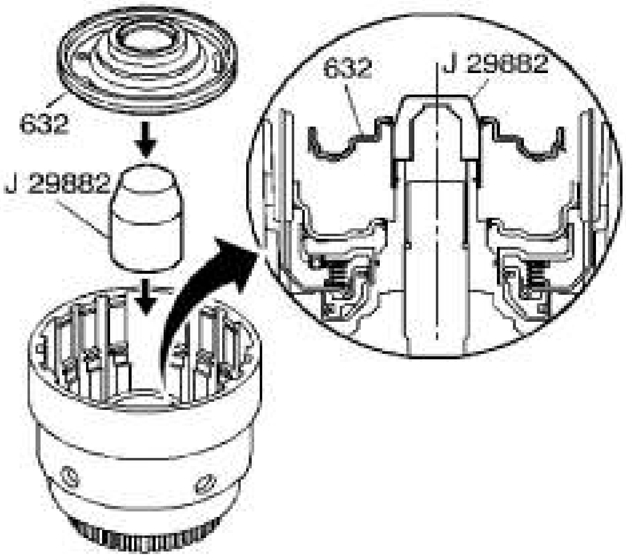
9. Install the J 29883 on the input housing.
10. Install the 3rd and 4th clutch apply ring and the forward housing and piston assembly using the following procedure:
    - Hold the assembly by the 3rd and 4th clutch apply ring (625) legs during installation.
    - Do not let the forward clutch piston (630) separate from the forward clutch housing.

- Firmly seat the assembly.

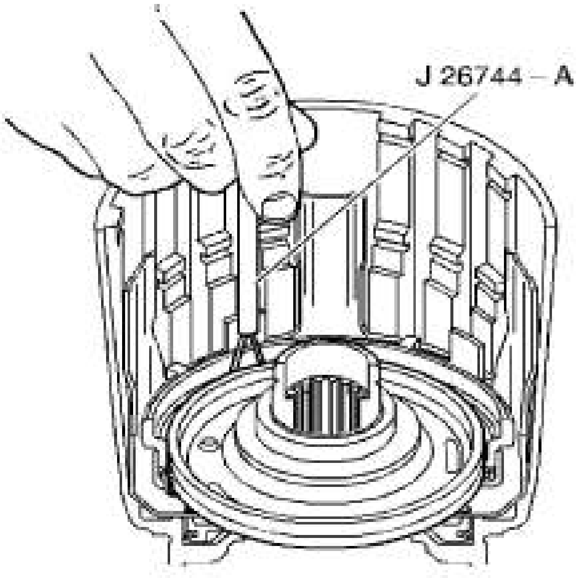
11. Remove the J 29883 from the input housing.



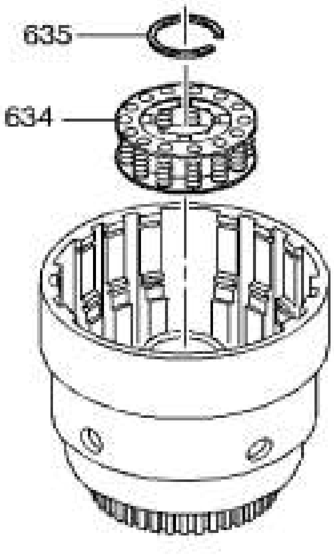
12. Inspect the overrun clutch piston (632) for the following conditions:
    - Porosity or damage
    - Seal damage
    - Overrun clutch ball proper operation



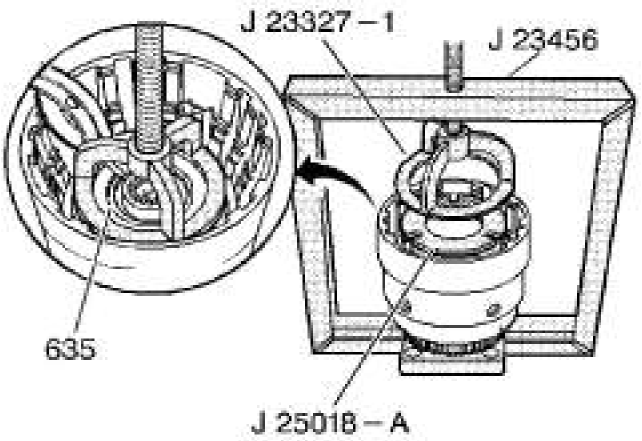
13. Install the J 29882 on the input housing.
14. Install the overrun clutch piston (632) into the input housing.
15. Remove the J 29882 from the input housing.



16. Using the J 26744-A , carefully install the overrun clutch piston outer seal.

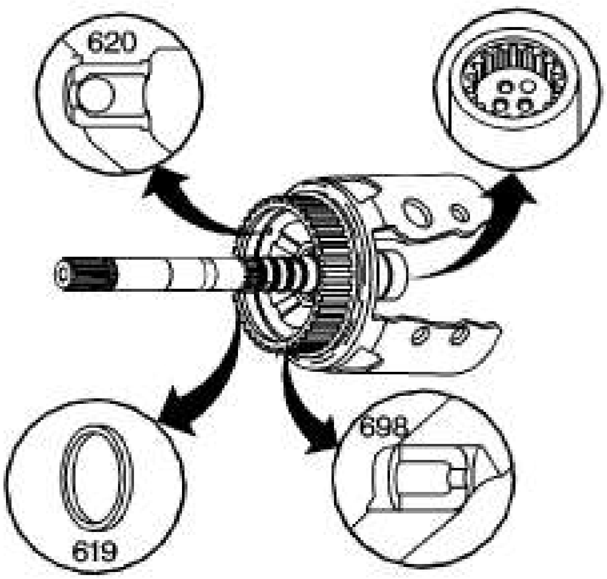


17. Install the overrun clutch spring (634) assembly.

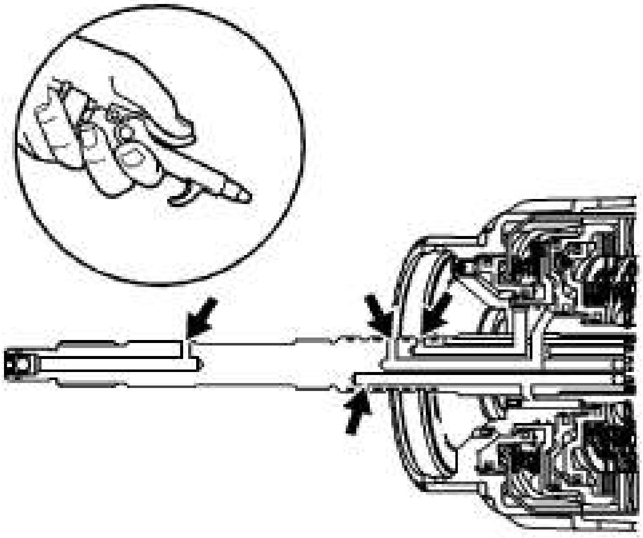


18. Install the J 23327-1 and the J 25018-A , and compress the overrun clutch spring assembly using J 23456 .
19. Install the overrun clutch spring retainer snap ring (635).
20. Remove the J 23327-1 and the J 25018-A .

Input Housing and Shaft Assembly Inspection

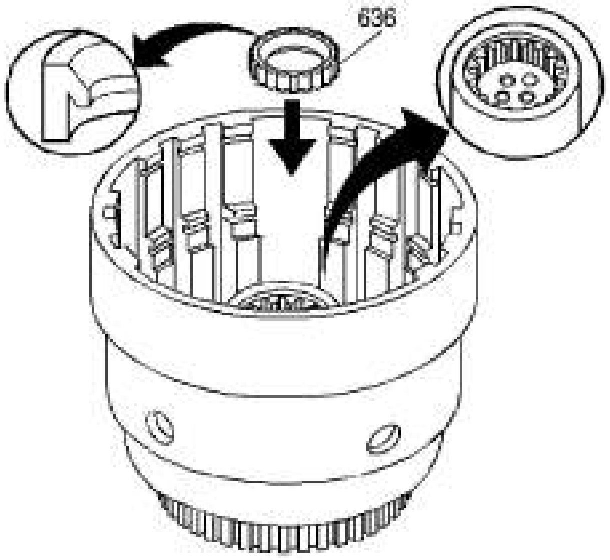


1. Inspect the input housing and shaft assembly for the following conditions:
    - Porosity
    - Spline wear - internal and external
    - Input speed sensor models, rotor teeth for cracks or damage
    - Three turbine shaft ball check valves are present and move freely
    - Retainer and ball check valve assembly (620)
    - Orificed cup plug (698)
    - Lube hole cracks
2. Test the input housing for cracks by tapping housing with wooden handle. Housing should produce a sharp ring.
3. Inspect the turbine shaft oil seal ring (619) grooves for damage or burrs. The oil seal rings (619) must fit loose into the ring grooves.



4. Inspect the oil feed passages for obstructions.
5. Apply compressed air into the passages indicated.

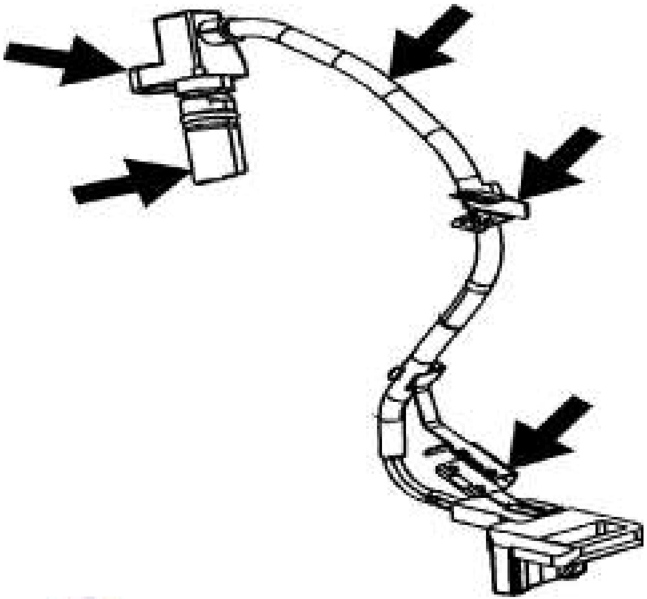
Input Housing to Output Shaft Seal Installation



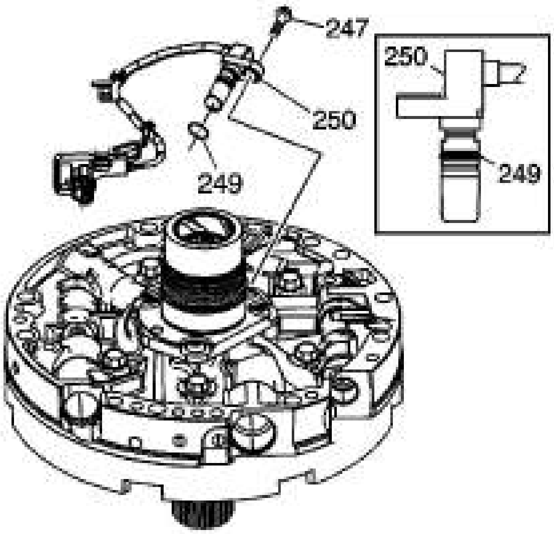
Install a new input housing to output shaft seal (636).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975684**

Input Speed Sensor Installation



1. Inspect the input speed sensor (ISS) assembly (250) for the following conditions:
    - Cracked or damaged housing
    - Worn or missing harness brackets
    - Damaged or worn wining or electrical connector
    - Loose, missing or damaged mounting bolt insert

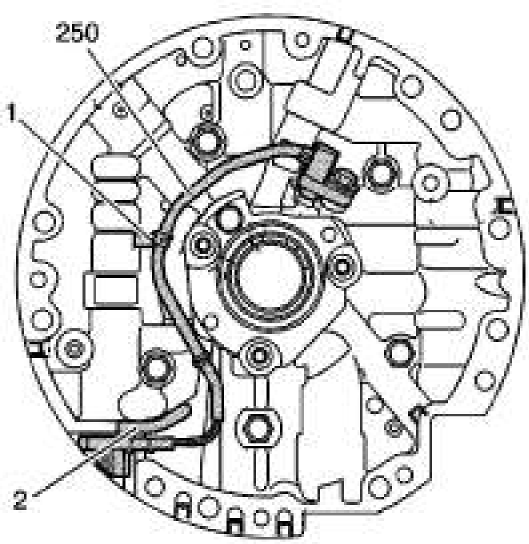


2. Remove the input speed sensor (ISS) O-ring (249) and discard.
3. Lubricate NEW O-ring (249) with transmission fluid and position in the ISS O-ring groove.
4. Insert the ISS (250) into oil pump ISS bore and fully seat.
5. Align ISS bolt insert with oil pump mounting bolt hole.

   Notice: Refer to Fastener Notice in the Preface section.

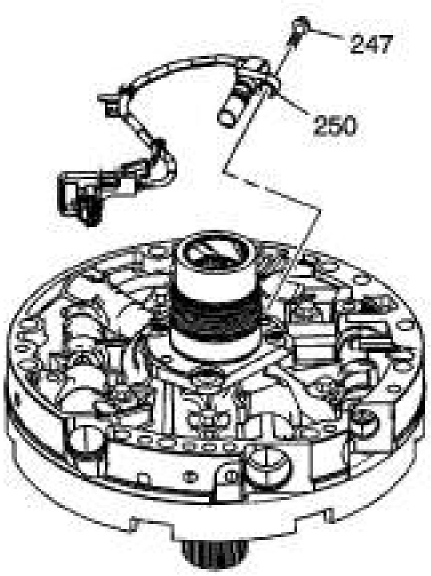
6. Install retaining bolt (247).

   Tighten
   Tighten the retaining bolt to 9-11 N·m (6.6-8.1 lb ft).



7. Route the ISS assembly (250) wire harness as shown. Install harness bracket #1 and #2 in the locations shown. Ensure the wire harness lays flat against the pump housing.

Input Speed Sensor Removal



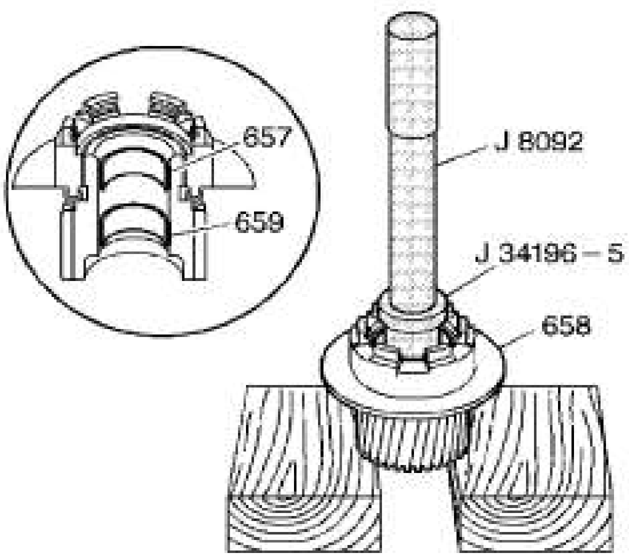
1. Remove the input speed sensor (ISS) retaining bolt (247).
2. Remove the ISS retaining clips and ISS assembly (250).

Input Sun Gear Bushing Replacement

Tools Required

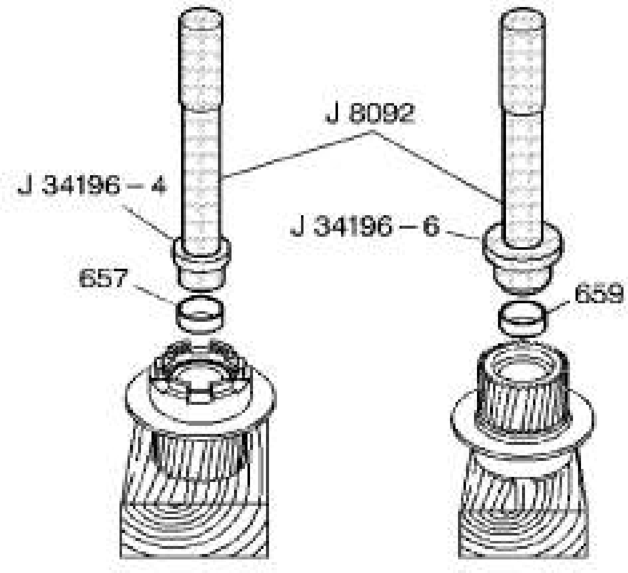
- J 8092 Universal Driver Handle - 3/4 in - 10
- J 34196-B Transmission Bushing Service Set

Removal Procedure



Using J 34196-5 which is part of kit J 34196-B with J 8092 , remove the input sun gear front bushing (657) and rear bushing (659).

Installation Procedure



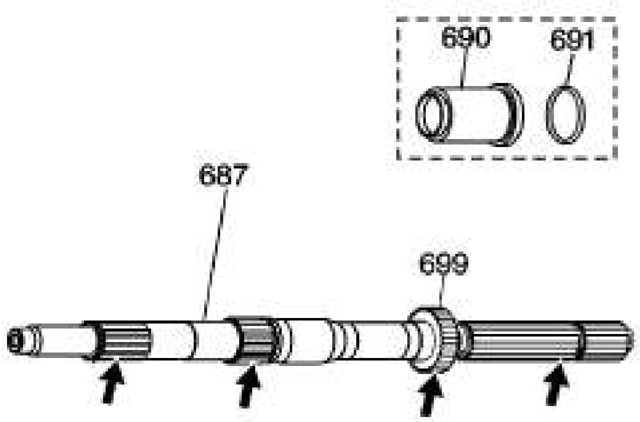
1. Using J 34196-4 which is part of kit J 34196-B with J 8092 , install the input sun gear front bushing (657).
2. Using J 34196-6 which is part of kit J 34196-B with J 8092 , install the input sun gear rear bushing (659).

Internal Transmission Speed Sensor Rotor Replacement

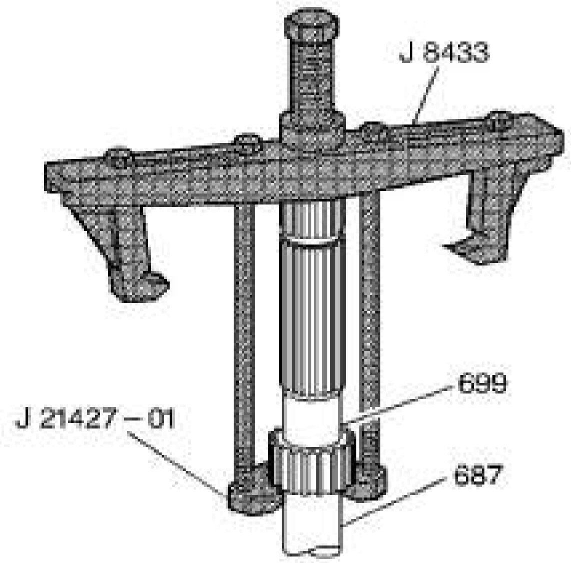
Tools Required

- J 8433 Two Jaw Puller
- J 21427-A Speedometer Gear Puller Adapter
- J 36352 Speed Sensor Rotor Installer Kit

Removal Procedure



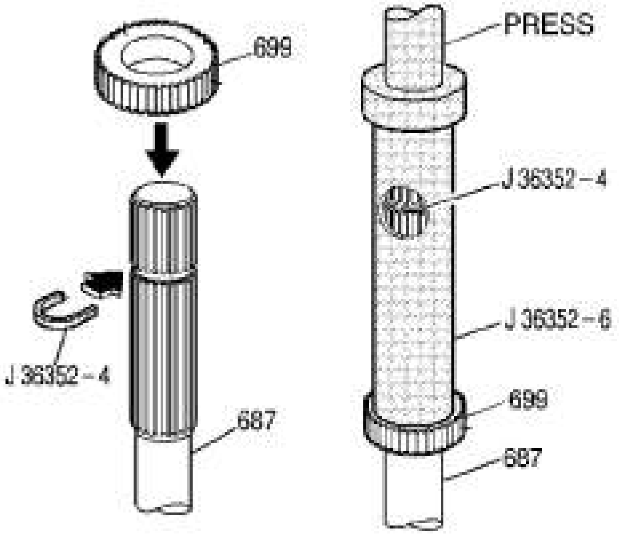
1. Inspect the internal transmission speed sensor rotor (699) for cracks or damaged teeth.
2. Inspect all splines on the output shaft (687) for cracks or damaged splines.
3. Remove the output shaft seal (691) and the output shaft sleeve (690).



J 8433
699
J 21427 – 01
687

4. If the internal speed sensor rotor (699) is damaged, replace it.
5. Using J 8433 with J 21427-01 , remove the internal speed sensor rotor (699) from the output shaft (687).

Installation Procedure



699
J 36352 – 4
687
PRESS
J 36352 – 4
J 36352 – 6
699
687

Important: Do not re-use an internal speed sensor rotor that has been removed.

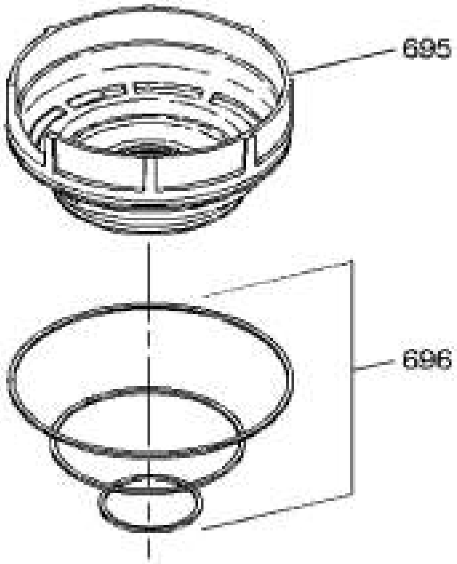
1. Slip a new internal speed sensor rotor (699) over the output shaft splines.
2. Install the J 36352-4 in the groove on the output shaft (687).
3. Place the J 36352-6 on the output shaft (687). Press on the J 36352-6 until it contacts the J

36352-4 in the window (the J 36352-4 will be a positive stop for the J 36352-6 .

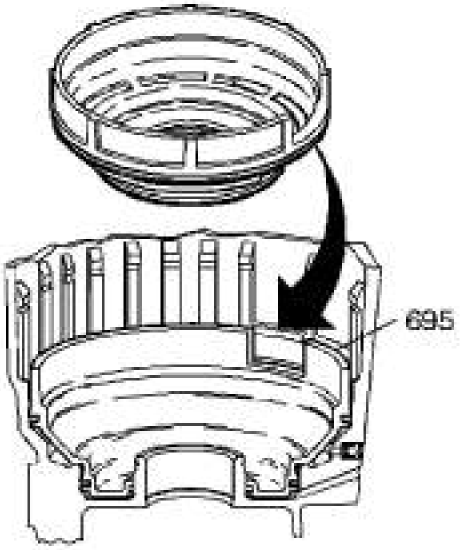
Low and Reverse Clutch Piston Installation

Tools Required

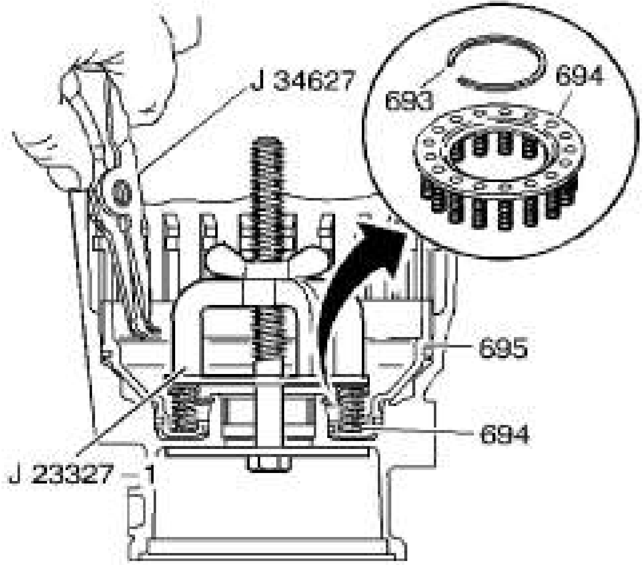
- J 23327-1 Forward Clutch Spring Compressor (Bridge)
- J 34627 J 34627 Snap Ring Remover and Installer



1. Install the transmission (low and reverse clutch outer, center, inner) seals (696) on the low and reverse clutch piston (695).
2. Lubricate the seals with assembly lubricant J 36850 or an equivalent.



3. Install the low and reverse clutch piston (695) into the case. The notch in the piston must be aligned with the parking brake pawl window, in the case.

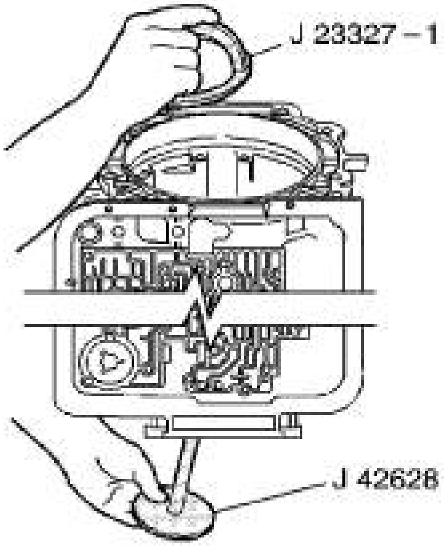


4. Install the low and reverse clutch spring assembly (694).
   - 4.1. Using the J 23327-1 , compress the low and reverse clutch spring assembly (694).
   - 4.2. Using J 36850 install the low and reverse clutch retainer ring (693).

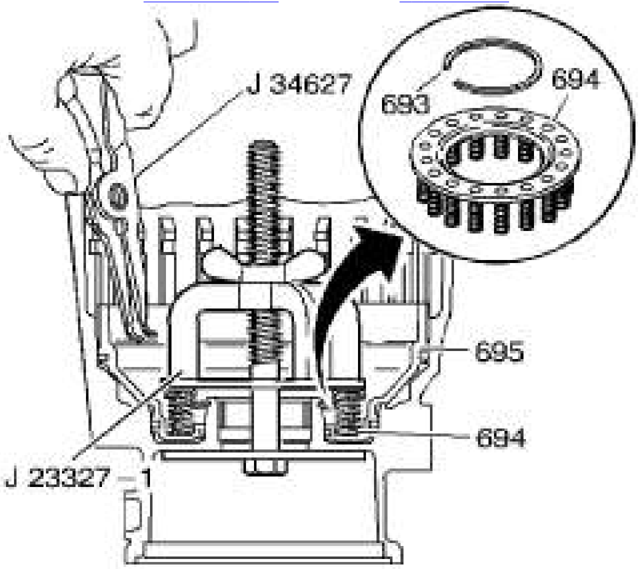
Low and Reverse Clutch Piston Removal

Tools Required

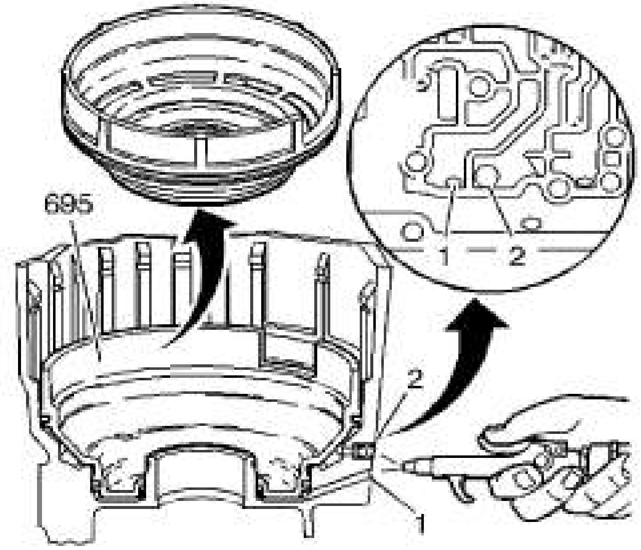
- J 23327-1 Forward Clutch Spring Compressor (Bridge)
- J-34627 Snap Ring Remover and Installer
- J-42628 Disc



1. Install the J 23327-1 and the J-42628 .

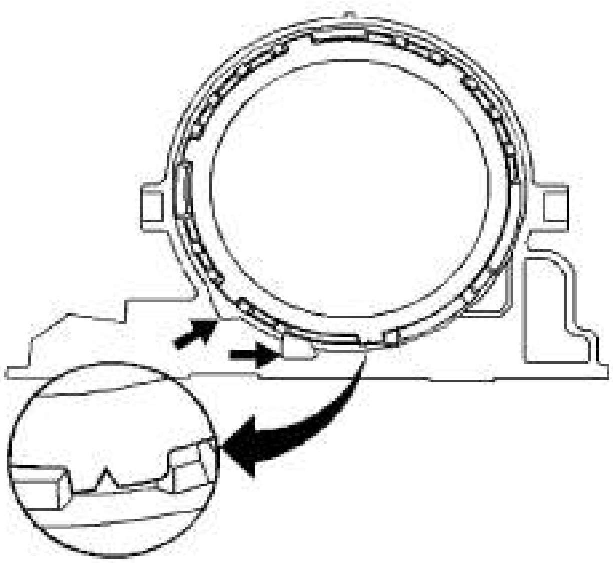


2. Tighten the J 23327-1 .
3. Remove the low and reverse clutch retainer ring (693) using the J-34627 .
4. Remove the low and reverse clutch spring assembly (694).



5. Blow compressed air into the case passage to remove the low and reverse clutch piston (695).
   - (1) LO Feed Passage
   - (2) REV Feed Passage

Low and Reverse Clutch Plate Installation

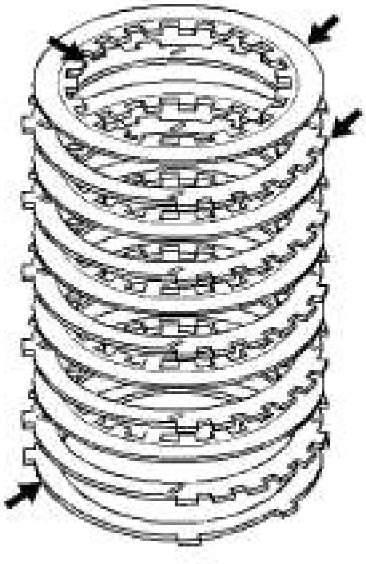


1. Install the waved plate.
2. Install the correct selective spacer plate (from the selection procedure).
3. Install the five fiber plate assemblies and four steel plates, starting with one fiber plate assembly and alternating with steel.
4. Index the steel plate splines in the case as shown.

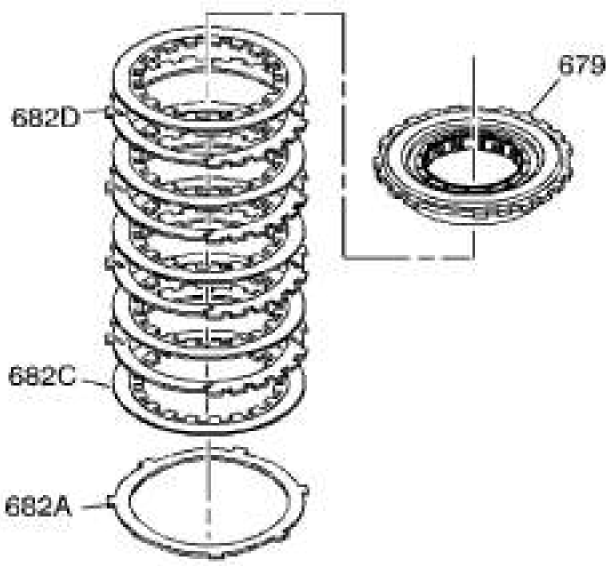
Low and Reverse Clutch Spacer Plate Selection

Tools Required

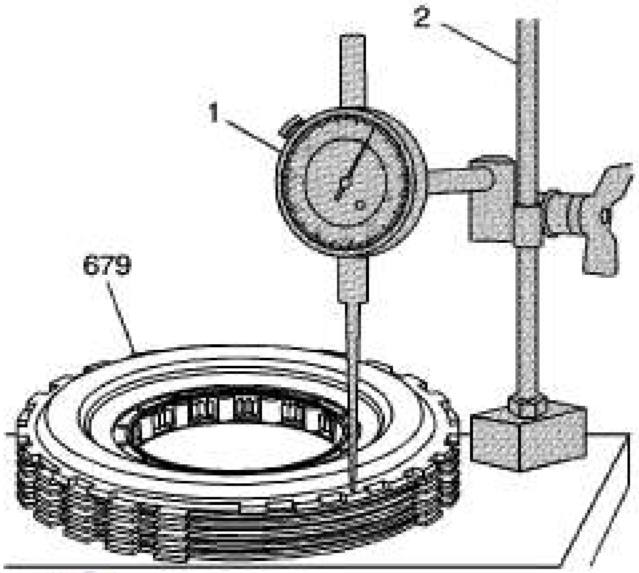
- J 8001 Dial Indicator Set
- J 26900-13 Magnetic Indicator Base



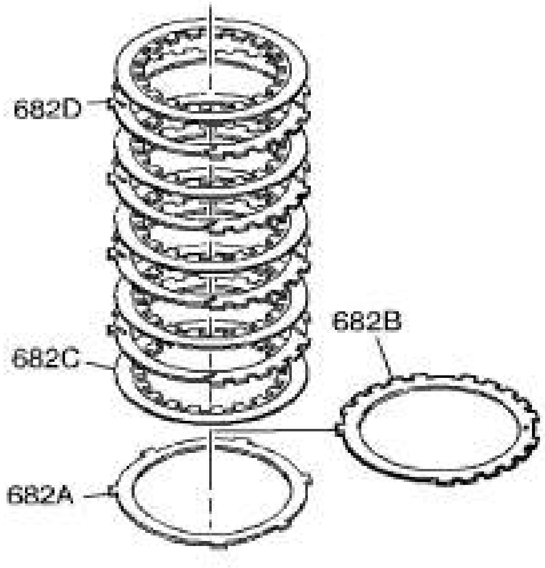
1. Inspect the low and reverse clutch plates for the following conditions:
   - Composition material wear
   - Composition material heat damage
   - Composition material delamination
   - Steel plates heat damage
   - Steel plates surface finish damage



2. Stack the low and reverse clutch plate assembly on a flat surface in the following order:
   - 2.1. One waved plate (682A)
   - 2.2. Five fiber plate assemblies (682C) and four steel plates (682D), starting with one fiber plate assembly and alternating with steel
   - 2.3. Low and reverse clutch support (679)



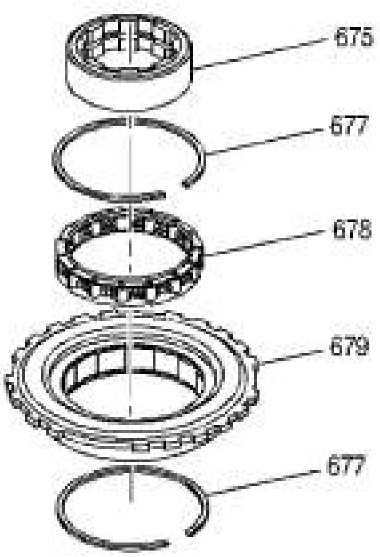
3. Using the J 8001 (1) and the J 26900-13 (2), measure the height of the clutch pack from the work surface to the top of the low and reverse clutch support (679).



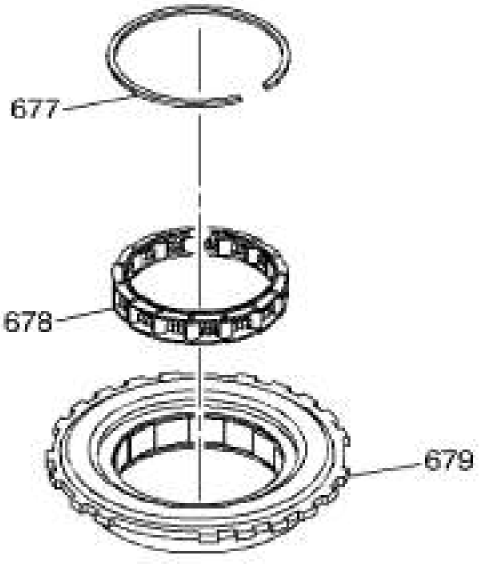
4. Install the proper selective spacer plate (682B) between the wave plate (682A) and the first fiber plate assembly (682C), with the identification side up.

   The overall height for the clutch pack including the selective spacer plate should be 29.23-29.90 mm (1.15-1.18 in).

Low and Reverse Clutch Support Disassemble



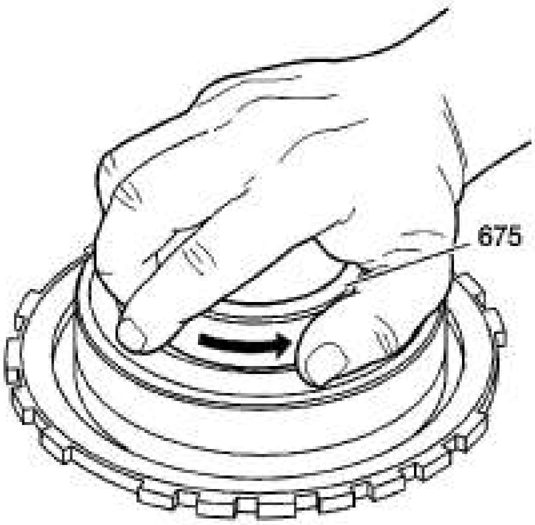
1. Remove the low and reverse roller clutch race (675) from the low and reverse clutch support (679). Inspect the race for damage and surface finish.
2. Remove the two low and reverse roller retainer rings (677) and the low and reverse roller clutch assembly (678). Inspect the roller clutch assembly for damaged rollers and broken springs.
3. Inspect the low and reverse clutch support (679) for loose cam and cam surface finish. Check the support for cracks and damaged lugs.



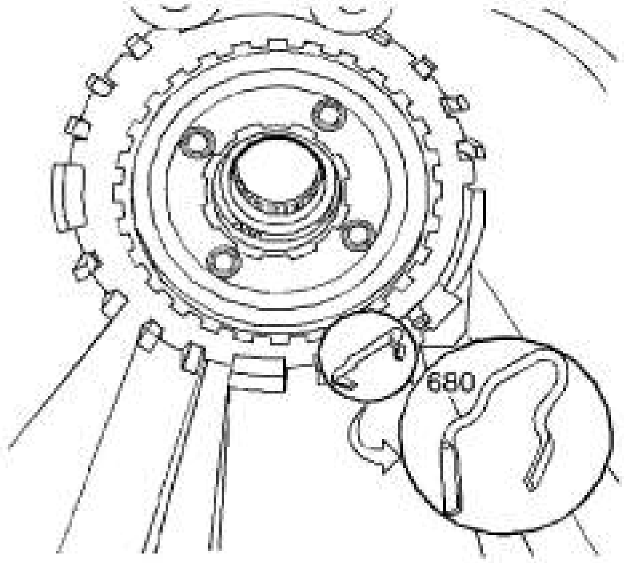
4. Clean and install the low and reverse roller clutch assembly (678) into the low and reverse

clutch support (679). Install the low and reverse retainer ring (677).

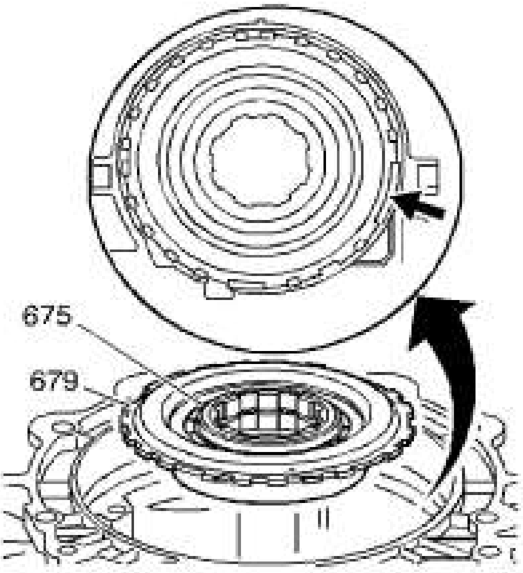
Low and Reverse Clutch Support Installation



1. Install the low and reverse roller clutch race (675). Simultaneously, turn and insert the race.
2. Rotate the race in order to verify proper operation. The race should only rotate in one direction.

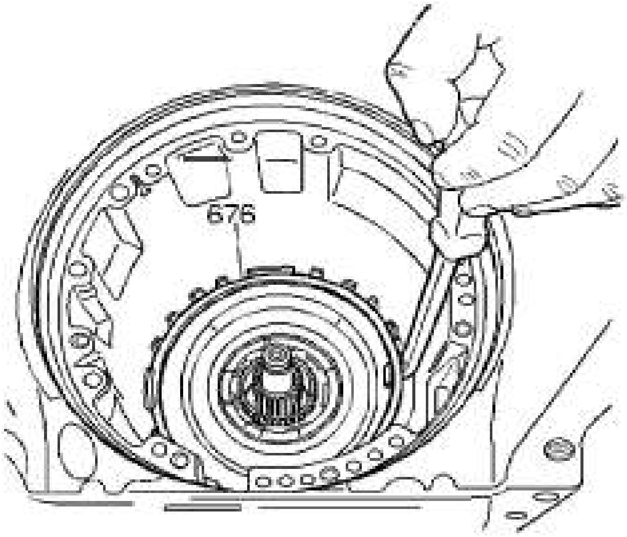


3. Install the low and reverse clutch support retainer spring (680) into the case.



Important: Align the wide low and reverse clutch support notch with the wide case lug.

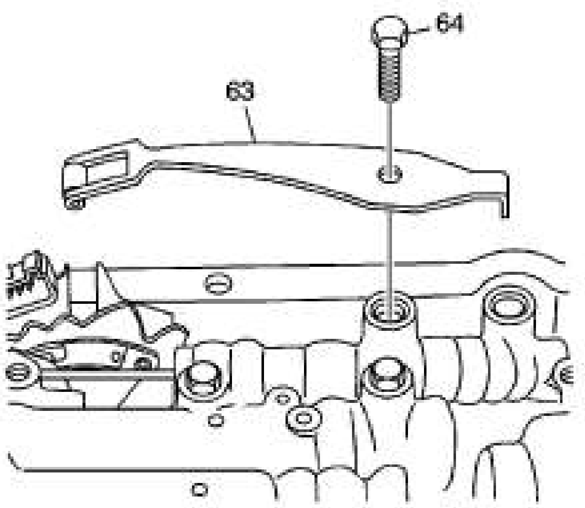
4. Install the low and reverse clutch support (679), roller clutch and roller clutch race (675) assembly into the case. Position the hub side down during the installation.



Important: Align the opening of the low and reverse clutch support retainer ring (676) with the low and reverse clutch support retainer spring (680). It is important that the low and reverse clutch support retainer ring opening is centered around the retainer spring. This will allow the retainer ring to fully seat in all of the transmission case lugs. If the retainer ring lays up against the retainer spring, the retainer ring will not fully seat. Possible damage to the transmission case lugs can occur if the low and reverse clutch support retainer ring is not fully seated in the transmission case lug.

5. Install the low and reverse support retainer ring (676) into the case.

Manual Detent Spring Installation



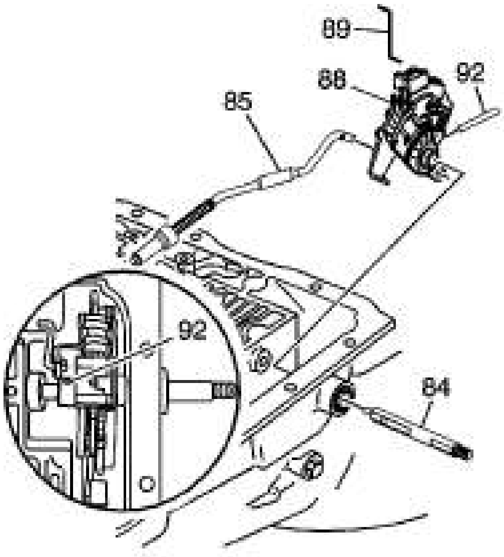
1. Inspect the manual detent spring assembly (63) for cracks or damage.
2. Install the manual detent spring assembly (63).

   Caution: Refer to Fastener Caution in the Preface section.

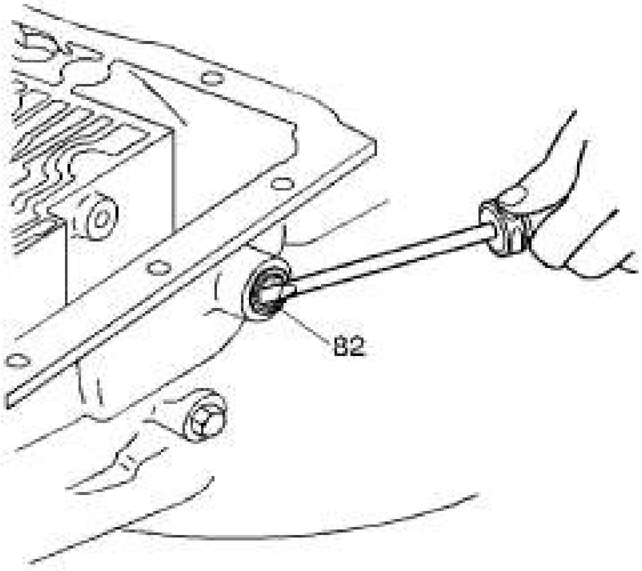
3. Install the manual detent spring bolt (64). Tighten the bolt to **20-27 N·m (15-20 lb ft)**.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 2036970**

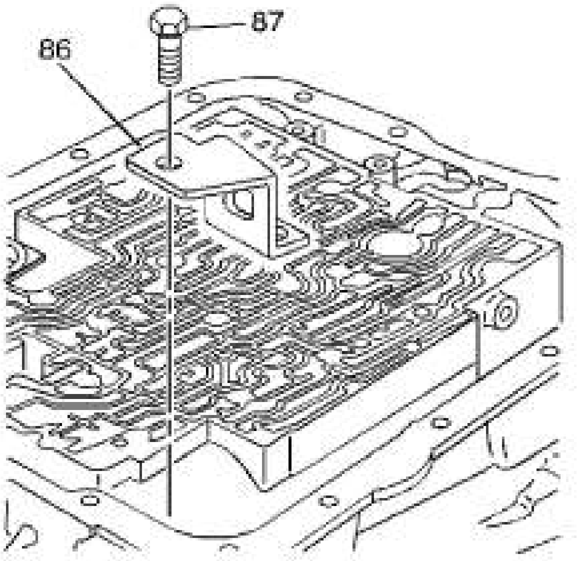
Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Removal



1. Remove the following parts:
   1. 1.1. Manual valve link (89)
   2. 1.2. Manual shift detent lever hub pin (92) discard, do not reuse
   3. 1.3. Manual shift detent lever with shaft position switch assembly (88)
   4. 1.4. Parking lock actuator assembly (85)
   5. 1.5. Manual shaft (84)

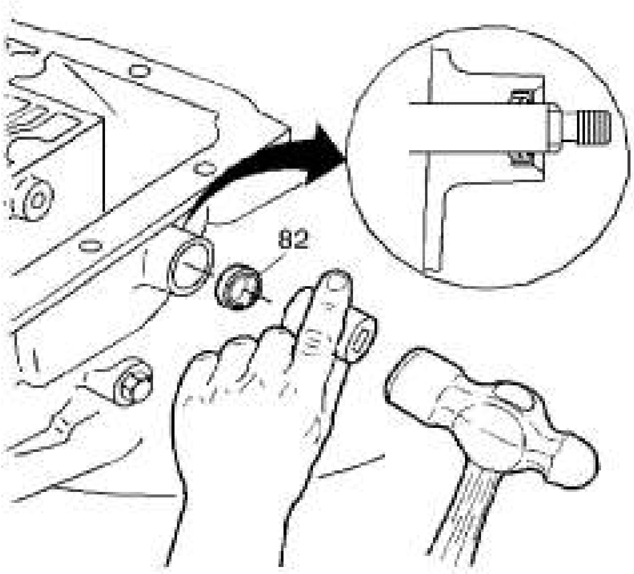


2. Remove the manual shaft seal (82) with a screwdriver.



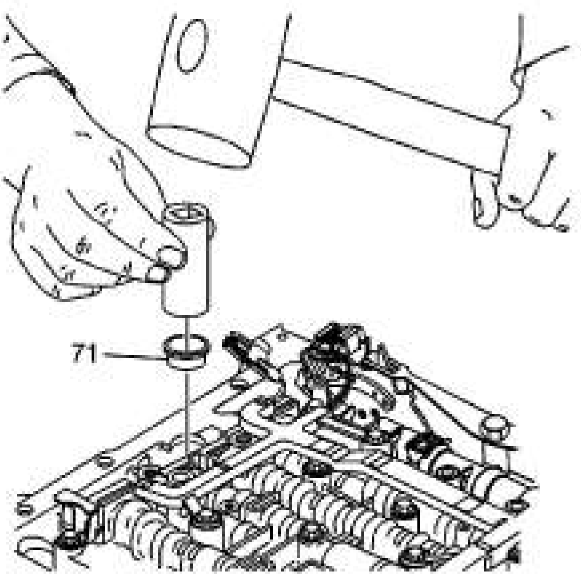
3. Remove the following components:
   - 3.1. The parking lock bracket bolt (87)
   - 3.2. The parking lock bracket (86)

Manual Shift Shaft Seal Installation

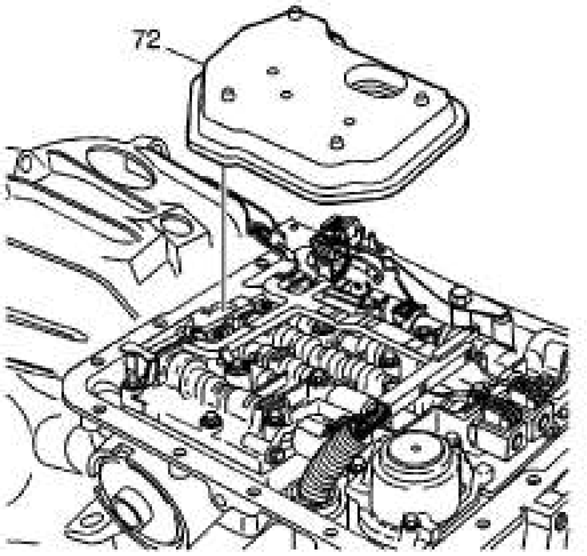


Install a new manual shaft seal (82).

Oil Filter Assembly Installation



1. Lubricate the filter seal (71) with transmission fluid.
2. Use a socket the same size diameter as the filter seal (71) and install the seal.

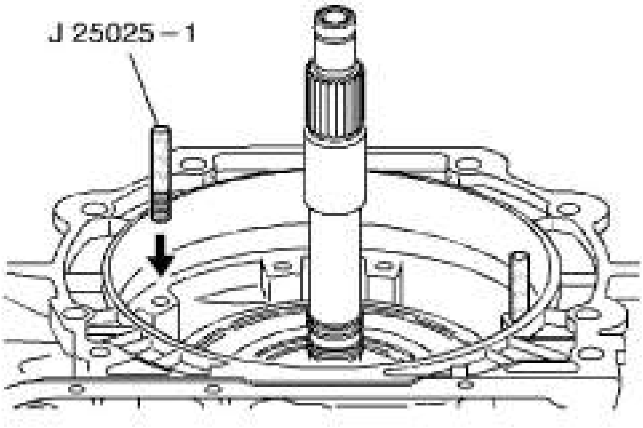


3. Install the transmission oil filter assembly (72).

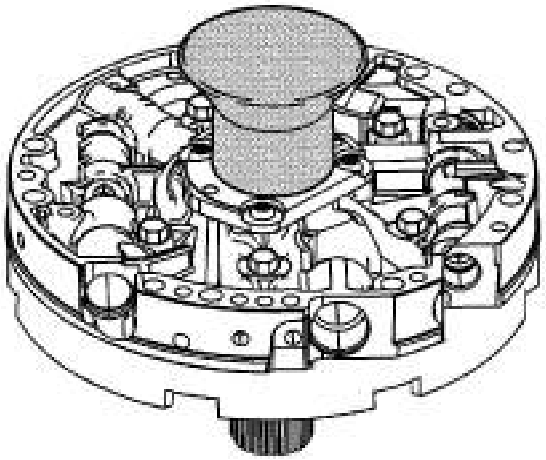
Oil Pump Assembly Installation

Tools Required

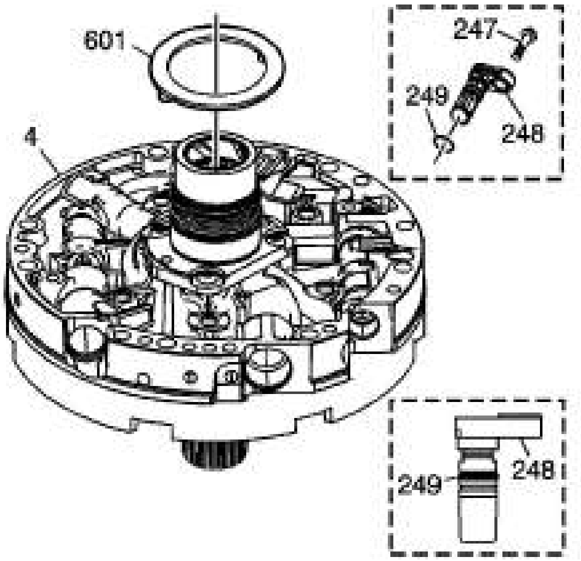
- J 25025-1 Dial Indicator Mounting Post
- J 39855 Stator Shaft Seal Installer



1. Install the J 25025-1 .



2. Remove the J 39855-2 which is part of kit J 39855 .

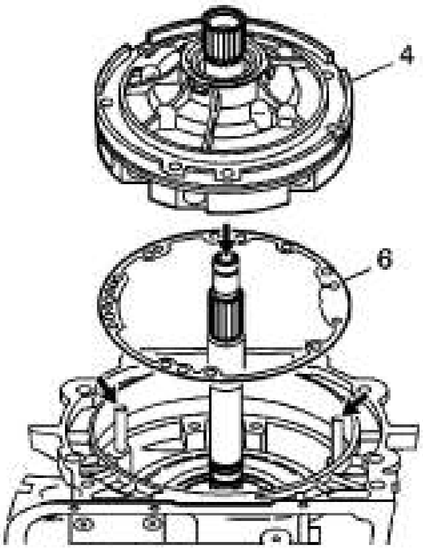


3. Install the pump to drum thrust washer (601).
4. Use J 36850 or equivalent to retain the washer to the pump.
5. For pump assemblies with an ISS hole plug (248), lubricate a NEW O-ring (249) with transmission fluid, and install onto the ISS hole plug (248).
6. Install the ISS hole plug (248) into the ISS hole and align with the mounting hole.

   Notice: Refer to Fastener Notice in the Preface section.

7. Install the retaining bolt (247).

   Tighten
   Tighten the retaining bolt to 9-11 N·m (6.6-8.1 lb ft).



8. Install the pump cover to case gasket (6).

   Important: The oil pump to case seal is installed after the oil pump assembly, during torque converter installation. Refer to Converter Housing Installation.

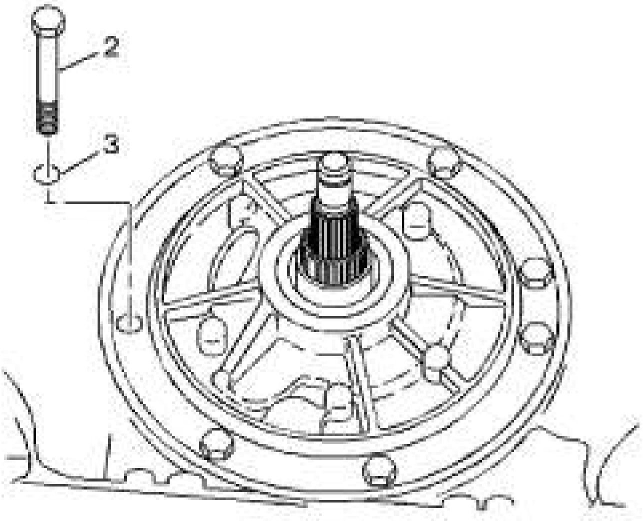
9. Install the oil pump assembly (4) into the case and align all holes properly.

   Important: The pump to case retaining bolt O-ring seals (3) must be replaced.

10. Install the pump to case retaining bolts (2) with new O-ring seals (3).

    Tighten
    Tighten the retaining bolts to 29 N·m (21 lb ft).

11. Remove the J 25025-1 .



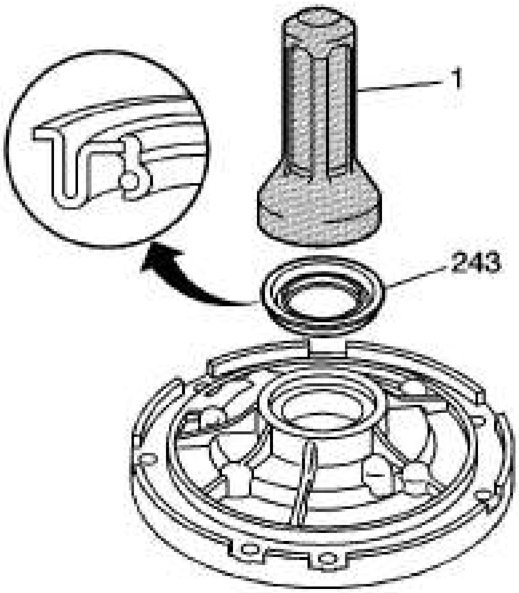
12. Install the remaining pump to case retaining bolts (2) and O-ring seals (3), in the holes where the J 25025-1 were.

Tighten
Tighten the retaining bolts to 29 N·m (21 lb ft).

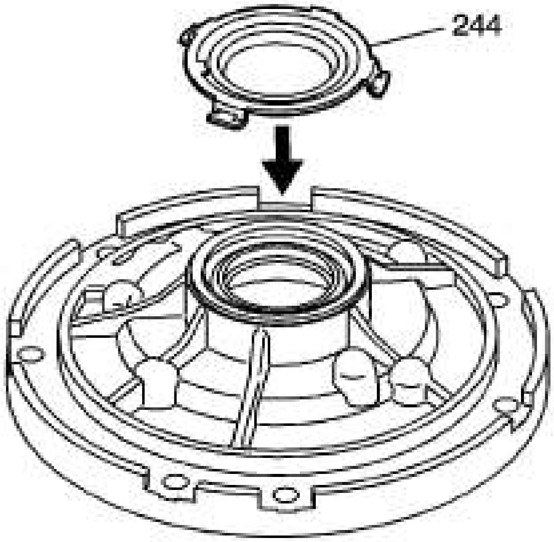
Oil Pump Body Assemble

Tools Required

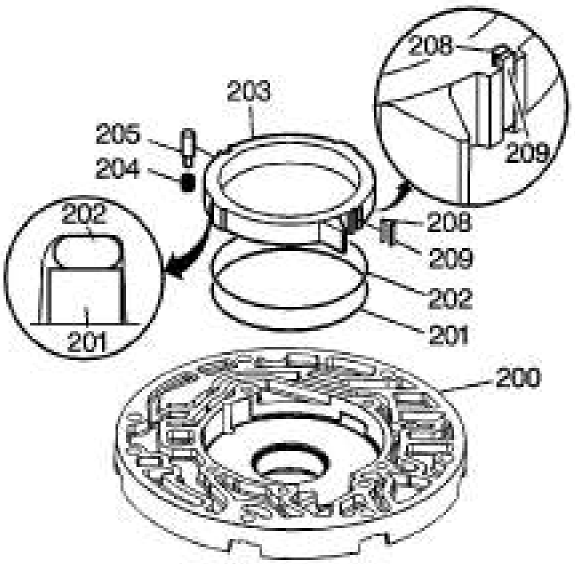
J 25016 Pump Seal and Speedometer Gear Installer



1. Using the J 25016 (1), install the oil seal assembly (243).



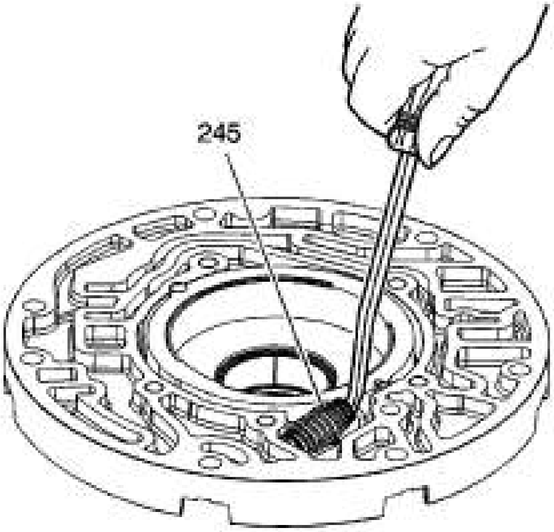
2. Install the front helix retainer (244).



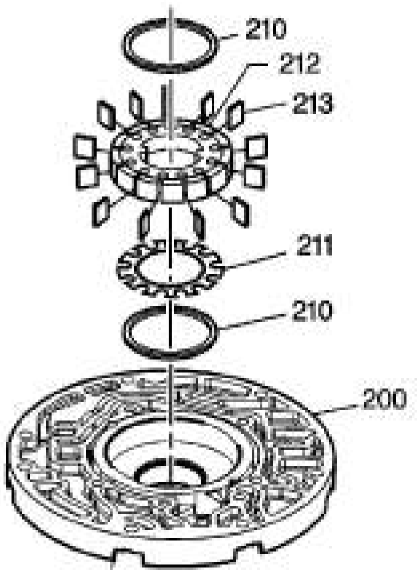
3. Install an O-ring seal (202) and oil seal ring (201) into the groove on the back side of the pump slide (203).
4. Use J 36850 , or an equivalent, to retain the seal and the ring on the slide.
5. Install the pivot pin spring (204) and the pivot pin (205).
6. Install the pump slide (203).
7. Index the slide notch with the pivot pin (205).

   The oil seal ring must face downward into the pump pocket.

8. Install the pump slide seal support (208) and the pump slide seal (209).



9. Install the fluid pump slide outer spring (245).

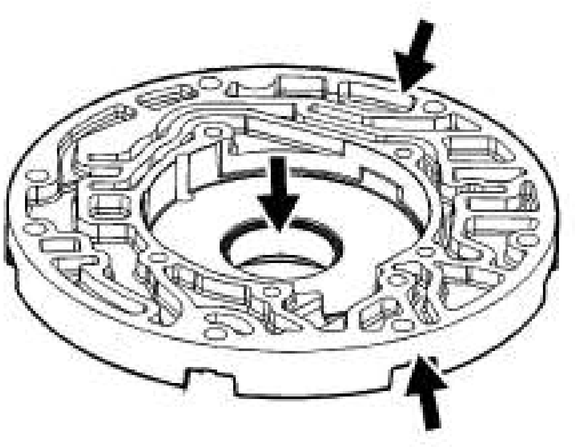


10. Install the bottom pump vane ring (210) and the rotor guide (211) into the rotor (212) and retain with J 36850 or an equivalent.
11. Install the rotor (212) with the rotor guide (211) toward the pump pocket.
12. Install the pump vanes (213).
13. Install the top pump vane ring (210).

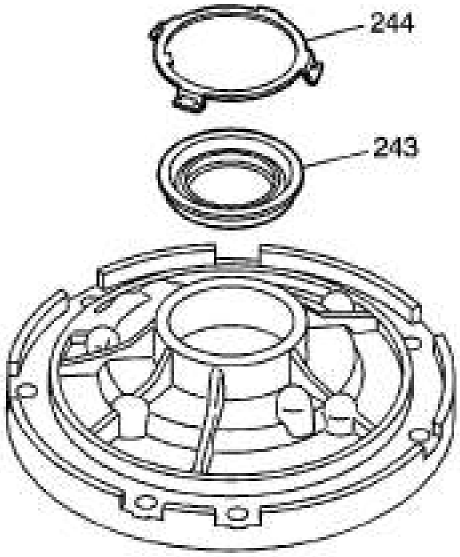
Oil Pump Body Bushing Replacement

Tools Required

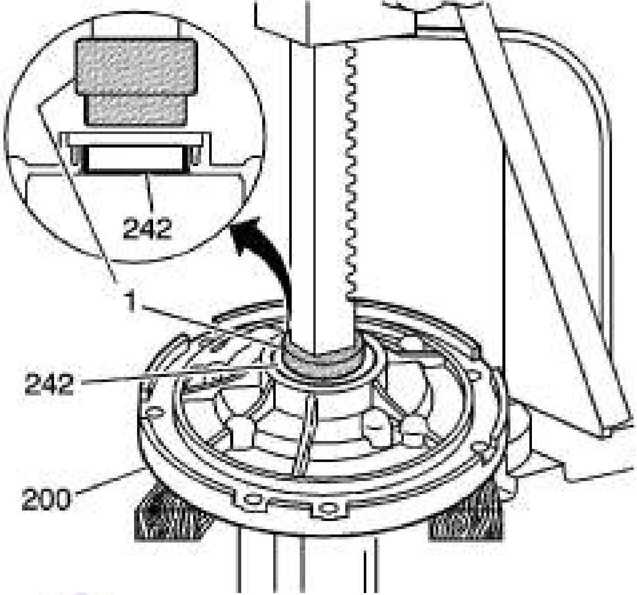
- J 41778-1 Pump Body Bushing Installer/Remover
- J 41778-2 Pump Body Bushing Position Stop



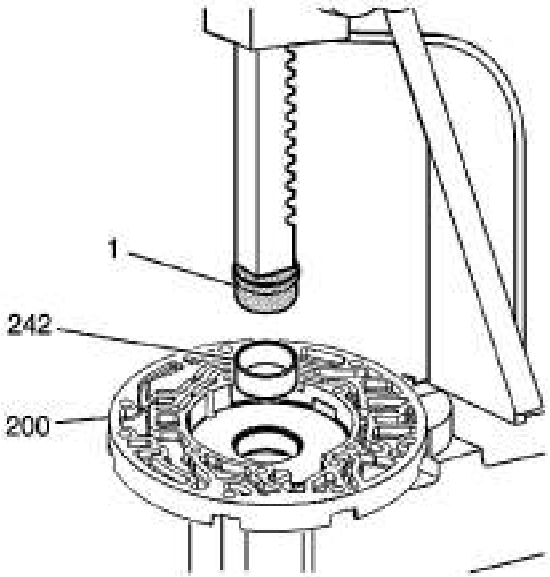
1. Inspect the oil pump body for the following:
   - Worn or damaged bushings
   - Foreign material or debris
   - Porosity
   - Scored or irregular mating faces
   - Cross channel leaks



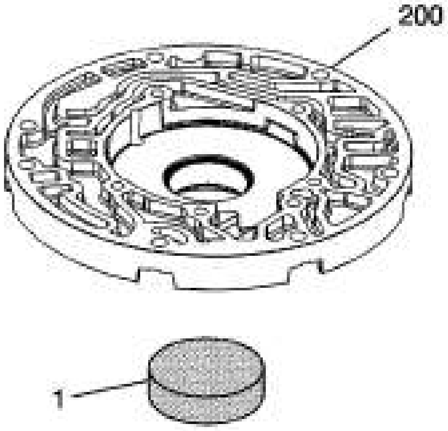
2. Remove the front fluid seal retainer (244).
3. Remove the oil seal assembly (243).



4. Using the J 41778-1 (1) with an arbor press, remove the pump body bushing (242).

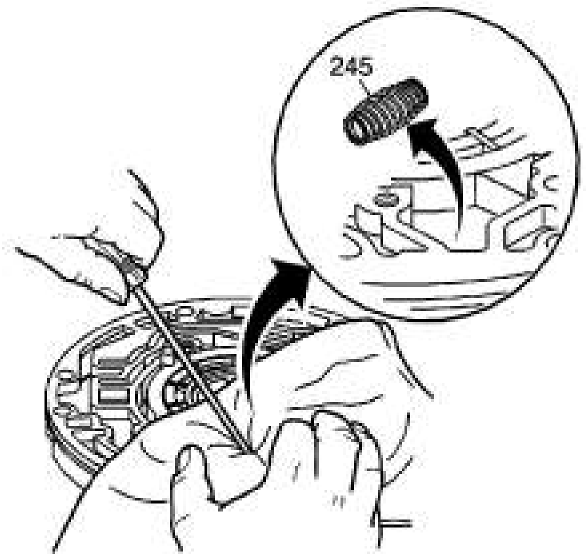


5. Using J 41778-1 (1) with an arbor press, install a new pump body bushing (242).

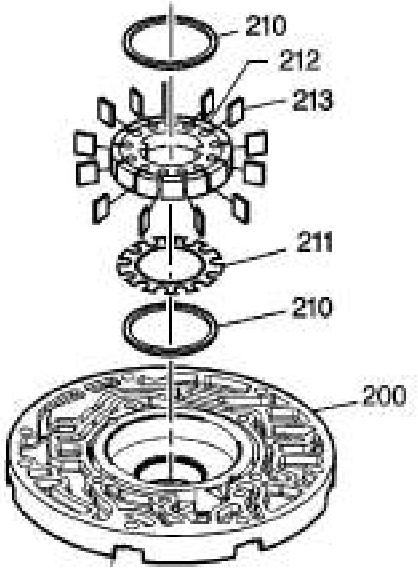


6. Use the J 41778-2 (1) to make sure proper bushing depth.

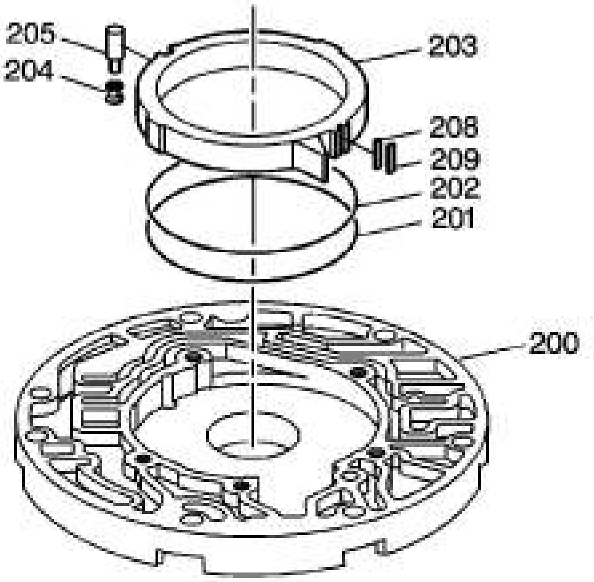
Oil Pump Body Disassemble



1. Remove the pump slide outer spring (245).
2. Place a rag over the spring while removing to prevent the spring from flying out.



3. Remove the oil pump rotor (212) and pump vane rings (210).
4. Remove the pump vanes (213).
5. Remove the rotor guide (211).

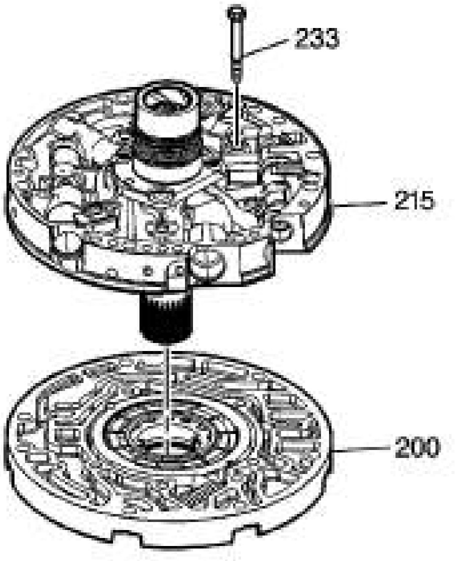


6. Remove the pump slide (203), pump slide support seal (208) and the pump slide seal (209).
7. Remove the slide seal back-up O-ring seal (202) and the oil seal - slide to wear plate, ring (201).
8. Remove the pivot slide pin (205) and the pivot pin spring (204).

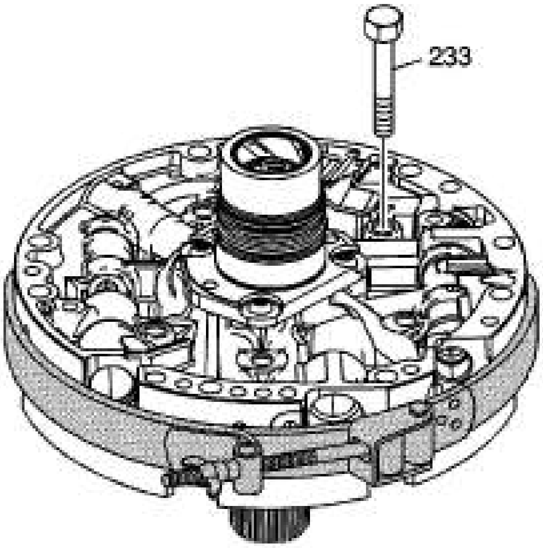
Oil Pump Cover and Body Assemble

Tools Required

J 21368 Pump Body and Cover Alignment Band



1. Place the oil pump cover onto the oil pump body and put stator shaft through a hole in the bench.
2. Install the pump cover retaining bolts (233) finger tight only.



3. Install the J 21368 .

   Notice: Refer to Fastener Notice in the Preface section.

4. Tighten the pump cover retaining bolts (233).

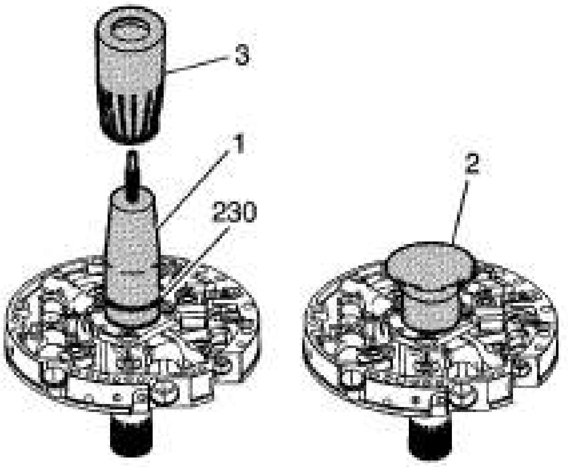
   Tighten
   Tighten the retaining bolts to 24 N·m (18 lb ft).

5. Remove the J 21368 .

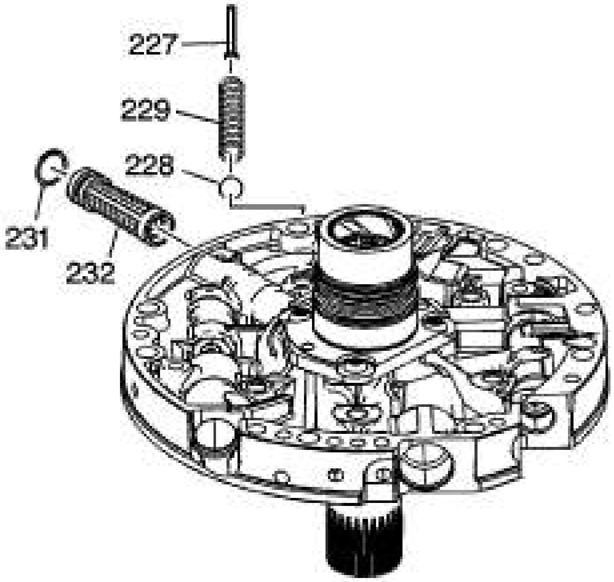
Oil Pump Cover Assemble

Tools Required

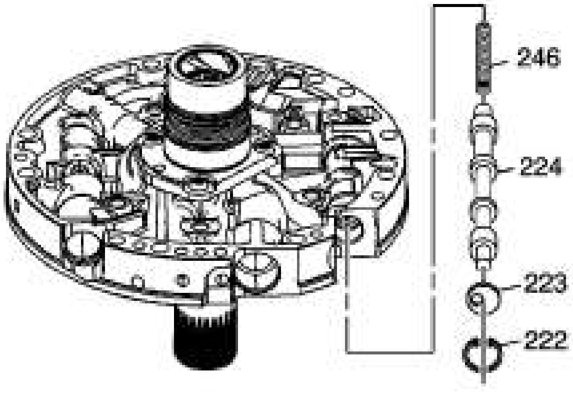
- J 38735-3 Pusher
- J 39855 Stator Shaft Seal Installer



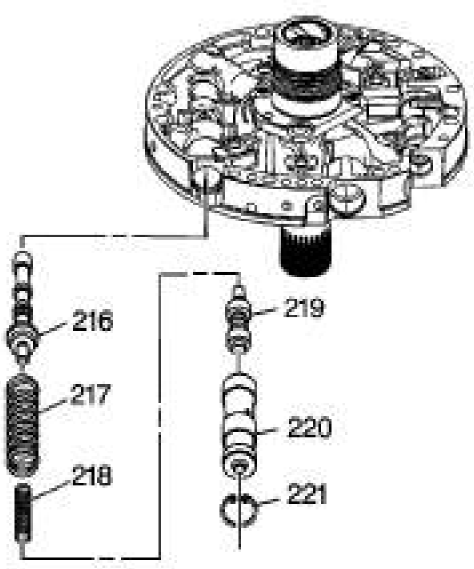
1. Using the J 39855-1 (1) which is part of kit J 39855 and the J 38735-3 (3), install the stator shaft oil seal rings (230).
2. Place J 39855-2 (2) which is part of kit J 39855 over the seals.
3. Leave J 39855-2 (2) which is part of kit J 39855 on the stator shaft until just before the pump is to be installed into the transmission.



4. Install the pressure relief ball (228) and pressure relief spring (229).
5. Install the pressure relief bolt rivet (227).
6. Install the oil pump cover screen seal (231) on the oil pump cover screen (232).
7. Install the oil pump cover screen (232) into the pump cover.

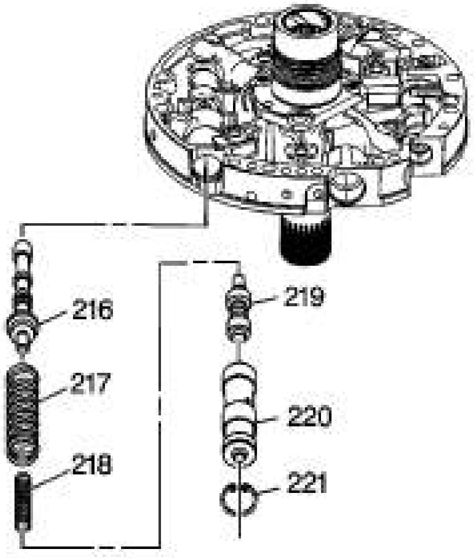


8. Install the converter clutch valve (246).
9. Install the converter clutch valve (224).
10. Install the stop valve (223) and the oil pump converter clutch valve retaining ring (222).

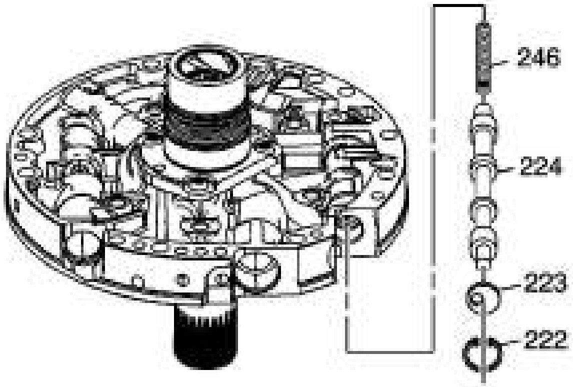


11. Install the pressure regulator valve (216).
12. Install the pressure regulator isolator spring (218) and the pressure regulator valve spring (217).
13. Install the reverse boost valve (219) in the reverse boost valve sleeve (220).
14. Install the reverse boost valve and sleeve in the pump cover.
15. Install the oil pump reverse boost valve retaining ring (221).

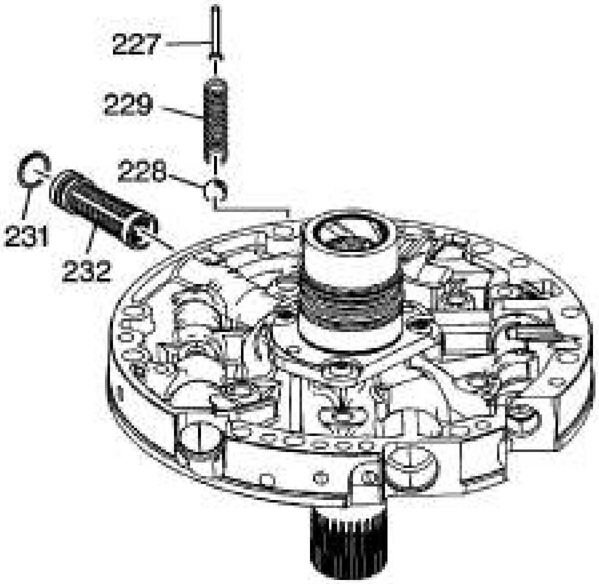
Oil Pump Cover Disassemble



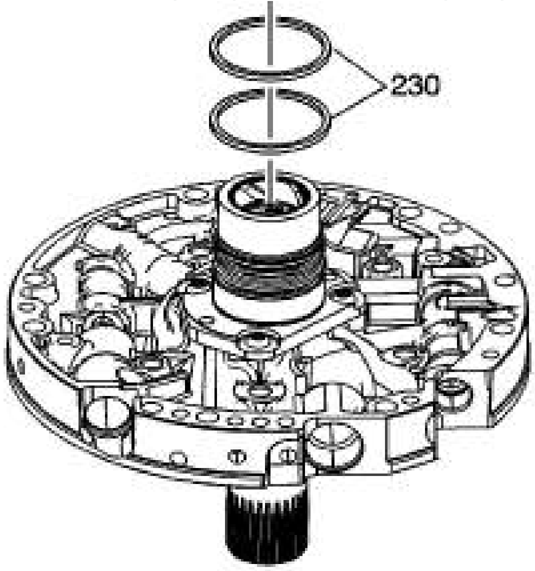
1. Remove the oil pump reverse boost valve retaining ring (221).
2. Remove the reverse boost valve sleeve (220) and the reverse boost valve (219).
3. Remove the pressure regulator isolator spring (218) and the pressure regulator valve spring (217).
4. Remove the pressure regulator valve (216).



5. Remove the oil pump converter clutch valve retaining ring (222).
6. Remove the stop valve (223) and the converter clutch valve (224).
7. Remove the converter clutch valve (246).

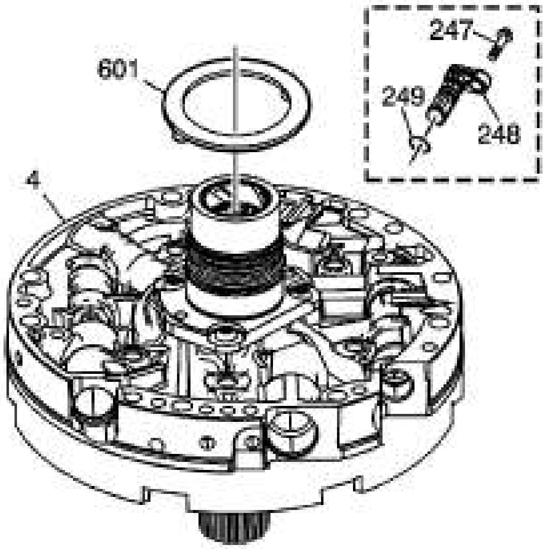


8. Remove the pressure relief bolt rivet (227).
9. Remove the pressure relief spring (229) and the pressure relief ball (228).
10. Remove the oil pump cover screen (232) and the oil pump cover screen seal (231).

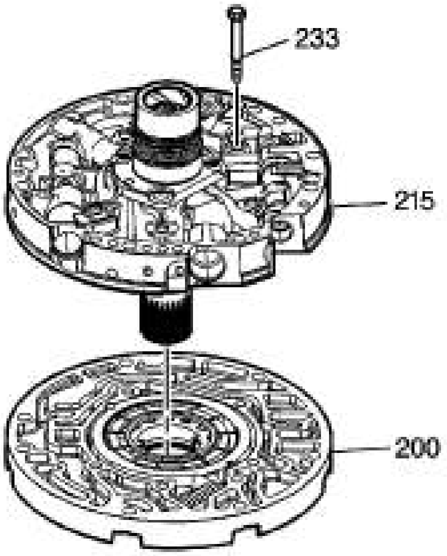


11. Remove the stator shaft oil seal rings (230).

Oil Pump Disassemble



1. Remove the thrust (pump to drum) washer (601).
2. For pump assemblies with an ISS hole plug (248), remove plug bolt (247) and ISS plug (248).
3. Remove the O-ring (249) and discard.



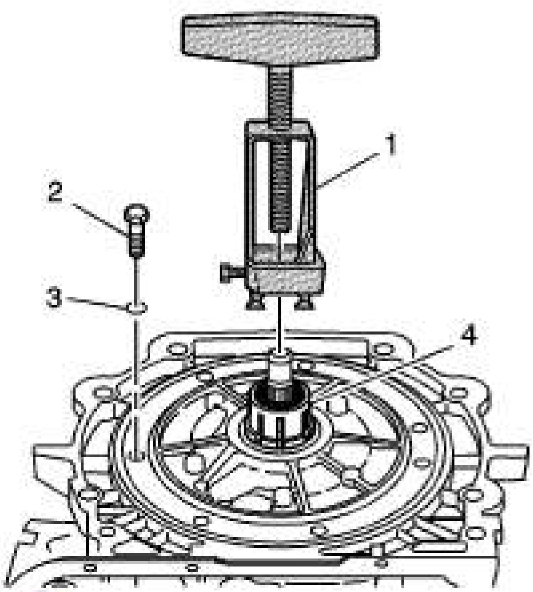
4. Remove the pump cover bolts (233).
5. Remove the pump cover (215) from the pump body (200).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975574**

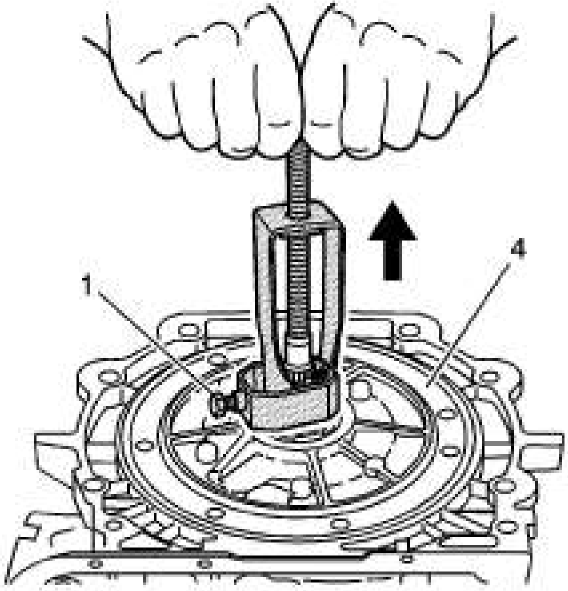
Oil Pump Removal

Tools Required

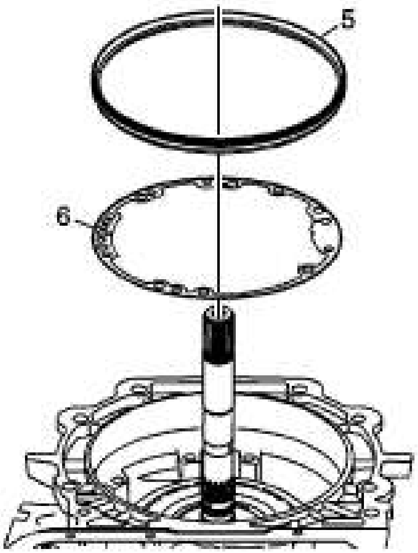
- J 37789-A Oil Pump Remover/Installer
- J 39119 Oil Pump Remover/Installer Adapter



1. Remove all pump retaining bolts (2) and pump bolt seals (3).
2. Install J 39119 (4) over stator shaft until it locks under splines.
3. Install J 37789-A (1).



4. To prevent slipping, securely fasten the J 37789-A J 37789-A around the J 39119 by tightening the bolt (1) with a wrench.
5. Turn the T-handle on top of J 37789-A .
6. Lift the pump (4) out of the case.



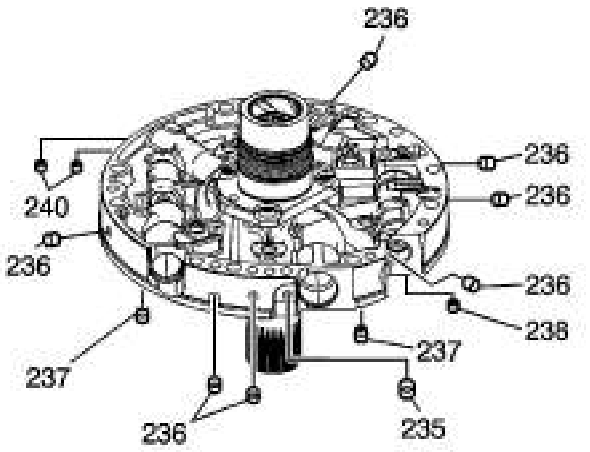
7. Remove the fluid pump seal (5).
8. Remove the pump cover to case gasket (6).

Oil Pump Stator Shaft Bushing Replacement

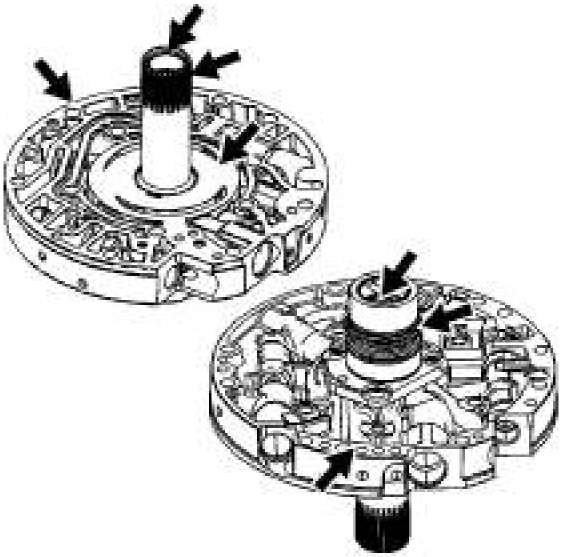
Tools Required

- J 7004-A Universal Remover
- J 8092 Universal Driver Handle - 3/4 in - 10
- J 21465-01 Bushing Service Set
- J 25019-14 Bushing Installer
- J 34196-B Transmission Bushing Service Set

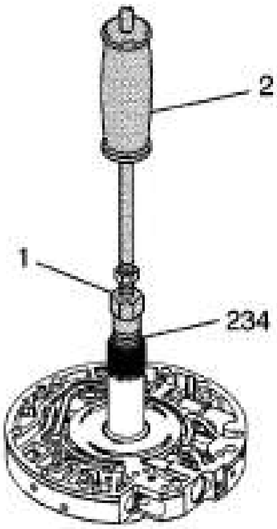
Removal Procedure



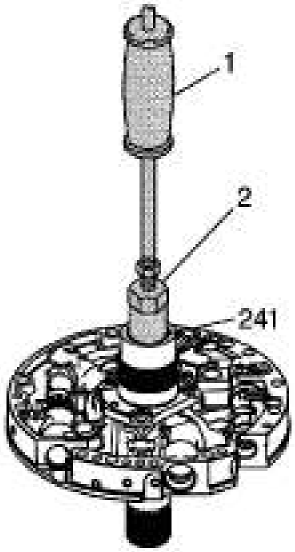
1. Inspect the pump cover, all check valve retainer and ball assemblies (237), cup plugs (235, 236) and orificed cup plugs (238, 240).



2. Inspect the pump cover for the following conditions:
   - Worn or damaged bushings.
   - Foreign material or debris.
   - Porosity.
   - Scored or irregular mating faces.
   - Cross channel leaks.

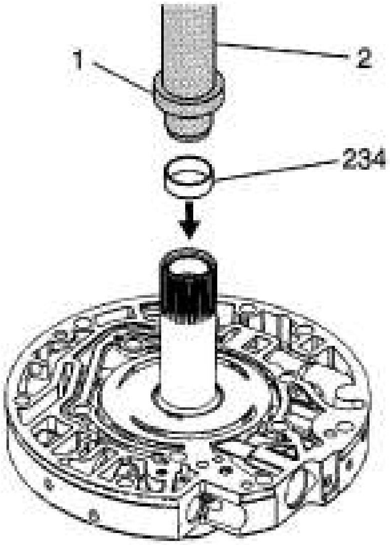


3. Using the J 21465-15 (1) with the J 7004-A (2), remove the stator shaft front bushing (234).

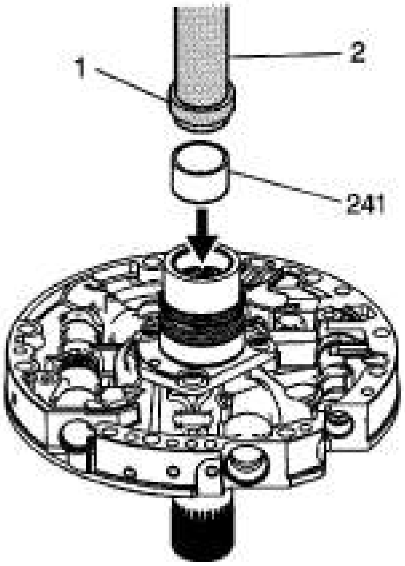


4. Using the J 25019-14 (2) with the J 7004-A (1), remove the stator shaft rear bushing (241).

Installation Procedure



1. Using the J 21465-2 (1) and the J 8092 (2), install a new stator shaft front bushing (234).

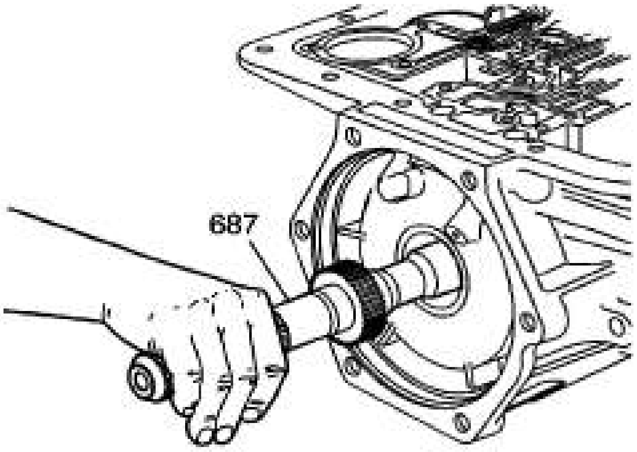


2. Using the J 34196-2 (1) which is part of kit J 34196-B and the J 8092 (2) , install the stator shaft rear bushing (241).

Output Shaft Installation

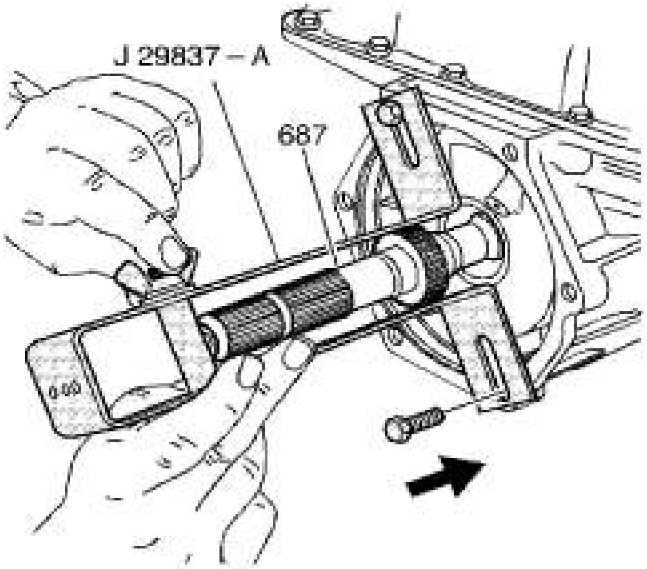
Tools Required

J 29837-A Output Shaft Support Fixture.



Important: It is important to note that the input shaft may need a light tap to fully seat into position. If the input shaft is not completely engaged, the output shaft to input carrier retainer will not seat.

1. Install the output shaft (687).

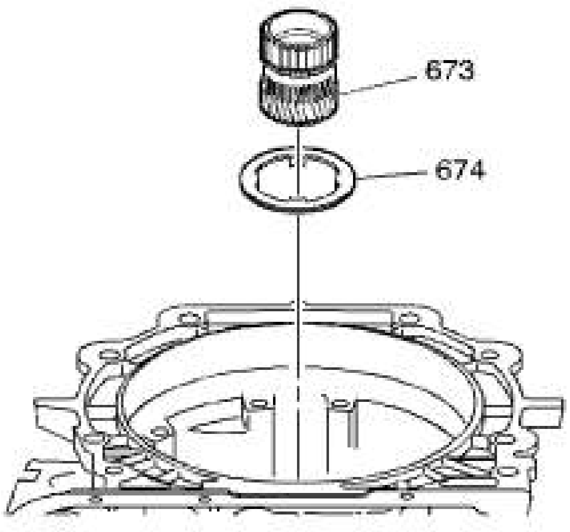


2. Install the J 29837-A .

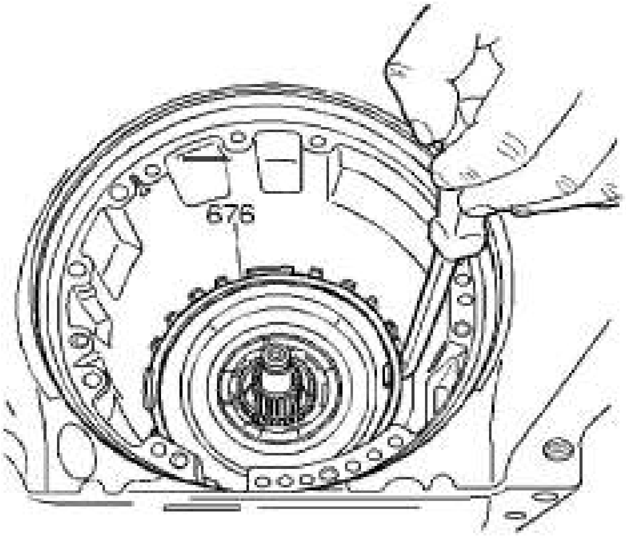
Output Shaft, Reaction Gear, Low / Rev Clutch Removal

Tools Required

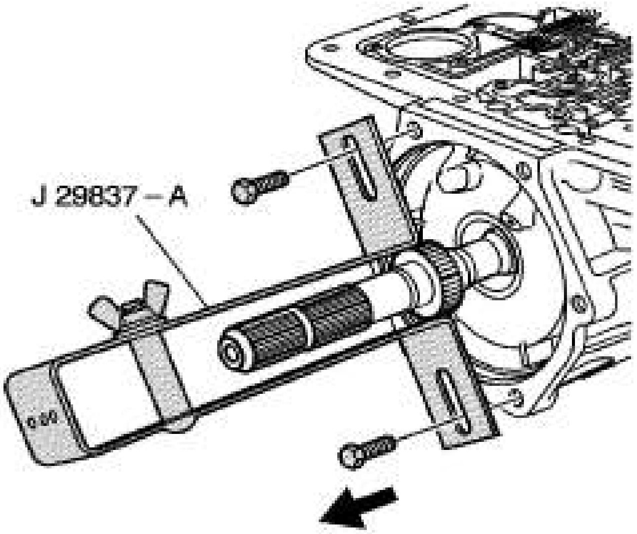
J 29837-A Output Shaft Support Fixture



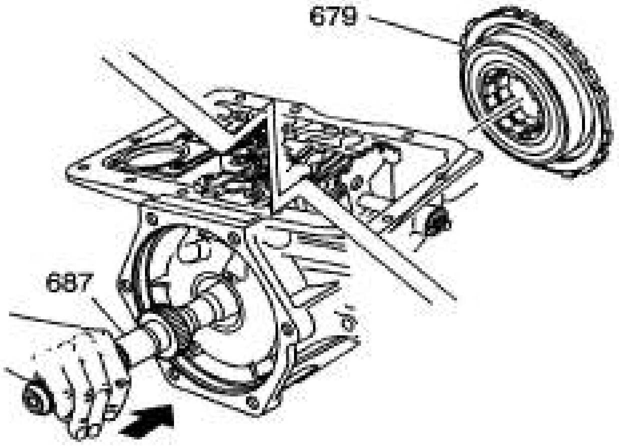
1. Remove the reaction sun gear (673) and the thrust washer (674).



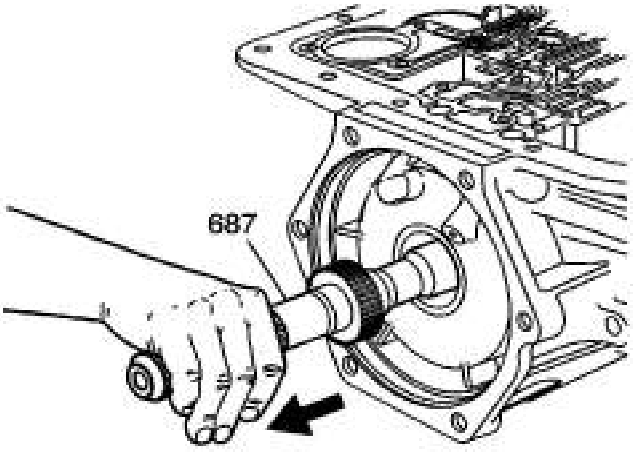
2. Remove the low and reverse support retainer ring (676).



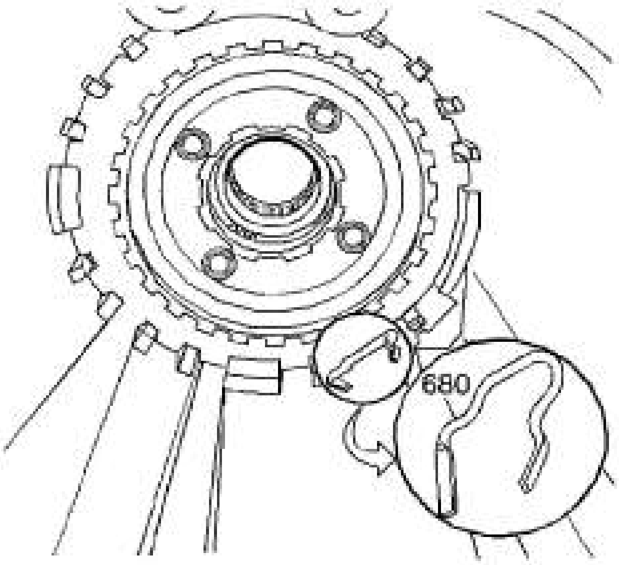
3. Remove the J 29837-A .



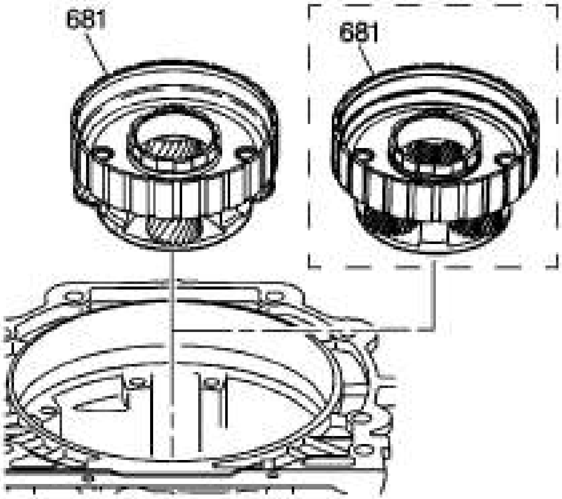
4. Push on the output shaft (687) in order to loosen the low and reverse clutch support (679).
5. Remove the low and reverse clutch support (679).



6. Remove the output shaft (687).

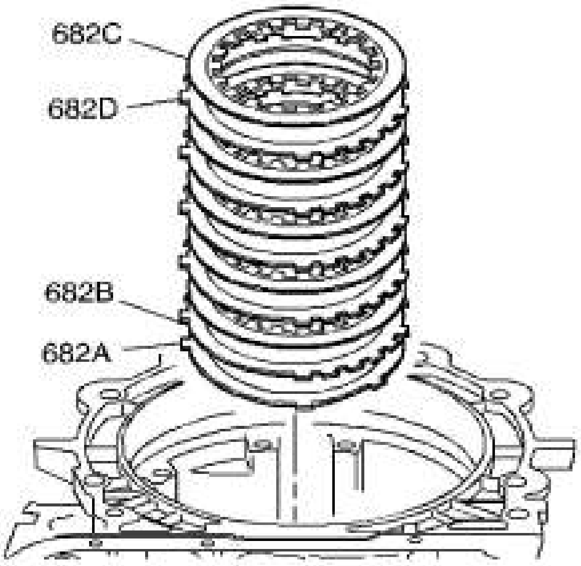


7. Remove the low and reverse clutch support retainer spring (680).

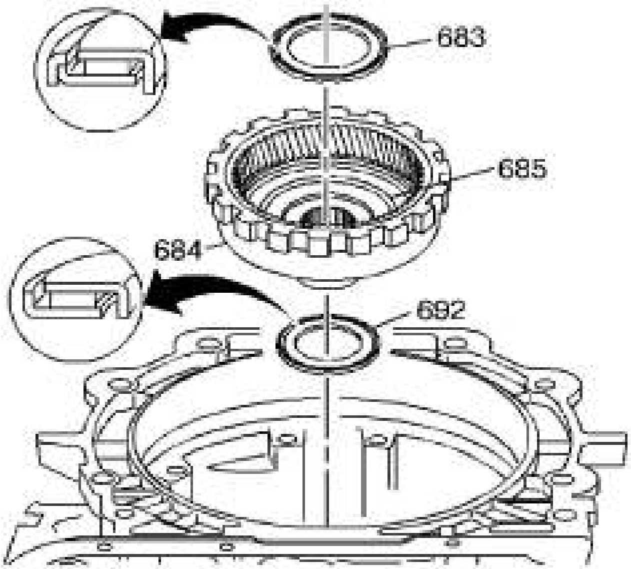


Important: The reaction carrier assembly (681) can be a 4 or 5 pinion design depending on the transmission model.

8. Remove the reaction carrier assembly (681).

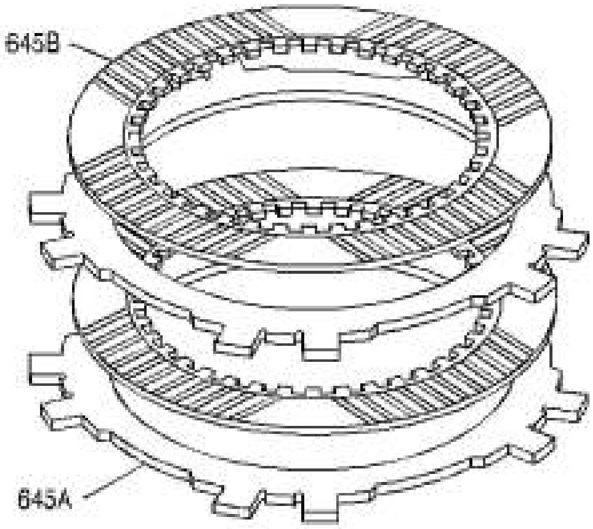


9. Remove the following components:
    9.1. The low and reverse clutch fiber plate assembly (682C)
    9.2. The low and reverse clutch steel plates (682D)
    9.3. The low and reverse clutch selective plate (682B)
    9.4. The low and reverse clutch waved plate (682A)

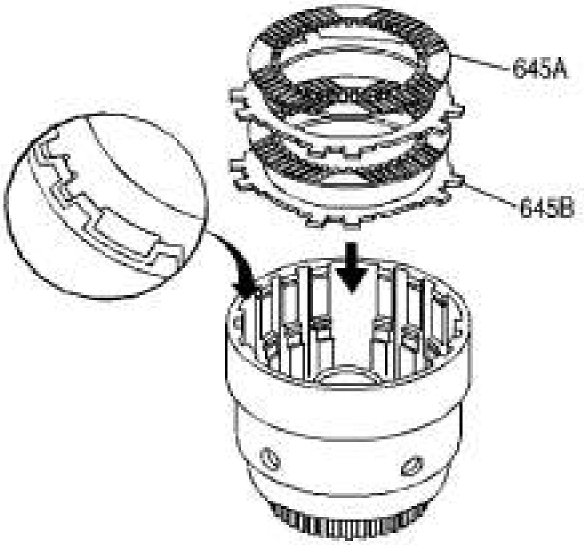


10. Remove the following components:
    10.1. The thrust bearing assembly (reaction carrier support) (683)
    10.2. The internal reaction gear (684)
    10.3. The internal reaction gear support (685)
    10.4. The reaction gear support bearing (692)

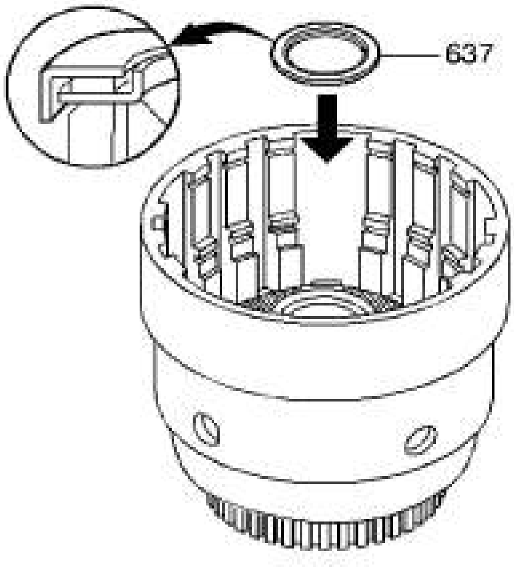
Overrun Clutch Installation



1. Inspect the fiber plate assemblies (645B) and the steel plates (645A) for the following defects:
    - Damaged tangs
    - Delamination
    - Excessive wear
    - Wear or heat damage



2. Install the overrun clutch plates into the input housing starting with a steel plate (645B) and alternating with fiber plate assemblies (645A).
3. Index the plates in the input housing with the wide notches remaining open.



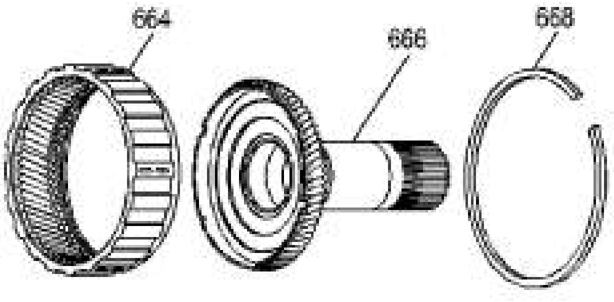
4. Install the input sun gear bearing assembly (637) into the input housing.

Reaction Carrier Shaft Replacement

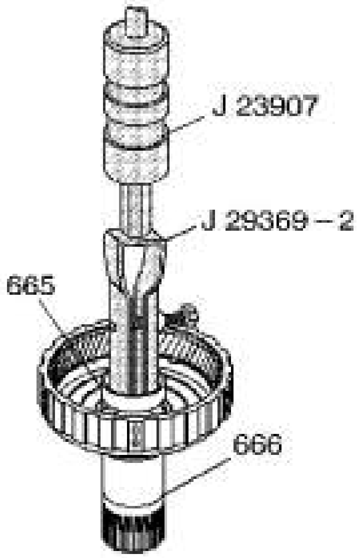
Removal Procedure

Tools Required

- J 8092 Universal Driver Handle - 3/4 in - 10
- J 7004-A Universal Remover
- J 23907 Slide Hammer with Bearing Adapter
- J 25019-14 Stator Pump Bushing Remover
- J 29369-2 Bushing and Bearing Remover 2-3 in
- J 34196-B Transmission Bushing Service Set

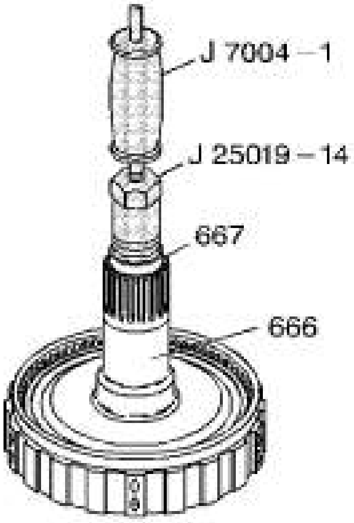


1. Remove the reaction carrier shaft/internal gear retainer (668) and the reaction carrier shaft (666) from the input internal gear (664).
2. Inspect the reaction carrier shaft (666) and the input internal gear (664) for the following defects:
   - Scoring
   - Cracking
   - Damaged or worn bushings
   - A cracked shaft
   - A damaged spline
   - Damaged gear teeth



J 23907
J 29369 – 2
665
666

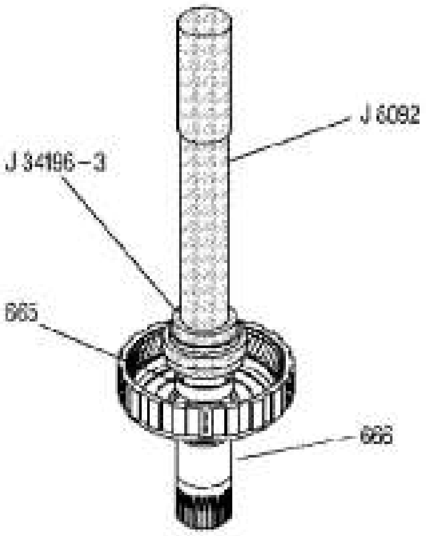
3. Using J 29369-2 with J 23907 , remove the reaction carrier shaft front bushing (665).



J 7004 – 1
J 25019 – 14
667
666

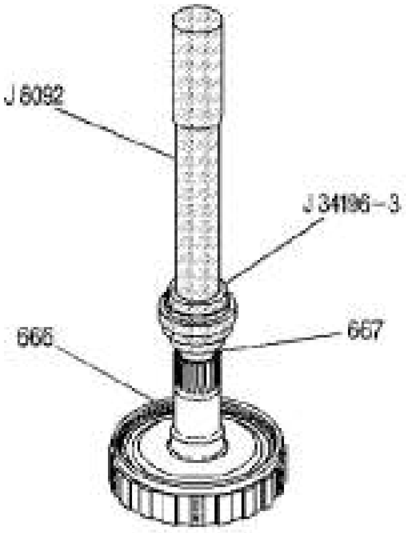
4. Using J 25019-14 with J 7004-A , remove the reaction carrier shaft rear bushing (667).

Installation Procedure



J 8092
J 34196-3
665
666

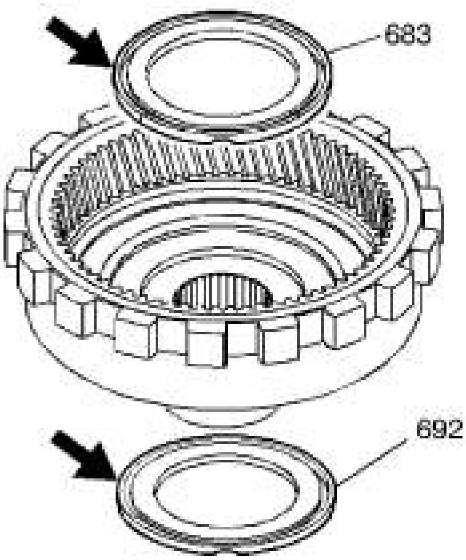
1. Using J 34196-3 which is part of kit J 34196-B J 34196-B with J 8092 , install a new reaction carrier shaft front bushing (665).



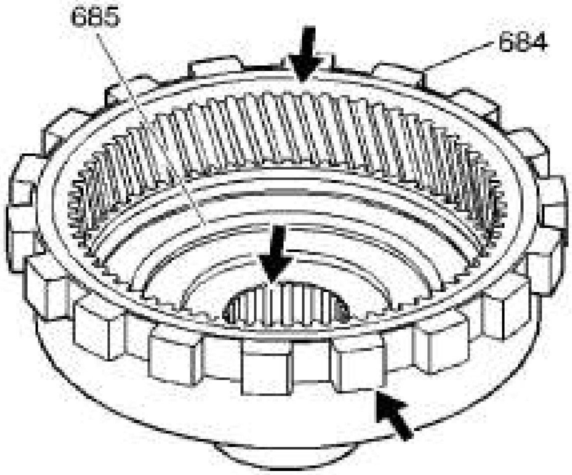
J 8092
J 34196-3
666
667

2. Using J 34196-3 which is part of kit J 34196-B with J 8092 , install a reaction carrier shaft rear bushing (667).

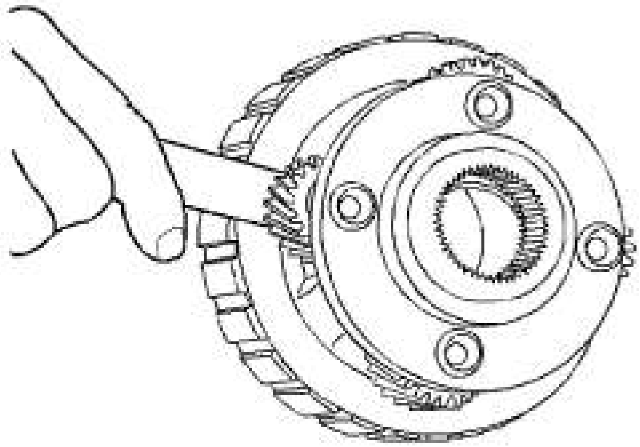
Reaction Gear and Carrier Inspection



1. Inspect the reaction carrier/support thrust bearing assembly (683) for wear or damage.
2. Inspect the reaction gear support to case bearing (692) for wear or damage.



3. Inspect the internal reaction gear (684) and the internal reaction gear support (685) for proper assembly, stripped splines, cracks, teeth, and lug damage.

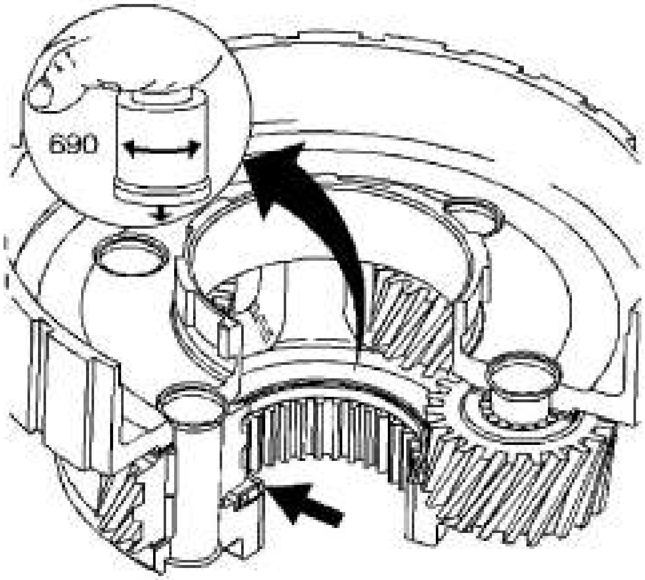


Important: Inspect all pinions, either 4 or 5 depending on model.

4. Check the reaction carrier pinion end play. The end play must not exceed 0.61 mm (0.024 in).

   Inspect the reaction carrier for the following conditions:

   - Pinion gear damage
   - Proper pinion staking
   - Excessive pinion washer wear
   - Keystoned pinion gears
5. Ensure that the pinions turn freely.



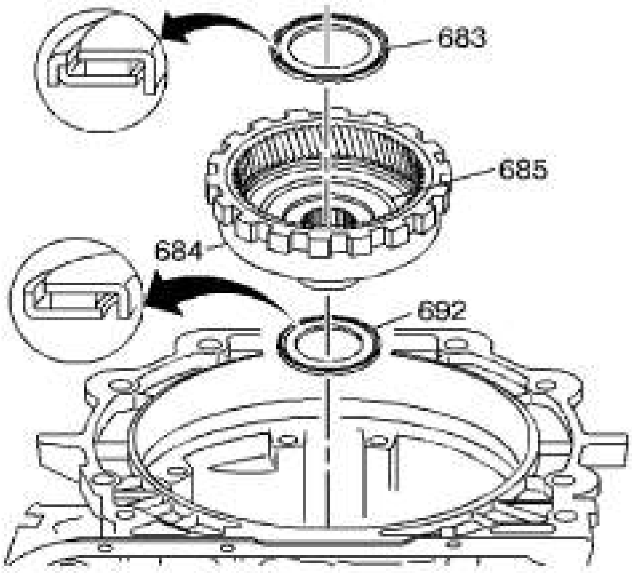
6. Inspect the reaction carrier captive thrust bearing for wear or damage.
    6.1. Without touching the pinion gears, place a bushing or an output shaft sleeve (690) onto the bearing race, and turn it with the palm of your hand.
    6.2. Any imperfections will be felt through the bushing.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | Document ID: 1975596

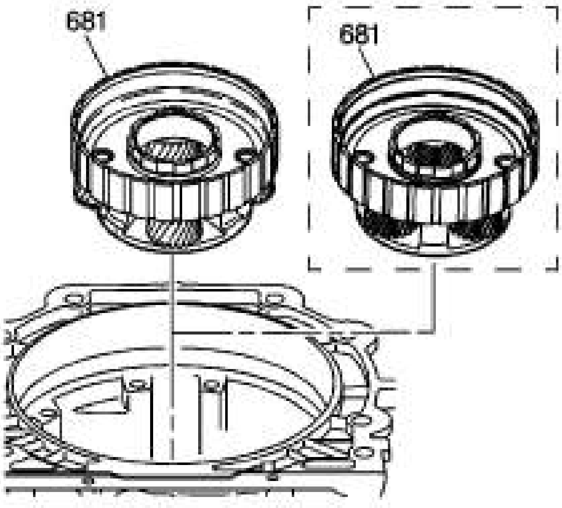
Reaction Gear and Carrier Installation

Tools Required

J 36850 Transjel Lubricant

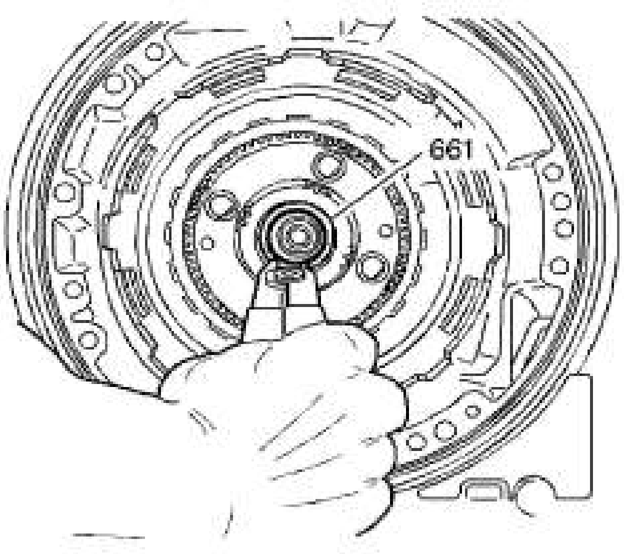


1. Install the reaction gear support to case bearing (692) onto the internal reaction gear support (685). Retain the bearing using J 36850 or equivalent.
2. Install the internal reaction gear (684) and the internal reaction gear support (685) into the case.
3. Install the reaction carrier/support thrust bearing assembly (683) into the internal reaction gear support (685). Retain bearing with J 36850 .



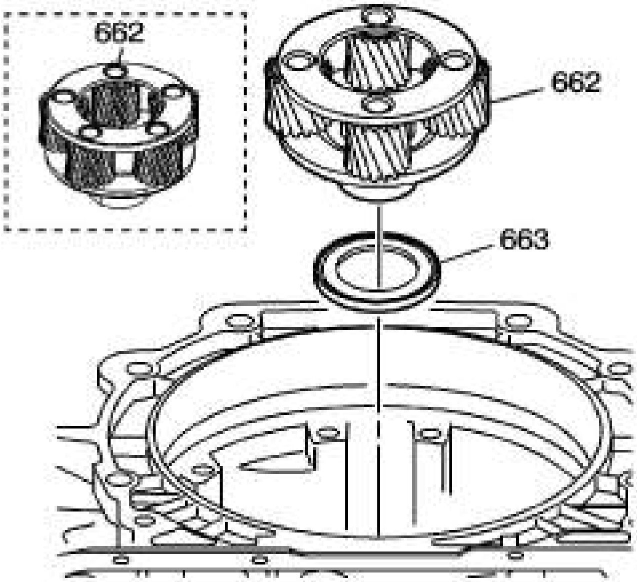
4. Install the reaction carrier assembly (681) into the internal reaction gear.

Reaction Gear Set Removal



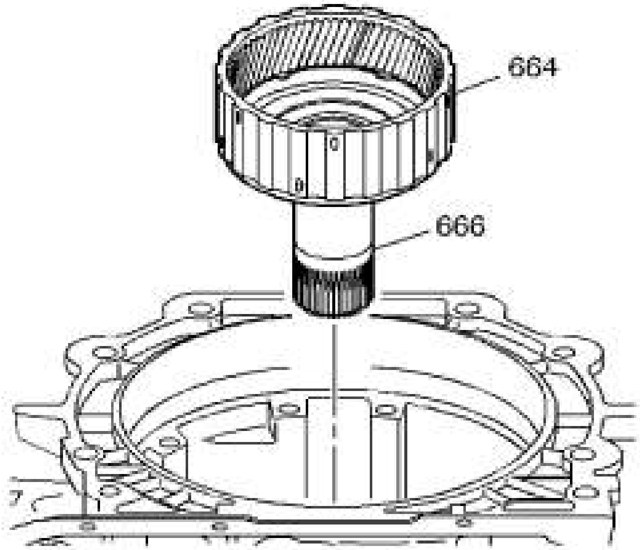
Important: The output shaft retainer ring (661) can not be reused, it must be replaced.

1. Use snap ring pliers to remove the output shaft to retainer snap ring (661).

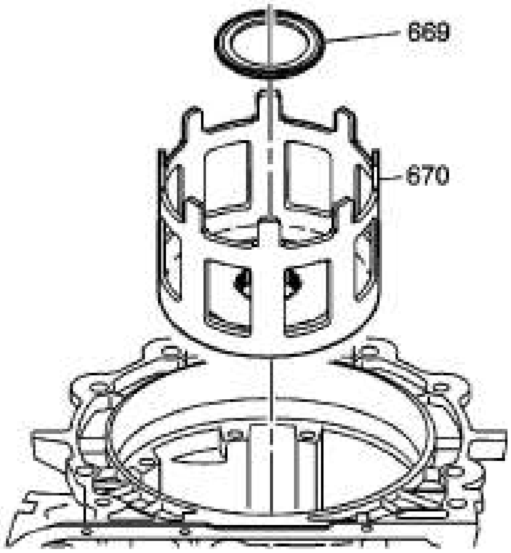


Important: The carrier assembly (662) can be a 4 or 5 pinion design depending on model.

2. Remove the input carrier assembly (662) and remove the thrust bearing assembly (663).



3. Remove the input internal gear (664) and the reaction carrier shaft assembly (666).



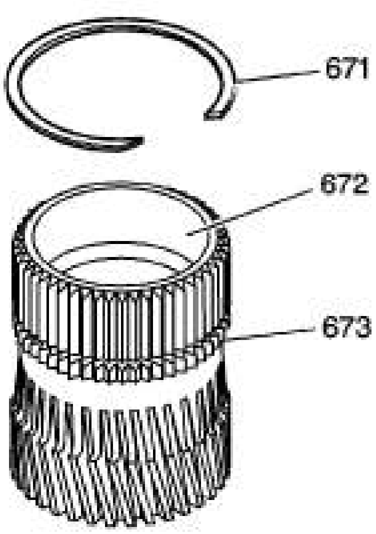
4. Remove the thrust washer (669) and the reaction sun shell (670).

Reaction Sun Gear Installation

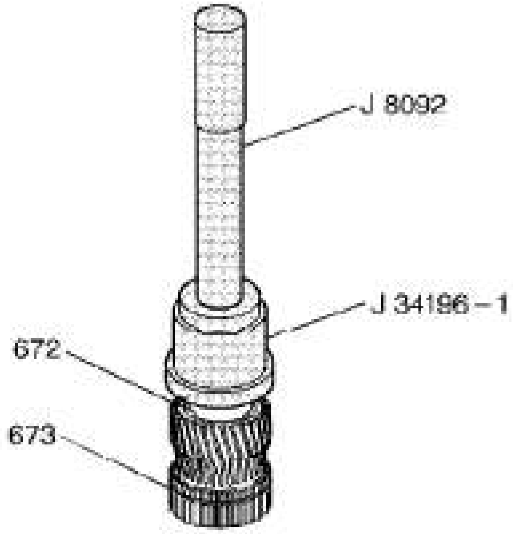
Tools Required

- J 34196-B Transmission Bushing Service Set
- J 8092 Universal Driver Handle - 3/4 in

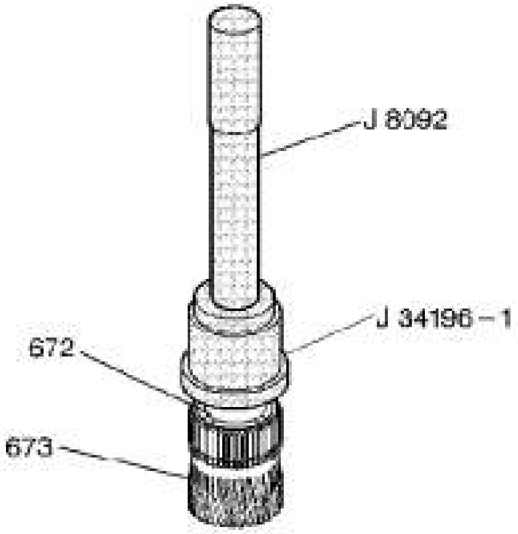
Important: Do not remove the retaining ring (671), except to replace it.



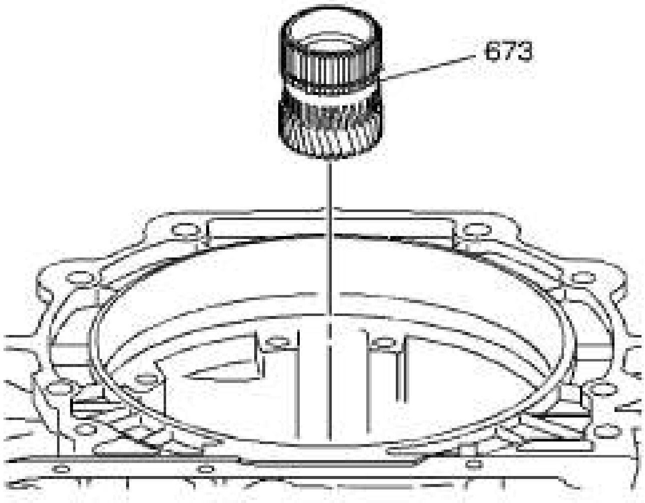
1. Inspect the reaction sun gear (673) for the following defects:
    - Nicks
    - Scores
    - Damaged spline or teeth
    - A worn bushing (672)
    - A loose or weak retaining ring (671)



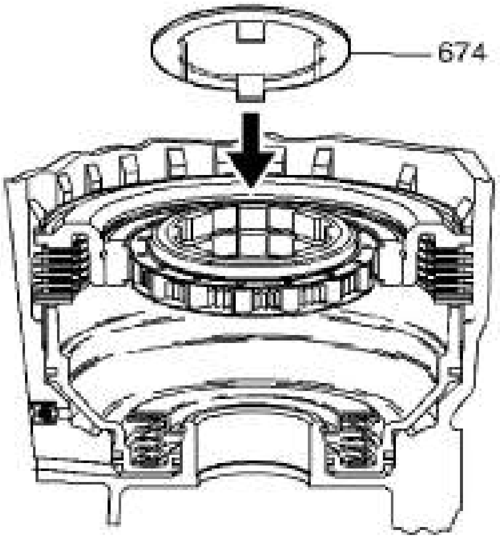
2. If the reaction sun gear bushing (672) needs replacement, use J 34196-1 which is part of kit J 34196-B with J 8092 to remove the reaction sun bushing (672) from the reaction sun gear (673).



3. Using J 34196-1 which is part of kit J 34196-B with J 8092 , install a new reaction sun bushing (672) into the reaction sun gear (673).



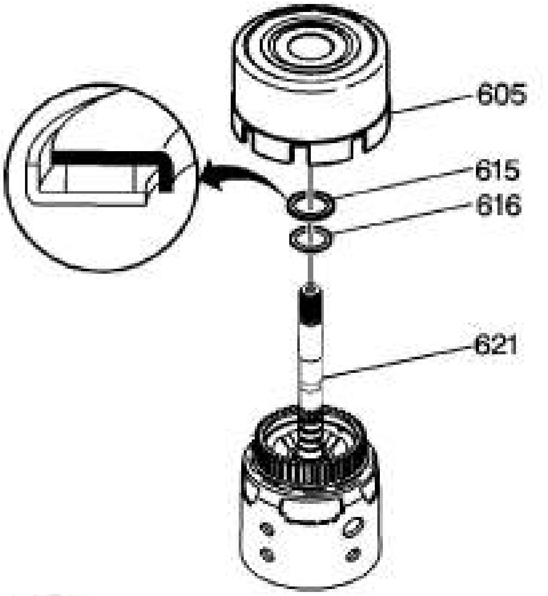
4. Install the reaction sun gear (673) into the reaction carrier.



5. Install the thrust washer (674) with the tangs pointing down. Index the tangs of the thrust washer with the splines of the low and reverse roller clutch race.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975657**

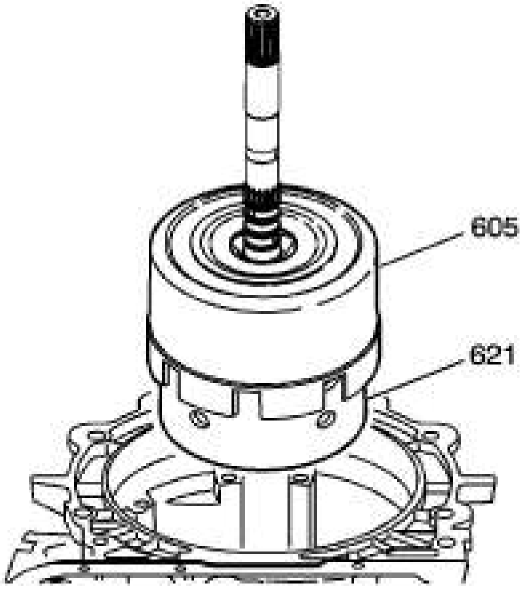
Reverse Input and 3-4 Clutch Housing Installation



1. Install the selective thrust washer (616) on the input housing (621).
2. Install the stator shaft/selective washer bearing assembly (615) on the input housing (621).

   The black race on the bearing goes toward the oil pump.

3. Install the reverse input clutch assembly (605) on the input housing (621).
4. Index the reverse input clutch plates with the input clutch hub. Make certain all clutch plates are fully engaged.

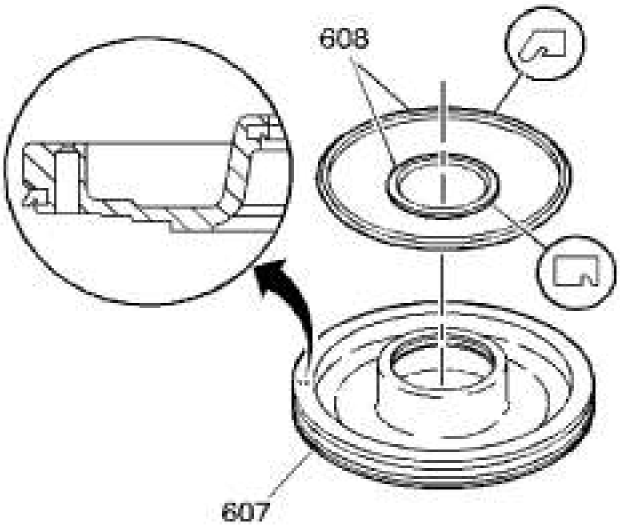


5. Install the reverse input and the input clutch assembly into the transmission case.
6. Index the 3rd and 4th clutch plates with the input internal gear.
   - Ensure that all clutch plates are fully engaged.
   - When properly assembled, the reverse input clutch housing will be located just below the case oil pump face.

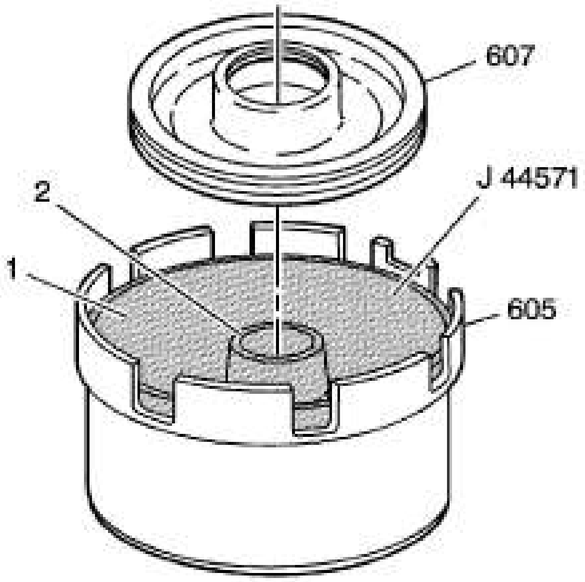
Reverse Input Clutch Assemble

Tools Required

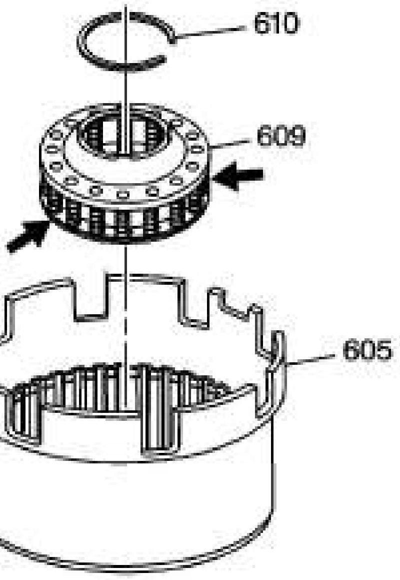
- J 23327-1 Forward Clutch Spring Compressor (Bridge)
- J 25018-A Clutch Spring Compressor Adapter
- J 44571-1 Reverse Input Clutch Piston Installer



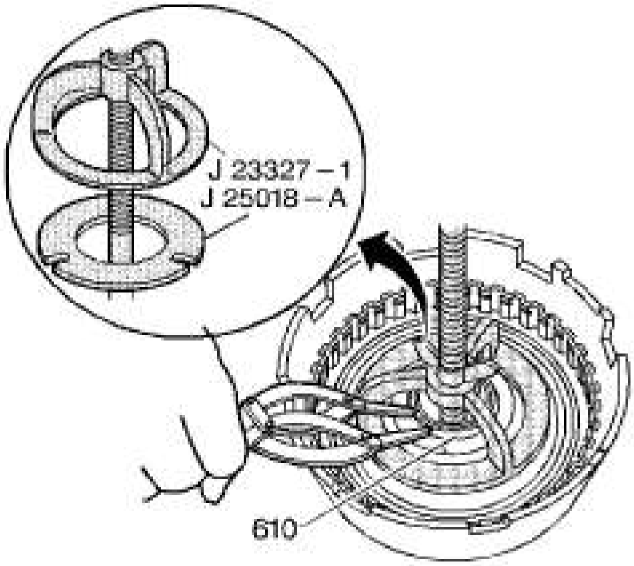
1. Inspect the reverse input clutch piston (607) for the following:
   - Damaged or porosity
   - Ring groove damage
2. Install the reverse input clutch inner and outer seals (608) on the piston.



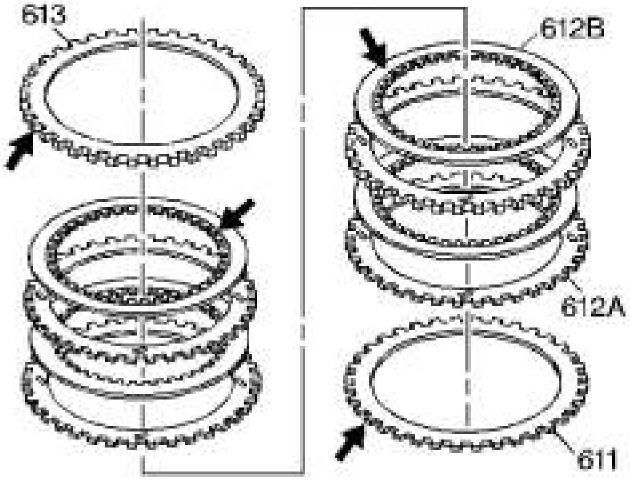
3. Install the J 44571-1 inner (2) and outer (1) reverse input clutch piston installer.
4. Install the reverse input clutch piston (607) into the housing (605).
5. Remove the J 44571-1 .



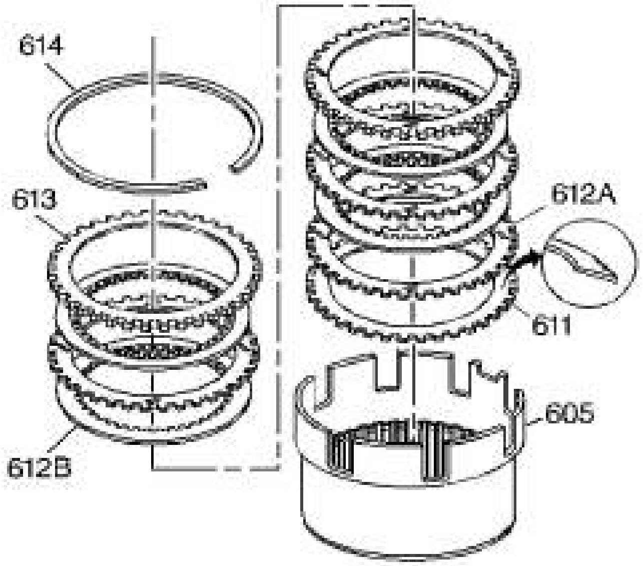
6. Inspect the reverse input clutch spring assembly (609) for bent, broken, distorted or damaged springs.
7. Install the reverse input clutch spring assembly (609).



8. Install the J 23327-1 and the J 25018-A .
9. Install the reverse input clutch spring retainer ring (610).



10. Inspect the belleville plate (611), the fiber plate assemblies (612B), the steel turbulator plates (612A) and the selective backing plate (613) for the following items:
    - Damaged tangs
    - Delamination
    - Excessive wear
    - Heat damage or wear
    - Surface finish
    - Flatness



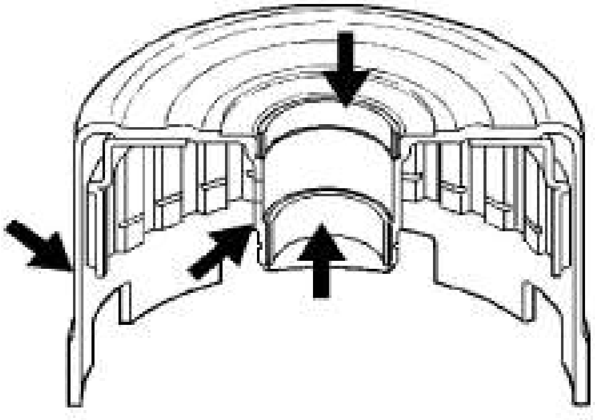
11. Install the reverse input clutch belleville plate (611), with the inner diameter up, into the reverse input clutch housing and drum assembly (605).
12. Install the reverse input clutch plates starting with a steel turbulator plate (612A) and alternate with a fiber plate assembly (612B).
13. Install the reverse input clutch selective backing plate (613).
14. Install the reverse input clutch retaining ring (614).

Reverse Input Clutch Bushing Replacement

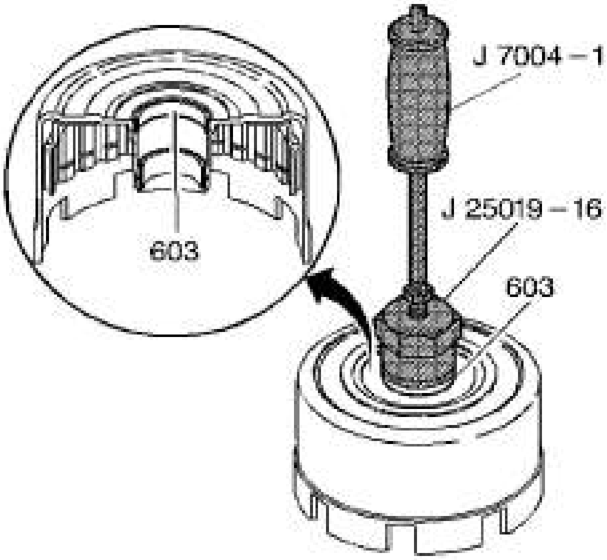
Removal Procedure

Tools Required

- J 25019 Bushing Service Set
- J 34196-B Transmission Bushing Service Set
- J 7004-A Universal Remover
- J 8092 Universal Driver Handle - 3/4 in - 10

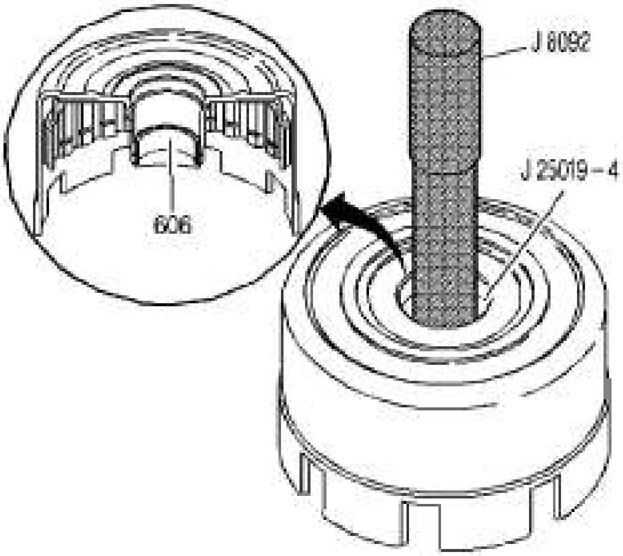


1. Inspect the reverse input clutch housing and drum assembly for the following conditions:
   - Damaged or worn bushings
   - Surface finish on the hub and outer housing - check band surface for flatness
   - Leak at the weld
   - Heat distortion
   - Rolled or distorted retaining ring groove



J 7004 – 1
J 25019 – 16
603
603

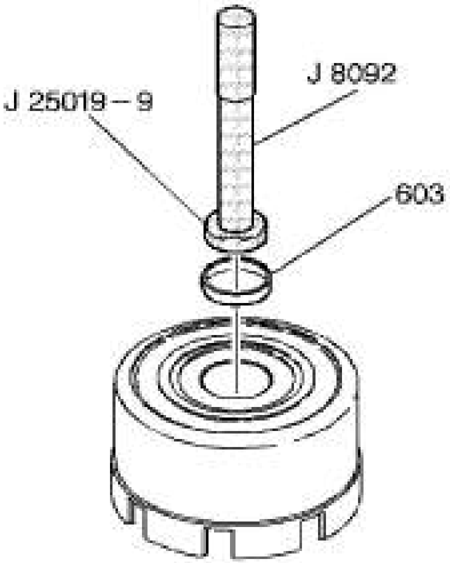
2. Using the J 25019-16 with the J 7004-A , remove the reverse input clutch front bushing (603).



J 8092
J 25019 – 4
606

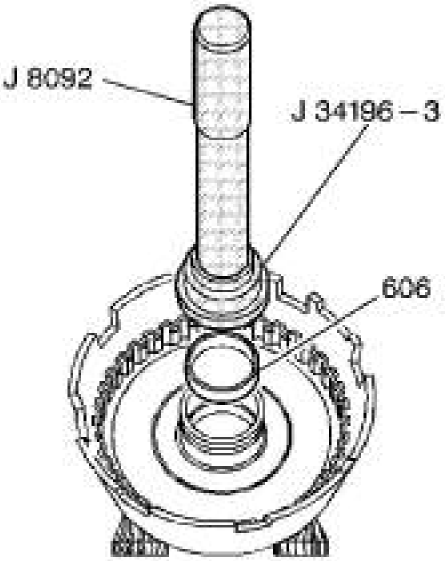
3. Using the J 25019-4 with the J 8092 , remove the reverse input clutch rear bushing (606).

Installation Procedure



J 25019 – 9
J 8092
603

1. Using the J 25019-9 with the J 8092 , install a reverse input clutch front bushing (603).



J 8092
J 34196 – 3
606

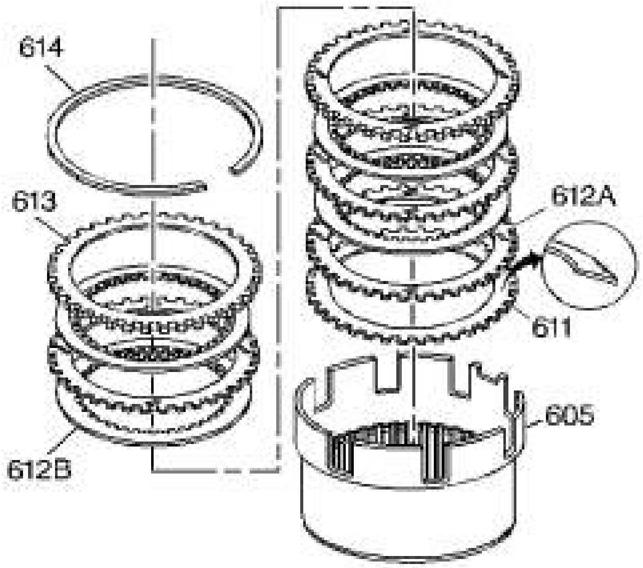
2. Using the J 34196-3 which is part of kit J 34196-B with the J 8092 , install a reverse input clutch rear bushing 606).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1975649**

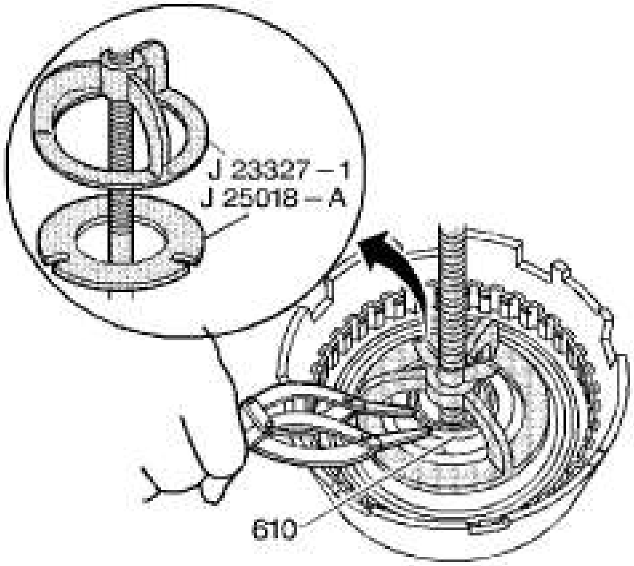
Reverse Input Clutch Disassemble

Tools Required

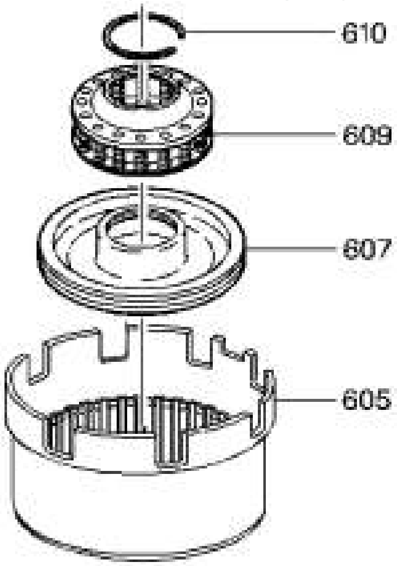
- J 23327-1 Forward Clutch Spring Compressor (Bridge)
- J 25018-A Clutch Spring Compressor Adapter



1. Remove the reverse input clutch retaining ring (614).
2. Remove all reverse input clutch plates (611-613).

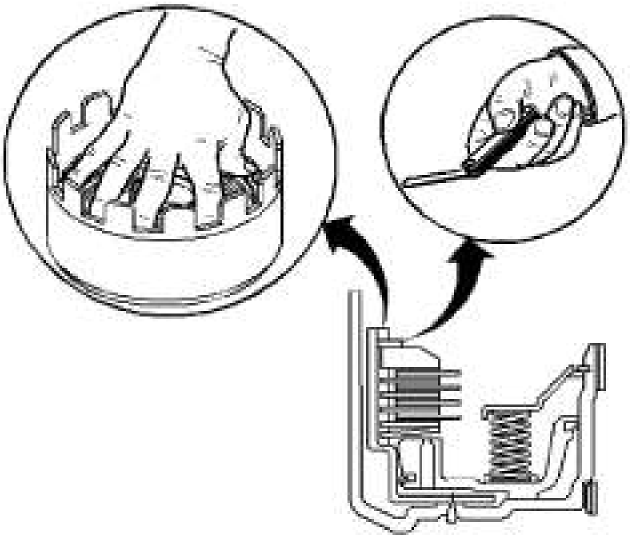


3. Install the J 23327-1 and the J 25018-A .
4. Compress the reverse input clutch spring assembly.
5. Remove the reverse input clutch spring retainer ring (610).



6. Remove the reverse input clutch spring assembly (609).
7. Remove the reverse input clutch piston assembly (607).

Reverse Input Clutch Plate Travel Check



1. Apply an evenly distributed load to the clutch pack.
2. Use feeler gauges to check the reverse input clutch plate travel.
3. Check the travel between the selective backing plate and the reverse input clutch retainer ring.

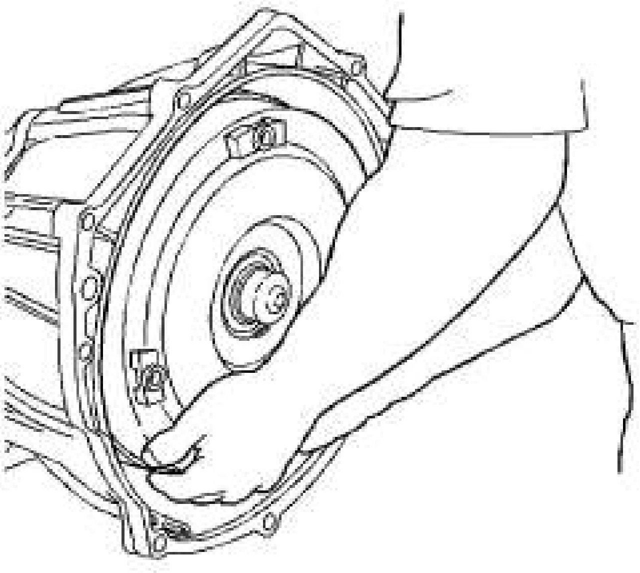
   Clutch Plate Travel Specifications
   The reverse input clutch plate travel should be 1.02-1.94 mm (0.040-0.076 in).

4. Select the proper selective backing plate to obtain the correct travel..

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Repair Instructions - Off Vehicle | **Document ID: 1992321**

Torque Converter Assembly Removal

Caution: The torque converter weighs approximately 65 lbs. Personal injury may result if you lift the torque converter improperly.

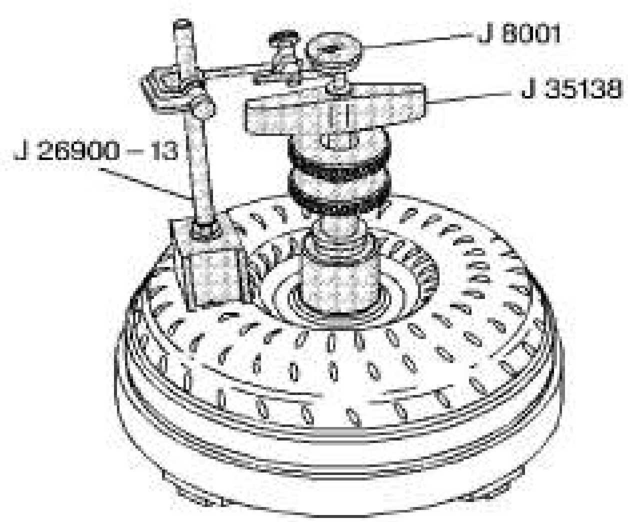


Remove the torque converter.

Torque Converter End Play Inspection

Tools Required

- J 8001 Dial Indicator Set
- J 26900-13 Magnetic Indicator Base
- J 35138 Converter End Play Checker
- J 39195 Converter End Play Check Tool



1. Inspect the torque converter and replace if any of the following conditions exist:
    - Evidence of damage to the pump assembly.
    - Metal particles are found after flushing the cooler and cooler lines.
    - External leaks in the hub area.
    - Converter pilot is broken, damaged or poor fit into the crankshaft.
    - Converter hub is scored or damaged.
    - Internal damage to the stator.
    - Contamination from engine coolant.
    - Excessive end play.

    Important: The torque converter should not be replaced if the fluid has an odor, discoloration or no evidence of metal or clutch plate material.

    Flushing the torque converter is not recommended.

2. Install the J 35138 , the J 26900-13 and the J 8001 or J 39195 to be used with the 300 mm

torque converter.

Specification

- The end play for a 245 mm torque converter should be 0-0.38 mm (0-0.015 in).
- The end play for a 298 mm torque converter should be 0.1-0.48 mm (0.004-0.019 in).
- The end play for a 258 mm and 300 mm torque converter should be 0.1-0.5 mm (0.004-0.020 in).

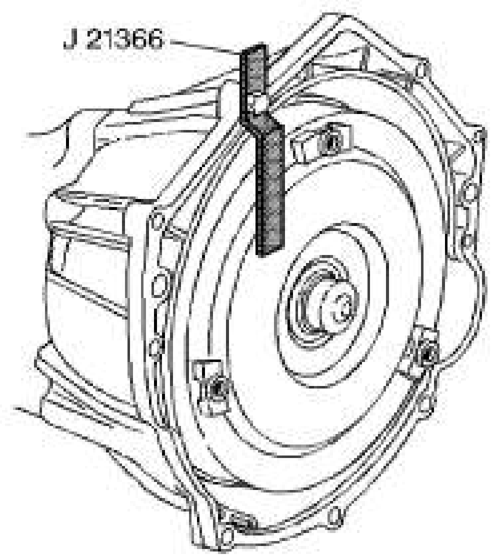
3. Remove the tools.

Torque Converter Installation

Tools Required

J 21366 Converter Holding Strap

Caution: The torque converter weighs approximately 65 lbs. Personal injury may result if you lift the torque converter improperly.

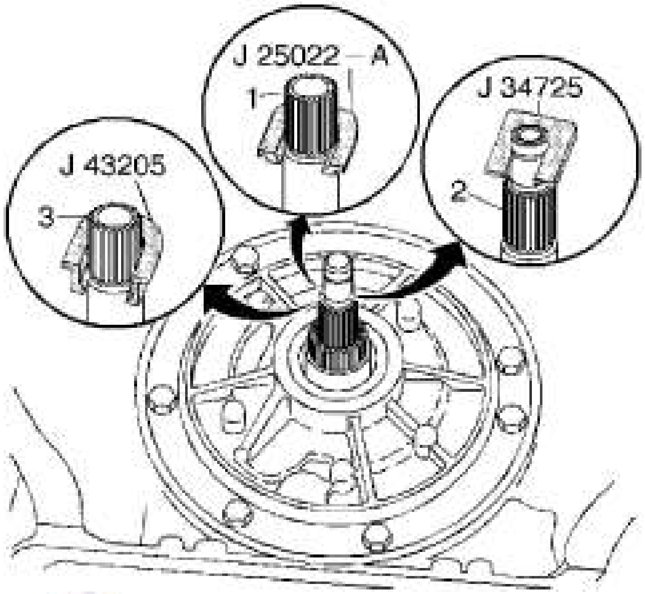


1. Install the torque converter.
2. Install the J 21366 .

Transmission End Play Check

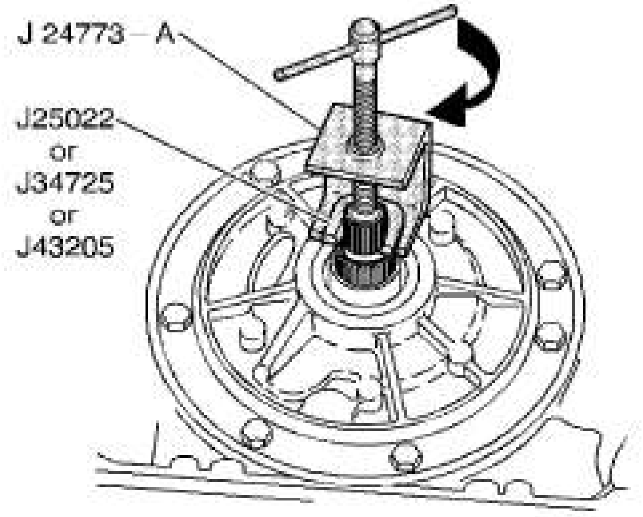
Tools Required

- J 25022 End Play Fixture Adapter (245 mm and 258 mm)
- J 34725 End Play Checking Adapter (298 mm)
- J 43205 End Play Fixture Adapter (300 mm)
- J 24773-A Oil Pump Remover
- J 8001 Dial Indicator Set
- J 25025-7A Dial Indicator Mounting Post



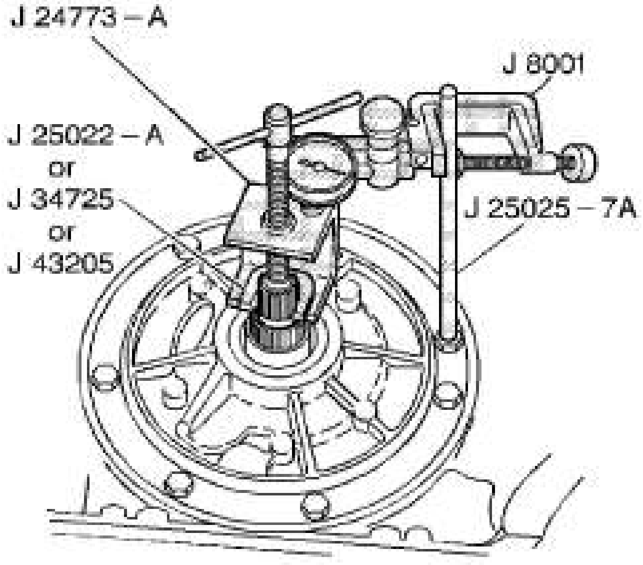
Important: Torque converter size is model dependent.

1. Install an end play fixture adapter.
    - Use J 25022 for a 245 mm and 258 mm turbine shaft (1).
    - Use J 34725 for a 298 mm turbine shaft (2).
    - Use J 43205 for a 300 mm turbine shaft (3).



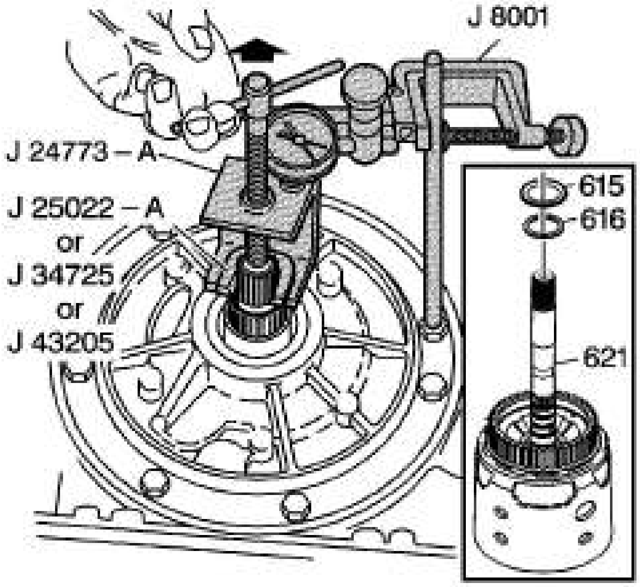
J 24773 – A
J25022
or
J34725
or
J43205

2. Install the J 24773-A .



J 24773 – A
J 8001
J 25022 – A
or
J 34725
or
J 43205
J 25025 – 7A

3. Remove an oil pump retaining bolt.
4. Install J 25025-7A (or a 278 mm or 11 in bolt) and lock nut.
5. Install J 8001-3 .



6. Set the J 8001-3 to zero.
7. Pull up on J 24773-A .

   Proper end play should be 0.13-0.92 mm (0.005-0.036 in).

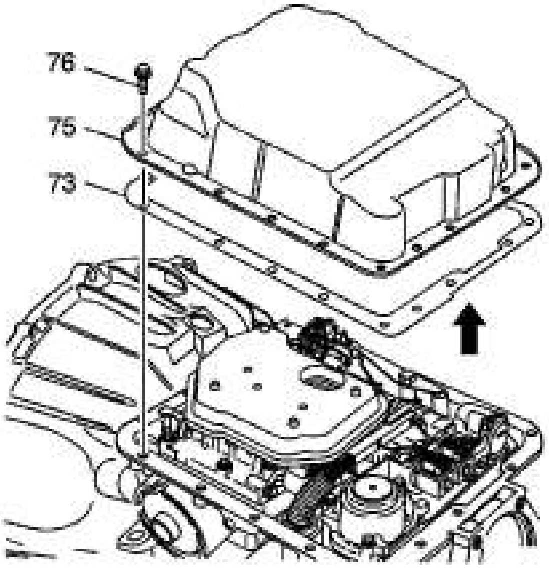
8. The selective thrust washer (616), which controls the end play, is located between the input housing (621) and the thrust bearing (615) on the oil pump hub.

   If the end play measurement is incorrect, refer to Torque Converter End Play Specifications. Choose a new selective thrust washer (616) based on the original selective washer and the information contained in the table.

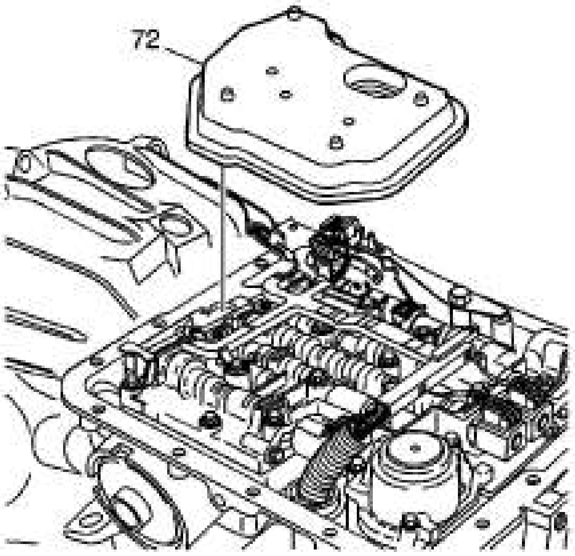
   If the dial indicator shows no end play, the selective thrust washer (616) and thrust bearing (615) may have been misassembled.

9. Correct the end play by changing the selective thrust washer (616).

Transmission Fluid Pan and Filter Assembly Removal

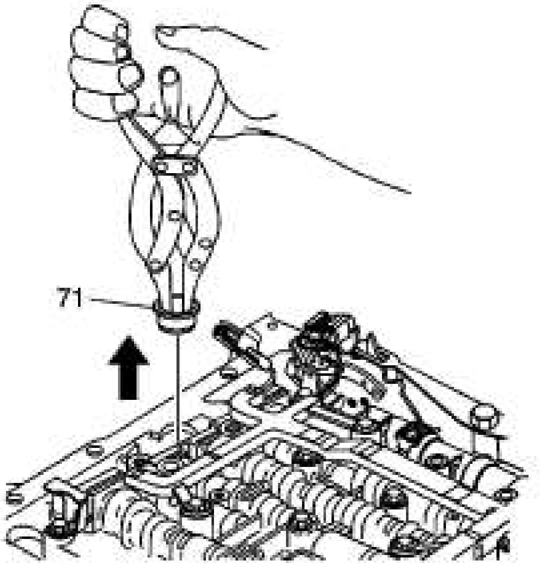


1. Remove the transmission oil pan screws (76).
2. Remove the transmission oil pan (75) and the transmission oil pan gasket (73).



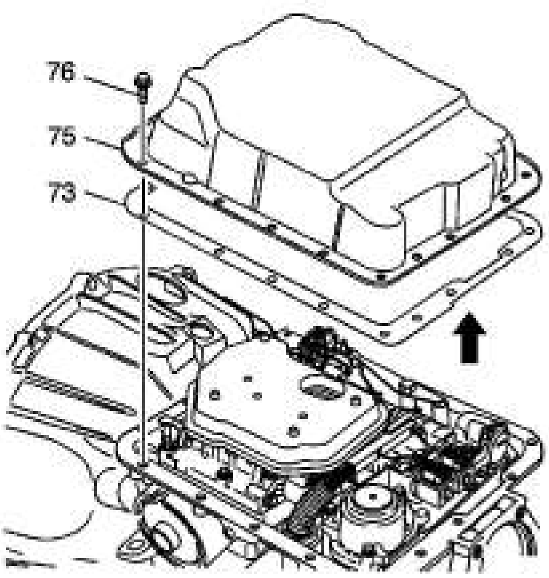
3. Remove the transmission oil filter assembly (72).
4. The filter may help in diagnosis. Cut away the top portion of the plastic filter housing and remove. Inspect the filter for the presence of the following items which may indicate wear or corrosion:
   - Clutch material

- Bronze slivers indicating bushing wear
- Steel particles



5. Remove the oil filter seal (71).

Transmission Fluid Pan Installation

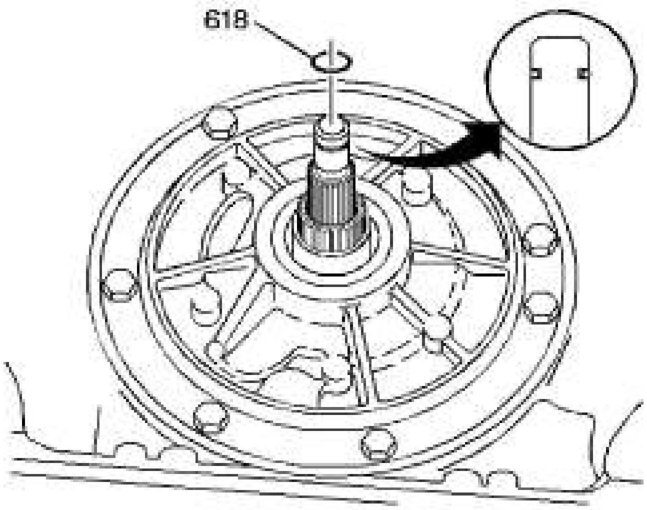


1. Place the transmission oil pan gasket (73) on the case.
2. Place the transmission oil pan (75) on the case.

   Caution: Refer to Fastener Caution in the Preface section.

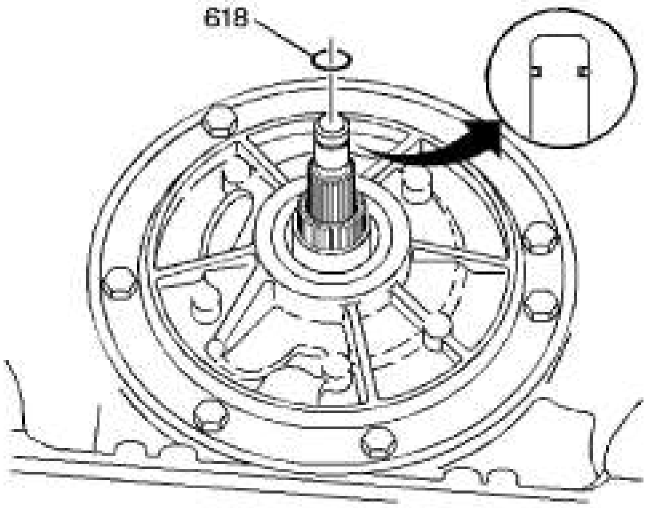
3. Install all of the transmission oil pan screws (76). Tighten the screws to **16 N·m (11.8 lb ft)**.

Turbine Shaft O-Ring Installation



Install the O-ring (618) on the turbine shaft. O-Ring location is location dependent.

Turbine Shaft O-Ring Removal

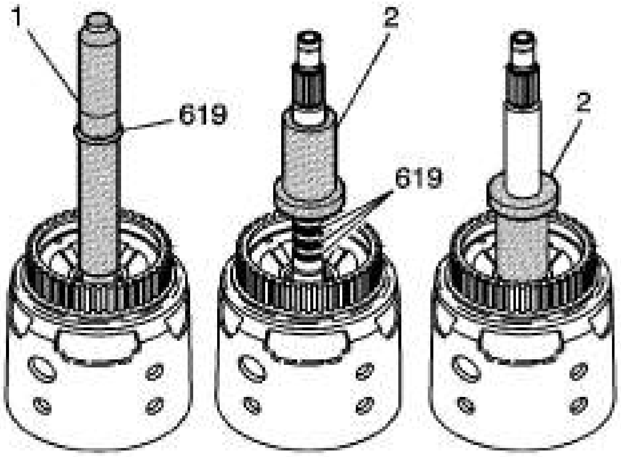


Remove the O-ring (618) from the turbine shaft. O-Ring location is model dependent.

Turbine Shaft Seal Installation

Tools Required

- J 36418-1B Turbine Shaft Seal Installer
- J 36418-2A Turbine Shaft Seal Sizer

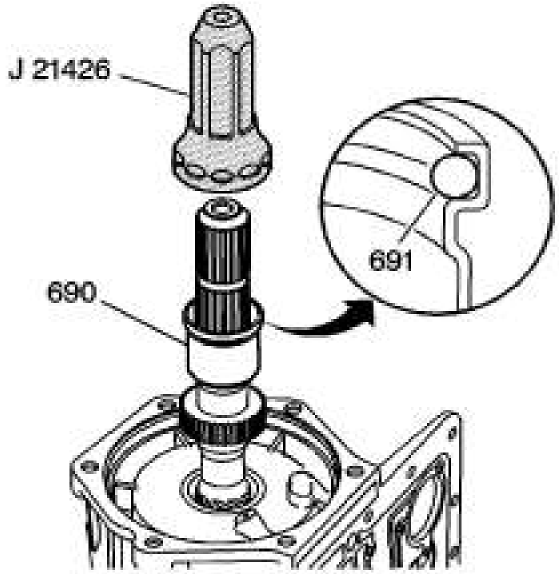


1. Use the J 36418-1B (1) in order to install the four turbine shaft oil seal rings (619).
2. Resize oil seal rings (619) after installation:
   1. Place J 36418-2A (2) over the turbine shaft oil seal rings (619) and seat against input housing.
   2. Remove J 36418-2A (2).
   3. Turn J 36418-2A (2) upside down and place over the turbine shaft oil seal ring (619).
   4. Seat against input housing.
   5. Leave J 36418-2A (2) in place over the turbine shaft oil seal rings (619) until the reverse input clutch housing is installed.

Vehicle Speed Sensor and Case Extension Installation

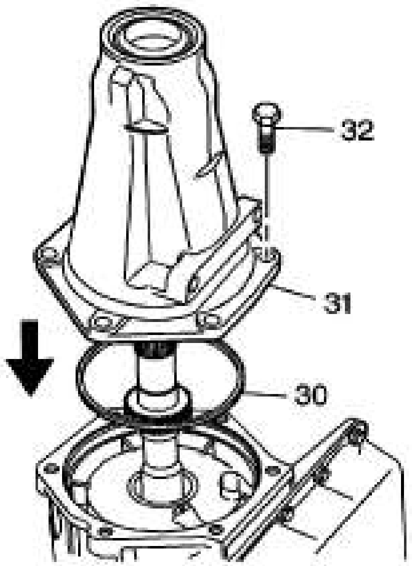
Tools Required

J 21426 Rear Seal Installer



1. Using the J 21426 , install an output shaft sleeve (690) and an output shaft seal (691).

   Do not push the sleeve past the machined surface on the output shaft.

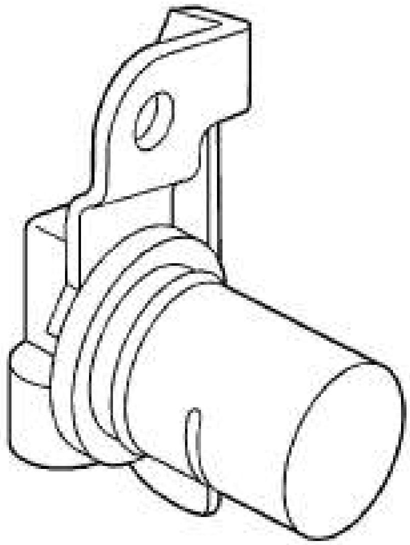


2. Install the case extension to case seal (30) and the case extension (31).

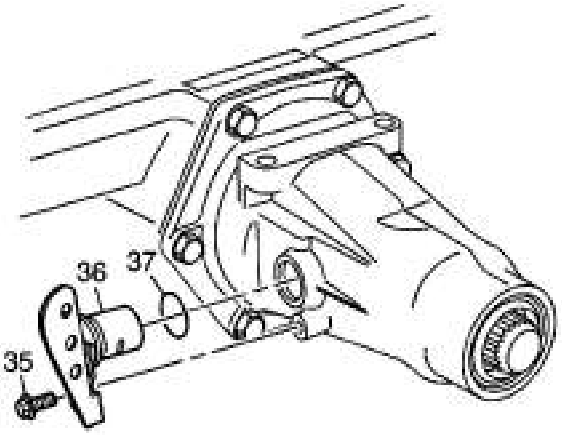
   Notice: Refer to Fastener Notice in the Preface section.

3. Install the case extension to case retaining bolts (32).

   Tighten
   Tighten the retaining bolts to 45 N·m (33 lb ft).

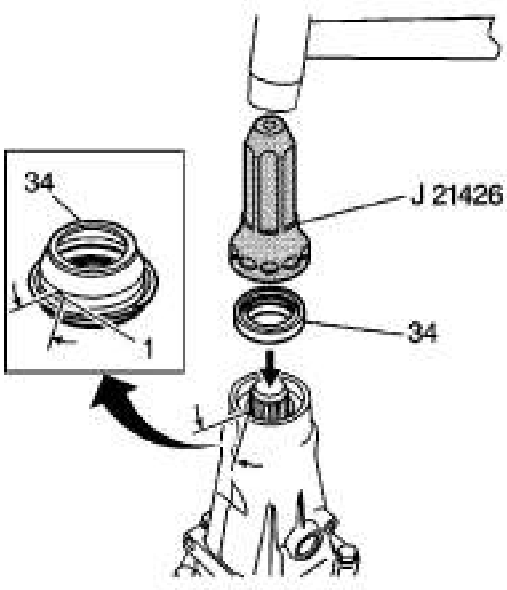


4. Inspect the transmission speed sensor for the following conditions:
   - Cracks
   - Nicks
   - Damage



5. Install a new O-ring seal (37) on the internal transmission speed sensor (36).
6. Install the internal transmission speed sensor (36).
7. Install the speed sensor retaining bolt (35).

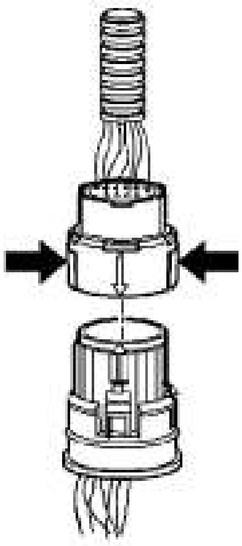
Tighten
Tighten the bolt to 12 N·m (9 lb ft).



Important: If installing a slip yoke type seal (34), position drain hole (1) to bottom of transmission within area shown.

8. Using the J 21426 , install the case extension oil seal assembly (34) (model dependent).

Automatic Transmission Inline 20-Way Connector Description



The transmission electrical connector is an important part of the transmission operating system. Any interference with the electrical connection can cause the transmission to set diagnostic trouble codes or affect proper operation.

The following items can affect the electrical connection:

- Bent pins in the connector from rough handling during connection and disconnection
- Wires backing away from the pins or coming uncrimped, in either the internal or the external wiring harness
- Dirt contamination entering the connector when disconnected
- Pins in the internal wiring connector backing out of the connector or pushed out of the connector during reconnection
- Transmission fluid leaking into the connector, wicking up into the external wiring harness and degrading the wire insulation
- Moisture intrusion in the connector
- Low pin retention in the external connector from connection and disconnection of the wiring connector assembly
- Pin corrosion from contamination
- Damaged connector assembly

Remember the following points:

- In order to remove the connector, squeeze the two tabs toward each other and pull straight up without pulling by the wires.
- Limit twisting or wiggling the connector during removal. Bent pins can occur.
- Do not pry the connector off with a screwdriver or other tool.
- Visually inspect the seals to make sure that they are not damaged during handling.
- In order to reinstall the external wiring connector, first orient the pins by lining up the arrows on each half of the connector. Push the connector straight down into the transmission without twisting or angling the mating parts.
- The connector should click into place with a positive feel and/or noise.
- Whenever the transmission external wiring connector is disconnected from the internal harness and the engine is operating, DTCs will set. Clear these DTCs after reconnecting the external connector.

Definitions and Abbreviations

Throttle Positions

Engine Braking: A condition where the engine friction is used to slow the vehicle by manually downshifting during a zero throttle coastdown.

Full Throttle Detent Downshift: A quick apply of the accelerator pedal to its full travel, forcing a downshift.

Heavy Throttle: Approximately 3/4 of accelerator pedal travel (75 percent throttle position).

Light Throttle: Approximately 1/4 of accelerator pedal travel (25 percent throttle position).

Medium Throttle: Approximately 1/2 of accelerator pedal travel (50 percent throttle position).

Minimum Throttle: The least amount of throttle opening required for an upshift.

Wide Open Throttle (WOT): Full travel of the accelerator pedal (100 percent throttle position).

Zero Throttle Coastdown: A full release of the accelerator pedal while the vehicle is in motion and in drive range.

Shift Condition Definitions

Bump: A sudden and forceful apply of a clutch or a band.

Chuggle: A bucking or jerking. This condition may be most noticeable when the converter clutch is engaged. It is similar to the feel of towing a trailer.

Delayed: A condition where a shift is expected but does not occur for a period of time. This may be described as a clutch or band engagement that does not occur as quickly as expected during a part throttle or wide open throttle apply of the accelerator, or during manual downshifting to a lower range. This term is also defined as LATE or EXTENDED.

Double Bump (Double Feel): Two sudden and forceful applies of a clutch or a band.

Early: A condition where the shift occurs before the car has reached proper speed. This condition tends to labour the engine after the upshift.

End Bump: A firmer feel at the end of a shift than at the start of the shift. This is also defined as END FEEL or SLIP BUMP.

Firm: A noticeably quick apply of a clutch or band that is considered normal with a medium to heavy throttle. This apply should not be confused with HARSH or ROUGH.

Flare: A quick increase in engine RPM along with a momentary loss of torque. This most generally occurs during a shift. This condition is also defined as SLIPPING.

Harsh (Rough): A more noticeable apply of a clutch or band than FIRM. This condition is considered undesirable at any throttle position.

Hunting: A repeating quick series of upshifts and downshifts that causes a noticeable change in engine RPM, such as a 4-3-4 shift pattern. This condition is also defined as BUSYNESS.

Initial Feel: A distinctly firmer feel at the start of a shift than at the finish of the shift.

Late: A shift that occurs when the engine RPM is higher than normal for a given amount of throttle.

Shudder: A repeating jerking condition similar to CHUGGLE but happens at a higher frequency. This condition may be most noticeable during certain ranges of vehicle speed.

Slipping: A noticeable increase in engine RPM without a vehicle speed increase. A slip usually occurs during or after initial clutch or band apply.

Soft: A slow, almost unnoticeable clutch or band apply with very little shift feel.

Surge: A repeating engine related condition of acceleration and deceleration that is less intense than CHUGGLE.

Tie-Up: A condition where two opposing clutch and/or bands are attempting to apply at the same time causing the engine to labour with a noticeable loss of engine RPM.

Noise Conditions

Drive Link Noise: A whine or growl that increases or fades with vehicle speed, and is most noticeable under a light throttle acceleration. It may also be noticeable in PARK or NEUTRAL operating ranges with the vehicle stationary.

Final Drive Noise: A hum related to vehicle speed which is most noticeable under a light throttle acceleration.

Planetary Gear Noise: A whine related to vehicle speed, which is most noticeable in FIRST gear, SECOND gear, FOURTH gear or REVERSE. The condition may become less noticeable, or go away, after an upshift.

Pump Noise: A high pitched whine that increases in intensity with engine RPM. This condition may also be noticeable in all operating ranges with the vehicle stationary or moving.

Torque Converter Noise: A whine usually noticed when a vehicle is stopped, and the transmission is in DRIVE or REVERSE. The noise will increase with engine RPM.

Transmission Abbreviations

A/C: Air Conditioning

AC: Alternating Current

AT: Automatic Transmission

CCDIC: Climate Control Driver Information Centre

DC: Direct Current

DIC: Driver Information Centre

DLC: Diagnostic Link Connector

DMM: Digital Multimeter

DTC: Diagnostic Trouble Code

ECT: Engine Coolant Temperature

EMI: Electromagnetic Interference

IAT: Intake Air Temperature

IGN: Ignition

MAP: Manifold Absolute Pressure

MIL: Malfunction Indicator Lamp

NC: Normally Closed

NO: Normally Open

OBD: On Board Diagnostic

OSS: Output (Shaft) Speed Sensor

PC: Pressure Control

TCM: Transmission Control Module

PWM: Pulse Width Modulation

RPM: Revolutions Per Minute

SS: Shift Solenoid

TAP: Transmission Adaptive Pressure

TFT: Transmission Fluid Temperature

TP: Throttle Position

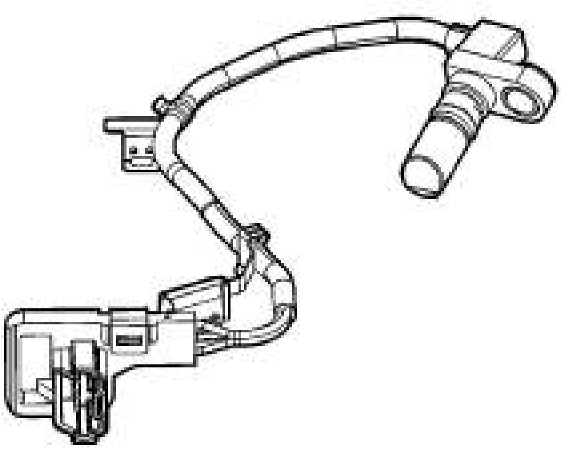
TV: Throttle Valve

OSS: Output Speed Sensor

WOT: Wide Open Throttle

Electronic Component Description (TCM)

Automatic Transmission Input Speed Sensor Assembly



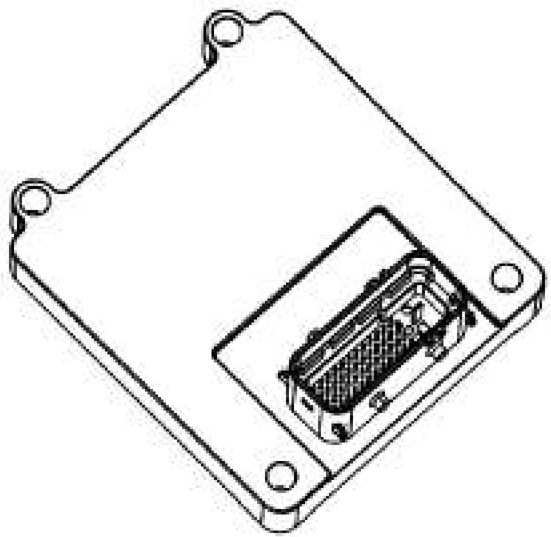
The Automatic Transmission Input Speed Sensor (AT ISS) Assembly is a hall-effect sensor that produces an input speed signal as the turbine shaft rotor teeth pass in front of the sensor tip.

The AT ISS is made of a permanent magnet with an iron pole piece and an integrated circuit (IC) chip with a two-element transducer molded into a plastic housing. The two-element transducer functions as an on/off switch by sensing changes in the magnetic field strength. The dual element design greatly increases the sensor's switching accuracy.

Because the turbine shaft is splined to the torque converter, it spins at engine speed. As the turbine shaft spins, the rotor teeth pass in front of the sensor tip, changing the magnetic field. As a result, the transducers are sensing high and low magnetic signals. The IC chip will then amplify and filter the high and low signal. Therefore, whenever the engine is running, the sensor will produce high and low signals proportional to turbine shaft speed. The more rotor teeth passing by the sensor's magnetic field in a specific amount of time, the faster the turbine shaft is spinning.

The ISS assembly is attached to the pump cover with the tip of the sensor passing though the stator shaft and sleeve. The ISS mounting bolt passes through a steel insert and into a threaded hole in the pump cover. The ISS wiring harness is routed and secured to the pump cover with clip-on brackets. At the transmission control module (TCM), the signal is electronically converted and is interpreted as transmission input speed. The TCM uses transmission input speed together with the transmission output speed to provide shift energy and torque management capabilities, improved shift quality (feel), increased TCC function, gear ratios that are more accurate and enhanced transmission diagnostics.

Electronic Component Description (TCM)



The transmission control module (TCM) (5.3L only) is mounted near the lower left front of the engine and connects directly to the engine wiring harness. A single 49-way connector is used to make the connection between the vehicle wiring and the TCM. The TCM is an electronic control module that receives input or provides output in order to control the operation of the 4L60 automatic transmission.

The TCM receives the following inputs from the engine control module (ECM):

- Engine speed and torque values
- Engine intake air temperature (IAT), accelerator pedal position (APP) information
- Engine coolant temperature (ECT)
- Kick-down request
- Traction control status
- Driver selected shift mode
- Air-conditioning (A/C) status
- Cruise control status

The ECM provides this data to the TCM through the controller area network (CAN). The CAN is a 2-wire communication connection between the 2 controllers.

Other TCM inputs are the following:

- Battery and ignition voltage
- Brake switch status
- Transmission manual shift shaft switch assembly

- Transmission fluid temperature (TFT)
- Transmission vehicle speed sensor (VSS)

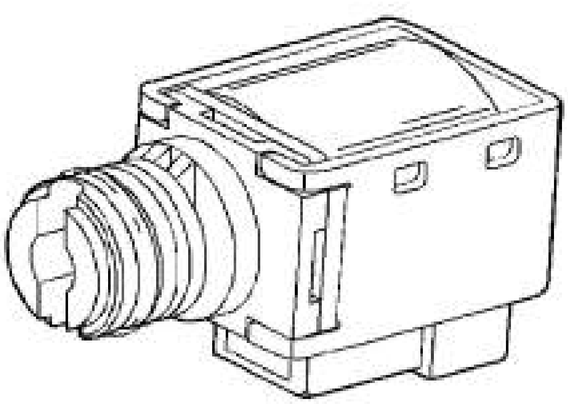
The TCM provides the following outputs in order to control the automatic transmission:

- Shift solenoids to control transmission shifting
- TCC PWM solenoid operation controls the apply and release of the torque converter clutch ASM
- Pressure control solenoid (PCS) regulates transmission line pressure

Other TCM outputs provided to the ECM are the following:

- MIL illumination request
- Vehicle speed
- Transmission input speed
- Transmission fluid temperature
- Commanded gear status
- TCC status
- Torque reduction requests
- Manual shift shaft switch status

1-2 and 2-3 Shift Solenoid Valves



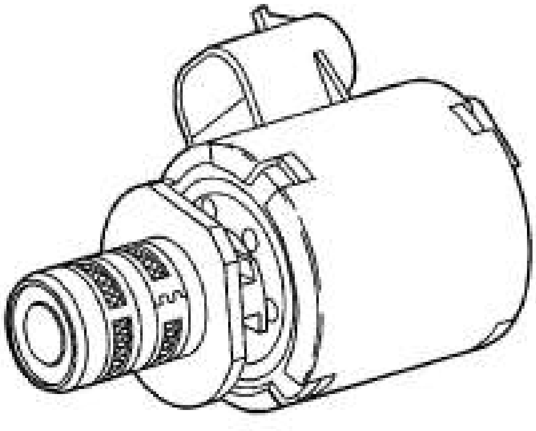
The 1-2 and 2-3 shift solenoid valves (also called A and B solenoids) are identical devices that control the movement of the 1-2 and 2-3 shift valves (the 3-4 shift valve is not directly controlled by a shift solenoid). The solenoids are normally-open exhaust valves that work in four combinations to shift the transmission into different gears.

The transmission control module (TCM) energizes each solenoid by grounding the solenoid through an internal quad driver. This sends current through the coil winding in the solenoid and moves the internal plunger out of the exhaust position. When ON, the solenoid redirects fluid to move a shift valve.

Important: The manual valve hydraulically can override the shift solenoids. Only in D4 do the shift solenoid states totally determine what gear the transmission is in. In the other manual valve positions, the transmission shifts hydraulically and the shift solenoid states CATCH UP when the throttle position and the vehicle speed fall into the correct ranges.

The TCM-controlled shift solenoids eliminate the need for TV and governor pressures to control shift valve operation.

Transmission Pressure Control Solenoid



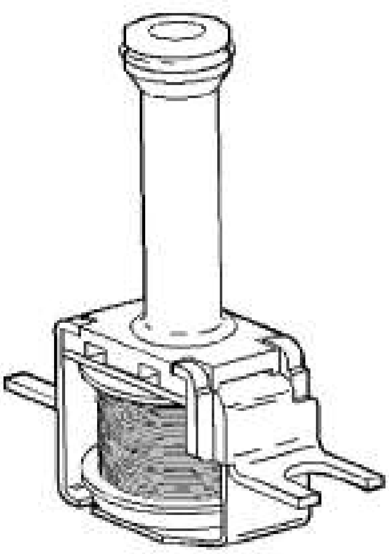
The transmission pressure control solenoid is an electronic pressure regulator that controls pressure based on the current flow through its coil winding. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the pressure regulator valve.

The transmission control module (TCM) controls the pressure control solenoid by commanding current between 0.1-1.1 amps. This changes the duty cycle of the solenoid, which can range between 5-95 percent, typically less than 60 percent. High amperage (1.1 amps) corresponds to minimum line pressure, and low amperage (0.1 amp) corresponds to maximum line pressure, if the solenoid loses power, the transmission defaults to maximum line pressure.

The TCM commands the line pressure values, using inputs such as engine speed and throttle position sensor voltage.

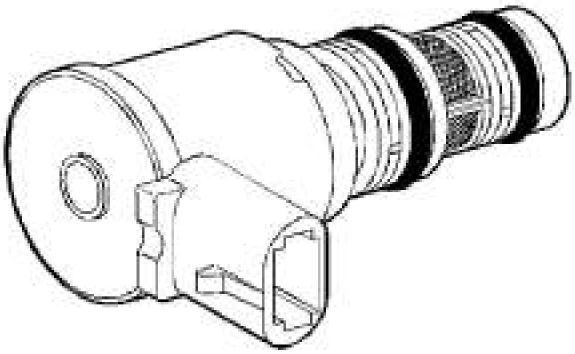
The pressure control solenoid takes the place of the throttle valve or the vacuum modulator that was used on past model transmissions.

Torque Converter Clutch Solenoid Valve



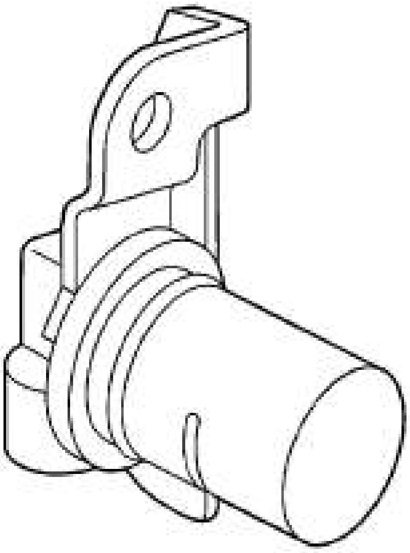
The torque converter clutch (TCC) solenoid valve is a normally-open exhaust valve that is used to control torque converter clutch apply and release. When grounded (energized) by the transmission control module (TCM), the TCC solenoid valve stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and move the TCC solenoid valve into the apply position.

Torque Converter Clutch Pulse Width Modulation Solenoid Valve



The torque converter clutch pulse width modulation solenoid valve controls the fluid acting on the converter clutch valve. The converter clutch valve controls the torque converter clutch (TCC) apply and release. This solenoid is attached to the control valve body assembly within the transmission. The TCC PWM solenoid valve provides a smooth engagement of the torque converter clutch by operating during a duty cycle percent of ON time.

Vehicle Speed Sensor Assembly



The vehicle speed sensor (VSS) assembly provides vehicle speed information to the transmission control module (TCM). The VSS assembly is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage as rotor teeth on the transmission output shaft pass through the sensor's magnetic field. The AC voltage level and the number of pulses increase as the speed of the vehicle increases. Output voltage varies with speed from a minimum of 0.5 volts at 100 RPM to more than 100 volts at 8,000 RPM. The TCM converts the pulsing voltage to vehicle speed. The TCM uses the vehicle speed signal to determine shift timing and torque converter clutch (TCC) scheduling.

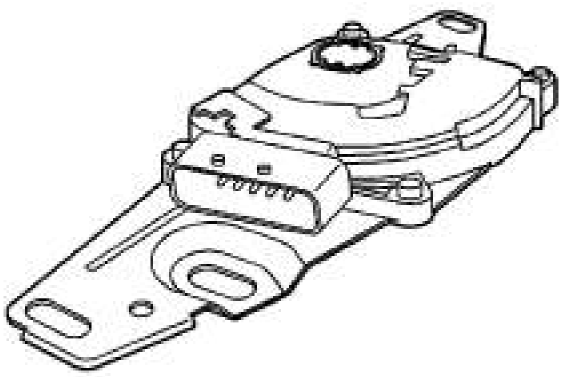
Automatic Transmission Fluid Temperature Sensor

The automatic transmission fluid temperature (TFT) sensor is part of the automatic transmission manual shift shaft position switch. The TFT sensor is a resistor, or thermistor, which changes value based on temperature. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases and as the temperature decreases, the resistance increases.

The transmission control module (TCM) supplies a 5-volt reference signal to the TFT sensor and measures the voltage drop in the circuit. When the transmission fluid is cold, the sensor resistance is high and the TCM detects high signal voltage. As the fluid temperature warms to a normal operating temperature, the resistance becomes less and the signal voltage decreases. Refer to Transmission Fluid Temperature Sensor Specifications for a complete comparison of sensor resistance, temperature and signal voltage.

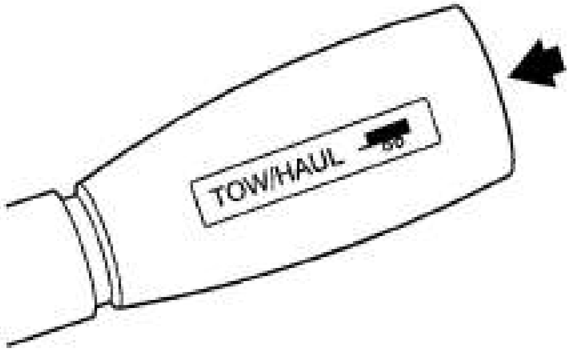
The TCM uses the TFT sensor information to control shift quality and torque converter clutch (TCC) application.

Transmission Range Switch



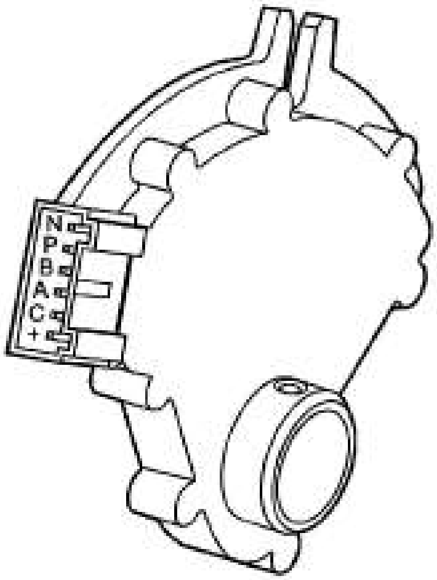
The transmission range (TR) switch is part of the park/neutral position (PNP) and backup lamp switch assembly, which is externally mounted on the transmission manual shaft. The TR switch contains four internal switches that indicate the transmission gear range selector lever position. The transmission control module (TCM) supplies ignition voltage to each switch circuit. As the gear range selector lever is moved, the state of each switch may change, causing the circuit to open or close. An open circuit or switch indicates a high voltage signal. A closed circuit or switch indicates a low voltage signal. The TCM detects the selected gear range by deciphering the combination of the voltage signals. The TCM compares the actual voltage combination of the switch signals to a TR switch combination chart stored in memory.

Tow/Haul Mode Switch



Tow/Haul mode enables the operator to achieve enhanced shift performance when towing or hauling a load. When tow/haul mode is selected, the tow/haul switch input signal to the body control module (BCM) is momentarily toggled to zero volts. This signals the powertrain control module (PCM) or transmission control module (TCM) to extend the length of time between upshifts and increase transmission line pressure. Cycling the tow/haul switch again, or cycling the ignition switch disables tow/haul mode and returns the transmission to a normal shift pattern.

Transmission Manual Shift Shaft Switch Assembly (88)



The transmission manual shift shaft switch assembly (88) is a sliding contact switch attached to the manual shift shaft inside the transmission case. The five inputs to the TCM from the transmission manual shift shaft switch assembly indicate the transmission gear selector lever position. This information is used for engine controls as well as determining the transmission shift patterns. The state of each input is available for display on the scan tool. The five input parameters represented are Signal A, Signal B, Signal C, Signal P (Parity) and Signal N (P/N Start).

Manual First Gear

A manual 2-1 downshift can be accomplished by moving the gear selector lever into the manual first (1) position when the transmission is operating in second gear. The downshift to first gear is controlled electronically by the PCM. The PCM will not energize the 1-2 shift solenoid valve to initiate the downshift until the vehicle speed is below approximately 48 to 56 km/h (30 to 35 mph). Above this speed, the transmission operates in a manual first-second gear state. The following text explains the manual 2-1 downshift.

Manual Valve

The selector lever moves the manual shaft and the manual valve into the manual first (1) position. This allows the line pressure to enter the Lo fluid circuit.

2-3 Shift Solenoid (SS) Valve

In both first and second gears, this solenoid is energized and maintains the signal B fluid pressure at the solenoid end of the 2-3 shift valve train.

2-3 Shift Valve Train

Held in the downshift position by the signal B fluid pressure from the solenoid, the valve train blocks the AFL fluid from entering the D432 fluid circuit. The D432 fluid circuit is open to exhaust past the valve.

1-2 Shift Solenoid (SS) Valve

Below approximately 48 to 56 km/h (30 to 35 mph) the PCM energizes the normally open solenoid. This blocks the signal A fluid pressure from exhausting through the solenoid and creates the pressure in the signal A fluid circuit. Above this speed, the PCM keeps the solenoid de-energized and the transmission operates in manual first-second gear.

1-2 Shift Valve

Signal A fluid pressure moves the valve against the spring force and into the downshift position. In this position, Lo fluid from the manual valve is routed into the Lo/1st fluid circuit and D4 fluid is blocked from entering the 2nd fluid circuit. The 2nd fluid exhausts through an orifice and an annulus exhaust port past the valve. This orifice (#26) helps control the 2-4 band release during a 2-1 downshift.

2-4 Band Releases

2-4 Servo Assembly

The 2nd clutch fluid, which was fed by the 2nd fluid, exhausts from the servo. This allows the spring force from the servo cushion and the servo return springs to move the 2nd apply piston and apply the pin to release the 2-4 band. These spring forces help control the 2-4 band release.

1-2 Accumulator Assembly

The 2nd clutch fluid also exhausts from the 1-2 accumulator assembly. The spring force and the accumulator fluid pressure move the accumulator piston to assist the 2nd clutch fluid exhaust.

Accumulator Valve

As the accumulator fluid is filling the 1-2 accumulator assembly, the accumulator valve regulates the D4 fluid into the accumulator fluid circuit. This regulation, biased by torque signal fluid pressure and spring force, helps control the movement of the 1-2 accumulator piston. The 2nd clutch fluid exhaust, and the 2-4 band release.

1-2 Upshift Checkball (#8)

Exhausting the 2nd clutch fluid pressure unseats the ball and is routed through the 2nd fluid circuit.

Lo and Reverse Clutch Applies

Lo Overrun Valve

The Lo/1st fluid is regulated through the lo overrun valve and into the Lo/reverse fluid circuit in order to control the lo and reverse clutch apply.

Lo and Reverse Piston

The Lo/reverse fluid pressure acts on the inner area of the piston in order to move the piston and in order to apply the lo and reverse clutch plates.

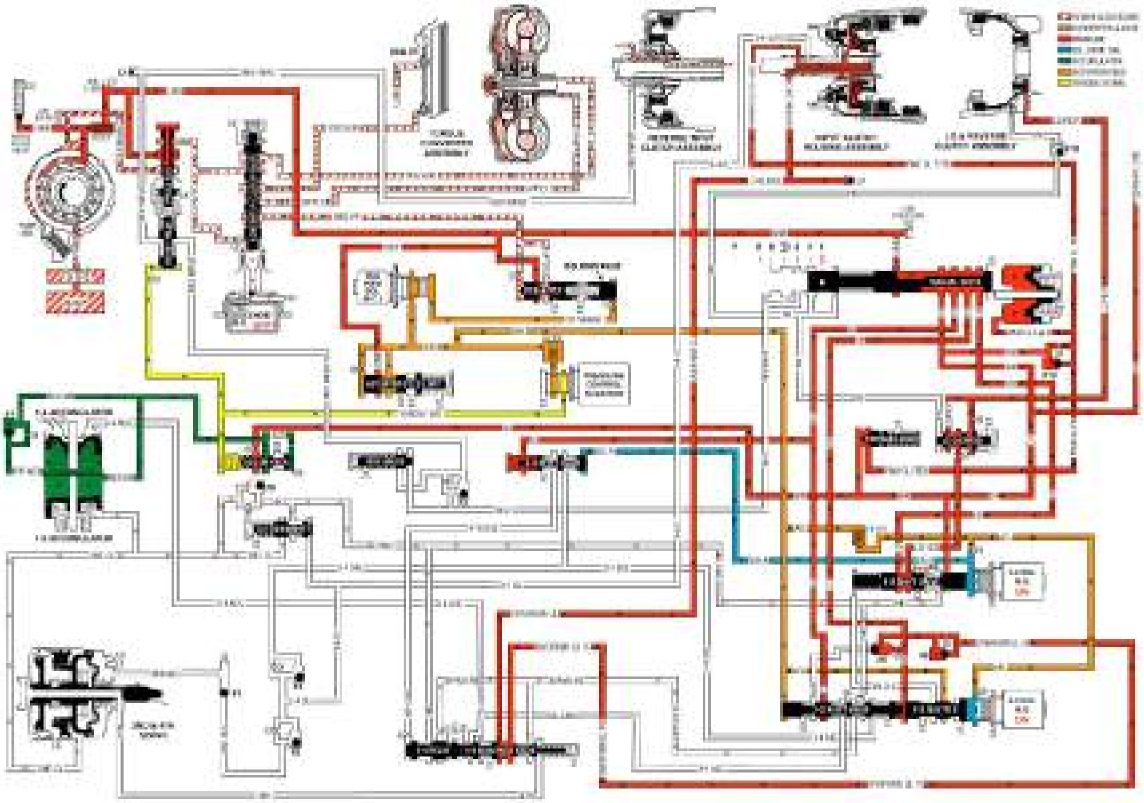
Overrun Clutch Applied

The overrun clutch remains applied in manual first in order to provide engine compression braking.

Pressure Control (PC) Solenoid Valve

Similar to manual second, the PCM output signal to the PC solenoid valve increases the operating range of the torque signal fluid pressure. This provides the increased line pressure for the additional torque requirements during the engine compression braking and the increased engine loads.

Manual First Gear



Manual Second Gear

A manual 3-2 downshift can be accomplished by moving the gear selector lever into the Manual Second (2) position when the transmission is operating in third gear. This causes the transmission to shift immediately into second gear regardless of vehicle operating conditions. Also, the transmission is prevented from operating in any other gear, first, third or fourth. The following information explains the additional changes during a manual 3-2 downshift, as compared to a forced 3-2 downshift. Some vehicles in manual second gear will start out in first gear, while other vehicles will have a second gear start. Refer to the owners manual for specific applications.

Manual Valve

The selector lever moves the manual shaft and the manual valve into the manual second (2) position. This allows the line pressure to enter the D2 fluid circuit.

Third and Fourth Gears Prevented

2-3 Shift Solenoid (SS) Valve

The PCM energizes the 2-3 SS valve and the AFL fluid pressure holds the 2-3 shift valve in the downshift position. This electronically prevents operation of the third and fourth gears.

2-3 Shift Valve Train

The D2 fluid is routed between the 2-3 shuttle and the 2-3 shift valves and causes the following:

- Regardless of the operating conditions, the D2 fluid pressure holds the 2-3 shift valve in the downshift position against the AFL fluid pressure.
- The 2nd fluid is blocked from entering the 3-4 signal fluid circuit and the 3-4 signal fluid circuit is open to an exhaust port at the valve.
- The 3-4 clutch cannot apply with the 3-4 signal fluid exhausted. Therefore, third and fourth gears are hydraulically prevented.
- The 2nd fluid feeds the servo feed fluid circuit, but the 2nd fluid circuit has no function in manual second.
- The AFL fluid is blocked by the 2-3 shift valve and the D432 fluid circuit is exhausted through the valve.
- The overrun fluid is exhausted through the 2-3 shuttle valve.

1-2 Shift Valve

The 1-2 SS valve is OFF, the signal A fluid exhausts through the solenoid and the spring force holds the valve in the upshifted position.

First Gear Prevented

The prevention of first gear is controlled electronically by the PCM through the 1-2 SS valve. The

PCM keeps the 1-2 SS valve de-energized, regardless of the vehicle operating conditions when the manual shift detent lever with shaft position switch signals manual second gear range. This keeps signal A fluid exhausted and the spring force holds the 1-2 shift valve in the upshift position.

Overrun Clutch Remains Applied

Overrun Clutch Feed Checkball (#5)

Orificed D2 fluid pressure seats the #5 checkball against the empty overrun clutch fluid circuit. This is done simultaneously with the overrun clutch fluid exhausting so that there is a continuous fluid supply to the overrun clutch feed fluid circuit.

Overrun Clutch Piston

A continuous supply of fluid pressure is routed to the piston in order to keep the overrun clutch plates applied.

Torque Converter Clutch

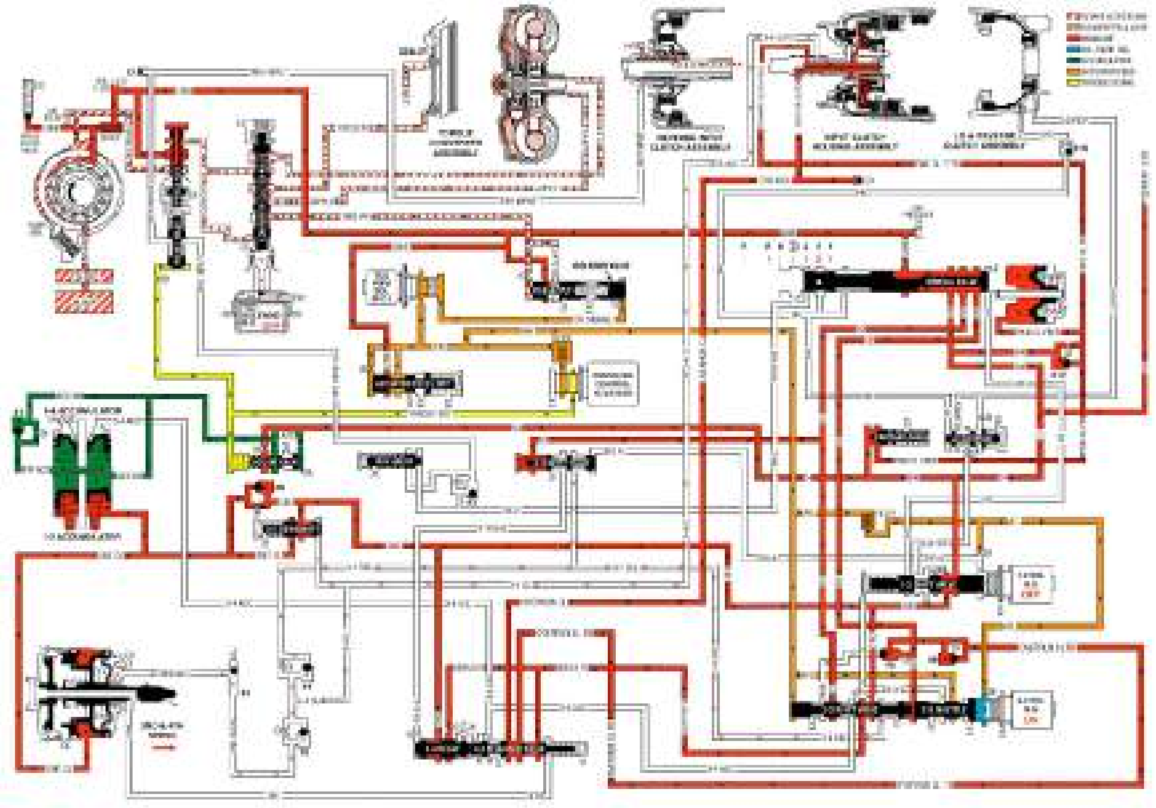
The converter clutch is released prior to downshifting into manual second-second gear. Under normal operating conditions, the TCC will not apply in second gear.

Pressure Control (PC) Solenoid Valve

Important: Some vehicles in Manual Second Gear, at a stop, will start out in 1st gear, while others will have a second gear start. Refer to Vehicle Owners Manual.

The PCM output signal to the PC solenoid valve increases the operating range of torque signal fluid pressure in manual second. This provides the increased line pressure for the additional torque requirements during the engine compression braking and increased engine loads.

Manual Second Gear



Manual Third Gear

A manual 4-3 downshift is available to increase vehicle performance when the use of only three gear ratios is desired. Manual Third gear range also provides engine braking in Third gear when the throttle is released. A manual 4-3 downshift is accomplished by moving the selector lever into the Manual Third (D) position. This moves the manual valve and immediately downshifts the transmission into Third gear. Refer to Overdrive Range, 4-3 Downshift for a complete description of a 4-3 downshift. In Manual Third, the transmission is prevented, both hydraulically and electronically, from shifting into Fourth gear. The following information explains the additional changes during a manual 4-3 downshift as compared to a forced 4-3 downshift.

Manual Valve

The selector lever moves the manual shaft and manual valve into the Manual Third position (D). This allows line pressure to enter the D3 fluid circuit.

1-2 Shift Solenoid (SS) Valve

When Manual Third is selected, the PCM de-energizes the 1-2 SS valve to immediately downshift the transmission into Third gear. This electronically prevents Fourth gear.

3-4 Shift Valve

D3 fluid pressure assists spring force to keep the valve in the downshifted position against the signal A fluid circuit. In this position, the valve blocks 3-4 signal fluid and the 4th signal fluid circuit is open to an exhaust port past the valve. Therefore, with D3 fluid pressure assisting spring force, Fourth gear is hydraulically prevented.

2-3 Shift Valve Train

With the 2-3 SS valve de-energized and open, actuator feed limit (AFL) fluid acting on the 2-3 shift valve holds both valves in the upshifted position. This allows D3 fluid to feed the overrun fluid circuit through the 2-3 shift valve.

Overrun Clutch Feed Checkball (#5)

Overrun fluid pressure seats the ball against the empty D2 fluid circuit.

Overrun Clutch Control Checkball (#6)

Overrun fluid pressure seats the #6 checkball and is orificed (#20) to fill the overrun clutch feed fluid circuit. This orifice controls the overrun clutch apply rate.

3-4 Relay Valve and 4-3 Sequence Valve

4th signal fluid pressure is exhausted from the end of the 3-4 relay valve. Overrun clutch feed fluid pressure assists spring force and closes both valves. This allows overrun clutch feed fluid to flow through the 4-3 sequence valve and fill the overrun clutch fluid circuit.

Overrun Clutch Piston

Overrun clutch fluid pressure moves the piston to apply the overrun clutch plates. The overrun clutch plates provide engine compression braking in Manual Third - Third Gear.

Overrun Clutch Air Bleed Checkball

This ball and capsule is located in the overrun clutch fluid circuit in the oil pump. It allows air to exhaust from the circuit as fluid pressure increases and also allows air into the circuit to displace the fluid when the clutch releases.

Torque Converter Clutch and Torque Converter Clutch PWM Solenoid Valve

The PCM de-energizes the TCC solenoid valve and operates the duty cycle of the TCC PWM solenoid valve to release the converter clutch prior to downshifting, (assuming the converter clutch is applied in Overdrive Range-Fourth Gear when Manual Third is selected). The PCM will re-apply the converter clutch in Manual Third-Third Gear when proper driving conditions have been met.

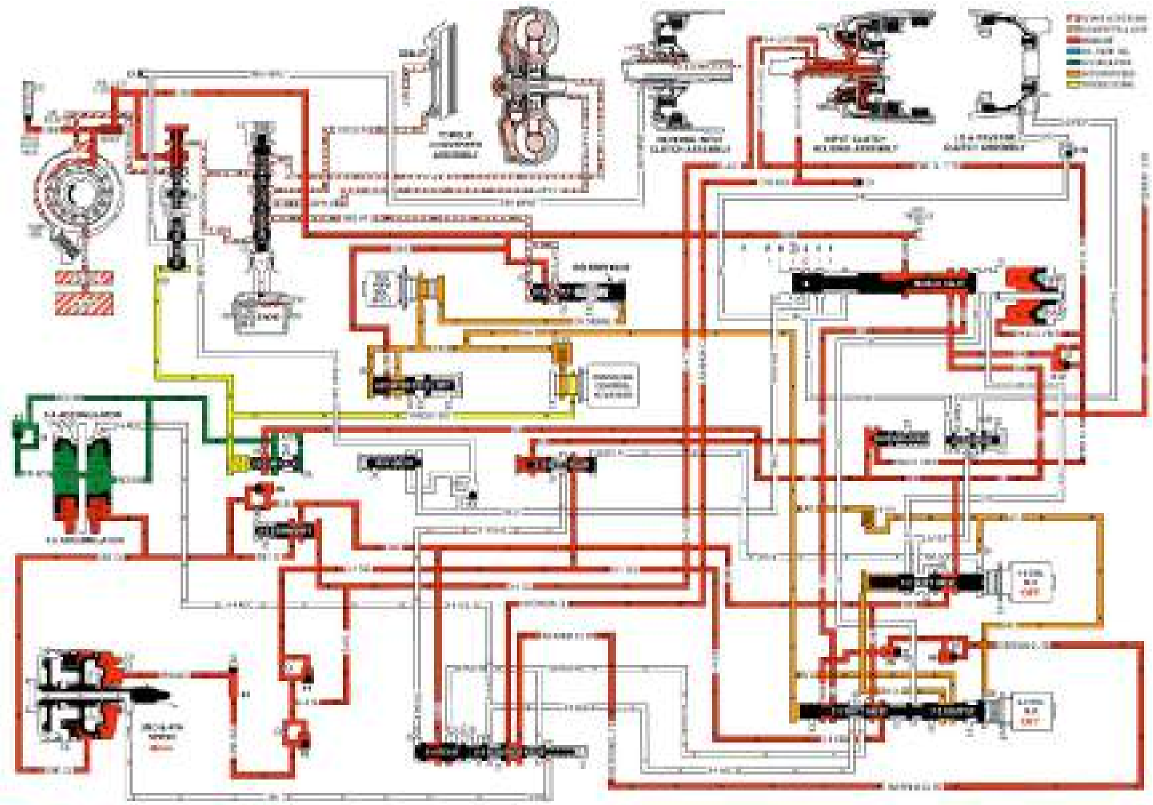
Pressure Control (PC) Solenoid Valve

The PC solenoid valve operates in the same manner as Overdrive Range, regulating in response to throttle position and other vehicle operating conditions.

Manual Third -- First and Second Gears: Overrun Clutch Released

In Manual Third, the transmission upshifts and downshifts normally between First, Second and Third gears. However, in First and Second gears, the 2-3 SS valve is energized and the 2-3 shift valve train is in the downshifted position. The 2-3 shift valve blocks D3 fluid from entering the overrun fluid circuit and opens the overrun fluid circuit to an exhaust port at the valve. This prevents overrun clutch apply and engine compression braking in Manual Third-First and Second Gears.

Manual Third Gear



Neutral - Engine Running

When the gear selector lever is moved to the Neutral position (N) from the Reverse position, the following changes occur to the transmission hydraulic and electrical systems.

Manual Valve

In the Neutral position, the manual valve blocks the line pressure from entering any other fluid circuits. Reverse and PR fluids exhaust past the manual valve.

Lo and Reverse Clutch Releases

Lo and Reverse Clutch Piston

PR and Lo/reverse fluids exhaust from the piston, thereby releasing the lo and reverse clutch plates. Exhausting PR fluid unseats the lo and reverse clutch checkball (#10) for a quick exhaust.

Lo Overrun Valve

Spring force closes the valve when the PR fluid pressure exhausts. Lo/reverse fluid exhausts through the valve, into the Lo/1st fluid circuit, past the 1-2 shift valve, into the Lo fluid circuit and through an exhaust port at the manual valve.

Reverse Input Cutch Releases

Reverse Input Clutch Piston

Reverse input fluid pressure exhausts from the piston, through the boost valve, past the #3 checkball and to the manual valve. With the reverse input fluid exhausted, the reverse input clutch plates are released and the transmission is in Neutral.

Reverse Abuse Valve

Reverse fluid pressure exhausts and spring force closes the valve.

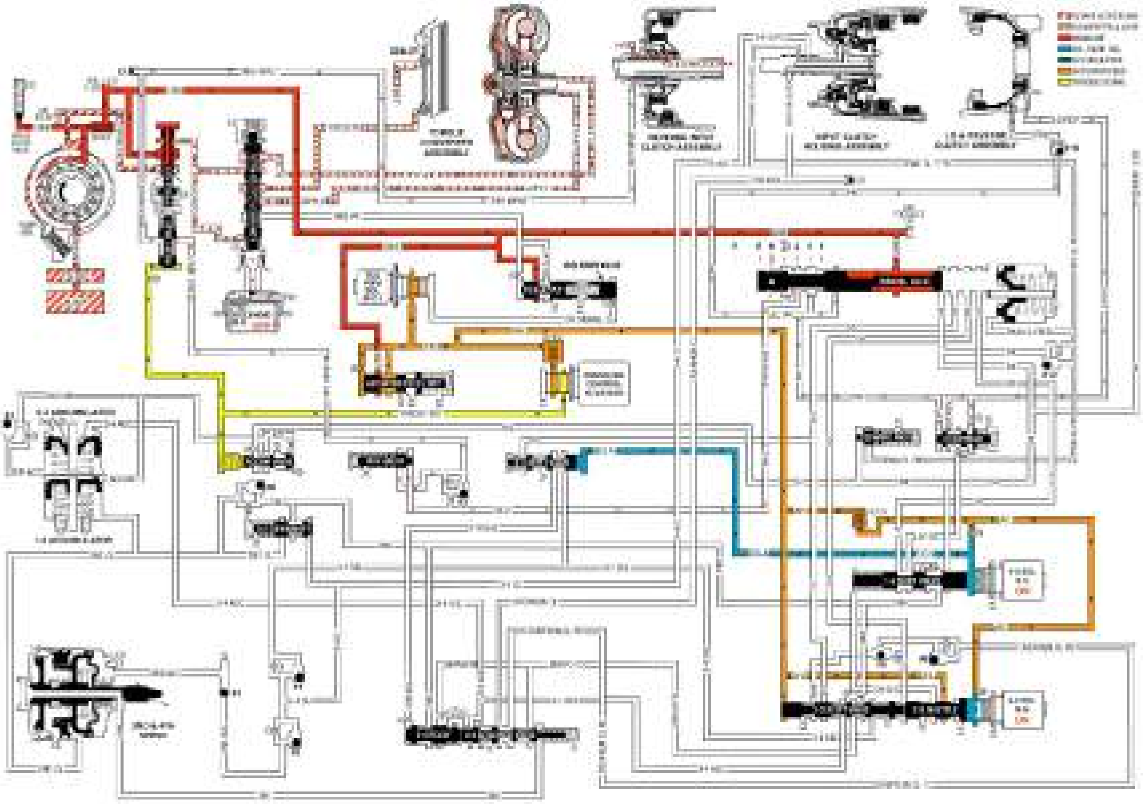
Boost Valve

Reverse input fluid pressure exhausts and line pressure returns to the normal operating range as in the Park and Overdrive positions.

Reverse Input Checkball (#3)

Exhausting reverse input fluid unseats the ball for a quick exhaust through the reverse fluid circuit and past the manual valve.

Neutral - Engine Running



Overdrive Range, 3-2 Downshift

Similar to a forced 4-3 downshift, a forced 3-2 downshift can occur because of minimum throttle (coastdown conditions), heavy throttle or increased engine load. In order to achieve a forced 3-2 downshift, the PCM energizes the 2-3 shift solenoid valve and the following changes occur:

Energized by the PCM, the normally open solenoid closes and blocks the signal B fluid from exhausting through the solenoid. This creates pressure in the signal B fluid circuit at the solenoid end of the 2-3 shift valve.

2-3 Shift Valve Train

The signal B fluid pressure from the shift solenoid moves both valves to the downshift position against AFL fluid pressure acting on the 2-3 shift valve. This causes the following changes:

- The AFL fluid is blocked from the D432 fluid circuit and the D432 fluid exhausts past the 2-3 shuttle valve.
- The 2nd fluid is blocked from feeding the 3-4 signal fluid circuit and the 2nd fluid is routed into the servo feed fluid circuit.
- The 3-4 signal fluid is exhausted past the valve. The 3-4 clutch fluid and the 3rd accumulator fluid, which were fed by the 3-4 signal fluid, also exhaust.

3-4 Clutch Releases and 2-4 Band Applies

3-4 Clutch Piston

The 3-4 clutch fluid exhausts from the piston and the 3-4 clutch plates are released.

3-4 Clutch Exhaust Checkball (#4)

Exhausting 3-4 clutch fluid seats the #4 checkball and is forced through orifice #13. This orifice controls the 3-4 clutch fluid exhaust and the 3-4 clutch release rate.

2-4 Servo Assembly

The 3rd accumulator fluid exhausts from the servo assembly. The 2nd clutch fluid pressure moves the 2nd apply piston against the servo return spring force in order to move the apply pin and apply the 2-4 band.

3-2 Downshift Valve and 1-2 Upshift Checkball (#8)

The 3-4 clutch fluid exhausts from the valve and the spring force moves the valve into the second gear position. However, before the spring force overcomes the exhausting 3-4 clutch fluid pressure, the 2nd fluid feeds the 2nd clutch fluid circuit through the valve. This bypasses the control of orifice #16 at the #8 checkball and provides a faster 2-4 band apply. Remember that the #8 checkball and orifice #16 are used to help control the 2-4 band apply during a 1-2 upshift.

Downshift Timing and Control

At higher vehicle speeds, the 2-4 band apply must be delayed to allow the engine speed RPM to increase sufficiently for a smooth transfer of engine load to the 2-4 band. Therefore, exhaust of the 3rd accumulator fluid must be delayed. However, at lower speeds the band must be applied quickly. In order to provide for the varying requirements for the 2-4 band apply rate, the exhausting 3rd accumulator fluid is routed to the 3rd accumulator checkball (#2).

3rd Accumulator Checkball (#2)

The exhausting 3rd accumulator fluid seats the #2 checkball and is forced through orifice #12. This fluid exhausts through the 3-4 clutch and the 3-4 signal fluid circuits and past the 2-3 shift valve. Orifice #12 slows the exhaust of the 3rd accumulator fluid and delays the 2-4 band apply rate.

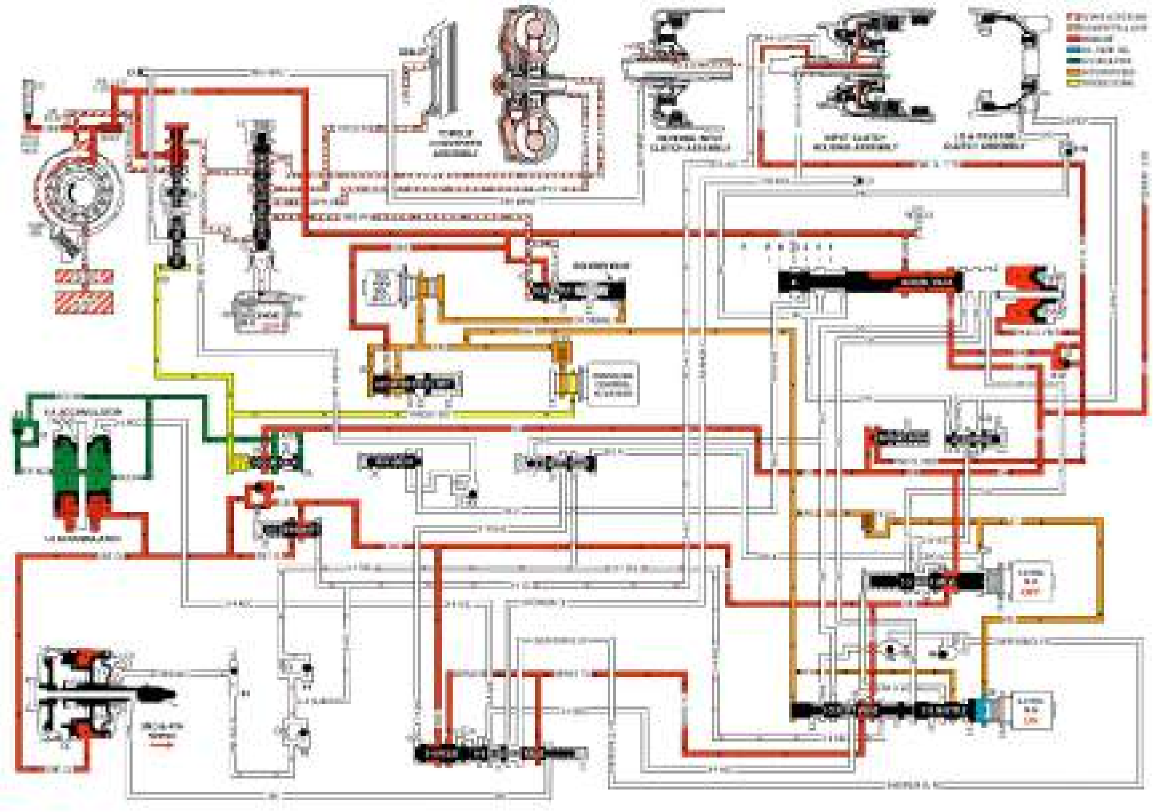
3rd Accumulator Exhaust Checkball (#7)

After the downshift is completed, the #7 checkball unseats and allows the residual fluid in the 3rd accumulator fluid circuit to exhaust.

Pressure Control (PC) Solenoid Valve

Remember that the PC solenoid valve continually adjusts torque signal fluid in relation to the various PCM input signals (mainly the throttle position).

Overdrive Range, 3-2 Downshift



Overdrive Range, 4-3 Downshift

When the transmission is operating in fourth gear, a forced 4-3 downshift occurs if there is a significant increase in throttle position. At minimum throttle, the vehicle speed decreases gradually (coastdown) and the PCM commands a 4-3 downshift. The PCM also initiates a forced 4-3 downshift when the throttle position remains constant but engine load is increased, such as driving up a steep incline. To achieve a 4-3 downshift, the PCM de-energizes the 1-2 shift solenoid valve and the following changes occur to the transmission's electrical and hydraulic systems:

1-2 Shift Solenoid (SS) Valve

De-energized by the PCM, the normally open solenoid opens and signal A fluid exhausts through the solenoid.

1-2 Shift Valve

As in Fourth gear, D432 fluid pressure and spring force hold the valve in the upshift position.

2-4 Band Releases

3-4 Shift Valve

With the signal A fluid pressure exhausted, the spring force moves the valve into the downshift position. In this position, the valve blocks the 3-4 signal fluid and the 4th signal fluid exhausts past the valve.

3-4 Relay Valve and 4-3 Sequence Valve

These valves control the timing of the 2-4 band release. With the 4th signal fluid pressure exhausted, the 3-4 accumulator fluid pressure moves the 3-4 relay valve into the third gear position. This opens the 3-4 accumulator fluid to an orificed exhaust (#5) past the 3-4 relay valve (shown by red arrows). Because the exhaust is orificed, the 3-4 accumulator fluid pressure momentarily holds the 4-3 sequence valve against spring force before completely exhausting.

When the exhausting 3-4 accumulator fluid pressure decreases sufficiently, the spring force moves the 4-3 sequence valve into the third gear position as shown. This opens both the 3-4 accumulator and the 4th fluid circuits to a quick exhaust past the 4-3 sequence valve. In this position the valve blocks the 2nd fluid from entering the servo feed fluid circuit.

2-4 Servo Assembly

The 4th fluid exhausts from the 4th apply piston in the servo assembly. The apply pin spring moves the 4th apply piston and the apply pin in order to release the band from the reverse input drum and shift the transmission into third gear.

3-4 Accumulator Assembly

The 3-4 accumulator fluid exhausts from the 3-4 accumulator piston. The orificed accumulator fluid pressure and the spring force move the piston into a third gear position.

3-4 Accumulator Checkball (#1)

As the accumulator fluid fills the 3-4 accumulator, it seats the #1 checkball and is forced through orifice #18. This orifice controls the rate at which accumulator fluid pressure fills the 3-4 accumulator and the 3-4 accumulator fluid exhausts from the accumulator assembly.

Accumulator Valve

Biased by torque signal fluid pressure and spring force, the accumulator valve regulates the D-4 fluid into the accumulator fluid circuit.

2-3 Shift Solenoid (SS) Valve

This solenoid remains de-energized as in fourth gear and the signal B fluid exhausts through the solenoid.

2-3 Shift Valve Train

The AFL fluid pressure at the 2-3 shift valve holds the valves in the upshift position. This allows the servo feed fluid to exhaust through the valve, into the 3-4 accumulator fluid circuit and past the 4-3 sequence valve.

Torque Converter Clutch Solenoid Valve

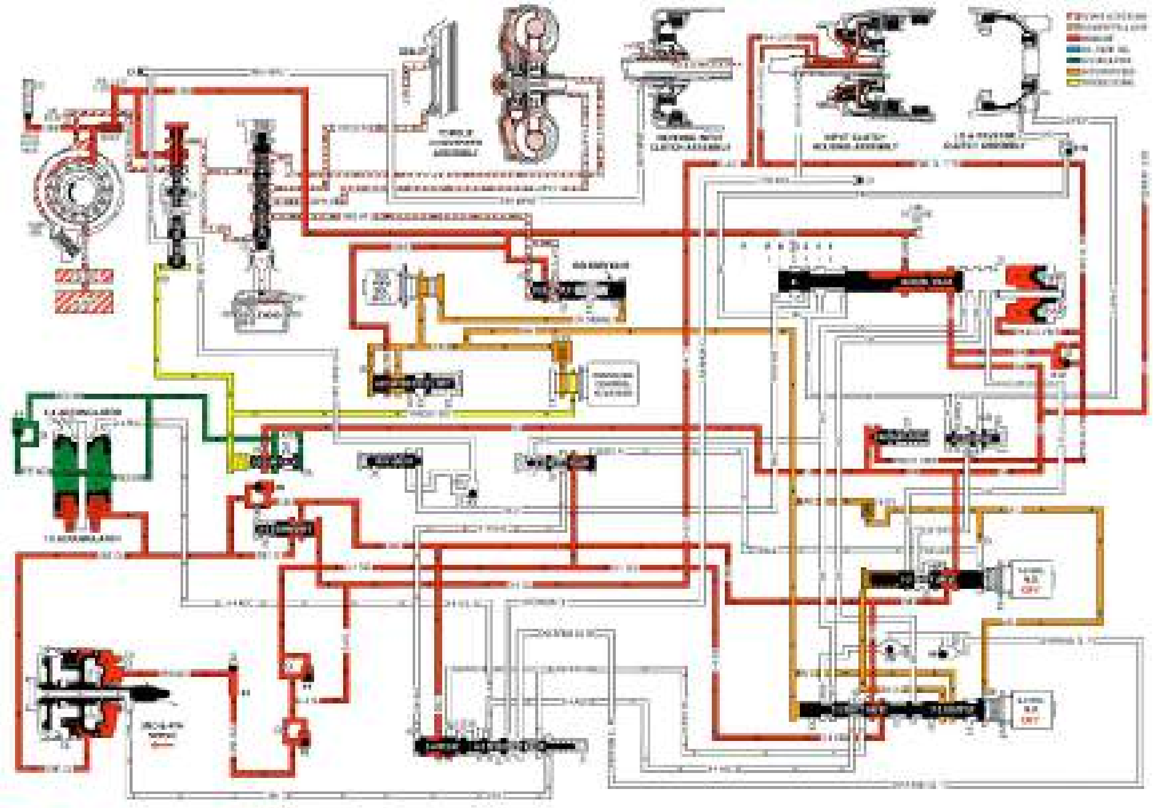
TCC PWM Solenoid Valve

The PCM de-energizes the TCC solenoid valve, and operates the duty cycle of the TCC PWM solenoid valve to release the converter clutch for a smooth disengagement, prior to initiating the 4-3 downshift.

Pressure Control (PC) Solenoid Valve

Remember that the PC solenoid valve continually adjusts the torque signal fluid pressure in relation to the various PCM input signals (mainly the throttle position).

Overdrive Range, 4-3 Downshift



Overdrive Range, First Gear

When the gear selector lever is moved to the Overdrive position, from the neutral position, the following changes occur to the transmission's hydraulic and electrical systems:

Manual Valve

Line pressure flows through the manual valve and fills the D4 fluid circuit. All other fluid circuits remain empty with the manual valve in the Overdrive position.

Forward Clutch Accumulator Checkball (#12)

D4 fluid pressure seats the checkball and is orificed (#22) into the forward clutch feed fluid circuit. This orifice helps control the forward clutch apply rate.

Forward Clutch Accumulator Piston

Forward clutch feed fluid pressure moves the piston against spring force. This action absorbs some of the initial increase of forward clutch feed fluid pressure to cushion the forward clutch apply.

Forward Clutch Abuse Valve

D4 fluid pressure acts on the valve opposite of spring force. At engine speeds greater than idle, D4 fluid pressure increases and moves the valve against spring force (as shown). D4 fluid can then quickly fill the forward clutch feed fluid circuit, thereby bypassing the control of orifice #22 and providing a faster apply of the forward clutch. Otherwise, with increased throttle opening and engine torque, the clutch may slip during apply.

1-2 Shift Solenoid (SS) Valve

Energized (ON) as in Neutral, the normally open solenoid is closed and blocks signal A fluid from exhausting through the solenoid. This maintains pressure in the signal A fluid circuit.

2-3 Shift Solenoid (SS) Valve

Energized (ON) as in Neutral, the normally open solenoid is closed and blocks signal B fluid from exhausting through the solenoid. This maintains signal B fluid pressure at the solenoid end of the 2-3 shift valve.

2-3 Shift Valve Train

Signal B fluid pressure at the solenoid end of the 2-3 shift valve holds the valve train in the downshifted position against AFL fluid pressure acting on the 2-3 shift valve. In this position, the 2-3 shuttle valve blocks AFL fluid from entering the D432 fluid circuit. The D432 fluid circuit is open to an exhaust port past the valve.

1-2 Shift Valve

Signal A fluid pressure holds the valve in the downshifted position against spring force. In the First gear position, the valve blocks D4 fluid from entering the 2nd fluid circuit.

Accumulator Valve

Biased by torque signal fluid pressure, spring force and orificed accumulator fluid pressure at the end of the valve, the accumulator valve regulates D4 fluid into accumulator fluid pressure. Accumulator fluid is routed to both the 1-2 and 3-4 accumulator assemblies in preparation for the 1-2 and 3-4 upshifts respectively.

Rear Lube (All Except Y-Car)

D4 fluid is routed through an orifice cup plug (#24) in the rear of the transmission case to feed the rear lube fluid circuit.

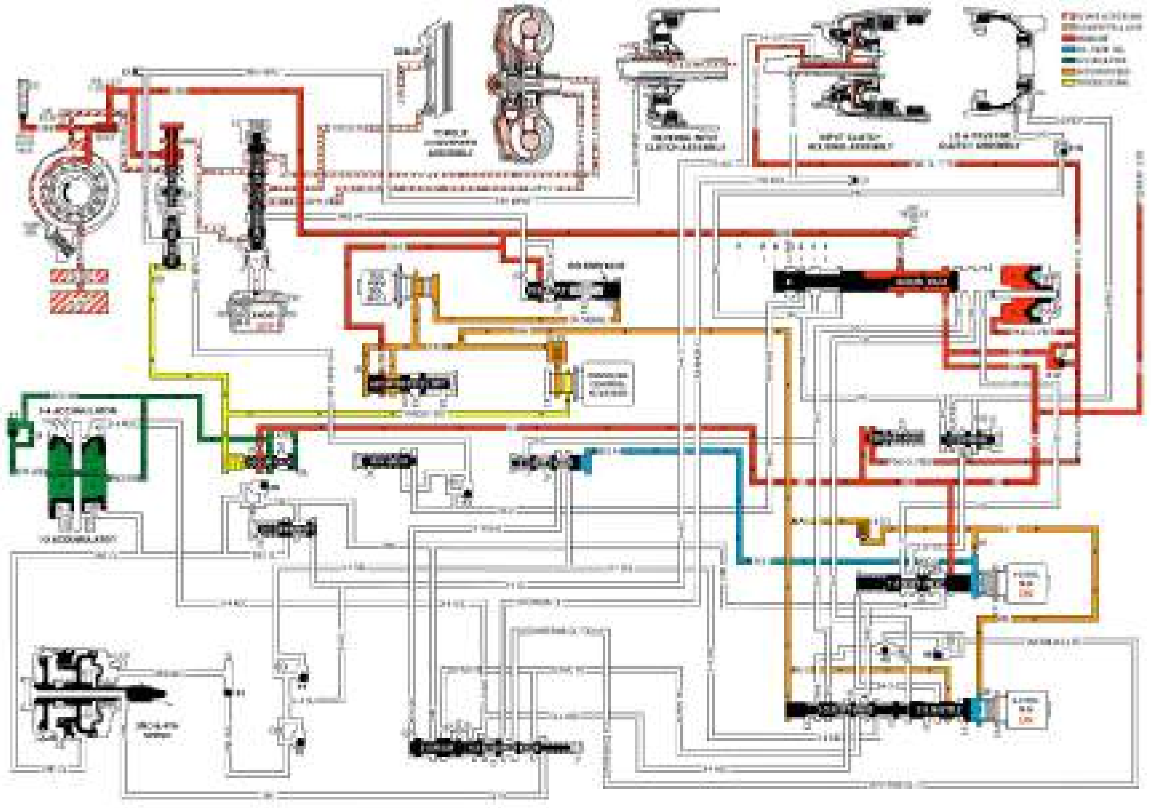
Pressure Control (PC) Solenoid Valve

Remember that the PC solenoid valve continually varies torque signal fluid pressure in relation to throttle position and vehicle operating conditions. This provides a precise control of line pressure.

Torque Converter Clutch PWM Solenoid Valve

In first gear, at approximately 6 mph, the PCM operates the TCC PWM solenoid valve at approximately a 90 percent duty cycle. This opens the AFL fluid circuit, to fill the converter clutch signal fluid circuit through the #9 orifice, and flows to the isolator valve. The CC signal fluid pressure, acting on the isolator valve, will move the regulated apply valve towards the closed position. Regulated line pressure is now routed into the regulated apply circuit, and flows to the closed converter clutch valve, and is blocked from entering the converter clutch apply circuit. Regulated apply fluid is routed through the #8 orifice to the front of the regulated apply valve, and regulates the line pressure entering the regulated apply circuit, in response to the CC signal fluid acting on the isolator valve.

Overdrive Range, First Gear



Overdrive Range, Fourth Gear - Torque Converter Clutch Applied

At higher vehicle speeds, the Hydra-matic 4L60-E transmission uses an overdrive gear ratio (fourth gear) in order to increase fuel economy and in order to maximize engine performance. When vehicle operating conditions are appropriate, the PCM energizes the 1-2 shift solenoid valve to shift the transmission into fourth gear.

1-2 Shift Solenoid (SS) Valve

Energized (turned ON) by the PCM, the normally open solenoid closes and blocks signal A fluid from exhausting through the solenoid. This creates pressure in the signal A fluid circuit.

2-3 Shift Solenoid (SS) Valve

De-energized (OFF) as in third gear, the 2-3 shift solenoid valve exhausts signal B fluid through the solenoid.

1-2 Shift Valve

D432 fluid pressure from the 2-3 shift valve and spring force hold the valve in the upshift position against signal A fluid pressure.

3-4 Shift Valve

Signal A fluid pressure moves the valve into the upshift position against the spring force. In this position, the valve routes 3-4 signal fluid into the 4th signal fluid circuit.

3-4 Relay Valve and 4-3 Sequence Valve

4th signal fluid pressure moves both valves into the upshift (fourth gear) position against the spring force acting on the 4-3 sequence valve. This causes the following changes:

- Orificed (#7) 2nd fluid is routed through the 3-4 relay valve and into the servo feed fluid circuit.
- Servo feed fluid is routed through the 4-3 sequence valve and into the 4th fluid circuit.
- 3-4 accumulator fluid routed from the 2-3 shuttle valve is blocked by both valves.

2-4 Servo Assembly

4th fluid is routed through the center of the servo apply pin and acts on the apply side of the 4th apply piston. 4th fluid pressure moves the 4th apply piston against the apply pin spring force acting on the release side of the 4th apply piston. This action moves the apply pin and applies the 2-4 band in order to obtain fourth gear.

2-4 Band Apply Accumulation

2-3 Shift Valve Train

The valve train remains in the upshift position with the AFL fluid pressure acting on the 2-3 shift valve. In addition to its operation third gear, the 2-3 shift valve directs servo feed fluid into the 3-4 accumulator fluid circuit.

3-4 Accumulator Assembly

3-4 accumulator fluid pressure moves the 3-4 accumulator piston against spring force and orificed accumulator fluid pressure. This action absorbs initial 4th clutch apply fluid pressure in order to cushion the 2-4 band apply. Remember that both of the 3-4 accumulator and 4th fluid circuits are fed by servo feed fluid. As 3-4 accumulator fluid fills the accumulator, any air in the system will exhaust through office #19. This piston movement forces some orificed accumulator fluid out of the 3-4 accumulator assembly.

3-4 Accumulator Checkball (#1)

The accumulator fluid forced from the accumulator unseats the #1 checkball and enters the accumulator fluid circuit. This fluid is routed to the accumulator valve. This is shown by the arrow directions in the fluid circuit.

Accumulator Valve

Accumulator fluid forced from the 3-4 accumulator is orificed to the end of the accumulator valve. This fluid pressure, in addition to spring force and torque signal fluid pressure, regulates the exhaust of excess accumulator fluid pressure through the middle of the valve. This regulation helps control the 2-4 band apply feel.

Torque Converter Clutch Applies

TCC Solenoid Valve

When operating conditions are appropriate, the PCM energizes the normally open TCC solenoid valve. This closes the solenoid, blocks the converter feed fluid from exhausting, and creates pressure in the converter feed fluid circuit at the converter clutch apply valve and TCC solenoid valve.

Converter Clutch Apply Valve

Converter feed fluid pressure moves the valve against spring force and into the apply position. In this position, release fluid is open to an exhaust port, and regulated apply fluid fills the apply fluid circuit. Converter feed fluid is routed through the converter clutch apply valve to feed the cooler fluid circuit.

Torque Converter

Release fluid from behind the pressure plate exhausts through the end of the turbine shaft. Apply fluid pressure is routed between the converter hub and stator shaft where it enters the torque converter. This fluid applies the converter clutch against the converter cover and keeps the converter filled with fluid.

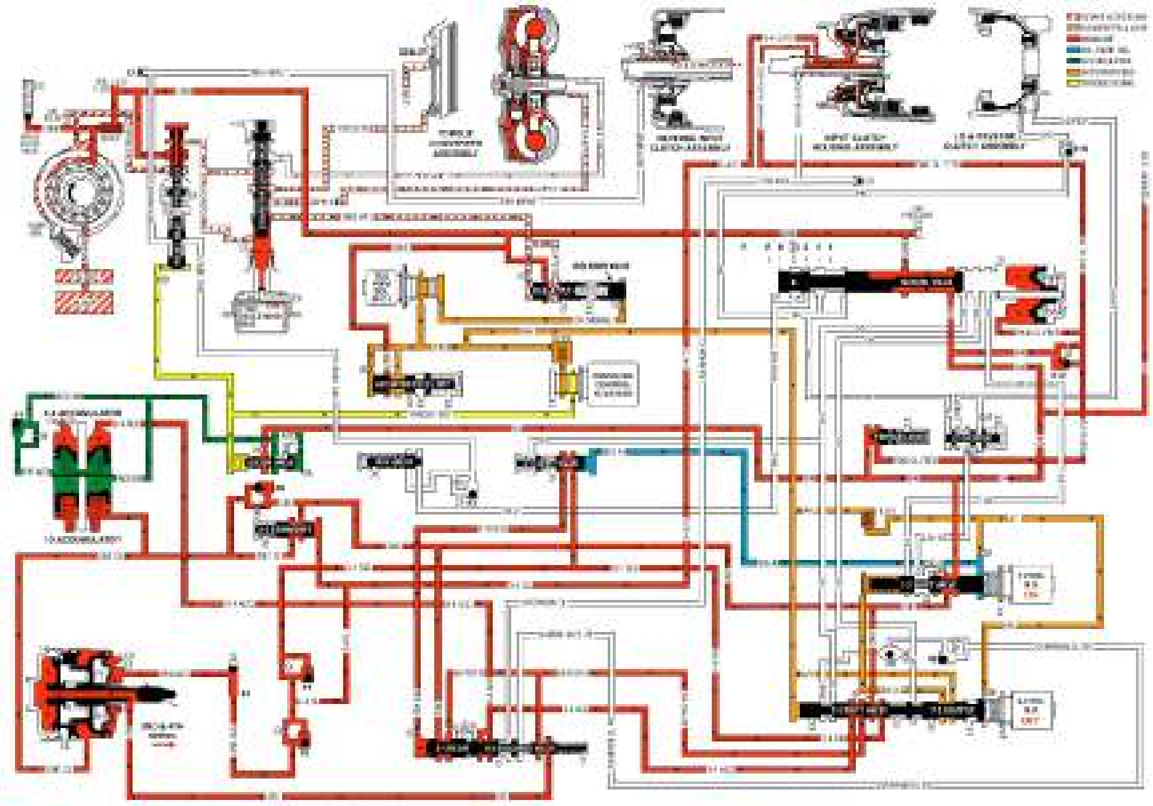
TCC Apply Checkball (#9)

Release fluid, exhausting from the converter, seats the #9 checkball located in the end of the turbine shaft, and is orificed around the ball. Orificing the exhausting release fluid controls the converter clutch apply rate, along with the TCC PWM solenoid valve.

TCC PWM Solenoid Valve

The torque converter clutch pulse width modulation (TCC PWM) solenoid valve controls the regulated apply valve position. This is done through the use of pulse width modulation (duty cycle operation). The solenoid duty cycle is controlled by the PCM in relation to vehicle operating conditions and regulates actuator feed limit (AFL) fluid into the CC signal circuit, through the #9 orifice, and to the isolator valve. This controls line pressure flow through the regulated apply valve, into the regulated apply circuit, and provides a smooth engagement of the TCC.

Overdrive Range, Fourth Gear - TCC Applied



2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 4L60-E/4L65-E/4L70-E | Description and Operation | Document ID: 2036984

Overdrive Range, Second Gear

As vehicle speed increases and other operating conditions are appropriate, the PCM de-energizes the 1-2 shift solenoid valve in order to shift the transmission to second gear.

1-2 Shift Solenoid (SS) Valve

De-energized (turned OFF) by the PCM, the normally open solenoid opens and signal A fluid exhausts through the solenoid.

2-3 Shift Solenoid (SS) Valve

Important: The actuator feed limit (AFL) fluid continues to feed the signal A fluid circuit through orifice #25. However, the exhaust port through the solenoid is larger than orifice #25 in order to prevent a pressure buildup in the signal A fluid circuit. Exhausting signal A fluid is represented by the blue arrows.

Energized (ON) as in first gear, the 2-3 shift solenoid valve blocks signal B fluid from exhausting through the solenoid. This maintains signal B fluid pressure at the solenoid end of the 2-3 shift valve.

1-2 Shift Valve

Without signal A fluid pressure, spring force moves the valve into the upshift position. D4 fluid is routed through the valve and fills the 2nd fluid circuit.

1-2 Shift Checkball (#8)

The 2nd fluid pressure seats the #8 checkball, flows through orifice #16, and fills the 2nd clutch fluid circuit. This orifice helps control the 2-4 band apply rate.

2-4 Servo Assembly

The 2nd clutch fluid pressure moves the #8 checkball, flows through orifice #16 and fills the 2nd clutch fluid circuit. This orifice helps to control the 2-4 band apply rate.

1-2 Accumulator

The 2nd clutch fluid pressure also moves the 1-2 accumulator piston against the spring force and the accumulator fluid pressure. This action absorbs the initial 2nd clutch fluid pressure in order to cushion the 2-4 band apply rate. Also, the movement of the 1-2 accumulator piston forces some accumulator fluid out of the accumulator assembly. This accumulator fluid is routed back to the accumulator valve.

Accumulator Valve

The accumulator fluid forced out of the 1-2 accumulator is orificed (#30) to the end of the accumulator valve. This pressure moves the valve against the spring force and the torque signal fluid pressure in order to regulate the exhaust of excess accumulator fluid. This regulation provides additional control for the 2-4 band apply rate. The fluid circuit shows the exhaust of the accumulator fluid during the shift by the arrow directions in the accumulator fluid circuit.

2-3 Shift Valve Train

The signal B fluid pressure from the 2-3 shift solenoid valve holds the valve train in the downshift position. The 2nd fluid is routed through the 2-3 shuttle valve and fills the servo feed fluid circuit.

3-4 Relay Valve and 4-3 Sequence Valve

Spring force holds these valves in the downshift position (first, second and third gear positions). The 2nd fluid is blocked by the 3-4 relay valve and the servo feed fluid is blocked by both valves in preparation for a 3-4 upshift.

3-2 Downshift Valve

Spring force holds the valve closed, blocking the 2nd fluid and the 2nd clutch fluid. This valve is used in order to help control the 3-2 downshift.

3-4 Shift Valve

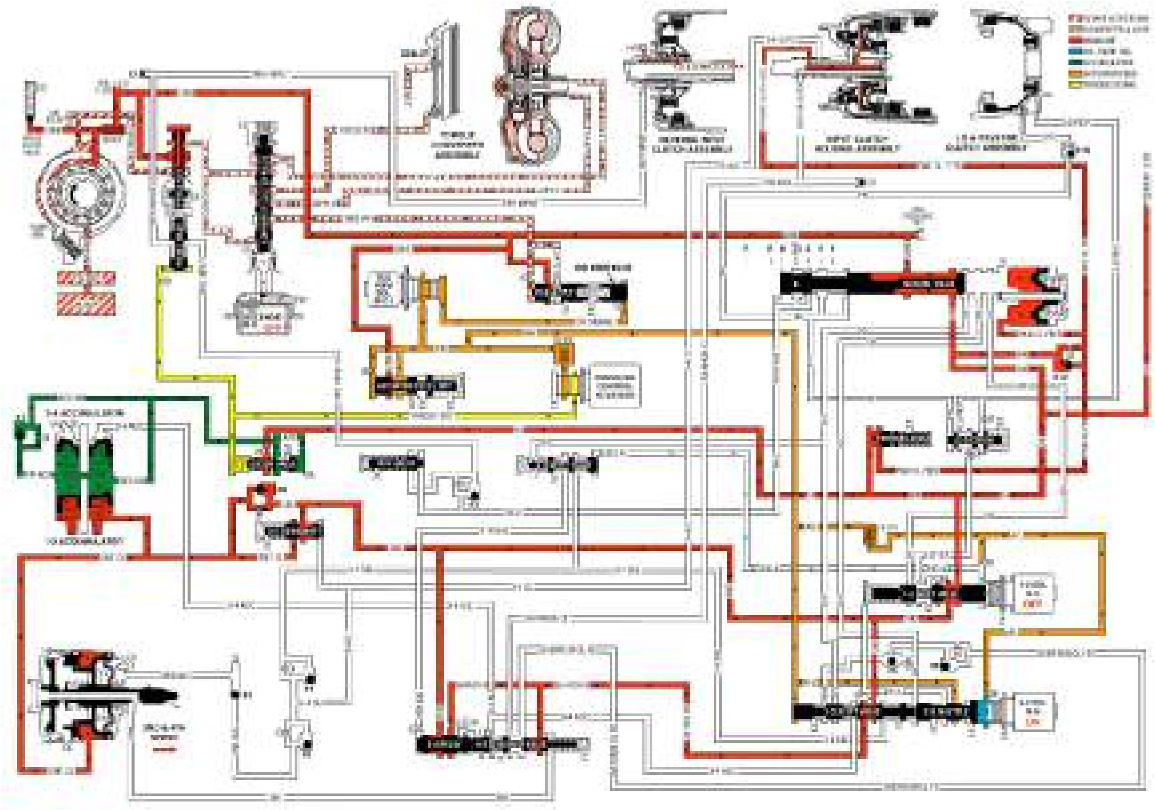
Signal A fluid pressure exhausts and spring force moves the valve into the downshift position (second and third gear positions).

Torque Converter Clutch

TCC Solenoid Valve

Under normal operating conditions, in Overdrive Range-Second Gear, the PCM keeps the normally open TCC solenoid valve de-energized. Converter feed fluid exhausts through the open solenoid, and spring force keeps the converter clutch apply valve in the release position.

Overdrive Range, Second Gear



Overdrive Range, Third Gear

As vehicle speed increases further and other vehicle operating conditions are appropriate, the PCM de-energizes the normally open 2-3 shift solenoid valve in order to shift the transmission into Third gear.

2-3 Shift Solenoid (SS) Valve

Note: AFL fluid continues to feed signal B fluid to the solenoid through orifice #29. However, the exhaust port through the solenoid is larger than orifice #29 to prevent a buildup of pressure in the signal B fluid circuit at the solenoid end of the 2-3 shift valve. Exhausting signal B fluid is represented by the arrows through the solenoid.

De-energized (turned OFF) by the PCM, the solenoid opens and actuator feed limit signal B fluid exhausts through the solenoid.

2-3 Shift Valve Train

AFL fluid pressure at the 2-3 shift valve moves the valve train toward the solenoid. In the upshifted position, the following changes occur:

- AFL fluid is routed through the 2-3 shift valve and fills the D432 fluid circuit.
- 2nd fluid is blocked from entering the servo feed fluid circuit and is orificed (#28) into the 3-4 signal fluid circuit. This orifice helps control the 3-4 clutch apply rate.
- Servo feed fluid exhausts past the valve into the 3-4 accumulator fluid circuit and through an exhaust port at the 3-4 relay valve.

3-4 Clutch Exhaust Checkball (#4)

3-4 signal fluid unseats the ball and enters the 3-4 clutch fluid circuit.

3-4 Clutch Piston

3-4 clutch fluid pressure moves the piston to apply the 3-4 clutch plates and obtain 3rd gear. However, the 2-4 band must release as the 3-4 clutch applies.

3rd Accumulator Checkball (#2)

3-4 clutch fluid pressure unseats the ball and fills the 3rd accumulator fluid circuit.

3rd Accumulator Exhaust Checkball (#7)

3rd accumulator fluid seats the ball against the orificed exhaust and is routed to the released side of the 2nd apply piston. Before the #7 checkball seats, air in the 3rd accumulator fluid circuit is exhausted through the orifice.

2-4 Servo Assembly

3rd accumulator fluid pressure acts on the release side of the 2nd apply piston and assists servo return spring force. The surface area on the release side of the piston is greater than the surface area on the apply side. Therefore, 3rd accumulator fluid pressure and servo return spring force move the 2nd apply piston against 2nd clutch fluid pressure. This action serves two functions:

- Move the apply pin to release the 2-4 band.
- Act as an accumulator by absorbing initial 3-4 clutch fluid to cushion the 3-4 clutch apply rate. Remember that the 3rd accumulator fluid circuit is fed by 3-4 clutch fluid.

3-2 Downshift Valve

3-4 clutch fluid pressure moves the valve against spring force. This opens the valve and allows 2nd fluid to feed the 2nd clutch fluid circuit through the valve.

1-2 Shift Solenoid (SS) Valve and 1-2 Shift Valve

The 1-2 SS valve remains de-energized and signal A fluid is exhausted through the solenoid. Also, D432 fluid pressure from the 2-3 shift valve assists spring force to hold the 1-2 shift valve in the upshifted position.

3-4 Shift Valve

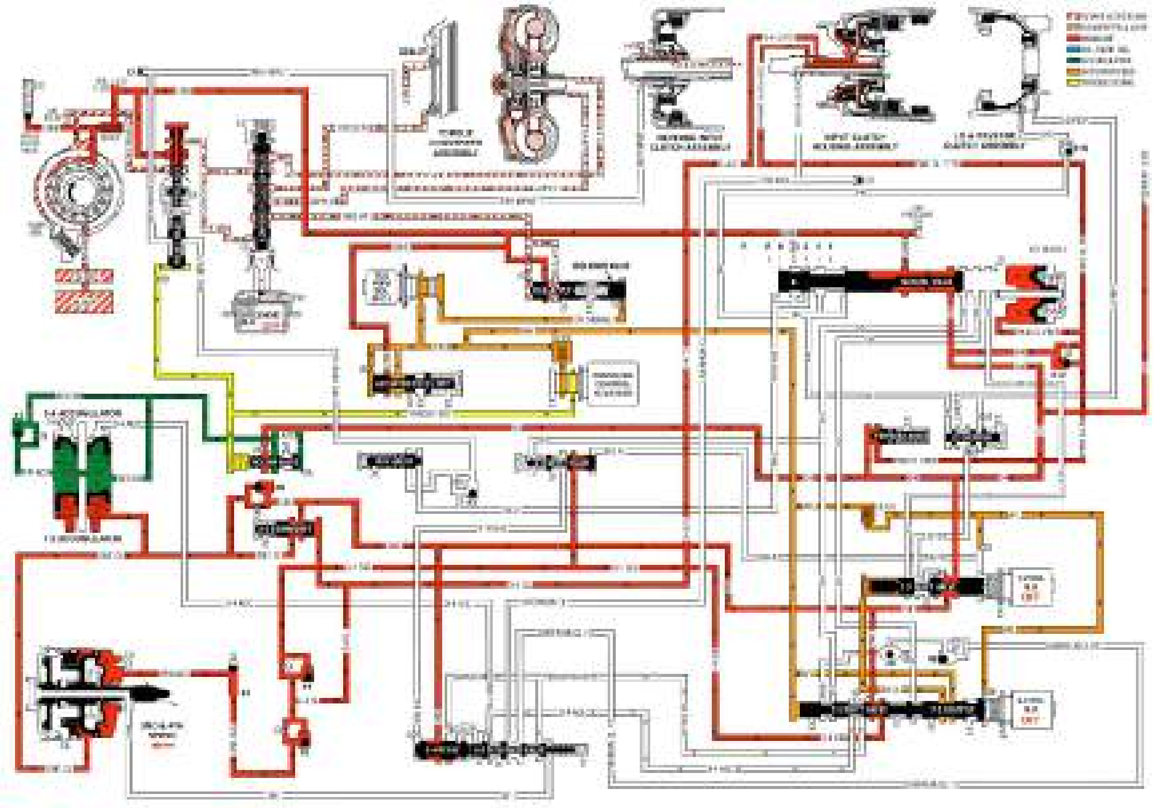
Spring force holds the valve in the downshifted position, blocking 3-4 clutch fluid in preparation for a 3-4 upshift.

Torque Converter Clutch

TCC Solenoid Valve

Under normal operating conditions, in Overdrive Range-Third Gear, the PCM keeps the normally open TCC solenoid valve de-energized. Converter feed fluid exhausts through the open solenoid, and spring force keeps the converter clutch apply valve in the release position. However, at speeds above approximately 121 km/h (75 mph), with the transmission still in third gear, the PCM will command TCC apply in third gear. Refer to Overdrive Range, Fourth Gear - Torque Converter Clutch Applied for more information on TCC apply.

Overdrive Range, Third Gear



Park - Engine Running

With the gear selector lever in the PARK (P) position and the engine running, the line pressure from the oil pump assembly is directed to various components in the valve body and the oil pump.

Pressure Regulator Valve

The pressure regulator valve regulates the oil pump output (line pressure) in response to the signal fluid pressure, the spring force and the line pressure acting on the end of the valve. The line pressure is routed through the valve and into both the converter feed and the decrease fluid circuits. Regulated line pressure is also directed to the manual valve, the converter clutch valve, the actuator feed limit valve, and the regulated apply valve.

Pressure Relief Valve

Controlled by spring force, this checkball limits the maximum value of the line pressure. When the line pressure reaches this limiting value, fluid is exhausted past the ball and returns to the sump.

Line Pressure Tap

The line pressure tap provides a location to measure the line pressure with a fluid pressure gage.

Actuator Feed Limit Valve

Biased by spring force and orificed AFL fluid, it limits the maximum value of line pressure entering the AFL fluid circuit. Below this limiting value, the AFL fluid pressure equals the line pressure. The AFL fluid is routed to the pressure control solenoid valve, the TCC PWM solenoid valve, the 1-2 and 2-3 shift solenoid valves, and the 2-3 shift valve train.

Pressure Control (PC) Solenoid Valve

Controlled by the powertrain control module (PCM), the PC solenoid valve regulates the filtered AFL fluid into the torque signal fluid pressure. The PCM controls this regulation by varying the current value to the PC solenoid valve in relation to the throttle position and other vehicle operating conditions.

Torque Converter Clutch (TCC)

Torque Converter Clutch PWM Solenoid and Regulator Apply and Isolator Valve

AFL fluid is routed to the TCC PWM solenoid valve, in Park the PCM has the duty cycle turned OFF. This prevents AFL fluid from entering the converter clutch signal fluid circuit. Regulated line pressure is routed to the regulator apply valve, which is open with CC signal circuit empty, and blocks line pressure from entering the regulated apply circuit. Any fluid in the regulated apply circuit will exhaust at the regulated apply valve.

TCC Solenoid Valve

Important: TCC converter feed valve assembly (#4), in the converter feed circuit, prevents converter drain down. The orifice is smaller than the exhaust through the TCC solenoid valve. Therefore, fluid pressure does not build up at the end of the converter clutch apply valve.

Under normal operating conditions, the PCM keeps the normally open TCC solenoid valve de-energized (OFF). Converter feed fluid exhausts through the open TCC solenoid valve, and spring force keeps the converter clutch apply valve in the release position.

Converter Clutch Valve

Held in the release position by spring force, it directs converter feed fluid into the release fluid circuit. Also, fluid returning from the converter in the apply fluid circuit is routed through the valve and into the cooler fluid circuit.

Torque Converter

Release fluid pressure unseats the TCC apply checkball (#9), keeps the pressure plate released from the converter cover and fills the converter with fluid. Fluid exits the converter between the converter hub and the stator shaft in the apply fluid circuit.

Cooler and Lubrication System

Cooler fluid from the converter clutch apply valve is routed through the transmission fluid cooler and into the lubrication fluid circuits.

Manual Valve

Controlled by the selector lever and the manual shaft, the manual valve is in the Park (P) position and directs the line pressure into the PR (Park/Reverse) fluid circuit. Line pressure is blocked from entering any other fluid circuit at the manual valve.

Lo and Reverse Clutch Applies

Lo and Reverse Clutch Piston

The PR fluid seats the lo and reverse clutch checkball (#10) and is orificed to the outer area of the piston. Orificing the PR fluid around the #10 checkball helps control the lo and reverse clutch apply. Also, Lo/reverse fluid pressure from the lo overrun valve acts on the inner area of the lo and reverse clutch piston in order to increase the clutch holding capacity.

Lo Overrun Valve

The PR fluid pressure moves the valve against the spring force and fills the Lo/reverse fluid circuit. Lo/reverse fluid is orificed (323) back to the lo overrun valve in order to assist the PR fluid in moving the valve against the spring force. The spring force provides a time delay for the PR fluid filling the Lo/reverse fluid circuit. The Lo/reverse fluid is routed to the inner area of the lo and reverse clutch piston in order to increase the holding capacity of the clutch.

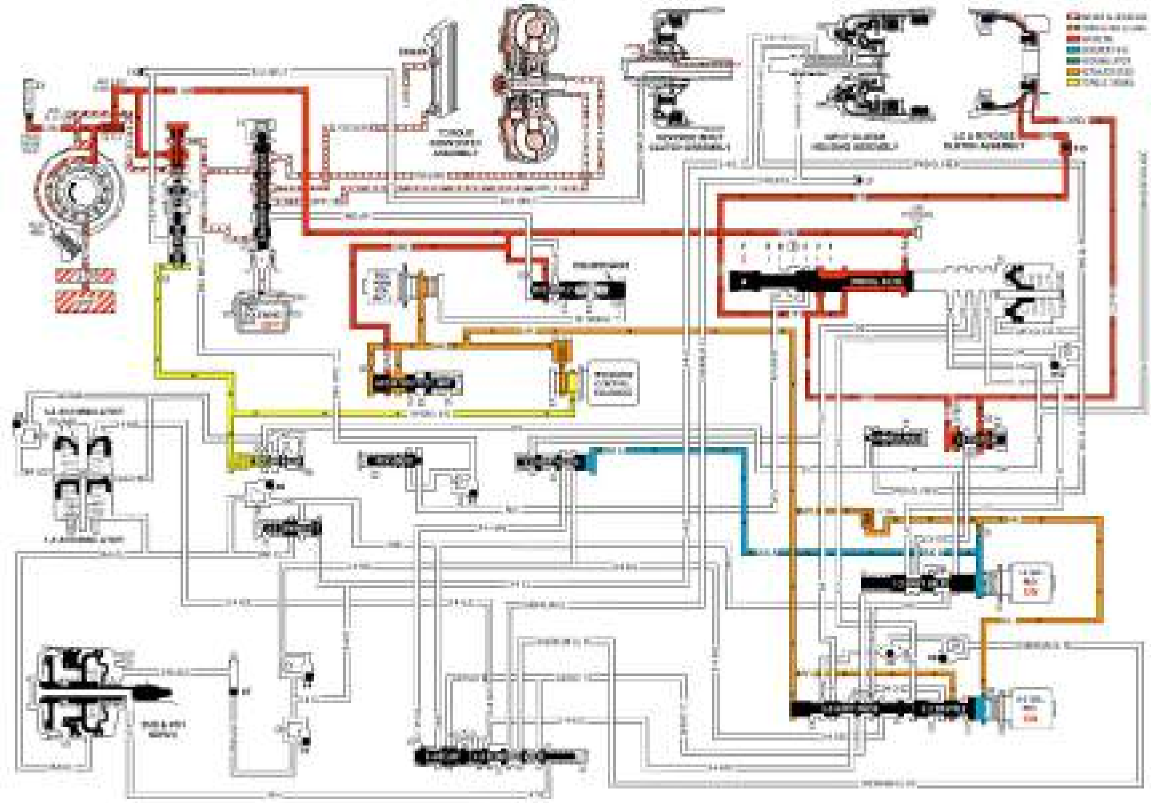
Shift Solenoid Valves (1-2 and 2-3)

Both shift solenoid valves, which are normally open, are energized by the PCM and block fluid from exhausting. This maintains the signal A fluid pressure at the 1-2 shift solenoid valve and signal B fluid pressure at the 2-3 shift solenoid valve.

Shift Valves (1-2, 2-3 and 3-4)

Signal A fluid pressure holds the 1-2 shift valve in the downshift position and the 3-4 valve in the upshift (first and fourth gear) position. The signal B fluid pressure from the 2-3 shift solenoid valve holds the 2-3 shift valve train in the downshift position.

Park - Engine Running



Reverse

When the gear selector lever is moved to the Reverse (R) position (from the Park position), the following changes occur to the transmissions hydraulic and electrical systems:

Manual Valve

The manual valve moves to the Reverse position and line pressure enters the reverse fluid circuit. As in Park, line pressure also fills the PR (Park/Reverse) fluid circuit. All other fluid circuits are blocked by the manual valve.

Lo and Reverse Clutch

As in Park, PR fluid pressure acts on the outer area of the lo and reverse clutch piston to apply the lo and reverse clutch. Also, Lo/reverse fluid from the lo overrun valve acts on the inner area of the piston to increase the holding capacity of the clutch (see Note below).

Reverse Input Checkball (#3)

Reverse fluid pressure seats the #3 checkball, flows through orifice #17 and fills the reverse input fluid circuit. This orifice helps control the reverse input clutch apply rate when engine speed is at idle.

Reverse Abuse Valve

Reverse fluid pressure acts on the end of the valve opposite of spring force. At engine speeds above idle, reverse fluid pressure, which is fed by line pressure, increases and moves the valve against spring force (as shown). Reverse fluid can then fill the reverse input fluid circuit through the reverse abuse valve. This bypasses the control of orifice #17 and provides a faster clutch apply.

Boost Valve

Reverse input fluid pressure moves the boost valve against the pressure regulator valve spring. The spring acts on the pressure regulator valve to increase the operating range of line pressure in Reverse. Reverse input fluid also flows through the valve and to the reverse input clutch piston. Remember that torque signal fluid pressure continually acts on the boost valve to control line pressure in response to vehicle operating conditions.

Reverse Input Clutch Piston

Reverse input fluid pressure moves the piston to apply the reverse input clutch plates and obtain Reverse.

Reverse Input Air Bleed Checkball

This ball and capsule is located in the reverse input fluid circuit in the oil pump to provide an air escape when the fluid pressure increases. It also allows air into the circuit to displace the fluid when the clutch releases.

Shift Solenoid Valves (1-2 and 2-3)

Both shift solenoid valves are energized as in the Park range. Signal A and signal B fluids are blocked from exhausting through the shift solenoid valves to maintain fluid pressure in these circuits at the end of the shift valves.

Shift Valves (1-2, 2-3 and 3-4)

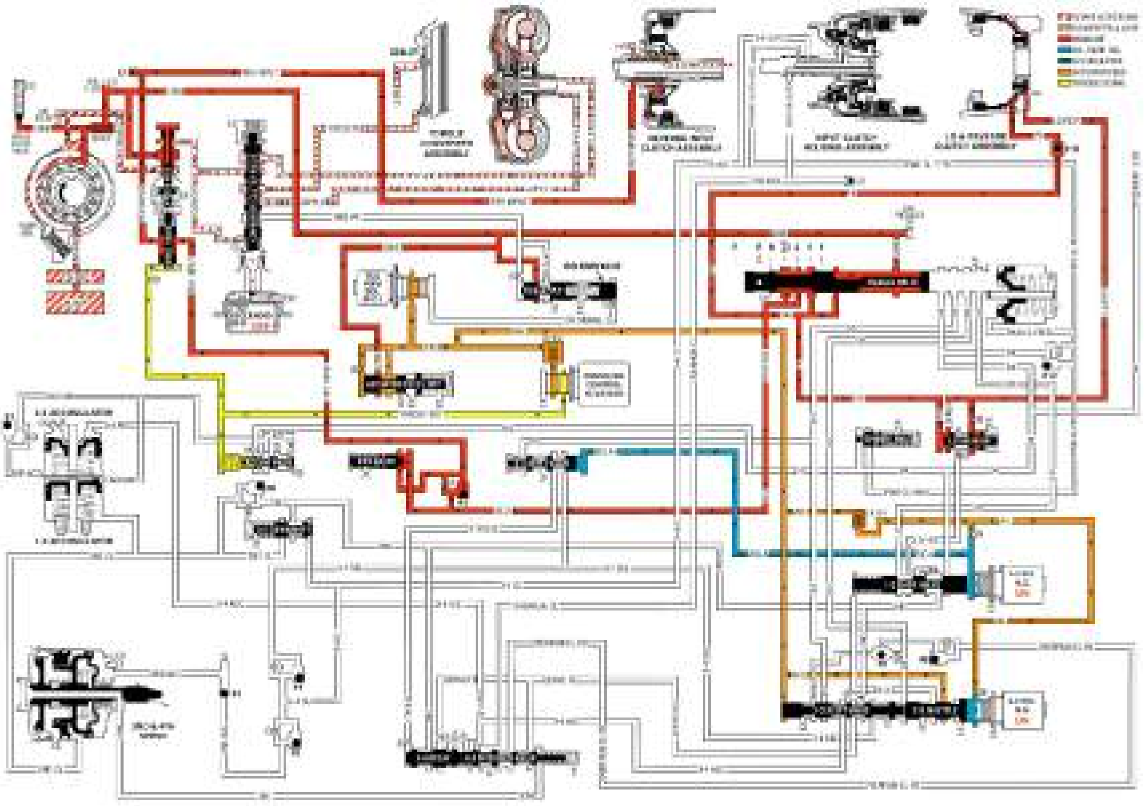
Signal A fluid pressure holds the 1-2 shift valve in the downshifted position and the 3-4 shift valve in the upshifted (First and Fourth gear) position. Signal B fluid pressure from the 2-3 shift solenoid valve holds the 2-3 shift valve train in the downshifted position.

Pressure Control (PC) Solenoid Valve

The PC solenoid valve continues to regulate AFL fluid into torque signal fluid pressure. The PCM varies the current at the solenoid to regulate torque signal fluid pressure in response to throttle position and other PCM input signals. Torque signal fluid pressure is used to control line pressure at the boost and pressure regulator valves.

Note: The explanation in each gear range is, for the most part, limited.

Reverse



Transmission Adaptive Functions

The 4L60-E transmission utilizes a line pressure control system during upshifts to compensate for the normal wear of transmission components. By adjusting the line pressure, the TCM can maintain acceptable transmission shift times. This process is known as "adaptive learning" or "shift adapts" and is similar to the closed loop fuel control system used for the engine.

In order for the TCM to perform a "shift adapt," it must first identify if an upshift is acceptable to analyse. For example, upshifts that occur during cycling of the A/C compressor or under extreme throttle changes may cause the TCM to incorrectly adjust line pressure. When an upshift is initiated, a number of contingencies, such as throttle position, transmission temperature, and vehicle speed, are checked in order to determine if the actual shift time is valid to compare to a calibrated desired shift time. If all the contingencies are met during the entire shift, then the shift is considered valid and the adapt function may be utilized if necessary.

Once an adaptable shift is identified, the TCM compares the actual shift time to the desired shift time and calculates the difference between them. This difference is known as the shift error. The actual shift time is determined from the time that the TCM commands the shift to the start of the engine RPM drop initiated by the shift. If the actual shift time is longer than the calibrated desired shift time, a soft feel or slow engaugement, then the TCM decreases current to the pressure control (PC) solenoid in order to increase line pressure for the next, same, upshift under identical conditions. If the actual shift time is shorter than the calibrated desired shift time, a firm engaugement, then the TCM increases current to the PC solenoid in order to decrease line pressure for the next, same, upshift under identical conditions.

The purpose of the adapt function is to automatically compensate the shift quality for the various vehicle shift control systems. It is a continuous process that will help to maintain optimal shift quality throughout the life of the vehicle.

Clearing Transmission Adaptive Pressure (TAP)

Transmission adaptive pressure (TAP) information is displayed and may be reset using a scan tool.

The adapt function is a feature of the TCM that either adds or subtracts line pressure from a calibrated base line pressure in order to compensate for normal transmission wear. The TAP information is divided into 13 units, called cells. The cells are numbered 4 through 16. Each cell represents a given torque range. TAP cell 4 is the lowest adaptable torque range and TAP cell 16 is the highest adaptable torque range. It is normal for TAP cell values to display zero or negative numbers. This indicates that the TCM has adjusted line pressure at or below the calibrated base line pressure.

Updating TAP information is a learning function of the TCM designed to maintain acceptable shift times. It is not recommended that TAP information be reset unless one of the following repairs has been made:

- Transmission overhaul or replacement
- Repair or replacement of an apply or release component, clutch, band, piston, servo
- Repair or replacement of a component or assembly which directly affects line pressure

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, the

TCM will need to relearn TAP values. Transmission performance may be affected as new TAPs are learned. Learning can only take place when the TCM has determined that an acceptable shift has occurred. The TCM must also relearn TAP values if it is replaced.

Transmission Component and System Description

The mechanical components of the 4L60-E are as follows:

- A torque converter with an electronically controlled capacity clutch (ECCC)

  This transmission is equipped with an ECCC. The pressure plate does not fully lock to the torque converter cover. Instead, the pressure plate maintains a small amount of slippage, about 20 RPM, in SECOND, THIRD, and FOURTH gears, depending on the vehicle application. ECCC was developed to reduce the possibility of noise, vibration, or chuggle caused by TCC apply. Typical apply speeds are 49-52 km/h (30-32 mph) in THIRD gear and 65-73 km/h (40-45 mph) in FOURTH gear. Full lockup is available at highway speeds on some applications.
- Torque converter assembly
- Servo assembly and 2-4 band assembly
- Reverse input clutch and housing
- Overrun clutch
- Forward clutch
- 3-4 clutch
- Forward sprag clutch assembly
- Lo and reverse roller clutch assembly
- Lo and reverse clutch assembly
- Two planetary gear sets: Input and Reaction
- Oil pump assembly
- Control valve body assembly

The electrical components of the 4L60-E are as follows:

- 1-2 and 2-3 shift solenoid valves
- Transmission pressure control (PC) solenoid
- Torque converter clutch (TCC) solenoid valve
- TCC pulse width modulation (PWM) solenoid valve
- Automatic transmission fluid temperature (TFT) sensor
- Vehicle speed sensor assembly

For more information, refer to Electronic Component Description .

Transmission General Information

How to Use This Section

This section provides the following information:

- General diagnosis information on transmissions
- Procedures for diagnosing the Hydra-matic transmission

When you diagnose any condition of the Hydra-matic transmission, begin with A Diagnostic Starting Point. This procedure indicates the proper path of diagnosing the transmission by describing the basic checks. This procedure will then refer you to the locations of specific checks. After you have determined the cause of a condition, refer to Repair Instructions for repair procedures. If the faulty component is not serviceable without removing the transmission from the vehicle, refer to OFF Vehicle repair information.

Basic Knowledge

Notice: Do not, under any circumstances, attempt to diagnose a powertrain condition without basic knowledge of this powertrain. If you perform diagnostic procedures without this basic knowledge, you may incorrectly diagnose the condition or damage the powertrain components.

You must be familiar with some basic electronics in order to use this section of the service manual. You should also be able to use the following special tools:

- A digital multimeter (DMM)
- A circuit tester
- Jumper wires or leads
- A line pressure gage set

Diagnosis

Notice: If you probe a wire with a sharp instrument and do not properly seal the wire afterward, the wire corrodes and an open circuit results.

Transmission Fluid Pump Specifications

Fluid Pump Specifications

Important:

- Rotor and slide must be chosen from the same size classification as the oil pump body.
- Allowable rotor and slide to fluid pump body end play is as follows:

Specification

- Slide to fluid Pump Body End Play -- 0.030-0.051 mm (0.0012-0.0020 in)
- Rotor to fluid Pump Body End Play -- 0.030-0.051 mm (0.0012-0.0020 in)

The fluid pump assembly has a selective rotor and slide components. These components are chosen based on pump body dimensions. Fluid pump rotor and slide components are available in five size classifications (1, 2, 3, 4, and 5) with the following tolerances:

Size Classification	Thickness (mm)	Thickness (in)
Rotor Selection		
1	17.948-17.961	0.7066-0.7071
2	17.961-17.974	0.7071-0.7076
3	17.974-17.987	0.7076-0.7081

Diagnostic Starting Point - Automatic Transmission

Begin the system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check - Vehicle will provide the following information:

- The identification of the control modules which command the system
- The ability of the control modules to communicate through the serial data circuit
- The identification of any stored diagnostic trouble codes (DTCs) and their status

The use of the Diagnostic System Check - Vehicle will identify the correct procedure for diagnosing the system and where the procedure is located.

Scan Tool Data Definitions

This list explains each data message displayed on the scan tool. This information will assist you in tracking down emissions or driveability DTCs, because you can view the displays while you are driving the vehicle. Refer to Diagnostic System Check - Vehicle for additional information.

1-2 Shift Error: This parameter displays the difference between the desired 1-2 shift time and the actual 1-2 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

1-2 Shift Time: This parameter displays the actual time of the last 1-2 shift. The shift time is based on the engine RPM drop after the commanded 1-2 shift. This value is only accurate if the shift was adaptable.

1-2 Sol.: This parameter displays the current commanded state of the shift solenoids. All three of the 5L40-E shift solenoids are normally-closed, which means that no fluid passes through when the solenoid is commanded OFF. When commanded ON, the solenoid opens and allows fluid to flow through. Refer to Shift Solenoid Valve State and Gear Ratio.

1-2 Sol. CKT Status: This parameter displays the solenoid valve feedback voltage signal circuit status on the scan tool. If the voltage is low when the solenoid is commanded OFF, the scan tool will display Open/Short to GND. If the voltage is high when the solenoid is commanded ON, the scan tool will display Short to Volts. If no circuit fault is present, the scan tool will display OK.

1-2 TAP Cell (4-16): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 N·m (12.5 lb. ft) of engine torque increment per cell, added to or subtracted from shift pressure during a 1-2 upshift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added in order to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted in order to increase shift time.

2-3 Shift Error: This parameter displays the difference between the desired 2-3 shift time and the actual 2-3 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

2-3 Shift Time: This parameter displays the actual time of the last 2-3 shift. The shift time is based on the engine RPM drop after the commanded 2-3 shift. This value is only accurate if the shift was adaptable.

2-3 Sol.: This parameter displays the commanded state of the 2-3 shift solenoid valve. When the transmission is in FIRST and SECOND gear, the display should indicate OFF, current is not flowing through the solenoid. When the transmission is in THIRD and FOURTH gear, the display should indicate ON, current is flowing through the solenoid.

2-3 Sol. CKT Status: This parameter displays the solenoid valve feedback voltage signal circuit status on the scan tool. If the voltage is low when the solenoid is commanded OFF, the scan tool will display Open/Short to GND. If the voltage is high when the solenoid is commanded ON, the scan tool will display Short to Volts. If no circuit fault is present, the scan tool will display OK.

2-3 TAP Cell (4-16): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 N·m (12.5 lb. ft) of engine torque increment per cell, added to or subtracted from shift pressure during a 2-3 upshift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added in order to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted in order to increase shift time.

3-4 Shift Error: This parameter displays the difference between the desired 3-4 shift time and the actual 3-4 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

3-4 Shift Time: This parameter displays the actual time of the last 3-4 shift. The shift time is based on the engine RPM drop after the commanded 3-4 shift. This value is only accurate if the shift was adaptable.

3-4 TAP Cell (4-16): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 N·m (12.5 lb. ft) of engine torque increment per cell, added to or subtracted from shift pressure during a 3-4 upshift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added in order to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted in order to increase shift time.

4-5 Shift Error: This parameter displays the difference between the desired 4-5 shift time and the actual 4-5 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

4-5 Shift Time: This parameter displays the actual time of the last adaptable 4-5 shift. The actual shift time is obtained by measuring the time required for the input shaft to decelerate from the previous ratio to the current ratio.

4-5 Sol.: This parameter indicates the current commanded state of the shift solenoids. All three of the 5L40-E shift solenoids are normally-closed, which means that no fluid passes through when the solenoid is commanded OFF. When the solenoid is commanded ON, the solenoid opens and allows fluid to flow through.

4-5 Sol. CKT Status: This parameter displays the solenoid driver feedback voltage signal and displays the circuit status on the scan tool. If the voltage is low when the solenoid is commanded OFF, the scan tool will display Open/Short to GND. If the voltage is high when the solenoid is commanded ON, the scan tool will display Short to Volts.

4-5 TAP Cell (4-16): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 N·m (12.5 lb. ft) of engine torque increment per cell, added to or subtracted from shift pressure during a 4-5 upshift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added in order to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted in order to increase shift time.

Commanded Gear: This parameter displays the current commanded state of the shift solenoid valves. The scan tool displays 1, 2, 3, 4 or 5.

Cruise: This parameter displays the commanded state of the cruise control system. The scan tool displays ENABLED or DISABLED. When the display indicates ENABLED, the ECM is allowing cruise control operation. When the display indicates DISABLED, the ECM has disabled cruise control operation. The TCM modifies upshift and downshift patterns when cruise control is enabled.

Current TAP Cell: This parameter displays the current transmission adaptive pressure (TAP) cell in use for transmission line pressure adaptation. The cells are based on 17 N·m (12.5 lb. ft) of engine torque. The higher the engine torque, the higher the current TAP cell. The last cell used will remain displayed until the next adaptable upshift occurs.

ECT: This parameter displays the input signal from the engine coolant temperature (ECT) sensor. The scan tool displays -40 to +151°C (-40 to +304°F). When the ECT is high at 151°C (304°F), the signal voltage is low, 0 V. When the ECT is low at -40°C (-40°F), the signal voltage is high, 5 V. The ECM sends the ECT information to the transmission control module (TCM) via the high speed GMLAN serial data line.

Engine Speed: This parameter displays the engine speed, based on a signal from the engine control module (ECM). The scan tool displays engine speed in revolutions per minute (RPM). The ECM sends the RPM information to the transmission control module (TCM) via the high speed GMLAN serial data line.

Engine Torque: This parameter displays the estimated amount of torque that is delivered from the engine. The scan tool displays engine torque in N·m (lb. ft). The ECM sends the engine torque information to the transmission control module (TCM) via the high speed GMLAN serial data line.

Gear Ratio: This parameter displays the actual transmission gear ratio. The scan tool displays the gear ratio calculated from the automatic transmission input shaft speed sensor (Automatic transmission ISS) and the automatic transmission output shaft speed sensor (Automatic transmission OSS) inputs.

Ignition Voltage: This parameter displays the system voltage measured at the ignition feed.

IMS: This parameter displays PARK, PARK/REVERSE, REVERSE, REVERSE/NEUTRAL, NEUTRAL, NEUTRAL/DRIVE 5, DRIVE 5, DRIVE 5/DRIVE 4, DRIVE 4, DRIVE 4/DRIVE 3, DRIVE 3, DRIVE 3/DRIVE 2, DRIVE 2, or INVALID. The IMS Range display represents a decoded status of the four inputs from the IMS. The combination of IMS inputs are used to determine which position the manual valve is in at any time.

IMS A/B/C/P: This parameter displays the status of the four A/B/C/P inputs from the automatic transmission internal mode switch. I indicates an ignition voltage signal. LOW indicates a 0 voltage signal. The scan tool will display HI/LOW, HI/LOW, HI/LOW, HI/LOW.

Last Shift Time: This parameter displays the actual time of the last upshift. This value is only accurate if the shift was adaptable.

PC Sol. Actual Current: This parameter displays the actual current flow through the pressure control solenoid circuit, which is measured by the control module. High current flow results in low line pressure. Low current flow results in high line pressure.

PC Solenoid Duty Cycle: This parameter displays the commanded state of the pressure control solenoid, expressed as a percentage of energised ON time. A reading of low percent indicates zero ON time, non energised, or no current flow. A high percent at idle indicates maximum ON time, energised, or high current flow.

PC Sol. Ref. Current: This parameter displays the commanded current of the pressure control solenoid circuit. High current results in low line pressure. Low current results in high line pressure.

Steady State TAP 1GR: This parameter displays a pressure modification which is added to the line pressure in 1st gear. The larger the value, the greater the increase to line pressure.

Steady State TAP 1GR/TCC: This parameter displays a pressure modification, which is added to the line pressure in 1st gear with TCC applied. The larger the value, the greater the increase to line pressure.

Steady State TAP 2GR: This parameter displays a pressure modification which is added to the line pressure in 2nd gear. The larger the value, the greater the increase to line pressure.

Steady State TAP 2GR / TCC: This parameter displays a pressure modification which is added to the line pressure in 2nd gear with TCC applied. The larger the value, the greater the increase to line pressure.

Steady State TAP 3GR: This parameter displays a pressure modification which is added to the line pressure in 3rd gear. The larger the value, the greater the increase to line pressure.

Steady State TAP 3GR / TCC: This parameter displays a pressure modification which is added to the line pressure in 3rd gear with TCC applied. The larger the value, the greater the increase to line pressure.

Steady State TAP 4GR: This parameter displays a pressure modification which is added to the line pressure in 4th gear. The larger the value, the greater the increase to line pressure.

Steady State TAP 4GR / TCC: This parameter displays a pressure modification which is added to the line pressure in 4th gear with TCC applied. The larger the value, the greater the increase to line pressure.

Steady State TAP 5GR: This parameter displays a pressure modification which is added to the line pressure in 5th gear. The larger the value, the greater the increase to line pressure.

Steady State TAP 5 GR / TCC: This parameter displays a pressure modification which is added to the line pressure in 5th gear with TCC applied. The larger the value, the greater the increase to line pressure.

Steady State TAP Reverse: This parameter displays a pressure modification which is added to the line pressure in Reverse gear. The larger the value, the greater the increase to line pressure.

TCC Brake Switch: This parameter displays the status of the TCC brake switch circuit input. OPEN indicates a zero voltage input, brake pedal applied. CLOSED indicates a voltage input, brake pedal released. The scan tool displays OPEN or CLOSED.

TCC Duty Cycle: This parameter displays the commanded percentage of ON time for the TCC PWM solenoid. A high percentage represents an ON, energised, commanded state. 0 percent represents an OFF, non-energised, commanded state.

TCC Duty Cycle CKT Status: This parameter displays the solenoid driver feedback voltage signal and displays the circuit status on the scan tool. If the voltage is low when the solenoid is commanded OFF, the scan tool will display Open/Short to GND. If the voltage is high when the solenoid is commanded ON, the scan tool will display Short to Volts. If no circuit fault is present, the scan tool will display OK.

TCC Slip Speed: This parameter displays the difference between transmission input speed and engine speed. A negative value indicates the engine speed is less than the input speed, deceleration. A positive value indicates the engine speed is greater than the input speed, acceleration. A value of zero indicates the engine speed is equal to the input speed, TCC applied.

TP Angle: This parameter displays a percentage that is calculated based on TP sensor voltage. The TP angle should display 0 percent at idle and 100 percent at wide open throttle (WOT).

Traction Control: This parameter displays Active or Inactive. When the ECM receives a request for torque reduction from the electronic brake traction control module (EBTCM), Active is displayed.

Trans. Fluid Temp.: This parameter displays the input signal of the transmission fluid temperature sensor. Transmission fluid temperature is high, 151°C (304°F), when signal voltage is low, 0 volt. Transmission fluid temperature is low, -40°C (-40°F), when signal voltage is high, 5 volt.

Trans. Oil Life: This parameter displays the transmission oil life remaining. The scan tool displays remaining oil life in percentage. The transmission oil life calculation is based on transmission fluid temperature and engine run time.

Transmission Hot Mode: This parameter displays the automatic transmission fluid temperature (TFT) and displays On or Off. Off indicates that the TFT has not exceeded 130°C (266° F). On indicates that the TFT has exceeded 130°C (266°F) and has not cooled to 120°C (248°F) for greater that 5 seconds. These numbers are approximate and differ with transmissions.

Transmission ISS: This parameter displays the rotational speed of the transmission input shaft. The scan tool displays input shaft speed as revolutions per minute (RPM).

Transmission OSS: This parameter displays the rotational speed of the transmission output shaft. The scan tool displays output shaft speed as revolutions per minute (RPM).

Vehicle Speed: This parameter displays the speed at which the vehicle is travelling. The scan tool displays vehicle speed as kilometres per hour (km/h), miles per hour (MPH). The vehicle speed is calculated based on the input signal from the automatic transmission output shaft speed sensor.

Diagnostic Trouble Code (DTC) Type Definitions

Diagnostic Trouble Codes (DTCs) are grouped into several types. Each type has a unique set of characteristics for Malfunction Indicator Lamp (MIL) operation, DTC storage, and DTC clearing. The following list contains a brief summary of the DTC types and the associated properties of each.

Type A

This DTC is emissions related. The MIL illuminates and default actions, if any, are activated immediately after a failure is detected. The DTC is then stored in history and the Freeze Frame data is captured.

Type B

This DTC is emissions related. Default actions, if any, are activated and a Failure Record is stored after the first failure is detected. At the time of the first fail, the DTC will appear in memory as pending. If the next trip reports a pass, the pending DTC is deleted. If the failure recurs on the next consecutive drive cycle, the MIL illuminates, the DTC is stored in history, and the Freeze Frame data is captured at the time of failure.

Type C

This DTC is non emission related and does not turn on the MIL. When a Type C DTC sets, a message may be displayed on the driver information centre. Type C DTCs that do not display a message were formerly referred to as type D DTCs.

Diagnostic Trouble Code (DTC) List / Type

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 1979940**

DTC P0115

Circuit Description

The engine control module (ECM) sends engine coolant temperature data to the transmission control module (TCM). The TCM uses this data to initiate warm-up shift patterns and to establish default transmission fluid temperature (TFT) values. The data is sent to the TCM through a communication network called GMLAN. Two circuits are used to communicate GMLAN data between the ECM and TCM. A fault in the GMLAN will not cause DTC P0115 to set by itself. If a GMLAN fault occurs, other DTCs will set before DTC P0115.

When the TCM receives invalid engine coolant temperature data from the ECM, then DTC P0115 will set. DTC P0115 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0115 Engine Coolant Temperature (ECT) Sensor Circuit

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- No other GMLAN errors are present.

Conditions for Setting the DTC

The TCM receives no valid engine coolant temperature data from the ECM for 2 seconds.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM uses 25°C (77°F) as a default engine coolant temperature value.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P0115 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Step		Value		

	Action	(s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** - Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. Did you record any ECM Failure Records?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 3
3	1. Clear the DTC. 2. Turn the ignition OFF for at least 30 seconds. 3. Start and allow the engine to idle. Did DTC P0115 reset?	--	Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	Did any other DTCs set?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 5
5	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 6	--
6	Perform the following operation to verify the repair: 1. Select DTC on the scan tool. 2. Select Clear Info. 3. Start and allow the engine to idle. 4. Select Specific DTC. 5. Enter DTC P0115. Has the test run and passed?	--	Go to Step 7	Go to Step 2

7	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0120

Circuit Description

The engine control module (ECM) sends accelerator pedal position data to the transmission control module (TCM). The TCM uses this data to modify shift speeds. The data is sent to the TCM through a communication network called GMLAN. Two circuits are used to communicate GMLAN data between the ECM and TCM. A fault in the GMLAN will not cause DTC P0120 to set by itself. If a GMLAN fault occurs, other DTCs will set before DTC P0120.

When the TCM receives invalid accelerator pedal data from the ECM, then DTC P0120 will set. DTC P0120 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0120 Throttle Position (TP) Sensor Circuit

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- No other GMLAN errors are present.

Conditions for Setting the DTC

The TCM receives no valid accelerator pedal data from the ECM for 2 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM uses the ECM default accelerator pedal value for determining shift speeds.
- The TCM turns off the pressure control solenoid. When the pressure control solenoid is off, line pressure is at maximum.
- The TCM freezes transmission adaptive functions.
- The TCM disables the TCC.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0120 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** - Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. Did you record any ECM Failure Records?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 3
3	1. Clear the DTC. 2. Turn the ignition OFF for at least 30 seconds. 3. Start, and allow the engine to idle. Did DTC P0120 reset?	--	Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	Did any other DTCs set?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 5
5	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 6	--
	Perform the following operation to verify the repair:			

6	1. Select DTC on the scan tool. 2. Select Clear Info. 3. Start, and allow the engine to idle. 4. Select Specific DTC. 5. Enter DTC P0120. Has the test run and passed?	--	Go to Step 7	Go to Step 2
7	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

The primary source of heat in the transmission is the torque converter. Hot oil exits the torque converter through the torque converter clutch (TCC) control valve and flows to the transmission cooler supply line. The supply line connects to the cooler, which is located in the radiator. From the cooler, the oil returns through the oil cooler return line and enters the lubrication circuits. After lubricating the internal components, the oil then returns to the oil pan. The oil pump draws oil through the filter from the oil pan, where the transmission fluid temperature (TFT) sensor is located. The oil pump pressurizes the oil and directs it to the pressure regulator valve. The pressure regulator valve is the starting point for the main supply of oil to the torque converter and the transmission hydraulic components.

When the transmission control module (TCM) detects high transmission oil temperature for an extended period of time, DTC P0218 sets. DTC P0218 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0218 Transmission Fluid Overtemperature

Conditions for Running the DTC

The transmission fluid temperature is -39 to +149°C (-38 to +300°F) for at least 5 seconds.

Conditions for Setting the DTC

The transmission fluid temperature is 132°C (270°F) or more for 600 seconds (10 minutes).

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- TRANSMISSION HOT - IDLE ENGINE displays on the driver information centre (DIC).
- The TCM freezes transmission adaptive functions.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0218 in TCM history.

Conditions for Clearing the DIC/DTC

- The TCM clears the DIC message when the condition no longer exists.
- The TCM cancels the DTC default actions when the condition no longer exists.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

- The DIC, if equipped, will display TRANSMISSION HOT - IDLE ENGINE when the transmission fluid temperature reaches 132°C (270°F).
- Observe DIC messaging that indicates the engine cooling system is hot.
- The TFT displayed on the scan tool should rise steadily to a normal operating temperature, then stabilize.
- Ask about the customer's driving habits, trailer towing, etc. Trailer towing should occur in D4.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Record the Failure Records before clearing the DTC.	125°C		

2	Using the Clear Info function erases the Failure Records from the ECM and the TCM. 3. Record the DTC Failure Records. Is the engine coolant temperature above the specified value when the DTC set?	(257° F)	Go to Engine Overheating	Go to Step 3
3	1. Clear the DTC. 2. Perform the Transmission Fluid Checking Procedure. Refer to Transmission Fluid Check . Is the action complete?	--	Go to Step 4	--
4	1. Inspect the transmission cooling system for restrictions or damage. Refer to Transmission Fluid Cooler Flushing and Flow Test . 2. Repair or replace the cooling system components as necessary. Did you find and correct a condition?	--	Go to Step 7	Go to Step 5
5	1. Perform the Line Pressure Check Procedure. Refer to Line Pressure Check . 2. Repair the transmission as necessary. Did you find and correct a condition?	--	Go to Step 7	Go to Step 6
6	1. Test the torque converter for a seized stator. Refer to Torque Converter Diagnosis . 2. Replace the torque converter as necessary. Did you find and correct a condition?	--	Go to Step 7	--
7	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle long enough to make sure the transmission temperature remains below 129°C (262°F). 4. Select Specific DTC. 5. Enter DTC P0218. Has the test run and passed?	--	Go to Step 8	Go to Step 2
8	With the scan tool, observe the stored information, capture info and DTC info.	--	Go to Diagnostic Trouble Code	

	Does the scan tool display any DTCs that you have not diagnosed?		(DTC) List - Vehicle	System OK

The transmission control module (TCM) continuously monitors the system voltage on the ignition 1 and the battery circuits. Lower than normal voltage may be inadequate to operate the transmission control solenoids properly. Improper solenoid operation may cause erratic transmission operation and tie-up conditions, which may result in internal damage.

When the TCM detects low voltage, DTC P0562 sets. DTC P0562 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0562 System Voltage Low

Conditions for Running The DTC

The engine speed is greater than 1,200 RPM.

Conditions for Setting The DTC

The TCM detects system voltage less than 11 volts for 10 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0562 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

- Observe the driver information centre (DIC) messaging that indicates the electrical system requires service.
- Inspect for the following conditions:
  - Loose or damaged terminals at the generator
  - Loose or worn generator drive belt

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests the charging system voltage with a nominal load.
5. This step obtains the ignition voltage measurement reported by the TCM.
6. This step tests the voltage drop from the battery and ignition voltage input at the TCM.
10. This step tests the voltage drop from the ground terminals of the TCM to the ground terminal of the battery.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic Trouble Code (DTC) List - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the			

2	engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the Failure Records. 4. Clear the DTC. 5. Using the DMM, measure and record the battery voltage across the battery terminals. Is the voltage higher than the specified value?	11 V	Go to Step 3	Go to Battery Inspection/Test
3	1. Start the engine. 2. Allow the engine to warm up to normal operating temperature. Is the charge indicator light ON?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 4
4	1. Turn ON the high beam headlamps. 2. Turn the HVAC blower control to the highest speed setting. 3. Turn ON the rear window defroster. 4. Increase the engine speed to 1,500 RPM. 5. Observe the DMM battery voltage and record your voltage reading for reference. Is the voltage within the specified range?	12.5-14.5 V	Go to Step 5	Go to Charging System Test
5	1. Increase the engine speed to 1,500 RPM. 2. Observe the Ignition Voltage with the scan tool. Is the scan tool Ignition Voltage within the specified range?	12.5-14.5 V	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 6
	1. Turn OFF the ignition. 2. Disconnect the TCM connector. 3. Probe terminal 9 and 27 of the TCM connector with the ground			

6	probe of the DMM. Refer to Measuring Voltage . 4. Connect the positive lead of the DMM to the battery positive terminal. 5. Turn ON the ignition, with the engine OFF. Are the voltage drop measurements less than the specified value?	0.5 V	Go to Step 10	Go to Step 7
7	Inspect the 10 amp ECM/TCM battery fuse and the 15 amp TCM/IPC ignition 1, fuse for an open. Refer to Circuit Protection - Fuses . Did you find an open fuse?	--	Go to Step 8	Go to Step 9
8	Repair the short to ground in the battery voltage circuit or the ignition voltage circuit. Refer to Wiring Repairs . Is the repair complete?	--	Go to Step 13	--
9	Test the battery voltage circuit or the ignition voltage circuit for an open or high resistance condition. Refer to Testing for Continuity . Did you find and correct a condition?	--	Go to Step 13	Go to Step 10
10	1. Turn ON the ignition, with the engine OFF. 2. Using the positive probe of the DMM, probe terminal 6 of the TCM connector. 3. Connect the negative probe of the DMM to the battery ground terminal. Observe and record the voltage measurement. 4. Using the positive probe of the DMM, probe terminal 7 of the TCM connector. Observe and record the voltage measurement. Refer to Measuring Voltage . Are both of the voltage drop measurements less than the specified value?	0.2 V	Go to Step 12	Go to Step 11
11	Repair the open or high resistance condition in the TCM ground circuits. Refer to Wiring Repairs . Is the repair complete?	--	Go to Step 13	--
	Replace the TCM.			

12	Refer to Control Module References . Is the action complete?	--	Go to Step 13	--
13	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Start the engine. • Allow the engine to warm up to normal operating temperature. • Raise the engine speed to at least 1,200 RPM. • TCM voltage must be greater than 11 volts for 12 seconds. 4. Select Specific DTC. 5. Enter DTC P0562. Has the test run and passed?	--	Go to Step 14	Go to Step 2
14	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

The transmission control module (TCM) continuously monitors the system voltage on the Ignition 1 and the battery circuits. Higher than normal voltage may cause the solenoids inside the transmission to operate improperly or damage solid-state components inside the TCM.

When the TCM detects high voltage, DTC P0563 sets. DTC P0563 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0563 System Voltage High

Conditions for Running The DTC

The ignition is ON.

Conditions for Setting The DTC

The TCM detects system voltage greater than 18 volts for 10 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0563 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- A scan tool can clear the DTC.

Diagnostic Aids

- Observe the driver information centre (DIC) messaging that indicates the electrical system requires service.
- Use the scan tool in order to inspect all other modules for voltage related DTCs.
- Running the engine with a battery charger attached may cause DTC P0563 to set.
  - Inspect the charging circuit for high resistance.
  - Inspect the vehicle battery for open or sulfated cells.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. This step tests the charging system voltage with a minimal load.

5. This step obtains the ignition voltage measurement reported by the TCM.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info			

2	function erases the Failure Records from the ECM and TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the Failure Records. Did you record a Failure Record for DTC P0560?	--	Go to DTC P0560	Go to Step 3
3	1. Clear the DTC. 2. Start the engine. 3. Allow the engine to warm up to normal operating temperature. Is the charge indicator light ON?	--	Go to Diagnostic System Check - Vehicle	Go to Step 4
4	1. Turn OFF all electrical accessories. 2. Increase the engine speed to 2,000 RPM. 3. Using the DMM, measure the voltage between the battery terminals. Record the measurement for reference. Is the voltage within the specified range?	12.5-14.5 V	Go to Step 5	Go to Charging System Test
5	1. Leave the engine running. 2. Observe the Ignition Voltage on the scan tool. 3. Increase the engine speed to 2,000 RPM. Is the difference between the voltage displayed on the scan tool and the voltage measurement in Step 4 greater than the specified value?	1.0 V	Go to Step 7	Go to Step 6
6	Did P0563 reset?	--	Go to Step 7	Go to Testing for Intermittent Conditions and Poor Connections
7	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 8	--
	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the			

8	following conditions: • Start the engine. • Allow the engine to warm up to normal operating temperature. • Observe the Ignition Voltage on the scan tool. • TCM voltage must remain below 18 volts for 12 seconds. 4. Select Specific DTC. 5. Enter DTC P0563. Has the test run and passed?	--	Go to Step 9	Go to Step 2
9	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0572

Circuit Description

The brake pedal position sensor is used to sense the action of the driver's application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The brake pedal position sensor receives a low reference signal and a 5-volt reference voltage from the instrument panel module (IPM) when the driver applies the brakes. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the IPM will apply battery voltage to the stop/turn signal voltage supply circuit to illuminate the stop lamps and the center high mounted stop lamp (CHMSL). The IPM also sends a brake pedal position sensor signal to the engine control module (ECM) as well as a serial data message to indicate the application of the brake pedal.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0572 Brake Switch Circuit 1 Low Voltage

Conditions for Running the DTC

- The ignition is in the ON position.
- Battery voltage greater than 11.5 volts.

Conditions for Setting the DTC

The ECM detects a short to ground on the signal circuit when the serial data message from the IPM indicates the brakes are applied.

Action Taken When the DTC Sets

- The ECM stores the DTC to memory.
- The ECM will record the operating conditions at the time the diagnostic failed. The ECM stores this information in Failure Records.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- You issue a scan tool CLEAR DTCs command.
- A history DTC will clear once 40 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- Verify that the Brake Pedal Position sensor is properly calibrated. Refer to Stop Lamp Switch

Adjustment .

- Test drive the vehicle if a switch or circuit condition cannot be located. An intermittent condition may be duplicated during a test drive.
- Thoroughly inspect the wiring and connectors. An incomplete inspection of the wiring and connectors may result in misdiagnosis causing part replacement with the reappearance of the malfunction. If an intermittent malfunction exists, Refer to Testing for Intermittent Conditions and Poor Connections .

Step	Action	Yes	No
Schematic Reference: Exterior Lights Schematics *Connector End View Reference:* Master Electrical Component List			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Test the stop lamp switch signal circuit for a short to ground. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	Go to Step 5	Go to Step 3
3	Inspect for poor connections at the engine control module (ECM) harness connector. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	Go to Step 5	Go to Step 4
4	Replace the ECM. Refer to Control Module References for replacement, setup, and programming. Did you complete the repair?	Go to Step 5	--
5	1. Use a scan tool in order to clear the DTCs. 2. Operate the vehicle within the Conditions for Running the DTC as specified in the supporting text. Does the DTC reset?	Go to Step 2	System OK

3	Inspect for poor connections at the engine control module (ECM) harness connector. Refer to Testing for Intermittent Conditions and Poor Connections . Did you find and correct the condition?	Go to Step 5	Go to Step 4
4	Replace the ECM. Refer to Control Module References for replacement, setup, and programming. Did you complete the repair?	Go to Step 5	--
5	1. Use a scan tool in order to clear the DTCs. 2. Operate the vehicle within the Conditions for Running the DTC as specified in the supporting text. Does the DTC reset?	Go to Step 2	System OK

DTC P0601

Circuit Description

A normal function of the transmission control module (TCM) is to perform an internal test that verifies the integrity of the ROM memory allocation. This diagnostic detects faults in the allocation of flash memory that contain the program and calibration by comparing a calculated checksum with a stored checksum. When the TCM detects that the calculated checksum is different from the stored checksum, DTC P0601 sets. DTC P0601 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0601 Transmission Control Module (TCM) Read Only Memory (ROM)

Conditions for Running The DTC

The ignition is ON.

Conditions for Setting The DTC

The TCM EEPROM checksums do not match.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids.
- The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear.
- The TCC commands maximum line pressure.
- The TCC freezes transmission adaptive functions.
- The TCC is disabled.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0601 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.

- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

DTC P0601 may set as a result of TCM reprogramming.

Test Description

The number below refers to the step number on the diagnostic table.

3. This step eliminates the TCM software as a possible cause of the DTC. If the DTC continues to set after reprogramming, the fault is in the TCM hardware.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Turn OFF the ignition for at least 30 seconds. 6. Turn ON the ignition. Did DTC P0601 reset?	--	Go to Step 3	Go to Diagnostic Aids
3	Perform the Transmission Control Module Programming Procedure. Refer to Control Module References .	--		

	Is the action complete?		Go to Step 5	Go to Step 4
4	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn OFF the ignition for at least 30 seconds. 4. Turn ON the ignition. 5. Select Specific DTC. 6. Enter DTC P0601. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0602

Circuit Description

A normal function of the transmission control module (TCM) is to perform an internal test that verifies the security of the diagnostic and shift calibration programming. The programming must contain security codes that enable a software lock to engage. The software lock is designed to prevent unauthorized changes to the diagnostics or shift calibrations. The software lock utility is processed independently from the diagnostic and shift calibration software and contains application specific data. This software lock data is entered into the TCM during the final assembly of the vehicle.

When the security codes from the diagnostic and shift calibration software fail to engage the software lock, the TCM sets DTC P0602. DTC P0602 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0602 Transmission Control Module (TCM) Not Programmed

Conditions for Running The DTC

The ignition is ON.

Conditions for Setting The DTC

The TCM detects an unlocked calibration memory range.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids.
- The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear.
- The Torque Converter Clutch (TCC) commands maximum line pressure.
- The TCC freezes transmission adaptive functions.
- The TCC is disabled.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0602 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

DTC P0602 may set as a result of TCM reprogramming.

Test Description

The number below refers to the step number on the diagnostic table.

3. This step eliminates the TCM software as a possible cause of the DTC. If the DTC continues to set after reprogramming, the fault is in the TCM hardware.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
